Other side-effects include: gastrointestinal effects: dyspepsia, abdominal distension, acute pancreatitis, oesophageal ulceration and candidiasis; musculoskeletal effects: muscle weakness, vertebral and long bone fractures, tendon rupture; endocrine effects: menstrual irregularities and amenorrhoea, hirsutism, weight gain, negative nitrogen and calcium balance, increased appetite; increased susceptibility to and severity of infection, reactivation of dormant tuberculosis; neuropsychiatric effects: psychological dependence, insomnia, increased intracranial pressure with papilloedema in children (usually after withdrawal), aggravation of schizophrenia, aggravation of epilepsy; ophthalmic effects: glaucoma, papilloedema, posterior subcapsular cataracts, corneal or scleral thinning and exacerbation of ophthalmic viral or fungal disease, increased intra-ocular pressure, exophthalmos; also impaired healing, petechiae, ecchymoses, facial erythema, suppression of skin test reactions, urtica, hyperhidrosis, skin atrophy, bruising, telangiectasia, myocardial rupture following recent myocardial infarction, congestive heart failure, leucocytosis, hyperglycaemia, hypersensitivity reactions (including anaphylaxis), thromboembolism, nausea, malaise, hiccups, headache, vertigo.

For other references to the side-effects of corticosteroids see section 3.2 (asthma), section 11.4 (eye) and section 13.4 (skin).

**STEROID TREATMENT CARD**

I am a patient on STEROID treatment which must not be stopped suddenly

- If you have been taking this medicine for more than three weeks, the dose should be reduced gradually when you stop taking steroids unless your doctor says otherwise.
- Read the patient information leaflet given with the medicine.
- Always carry this card with you and show it to anyone who treats you (for example a doctor, nurse, pharmacist or dentist). For one year after you stop the treatment, you must mention that you have taken steroids.
- If you become ill, or if you come into contact with anyone who has an infectious disease, consult your doctor promptly. If you have never had chickenpox, you should avoid close contact with people who have chickenpox or shingles. If you do come into contact with chickenpox, see your doctor urgently.
- Make sure that the information on the card is kept up to date.

**BETAMETHASONE**

**indications** suppression of inflammatory and allergic disorders; congenital adrenal hyperplasia; see also notes above; ear (section 12.1.1); eye (section 11.4.1); nose (section 12.2.1); oral ulceration (section 12.3.1)

**Cautions** see notes above; transient effect on fetal movements and heart rate

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- **By mouth**, usual range 0.5–5 mg daily; see also Administration (above)
- **By intramuscular injection or slow intravenous injection or infusion**, 4–20 mg, repeated up to 4 times in 24 hours; **CHILD, by slow intravenous injection**, up to 1 year 1 mg, 1–5 years 2 mg, 6–12 years 4 mg, repeated up to 4 times in 24 hours according to response
Betanel® (UCB Pharma) 
Tablets, scored, betamethasone 500 micrograms. Net price 100-tab pack = £4.39. Label: 10, steroid card, 21

Betnesol® (UCB Pharma) 
Soluble tablets, pink, scored, betamethasone 500 micrograms (as sodium phosphate). Net price 100-tab pack = £5.17. Label: 10, steroid card, 13, 21

CORTISONE ACETATE

Indications see under Dose but now superseded, see also notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- For replacement therapy, 25–37.5 mg daily in divided doses

Contra-indications see notes above

Cautions see notes above

Indications suppression of inflammatory and allergic disorders

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- Usual maintenance 3–18 mg daily (acute disorders, initially up to 120 mg daily); see also Administration (above)
- CHILD 0.25–1.5 mg/kg daily (or on alternate days); see also Administration (above)

Calcort® (Shire) 
Tablets, deflazacort 6 mg, net price 60-tab pack = £16.46. Label: 5, 10, steroid card

DEFLAZACORT

Indications suppression of inflammatory and allergic disorders; diagnosis of Cushing’s disease, congenital adrenal hyperplasia; cerebral oedema associated with malignancy; croup (section 3.1); nausea and vomiting with chemotherapy (section 8.1); rheumatic disease (section 10.1.2); eye (section 11.4.1); skin (section 13.4)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- By mouth, usual range 0.5–10 mg daily; CHILD 10–100 micrograms/kg daily; see also Administration (above)
- By intramuscular injection or slow intravenous injection or infusion (as dexamethasone phosphate), initially 0.5–24 mg; CHILD 200–400 micrograms/kg daily

Dexamethasone (Non-proprietary) 
Tablets, dexamethasone 2 mg, net price 20 = £1.75. Label: 10, steroid card, 21

Available from Organon

Oral solution, sugar-free, dexamethasone (as dexamethasone sodium phosphate) 2 mg/5 mL, net price 150-mL = £42.30. Label: 10, steroid card, 21

Brands include Dexsol

Injection, dexamethasone phosphate (as dexamethasone sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.00, 2-mL vial = £1.98; 24 mg/mL, 5-mL vial = £16.66. Label: 10, steroid card

Available from Hospira

Injection, dexamethasone (as dexamethasone sodium phosphate) 4 mg/mL, net price 1-mL amp = 91p, 2-mL vial = £1.27. Label: 10, steroid card

Available from Organon

HYDROCORTISONE

Indications adrenocortical insufficiency (section 6.3.1); shock; see also notes above; hypersensitivity reactions e.g. anaphylactic shock and angioedema (section 3.4.3); asthma (section 3.1); severe inflammatory bowel disease (section 1.5); haemorrhoids (section 1.7.2); rheumatic disease (section 10.1.2); eye (section 11.4.1); skin (section 13.4)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also phosphate ester associated with paraesthesia and pain (particularly in the perineal region)

Dose

- By mouth, replacement therapy, 20–30 mg daily in divided doses—see section 6.3.1; CHILD 10–30 mg

- By intramuscular injection or slow intravenous injection or infusion, 100–500 mg, 3–4 times in 24 hours or as required; CHILD by slow intravenous injection up to 1 year 25 mg, 1–5 years 50 mg, 6–12 years 100 mg

Hydrocortisone (Non-proprietary) 
Tablets, scored, hydrocortisone 10 mg, net price 30-tab pack = 70p; 20 mg, 30-tab pack = £1.07. Label: 10, steroid card, 21

Efcortesol® (Sovereign) 
Injection, hydrocortisone 100 mg (as sodium phosphate)/mL, net price 1-mL amp = 75p, 5-mL amp = £4.48. Label: 10, steroid card

Note Paraeesthesia and pain (particularly in the perineal region) may follow intravenous injection of the phosphate ester

1. Restriction does not apply where administration is for saving life in emergency
Sex hormones

6.4

6.4.1 Female sex hormones

6.4.2 Male sex hormones and antagonists

6.4.3 Anabolic steroids

6.4.1.1 Oestrogens and HRT

6.4.1.2 Progestogens

6.4.1.1 Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

PREDNISOLONE

Indications suppression of inflammatory and allergic disorders; see also notes above; inflammatory bowel disease (section 1.5); asthma, section 3.1 and section 3.2; immunosuppression, section 8.2.2; rheumatic disease, section 10.1.2; eye, section 11.4.1; ear, section 12.1.1

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

• By mouth, initially, up to 10–20 mg daily (severe disease, up to 60 mg daily), preferably taken in the morning after breakfast; can often be reduced within a few days but may need to be continued for several weeks or months

Maintenance, usual range, 2.5–15 mg daily, but higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily

• By intramuscular injection, prednisolone acetate (section 10.1.2.2), 25–100 mg once or twice weekly

Prednisolone (Non-proprietary)

Tablets, prednisolone 1 mg, net price 28-tab pack = 88p; 5 mg, 28-tab pack = 98p; 25 mg, 56-tab pack = £20.00. Label: 10, steroid card, 21

Tablets, both e/c, prednisolone 2.5 mg (brown), net price 30-tab pack = £4.81; 5 mg (red), 30-tab pack = £4.88. Label: 5, 10, steroid card, 25

Brands include DeltaCortril Enetic

Soluble tablets, prednisolone 5 mg (as sodium phosphate), net price 30-tab pack = £7.45. Label: 10, steroid card, 13, 21

Injection, see section 10.1.2.2

TRIAMCINOLONE

Indications suppression of inflammatory and allergic disorders; see also notes above; rheumatic disease, section 10.1.2; mouth, section 12.3.1; skin, section 13.4

Cautions see notes above; also high dosage may cause proximal myopathy, avoid in chronic therapy

Contra-indications see notes above

Side-effects see notes above

Dose

• By deep intramuscular injection, into gluteal muscle, 40 mg of acetone depot for depot effect, repeated at intervals according to the patient’s response; max. single dose 100 mg

Kenalog® Intra-articular/Intramuscular (Squibb)

Injection (aqueous suspension), triamcinolone acetonide 40 mg/mL, net price 1-mL vial = £1.70; 1-mL prefilled syringe = £2.11; 2-mL prefilled syringe = £3.66. Label: 10, steroid card

Note Intramuscular needle with prefilled syringe should be replaced for intra-articular injection
In terms of oestrogenic activity natural oestrogens (estradiol (estradiol), estrone (oestrone), and estriol (oestradiol)) have a more appropriate profile for hormone replacement therapy (HRT) than synthetic oestrogens (ethinylestradiol (ethinyl-oestradiol) and mestranol). Tibolone has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

### Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis (section 6.6.1) but other drugs (section 6.6) are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation (section 7.2.1) used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern (section 6.6).

Clonidine (section 2.5.2 and section 4.7.4.2) may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table below.

The CSM advises that the minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered (section 6.6). HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

### Risk of breast cancer

The CSM has estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment, see HRT Risk table below for details. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

### Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT, see HRT Risk table below for details.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

### Risk of ovarian cancer

Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer, see HRT Risk table below for details; this excess risk disappears within a few years of stopping.

### Risk of venous thromboembolism

Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use, see HRT Risk table below for details.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it may be prudent to review the need for HRT as in some cases the risks of HRT may exceed the benefits. See below for advice on surgery.

### Risk of stroke

Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke, see HRT Risk table below for details.

### Risk of coronary heart disease

HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause, see HRT Risk table below for details. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

### Choice

The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous...
administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone are not suitable for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or it may be given by subcutaneous or transdermal administration, which avoids first-pass metabolism. In the case of subcutaneous implants, recurrence of vasomotor symptoms at supraphysiological plasma concentrations may occur; moreover, there is evidence of prolonged endometrial stimulation after discontinuation (calling for continued cyclical progestogen). For the use of topical HRT preparations see section 7.2.1.

Contraception

HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill (section 7.3.1) to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives.

</table>

Note Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference.

Taken from MHRA/CHM (Drug Safety Update 2007; 1 (2): 2–6 available at www.mhra.gov.uk/mhra/drugsafetyupdate

1. Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
2. Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
3. The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
4. Limited data does not suggest an increased risk of thromboembolism with tibolone compared to combined HRT or women not taking HRT.
5. Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
6. Tibolone use increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
7. Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
8. There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.
any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

**Surgery** Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery (see Risk of Venous Thromboembolism, above); it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with heparin may be prudent to stop HRT 4–6 weeks before surgery (see Risk of Venous Thromboembolism, above); it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with heparin, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery (see Risk of Venous Thromboembolism, above); it should be restarted only after full mobilisation.

**Withdrawal bleeding**: Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

**Dose**
- See under preparations

**Counselling on patches**: Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.

**OESTROGENS FOR HRT**

**Note** Relates only to small amounts of oestrogens given for hormone replacement therapy

**Indications** see notes above and under preparations

**Cautions** prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer (see notes above); migraine (or migraine-like headaches); diabetes (increased risk of heart disease); history of breast nodules or fibrocystic disease—closed monitor breast status (risk of breast cancer, see notes above); risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative); uterine fibroids may increase in size, symptoms of endometriosis may be exacerbated; factors predisposing to thromboembolism (see notes above); presence of antiphospholipid antibodies (increased risk of thrombotic events); increased risk of gall-bladder disease reported; hypophysal tumours; acute porphyria (see section 9.8.2); interactions: Appendix 1 (oestrogens)

**Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**Contra-indications** pregnancy; oestrogen-dependent cancer, history of breast cancer, active thrombophlebitis, active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction), venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment), liver disease (where liver function tests have failed to return to normal), Dubin-Johnson and Rotor syndromes (or monitor closely), untreated endometrial hyperplasia, undiagnosed vaginal bleeding, breast-feeding

**Side-effects** see notes above for risks of long-term use; nausea and vomiting, abdominal cramps and bloating, weight changes, breast enlargement and tenderness, premenstrual-like syndrome, sodium and fluid retention, cholestatic jaundice, glucose intolerance, altered blood lipids—may lead to pancreatitis, rashes and chloasma, changes in libido, depression, mood changes, headache, migraine, dizziness, leg cramps (rule out venous thrombosis), vaginal candidiasis, contact lenses may irritate; transdermal delivery systems may cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure), and headache has been reported on vigorous exercise.

**Premarie**: (Wyeth) (HR)

- **Premarie Low Dose tablets**, s/c, ivory, conjugated oestrogen (equine) 300 micrograms and medroxyprogesterone acetate 1.5 mg, net price 3 × 28-tab pack = £29.85
- **Dose** menopausal symptoms in women with a uterus, 1 tablet daily continuously

- **Premarie tablets**, s/c, blue, conjugated oestrogen (equine) 625 micrograms and medroxyprogesterone acetate 5 mg, Net price 3 × 28-tab pack = £27.14
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously (starting on day 1 of menstruation if cycles have not ceased)

- **Premarie Cycle Calendar pack**, all s/c, 14 white tablets, conjugated oestrogens (equine) 625 micrograms; 14 green tablets, conjugated oestrogens (equine) 625 micrograms and medroxyprogesterone acetate 10 mg, net price 3 × 28-tab pack = £24.87
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 white tablet daily for 14 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 green tablet daily for 14 days; subsequent courses are repeated without interval

- **Premarap-C**: (Wyeth) (HR)

- **Premarap-C 0.625 Calendar pack**, s/c, 28 maroon tablets, conjugated oestrogens (equine) 625 micrograms; 12 light brown tablets, norgestrel 150 micrograms (≡ levonorgestrel 75 micrograms). Net price 3 × 40-tab pack = £17.67
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 maroon tablet daily continuously, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), and 1 brown tablet daily on days 17–28 of each 28-day treatment cycle; subsequent courses are repeated without interval

- **Premarap-C 1.25 Calendar pack**, s/c, 28 yellow tablets, conjugated oestrogens (equine) 1.25 mg; 12 light brown tablets, norgestrel 150 micrograms (≡ levonorgestrel 75 micrograms). Net price 3 × 40-tab pack = £17.87
- **Dose** see under 0.625 Calendar pack, but taking 1 yellow tablet daily continuously (instead of 1 maroon tablet) if symptoms not fully controlled with lower strength
Endocrine system

Female sex hormones

Estradiol with progestogen

Angeliq® (Schering Health) (PAP)

Tablets, f/c, red, estradiol 1 mg, drospirenone 2 mg. Net price 3 × 28-tab pack = £25.80

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

Cautions use with care if an increased concentration of potassium might be hazardous; renal impairment (Appendix 3)

Note Unsuitable for use in perimenopausal women or within 12 months of last menstrual period—see Choice above

Climestag® (Novartis) (PAP)

Climestag® 1-mg tablets, 16 grey-blue, estradiol valerate 1 mg; 12 white, estradiol valerate 1 mg and norethisterone 1 mg. Net price 28-tab pack = £5.74; 3 × 28-tab pack = £16.69

Dose menopausal symptoms, a 1 grey-blue tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 white tablet for 12 days; subsequent courses are repeated without interval

Climestag® 2-mg tablets, 16 blue, estradiol valerate 2 mg; 12 yellow, estradiol valerate 2 mg and norethisterone 1 mg. Net price 28-tab pack = £5.74; 3 × 28-tab pack = £16.69

Dose see Climestag 1-mg, but starting with 1 blue tablet daily (instead of 1 grey-blue tablet) if symptoms not controlled with lower strength

Climesse® (Novartis) (PAP)

Tablets, pink, estradiol valerate 2 mg, norethisterone 700 micrograms. Net price 1 × 28-tab pack = £10.34; 3 × 28-tab pack = £31.03

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus. 1 tablet daily continuously

Note Unsuitable for use in perimenopausal women or within 12 months of last menstrual period—see Choice above

Clinorette® (ReSource Medical) (PAP)

Tablets, f/c, 16 white, estradiol 2 mg; 12 pink, estradiol 2 mg and norethisterone 1 mg, net price 3 × 28-tab pack = £9.23

Dose menopausal symptoms, in women with a uterus, 1 white tablet daily for 16 days starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 pink tablet daily for 12 days; subsequent courses are repeated without interval

Cyclo-Progynova® (Viatris) (PAP)

Cyclo-Progynova® 2-mg tablets, all s/c, 11 white, estradiol valerate 2 mg; 10 brown, estradiol valerate 2 mg and norgestrel 500 micrograms (= levonorgestrel 250 micrograms). Net price per pack = £3.11

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily on a continuous basis (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

Elette-Duet Conti® tablets, f/c, grey, estradiol 2 mg, norethisterone acetate 1 mg. Net price 3 × 28-tab pack = £17.97

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily on a continuous basis (if changing from cyclical HRT begin treatment the end of scheduled bleed)

Note Unsuitable for use in perimenopausal women or within 12 months of last menstrual period—see Choice above

Estracombi® (Novaris) (PAP)

Combination pack, self-adhesive patches of Estraderm TTS® 50 (releasing estradiol approx. 50 micrograms/24 hours) and of Estragest TTS® (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate 250 micrograms/24 hours); net price 1-month pack (4 of each) = £13.37, 3-month pack (12 of each) = £40.11. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), 1 Estraderm TTS® 50 patch to be applied twice weekly for 2 weeks followed by 1 Estragest TTS® patch twice weekly for 2 weeks; subsequent courses are repeated without interval

Evorel® (Janssen-Cilag) (PAP)

Evorel® Conti patches, self-adhesive, (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £12.00, 24-patch pack = £35.99. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 patch to be applied twice weekly continuously

Evorel® Sequel combination pack, 4 self-adhesive patches of Evorel® 50 (releasing estradiol approx. 50 micrograms/24 hours) and 4 self-adhesive patches of Evorel® Conti (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £10.23. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 Evorel® 50 patch to be applied twice weekly for 2 weeks followed by 1 Evorel® Conti patch twice weekly for 2 weeks; subsequent courses are repeated without interval

Femapak® (Solvay) (PAP)

Femapak® 40 combination pack of 8 self-adhesive patches of Fematrix® 40 (releasing estradiol approx. 40 micrograms/24 hours) and 14 tablets of dydrogesterone 10 mg. Net price per pack = £7.61. Counselling, administration

Dose see under Femapak 80

Femapak® 80 combination pack of 8 self-adhesive patches of Fematrix® 80 (releasing estradiol approx. 80 micrograms/24 hours) and 14 tablets of dydrogesterone 10 mg. Net price per pack = £8.06. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in case of Femapak® 80 only), in women with a uterus, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), apply 1 patch twice weekly continuously and take 1 tablet daily on days 15–28 of each 28-day treatment cycle; therapy should be initiated with Femapak® 40 in those with menopausal symptoms, prolonged oestrogen deficiency or anticipated intolerance to higher strengths, subsequently adjusted to lowest effective dose

Femoston® (Solvay) (PAP)

Femoston® 1/10 tablets, both f/c, 14 white, estradiol 1 mg, 14 grey, estradiol 1 mg, dydrogesterone 10 mg. Net price 3 × 28-tab pack = £13.47

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 14 days...
days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 grey tablet for 14 days, subsequent courses repeated without interval.

**Femoston®**
- 2/10 tablets, both f/c, 14 red, estradiol 2 mg; 14 yellow, estradiol 2 mg, dydrogesterone 10 mg. Net price 3 x 28-tab pack = £13.47
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 red tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 yellow tablet daily for 14 days; subsequent courses repeated without interval; therapy required for menopausal symptoms alone, Femoston 1/10 given initially and Femoston 2/10 substituted if symptoms not controlled
- **Note** Unsuitable for use in perimenopausal women or within 12 months of last menstrual period—see Choice above

**FemSeven® Conti**
- (Merck)
- **Patches**, self-adhesive (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 7 micrograms/24 hours); net price 4-patch pack = £15.48, 12-patch pack = £ 44.12. Counseling, administration
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)
- **Note** Unsuitable for use in perimenopausal women or within 12 months of last menstrual period—see Choice above

**FemSeven® Sequi**
- (Merck)
- **Combination pack**, self-adhesive patches of FemSeven Sequi Phase 1 (releasing estradiol approx. 50 micrograms/24 hours) and of FemSeven Sequi Phase 2 (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 10 micrograms/24 hours); net price 1-month pack (2 of each) = £13.18, 3-month pack (6 of each) = £37.54. Counseling, administration
- **Dose** menopausal symptoms in women with a uterus, 1 patch to be applied once a week continuously
- **Note** Unsuitable for use in perimenopausal women or within 12 months of last menstrual period—see Choice above

**Indivina®**
- (Orion)
- **Indivina® 1 mg/2.5 mg tablets**, estradiol valerate 1 mg, medroxyprogesterone acetate 2.5 mg, net price 3 x 28-tab pack = £21.49
- **Indivina® 1 mg/5 mg tablets**, estradiol valerate 1 mg, medroxyprogesterone acetate 5 mg, net price 3 x 28-tab pack = £21.49
- **Indivina® 2 mg/5 mg tablets**, estradiol valerate 2 mg, medroxyprogesterone acetate 5 mg, net price 3 x 28-tab pack = £21.49
- **Indivina® 2 mg/10 mg tablets**, estradiol valerate 2 mg, medroxyprogesterone acetate 10 mg, net price 3 x 28-tab pack = £21.49
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT
- **Note** Less suitable for use in perimenopausal women or within 3 years of last menstrual period—see Choice above

**Kliofem®**
- (Novo Nordisk)
- **Tablets**, f/c, yellow, estradiol 2 mg, norethisterone acetate 1 mg. Net price 3 x 28-tab pack = £11.43
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT
- **Note** Unsuitable for use in perimenopausal women or within 12 months of last menstrual period—see Choice above

**Kliovance®**
- (Novo Nordisk)
- **Tablets**, f/c, estradiol 1 mg, norethisterone acetate 500 micrograms, net price 3 x 28-tab pack = £14.67
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT
- **Note** Unsuitable for use in perimenopausal women or within 12 months of last menstrual period—see Choice above

**Novofem®**
- (Novo Nordisk)
- **Tablets**, f/c, 16 red, estradiol 1 mg; 12 white, estradiol 1 mg, norethisterone acetate 1 mg, net price 3 x 28-tab pack = £13.50
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 red tablet daily for 16 days then 1 white tablet daily for 12 days; subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

**Nuvelle®**
- (Schering Health)
- **Nuvelle® tablets**, all s/c, 16 white, estradiol valerate 2 mg; 12 pink, estradiol valerate 2 mg and levonorgestrel 75 micrograms. Net price 3 x 28-tab pack = £12.87
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 16 days, starting on day 1 of menstruation (or any time if cycles have ceased or are infrequent) then 1 pink tablet daily for 12 days; subsequent courses are repeated without interval
- **Nuvelle® Continuous tablets**, f/c, pink, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 x 28-tab pack = £16.85
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT
- **Note** Unsuitable for use in perimenopausal women or within 12 months of last menstrual period—see Choice above

**Tridestra®**
- (Orion)
- **Tablets**, 70 white, estradiol valerate 2 mg; 14 blue, estradiol valerate 2 mg and medroxyprogesterone acetate 20 mg; 7 yellow, inactive. Net price 91-tab pack = £80.40
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 70 days, then 1 blue tablet daily for 14 days, then 1 yellow tablet daily for 7 days; subsequent courses are repeated without interval

**Trisequens®**
- (Novo Nordisk)
- **Tablets**, 12 blue, estradiol 2 mg; 10 white, estradiol 2 mg, norethisterone acetate 1 mg; 6 red, estradiol 1 mg, net price 3 x 28-tab pack = £11.10
- **Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 blue tablet daily, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily in sequence (without interruption)

### Conjugated oestrogens only

**Premarin®**
- (Wyeth)
- **Tablets**, all s/c, conjugated oestrogens (equine) 300 microigrams (green) net price 3 x 28-tab pack = £9.72, 625 micrograms (maroon), 3 x 28-tab pack = £9.72, 1.25 mg (yellow), 3 x 28-tab pack = £13.19
- **Dose** menopausal symptoms, 0.3–1.25 mg daily continuously; osteoporosis prophylaxis (see section 6.6), 0.625–1.25 mg daily continuously; with cyclical progesteron for 12–14 days of each cycle in women with a uterus

### Estradiol only

**Estradiol implants**
- (Organon)
- **Implant**, estradiol 25 mg, net price each = £12.95; 50 mg, each = £21.08
- **Dose** by implantation, oestrogen replacement, and osteoporosis prophylaxis (see section 6.6) with cyclical progesteron for 12–14 days of each cycle in women with a uterus, see notes above.
6.4.1 Female sex hormones

100 mg as required (usually every 4–8 months) according to oestrogen levels—check before each implant.

Note: On cessation of treatment or if implants are removed from those with a uterus, cyclical progestogen should be continued until withdrawal bleed stops.

**Bedrol** (ReSource Medical)

**Tablets**, 1/c, estradiol 2 mg, net price 3 × 28-tab pack = £5.07.

**Dose** menopausal symptoms, with cyclical progestogen for 12–14 days of each cycle in women with a uterus; therapy should be initiated with 1 patch to be applied weekly continuously, starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent).

**Climaval** (Novartis)

**Dose** menopausal symptoms (if patient has had a hysterectomy), 1–2 mg daily.

**Eleste-Solo** (Meda)

**Eleste-Solo** 1 mg tablets, estradiol 1 mg. Net price 3 × 28-tab pack = £5.34.

**Dose** menopausal symptoms, with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 1 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent).

**Eleste-Solo** 2 mg tablets, orange, estradiol 2 mg. Net price 3 × 28-tab pack = £5.34.

**Dose** menopausal symptoms not controlled with lower strength oestrogen deficiency or anticipated intolerance to higher strength, dosage may be increased if required, subsequently adjusted to lowest effective dose.

**Estraderm MX** (Novartis)

**Tablets**, self-adhesive, estradiol, MX 40 patch (releasing approx. 40 micrograms/24 hours), net price 8-patch pack = £5.19; MX 80 patch (releasing approx. 80 micrograms/24 hours), 8-patch pack = £5.99. Counselling, administration.

**Dose** menopausal symptoms (and osteoporosis prophylaxis in case of Estraderm TTS 50 only; see section 6.6), 1 patch to be applied twice weekly continuously, with cyclical progesterone for 12 days of each cycle in women with a uterus; therapy should be initiated with TTS 50 for first month, subsequently adjusted to lowest effective dose.

**Estraderm TTS** (Novartis)

**Tablets**, self-adhesive, estradiol, TTS 25 patch (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £7.45, 24-patch pack = £22.36; TTS 50 patch (releasing approx. 50 micrograms/24 hours), 8-patch pack = £7.48, 24-patch pack = £22.43; TTS 100 patch (releasing approx. 100 micrograms/24 hours), 8-patch pack = £9.02, 24-patch pack = £27.16, 20-patch pack (hosp. only) = £16.76. Counselling, administration.

**Dose** menopausal symptoms (and osteoporosis prophylaxis in case of Estraderm TTS 50 only; see section 6.6), 1 patch to be applied twice weekly continuously, with cyclical progestogen for 12 days of each cycle in women with a uterus; therapy should be initiated with TTS 50 for first month, subsequently adjusted to lowest effective dose.

**Estradot** (Novartis)

**Patches**, self-adhesive, estradiol, ’25’ patch (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £5.20; ’37.5’ patch (releasing approx. 37.5 micrograms/24 hours), 8-patch pack = £5.21; ’50’ patch (releasing approx. 50 micrograms/24 hours), 8-patch pack = £5.22, ’75’ patch (releasing approx. 75 micrograms/24 hours), 8-patch pack = £6.08; ’100’ patch (releasing approx. 100 micrograms/24 hours), 8-patch pack = £6.31. Counselling, administration.

**Dose** menopausal symptoms (all strengths) and osteoporosis prophylaxis (Estradot ‘50’; ‘75’; and ‘100’ only; see section 6.6), 1 patch to be applied twice weekly continuously, with cyclical progesterone for 12 days of each cycle in women with a uterus; for osteoporosis prophylaxis therapy should be initiated with ’50’ patch.

**Evorel** (Janssen-Cilag)

**Patches**, self-adhesive, estradiol, ’25’ patch (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £2.86; ’50’ patch (releasing approx. 50 micrograms/24 hours), 8-patch pack = £3.24, 24-patch pack = £9.72; ’75’ patch (releasing approx. 75 micrograms/24 hours), 8-patch pack = £3.44; ’100’ patch (releasing approx. 100 micrograms/24 hours), 8-patch pack = £3.57. Counselling, administration.

**Dose** menopausal symptoms and osteoporosis prophylaxis (except Evorel 25; see section 6.6), 1 patch to be applied twice weekly continuously, with cyclical progesterone for at least 12 days of each cycle in women with a uterus; therapy should be initiated with ’50’ patch for first month, subsequently adjusted to lowest effective dose.

**Fematrix** (Solvay)

**Fematrix** 40 patch, self-adhesive, estradiol, ‘40’ patch (releasing approx. 40 micrograms/24 hours). Net price 8-patch pack = £4.95. Counselling, administration.

**Dose** menopausal symptoms, 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progesterone for 12–14 days of each cycle in women with a uterus; therapy should be initiated with MX 40 in those with menopausal symptoms, prolonged oestrogen deficiency or anticipated intolerance to higher strength, dosage may be increased if required, subsequently adjusted to lowest effective dose.

**Fematrix** 80 patch, self-adhesive, estradiol (releasing approx. 80 micrograms/24 hours). Net price 8-patch pack = £5.40. Counselling, administration.

**Dose** menopausal symptoms and osteoporosis prophylaxis (see section 6.6), as for Fematrix 40, therapy should be initiated with Fematrix 40 in those with menopausal symptoms, prolonged oestrogen deficiency or anticipated intolerance to higher strength.

**FemSeven** (Merck)

**Patches**, self-adhesive, estradiol, ’50’ patch (releasing approx. 50 micrograms/24 hours), net price 4-patch pack = £6.04, 12-patch pack = £18.02; ’75’ patch (releasing approx. 75 micrograms/24 hours), net price 4-patch pack = £6.98; ’100’ patch (releasing approx.
100 micrograms/24 hours), net price 4-patch pack = £7.28. Counselling, administration

**Dose**  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied once a week continuously, with cyclical progestogen for at least 10 days of each cycle in women with a uterus; therapy should be initiated with FemSeven 50 patches for the first few months, subsequently adjusted according to response

**Oestrogel**<sup>®</sup> (Ferring) <sup>[fn]</sup>

**Gel**, estradiol 0.06%, net price 64-dose pump pack = £7.39. Counselling, administration

**Dose**  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 2 measures (estradiol 1.5 mg) to be applied over an area twice that of the template provided once daily continuously, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), with cyclical progestogen for 12 days of each cycle in women with a uterus; for menopausal symptoms may be increased if necessary after 1 month to max. 4 measures daily

**Counselling**  Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application

**Progynova**<sup>®</sup> (Schering Health) <sup>[fn]</sup>

**Tablets**, both s/c, estradiol valerate 1 mg (beige), net price 3 x 28-tab pack = £6.56; 2 mg (blue), 3 x 28-tab pack = £6.56

**Dose**  menopausal symptoms, 1–2 mg daily continuously; osteoporosis prophylaxis (see section 6.6), 2 mg daily continuously, with cyclical progestogen for 12 days of each cycle in women with a uterus

**Progynova**<sup>®</sup> TS (Schering Health) <sup>[fn]</sup>

**Patches**, self-adhesive, Progynova TS 50 (releasing estradiol approx. 50 micrograms/24 hours), net price 12-patch pack = £16.71; Progynova TS 100 (releasing estradiol approx. 100 micrograms/24 hours), 12-patch pack = £18.39. Counselling, administration

**Dose**  menopausal symptoms and osteoporosis prophylaxis (Progynova TS 50 only; see section 6.6), 1 patch to be applied once a week continuously or 1 patch per week for 3 weeks followed by a 7-day patch-free interval (cyclical), with cyclical progestogen for 12–14 days of each cycle in women with a uterus; in those with menopausal symptoms, therapy should be initiated with Progynova TS 50, dosage may be increased if required, subsequently adjusted to lowest effective dose

**Note**  Women receiving Progynova TS 100 patches for meno-pausal symptoms may continue with this strength for osteoporosis prophylaxis (see section 6.6)

**Sandrena**<sup>®</sup> (Organon) <sup>[fn]</sup>

**Gel**, estradiol (0.1%), 500 microgram/500 mg sachet, net price 28-sachet pack = £5.28, 1 mg/1 g sachet, 28-sachet pack = £6.08. Counselling, administration

**Excipients**  include propylene glycol (see section 13.1.3)

**Dose**  menopausal symptoms, estradiol 1 mg (1 g gel) to be applied once daily over area 1–2 times size of hand, with cyclical progestogen for 12–14 days of each cycle in women with a uterus; dose may be adjusted after 2–3 cycles to a usual dose of estradiol 0.5–1.5 mg (0.5–1.5 g gel) daily

**Counselling**  Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour

**Zumenon**<sup>®</sup> (Govaly) <sup>[fn]</sup>

**Tablets**, f/c, estradiol 1 mg, net price 84-tab pack = £6.89; 2 mg (red), 84-tab pack = £6.89

**Dose**  menopausal symptoms, initially 1 mg daily starting on day 5 of menstruation (or any time if cycles have ceased or are infrequent) adjusted to 1–4 mg daily according to response; osteoporosis prophylaxis (see section 6.6), 2 mg daily; with cyclical progestogen for 10–14 days of each cycle in women with a uterus

### Estradiol, estril and estrene

**Hormonin**<sup>®</sup> (Shire) <sup>[fn]</sup>

**Tablets**, pink, estradiol 600 micrograms, estril 270 micrograms, estrone 1.4 mg. Net price 84-tab pack = £6.61

**Dose**  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1–2 tablets daily, with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Note**  Hormonin tablets can be given continuously or cyclically (21 days out of 28)

### Estril only

**Ovestin**<sup>®</sup> (Organon) <sup>[fn]</sup>

**Tablets**, scored, estril 1 mg. Net price 30-tab pack = £3.91. Label: 25

**Dose**  genito-urinary symptoms associated with oestrogen-deficiency states, 0.5–3 mg daily, as single dose, for up to 1 month, then 0.5–1 mg daily until restoration of epithelial integrity (short-term use); infertility due to poor cervical penetration, 0.25–1 mg daily on days 6–15 of cycle

**Estropipate only**

**Harmogen**<sup>®</sup> (Pharmacia) <sup>[fn]</sup>

**Tablets**, peach, scored, estopipate 1.5 mg. Net price 28-tab pack = £3.77

**Dose**  menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1.5 mg daily continuously (with cyclical progestogen for 10–13 days of each cycle in women with a uterus), up to 3 mg daily (in single or divided doses) for vasomotor symptoms and menopausal vaginitis

### TIBOLONE

**Indications**  short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues); osteoporosis prophylaxis in women at risk of fractures (second-line)

**Cautions**  see notes above and under Oestrogens for HRT; vaginal bleeding (investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment); renal impairment, history of liver disease (Appendix 2), epilepsy, migraine, diabetes mellitus, hypercholesterolaemia; withdraw if signs of thromboembolic disease, abnormal liver function tests or cholestatic jaundice; see also Note below; interactions: Appendix 1 (tibolone)

**Contra-indications**  see notes above and under Oestrogens for HRT; hormone-dependent tumours, history of cardiovascular or cerebrovascular disease (e.g. thrombophlebitis, thromboembolism), uninvestigated vaginal bleeding, severe liver disease, pregnancy, breast-feeding

**Side-effects**  see notes above; also abdominal pain, weight changes, vaginal bleeding, leukorrhoea, facial hair, and rarely amnesia; gastro-intestinal disturbances, oedema, dizziness, headache, migraine, depression, breast cancer (see notes above and section 6.4.1.1), arthralgia, myalgia, visual disturbances, seborrhoeic dermatitis, rash and pruritus also reported

**Dose**

- 2.5 mg daily

**Note**  Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive; also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding); induce withdrawal bleed with progestogen if transferring from another form of HRT
Ethinylestradiol

Ethinylestradiol (ethinyloestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs (section 6.6) cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under specialist supervision for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited). Side-effects include nausea, fluid retention, and thrombosis. Impotence and gynaecomastia have been reported in men.

For use in prostate cancer, see section 8.3.1.

Ethinylestradiol (Ethinyloestradiol)

**Indications** see notes above

**Cautions** cardiovascular disease (sodium retention with oedema, thromboembolism), hepatic impairment (jaundice), see also under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 397)

**Contra-indications** see under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 397)

**Side-effects** feminising effects in men; see also under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 397)

**Dose**
- Menopausal symptoms and osteoporosis prophylaxis, (with intact uterus), 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period
- Female hypogonadism, 10–50 micrograms daily, usually on cyclical basis; initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy
- Menstrual disorders, 20–50 micrograms daily from day 5 to 25 of each cycle, with progestogen added either throughout the cycle or from day 15 to 25

**Ethinylestradiol** (Non-proprietary) Tablets, ethinylestradiol 10 micrograms, net price 21-tab pack = £18.55; 50 micrograms, 21-tab pack = £18.55; 1 mg, 28-tab pack = £34.53

**Raloxifene**

Raloxifene is licensed for the treatment and prevention of postmenopausal osteoporosis; unlike hormone replacement therapy, raloxifene does not reduce menopausal vasomotor symptoms.

Raloxifene may reduce the incidence of oestrogen-receptor-positive breast cancer but its role in established breast cancer is not yet clear. The manufacturer advises avoiding its use during treatment for breast cancer.
molecular weight heparin (section 2.8.1) may decrease the risk of fetal loss (use under specialist supervision only).

Hormone replacement therapy In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis (see section 6.4.1.1). Combined packs incorporating suitable progestogen tablets are available, see p. 397.

Oral contraception Desogestrel, etynodiol (ethynodiol), gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives (section 7.3.1 and section 7.3.2).

Cancer Progestogens also have a role in neoplastic disease (section 8.3.2).

Cautions Progestogens should be used with caution in conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, cardiac or renal dysfunction, and in those susceptible to thromboembolism (particular caution with high dose). Care is also required in liver impairment (avoid if severe), and in those with a history of depression. Progestogens can decrease glucose tolerance and diabetes should be monitored closely. For interactions see Appendix 1 (progestogens).

Contra-indications Progestogens should be avoided in patients with a history of liver tumours, and in severe liver impairment. They are also contra-indicated in those with a history of liver tumours, and in severe hepatic, hepatic, renal impairment, and in those susceptible to thromboembolism (particular caution with high dose). Care is also required in liver impairment (avoid if severe), and in those with a history of depression. Progestogens can decrease glucose tolerance and diabetes should be monitored closely. For interactions see Appendix 1 (progestogens).

Side-effects Side-effects of progestogens include menstrual disturbances, premenstrual-like syndrome (including bloating, fluid retention, breast tenderness), weight change, nausea, headache, dizziness, insomnia, drowsiness, depression, change in libido; also skin reactions (including urticaria, pruritus, rash, and acne), hirsutism and alopecia. Jaundice and anaphylactoid reactions have also been reported.

**DYROGESTERONE**

**Indications** HRT (section 6.4.1.1)

**Contra-indications** see notes above; pregnancy (Appendix 4)

**Side-effects** see notes above; indigestion

**Dose**
- By mouth, 2.5–10 mg daily for 5–10 days beginning on day 16 to 21 of cycle, repeated for 2 cycles in dysfunctional uterine bleeding and 3 cycles in secondary amenorrhoea
- Mild to moderate endometriosis, 10 mg 3 times daily for 90 consecutive days, beginning on day 1 of cycle
- Progestogenic opposition of oestrogen HRT, 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

**Prorad®** (Pharmacia) tablets, all scored, medroxyprogesterone acetate 2.5 mg (orange), net price 30-tab pack = £1.84; 5 mg (blue), 10-tab pack = £1.23; 10 mg (white), 10-tab pack = £2.47, 90-tab pack = £22.16

**Climanor®** (ReSource Medical) Tablets, f/c, medroxyprogesterone acetate 5 mg, net price 28-tab pack = £3.27

**Combined preparations** Section 6.4.1.1

**NORETHISTERONE**

**Indications** see under Dose; HRT (section 6.4.1.1); contraception (section 7.3.1 and section 7.3.2); malignant disease (section 8.3.2)

**Contra-indications** see notes above; breast-feeding (Appendix 5)

**Side-effects** see notes above; pregnancy (Appendix 4)

**Dose**
- Endometriosis, by mouth, 10–15 mg daily for 4–6 months or longer, starting on day 5 of cycle (if spotting occurs increase dose to 20–25 mg daily, reduced once bleeding has stopped)
- Dysfunctional uterine bleeding, menorrhagia (but see notes above), by mouth, 5 mg 3 times daily for 10 days to arrest bleeding; to prevent bleeding 5 mg twice daily from day 19 to 26
- Dysmenorrhoea (but see notes above), by mouth, 5 mg 3 times daily from day 5 to 24 for 3–4 cycles
- Premenstrual syndrome (but not recommended, see notes above), by mouth, 5 mg 2–3 times daily from day 19 to 26 for several cycles
- Postponement of menstruation, by mouth, 5 mg 3 times daily starting 3 days before expected onset (menstruation occurs 2–3 days after stopping)

**Tablets of 5 mg**

**Norethisterone** (Non-proprietary) tablets, norethisterone 5 mg, net price 30-tab pack = £2.65

**Primolut N** (Schering Health) Tablets, norethisterone 5 mg. Net price 30-tab pack = £2.01

**Urovian®** (Pharmacia) tablets, norethisterone 5 mg. Net price 30-tab pack = £1.40, 90-tab pack = £4.21

**Combined preparations** Section 6.4.1.1
Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids (section 6.4.3).

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is an associated hypoandrogenism; they should not be given until the hypoandrogenism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone (section 6.5.1) which will stimulate spermatogenesis as well as androgen production.

Caution should be used when androgens or chorionic gonadotrophin are used in treating boys with delayed puberty since the fusion of epiphyses is hastened and may result in short stature; skeletal maturation should be monitored.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively Sustanon®, which consists of a mixture of testosterone esters and has a longer duration of action, may be used. Satisfactory replacement therapy can sometimes be obtained with 1 mL of Sustanon 250®, given by intramuscular injection once a month, although more frequent dose intervals are often necessary. Implants of testosterone can be used for hypogonadism; the implants are replaced every 4 to 5 months.

Testosterone implants can be used in postmenopausal women as an adjunct to hormone replacement therapy. A testosterone patch is also licensed to improve libido in surgically induced menopausal women (receiving concomitant oestrogen therapy).

## TESTOSTERONE AND ESTERS

**Indications** see under preparations

**Cautions** cardiac, renal, or hepatic impairment

(Appendix 2), elderly, ischaemic heart disease, hypertension, epilepsy, migraine, diabetes mellitus, skeletal metastases (risk of hypercalcaemia), undertaken regular examination of the prostate and breast during treatment; monitor full blood count, lipid profile and liver function; pre-pubertal boys (see notes above and under Side-effects); **interactions**: Appendix 1 (testosterone)

**Women** Regularly assess for androgenic side-effects; women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism

**Contra-indications** breast cancer in men, prostate cancer, history of primary liver tumours, hypercalcaemia, pregnancy (Appendix 4), breast-feeding (Appendix 5), nephrotic syndrome

**Side-effects** prostate abnormalities and prostate cancer, headache, depression, gastro-intestinal bleeding, nausea, vomiting, cholestatic jaundice, changes in libido, gynaecomastia, polycystic ovaries, anxiety, irritability, nervousness, asthenia, paraesthesia, hypertension, electrolyte disturbances including sodium retention with oedema and hypercalcaemia, weight gain; increased bone growth, muscle cramps, atherosclerosis; androgenic effects such as hirsutism, male-pattern baldness, seborrhoea, acne, pruritus, excessive frequency and duration of penile erection, precocious sexual development and premature closure of epiphyses in pre-pubertal males, suppression of spermatogenesis in men and virilism in women; rarely liver tumours; sleep apnoea also reported; **with patches, buccal tablets, and gel**, local irritation and allergic reactions (including burn-like lesions with patches), and taste disturbances

**Dose** See under preparations
Virormone  

- Testosterons (Organon)  
  Capsules, orange, testosterone undecanoate 40 mg in oily solution. Net price 30-cap pack = £8.89; 60-cap pack = £17.79. Label: 21, 25  
  **Dose** androgen deficiency, 120–160 mg daily for 2–3 weeks; maintenance 60–120 mg daily

**Buccal**

- Striant® SR (Ardana)  
  Mucoadhesive buccal tablets, m/r, testosterone 30 mg, net price 60-tab pack = £45.84. Counselling, see under Dose below  
  **Dose** hypogonadism, 30 mg every 12 hours; CHILD and ADOLESCENT under 18 years not recommended  
  **Counselling** Place rounded side of tablet on gum above front teeth and hold lip firmly over the gum for 30 seconds. If tablet detaches within 4 hours of next dose, replace with new tablet which is considered the second dose for the day.

**Intramuscular**

- Testosterone Enantate (Cambridge)  
  **Injection** (oily), testosterone enantate 250 mg/mL. Net price 1-mL amp = £11.01  
  **Dose** by slow intramuscular injection, hypogonadism, initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks  
  **Breast cancer** 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks  
  **Note** under 18 years not recommended

- Nebido® (Bayer)  
  **Injection** (oily), testosterone undecanoate 250 mg/mL. Net price 4-mL amp = £76.70  
  **Dose** by deep intramuscular injection, hypogonadism in men over 18 years, 1 g every 10–14 weeks; if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks

- Sustanon 100® (Organon)  
  **Injection** (oily), testosterone propionate 20 mg, testosterone phenylpropionate 40 mg, and testoster-

- Sustanon 250® (Organon)  
  **Injection** (oily), testosterone propionate 30 mg, testosterone phenylpropionate 60 mg, testosterone isocaproate 40 mg/mL. Net price 1-mL amp = £1.09  
  **Excipients** include arachis (peanut) oil, benzyl alcohol (see Excipients p 2)  
  **Dose** by deep intramuscular injection, androgen deficiency, 1 mL every 2 weeks

- Transdermal preparations

- Andropatch® (GSK)  
  **Patches**, self-adhesive, releasing testosterone approx. 2.5 mg/24 hours, net price 60-patch pack = £49.10; releasing testosterone approx. 5 mg/24 hours, net price 30-patch pack = £49.10. Counselling, administration  
  **Dose** androgen deficiency in men (over 15 years) associated with primary or secondary hypogonadism, apply to clean, dry, unbroken skin on back, abdomen, upper arms or thighs, removing after 24 hours and siting replacement patch on a different area (with an interval of 7 days before using the same site), initially apply patches equivalent to testosterone 5 mg/24 hours (2.5 mg/24 hours in non-virilised patients) at night (approx. 10 p.m.), then adjust to 2.5 mg to 7.5 mg every 24 hours according to plasma-testosterone concentration (those with a body-weight over 130 kg may require 7.5 mg every 24 hours)

- Intrinsa® (Procter & Gamble)  
  **Patches**, self-adhesive, releasing testosterone approx. 300 micrograms/24 hours, net price 8-patch pack = £28.00. Counselling, administration  
  **Dose** hypoactive sexual desire disorder associated with surgically induced menopause (in women receiving concomitant oestrogen therapy (section 6.4.1.1)), apply 1 patch twice weekly continuously to clean, dry, unbroken skin on lower abdomen below waistline; site replacement patch on a different area (avoid using same area for 7 days); assess treatment after 3–6 months, discontinue if no benefit

  **Note** Not recommended for women naturally menopausal or those taking conjugated oestrogens. Safety and efficacy of use beyond 1 year not established

- Testim® (Ipsen)  
  **Gel**, testosterone 50 mg/5 g tube, net price 30-tube pack = £33.00. Counselling, administration  
  **Excipients** include propylene glycol (see section 13.1.3)  
  **Dose** hypogonadism due to testosterone deficiency in men (over 18 years), 50 mg testosterone (5 g gel) applied once daily, subsequent application adjusted according to response; max. 100 mg (10 g gel) daily  
  **Counselling** Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours  
  **Avoid skin contact with application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

- Testogel® (Schering Health)  
  **Gel**, testosterone 50 mg/5 g sachet, net price 30-sachet pack = £33.00. Counselling, administration  
  **Dose** hypogonadism due to androgen deficiency in men (over 18 years), 50 mg testosterone (5 g gel) to be applied once daily; subsequent application adjusted according to response in 25-mg (2.5 g gel) increments to max. 100 mg (10 g gel) daily  
  **Counselling** Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours  
  **Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

- Tostran® (ProStrakan)  
  **Gel**, testosterone 2% (10 mg/ metered application), net price 60-g multidose dispenser = £26.67. Counselling, administration  
  **Excipients** include butyric acid, propylene glycol (see section 13.1.3)  
  **Dose** hypogonadism due to testosterone deficiency in men (over 18 years), initially 60 mg testosterone (3 g gel) applied once daily;  
  **Note** Testosterone transfer to other people, especially pregnant women and children—consult product literature
Cyproterone acetate

Anti-androgens

Cyproterone acetate

Dose

Side-effects

Contra-indications

Indications

Cautions

Applying gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area. Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature.

MESTEROLONE

Indications see under Dose

Cautions see under Testosterone and Esters

Contra-indications see under Testosterone and Esters

Side-effects see under Testosterone and Esters but spermatogenesis unimpaired

Dose

Androgen deficiency and male infertility associated with hypogonadism, 25 mg 3–4 times daily for several months, reduced to 50–75 mg daily in divided doses for maintenance; CHILD not recommended

Pro-Viron® (Schering Health)

Tablets, scored, mesterolone 25 mg. Net price 30-tab pack = £4.44

Anti-androgens

Cyproterone acetate

Cyproterone acetate is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in animal studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also used as an adjunct in prostatic cancer (section 8.3.4.2) and in the treatment of acne and hirsutism in women (section 13.6.2).

CYPROTERONE ACETATE

Indications see notes above; prostate cancer (section 8.3.4.2)

Cautions ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known); blood counts initially and throughout treatment; monitor hepatic function regularly (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; diabetes mellitus (see also Contra-indications)

Driving Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

Contra-indications do not apply in prostate cancer hepatic disease (Appendix 2), severe diabetes (with vascular changes); sickle-cell anaemia, malignant or wasting disease, severe depression, history of thrombo-embolic disorders; youths under 18 years (may arrest bone maturation and testicular development)

Side-effects fatigue and lassitude, breathlessness, weight changes, reduced sebum production (may clear acne), changes in hair pattern, gynaecomastia (rarely leading to galactorrhoea and benign breast nodules); rarely hypersensitivity reactions, rash and osteoporosis; inhibition of spermatogenesis (see notes above); hepatotoxicity reported (including jaundice, hepatitis and hepatic failure usually in men given 200–300 mg daily for prostatic cancer, see section 8.3.4.2 for details and warnings)

Dose

Male hypersexuality, 50 mg twice daily after food

Cyproterone Acetate (Non-proprietary)

Tablets, cyproterone acetate 50 mg. net price 56-tab pack = £31.54. Label: 21 counselling, driving

Androcur® (Schering Health)

Tablets, scored, cyproterone acetate 50 mg. Net price 56-tab pack = £25.89. Label: 21 counselling, driving

Dutasteride and finasteride

Dutasteride and finasteride are specific inhibitors of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone. This inhibition of testosterone metabolism leads to reduction in prostate size, with improvement in urinary flow rate and in obstructive symptoms. Dutasteride and finasteride are alternatives to alpha-blockers (section 7.4.1) particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men (section 13.9).

Cautions Dutasteride and finasteride decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment. Both dutasteride and finasteride are excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant. Women of childbearing potential should avoid handling crushed or broken tablets of finasteride and leaking capsules of dutasteride.

Contra-indications Dutasteride and finasteride are contra-indicated in women, children, and adolescents.

Side-effects The side-effects of dutasteride and finasteride include impotence, decreased libido, ejaculation disorders, and breast tenderness and enlargement.

DUTASTERIDE

Indications benign prostatic hyperplasia

Cautions see notes above; interactions: Appendix 1 (dutasteride)

Contra-indications see notes above; also severe hepatic impairment

Side-effects see notes above

Dose

500 micrograms daily (may require 6 months’ treatment before benefit is obtained)

Avodart® (GSK)

Capsules, yellow, dutasteride 500 micrograms, net price 30-cap pack = £24.81. Label: 25
6.4.3 Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anaemias (section 9.1.3). Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is quite unjustified; some athletes abuse them.

NANDROLONE

Indications osteoporosis in postmenopausal women (but not recommended, see notes above); aplastic anaemia (section 9.1.3)

Cautions cardiac and renal impairment, hepatic impairment (Appendix 2), hypertension, diabetes mellitus, epilepsy, migraine; monitor skeletal maturation in young patients; skeletal metastases (risk of hypercalcaemia); interactions: Appendix 1 (anabolic steroids)

Contra-indications severe hepatic impairment, prostate cancer, male breast cancer, pregnancy (Appendix 4) and breast-feeding, alcohol dependence, susceptibility to radiation, hepatoma, breast carcinoma

Side-effects acne, sodium retention with oedema, virilisation with high doses including voice changes (sometimes irreversible), amenorrhoea, inhibition of spermatogenesis, premature epiphyseal closure; abnormal liver-function tests reported with high doses; liver tumours reported occasionally on prolonged treatment with anabolic steroids

Dose

See below

Deca-Durabolin® (Organon) (oil) Injection (oily), nandrolone decanoate 50 mg/mL, net price 1-mL amp = £3.29

Exipients include arachis (peanut) oil, benzyl alcohol (see Excipients, p. 2)

Dose by deep intramuscular injection, 50 mg every 3 weeks

6.5 Hypothalamic and pituitary hormones and anti-oestrogens

6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens

Anti-oestrogens

The anti-oestrogens clomifene (clomiphene) and tamoxifen (section 8.3.4.1) are used in the treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease). They induce gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chiorionic gonadotrophin is sometimes used as an adjunct. Patients should be warned that there is a risk of multiple pregnancy (rarely more than twins).

CLOMIFENE CITRATE

(Clamiphene Citrate)

Indications anovulatory infertility—see notes above

Cautions see notes above; polycystic ovary syndrome (cysts may enlarge during treatment), ovarian hyperstimulation syndrome, ectopic pregnancy, incidence of multiple births increased (consider ultrasound monitoring), visual symptoms (discontinue and initiate ophthalmological examination); breast-feeding (Appendix 5)

CSM Advice The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer)

Contra-indications hepatic disease (Appendix 2), ovarian cysts, hormone-dependent tumours or abnormal uterine bleeding of undetermined cause, pregnancy (exclude before treatment; Appendix 4)

Side-effects visual disturbances (withdraw), ovarian hyperstimulation (withdraw), hot flushes, abdominal discomfort, occasionally nausea, vomiting, depression, insomnia, breast tenderness, headache, intermenstrual spotting, minor and endometriosis, convulsions, weight gain, rashes, dizziness, hair loss

Dose

50 mg daily for 5 days, starting within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen-induced withdrawal bleed) if cycles have ceased;
second course of 100 mg daily for 5 days may be given in absence of ovulation; most patients who are going to respond will do so to first course; 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended—see CSM advice, above

Clomifene (Non-proprietary) Tablets, clomifene citrate 50 mg, net price 30-tab pack = £11.35

Clomid® (Aventis Pharma) Tablets, yellow, scored, clomifene citrate 50 mg. Net price 30-tab pack = £8.80

Anterior pituitary hormones

Corticotrophins

Tetracosactide (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

TETRACOSACTIDE

(Tetracosactrin)

Indications see notes above

Cautions as for corticosteroids, section 6.3.2; important: risk of anaphylaxis (medical supervision; consult product literature); Interactions: Appendix 1 (corticosteroids)

Contra-indications as for corticosteroids, section 6.3.2; avoid injections containing benzyl alcohol in neonates (see under preparations)

Side-effects as for corticosteroids, section 6.3.2

Dose

• See under preparations below

Synacthen® (Alliance) Injection, tetracosactide 250 micrograms (as acetate)/mL. Net price 1-ml amp = £2.93

Dose diagnostic (30-minute test), by intramuscular or intra-venous injection, 250 micrograms as a single dose

Synacthen Depot® (Alliance) Injection (aqueous suspension), tetracosactide acetate 1 mg/mL, with zinc phosphate complex. Net price 1-ml amp = £4.18

Excipients include benzyl alcohol (avoid in neonates, see Excipients p. 2)

Dose diagnostic (5-hour test), by intramuscular injection, 1 mg as a single dose

Note Formerly used therapeutically by intramuscular injection, in an initial dose of 1 mg daily (or every 12 hours in acute cases), reduced to 1 mg every 2–3 days, then 1 mg weekly (or 500 micrograms every 2–3 days) but value was limited (see notes above)

Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together (as in human menopausal gonadotrophin), follicle-stimulating hormone alone (as in follicitropin), or choric gonadotrophin, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene, or in supernovulation treatment for assisted conception (such as in vitro fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotropic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone (section 6.4.2).

CHORIONIC GONADOTROPIN

(Human Chorionic Gonadotrophin; HCG)

A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone

Indications see notes above

Cautions cardiac or renal impairment, asthma, epilepsy, migraine; prepubertal boys (risk of premature epiphyseal closure or precocious puberty)

Contra-indications androgen-dependent tumours

Side-effects oedema (particularly in males—reduce dose), headache, tiredness, mood changes, gynaecomastia, local reactions; may aggravate ovarian hyperstimulation, multiple pregnancy

Dose

• By subcutaneous or intramuscular injection, according to patient’s response

Choragon® (Ferring) Injection, powder for reconstitution, chorionic gonadotrophin. Net price 5000-unit amp (with solvent) = £3.26. For intramuscular injection

Pregnyl® (Organon) Injection, powder for reconstitution, chorionic gonadotrophin. Net price 1500-unit amp = £2.20; 5000-unit amp = £3.27 (both with solvent). For subcutaneous or intramuscular injection

CHORIOGONADOTROPIN ALFA

(Human chorionic gonadotropin)

Indications see notes above

Cautions rule out infertility caused by hypothyroidism, adrenocortical deficiency, hyperprolactinaemia, tumours of the pituitary or hypothalamus

Contra-indications ovarian enlargement or cyst (unless caused by polycystic ovarian disease); ectopic pregnancy in previous 3 months; active thromboembolic disorders; hypothyliamus, pituitary, ovarian, uterine or mammary malignancy

Side-effects nausea, vomiting, abdominal pain; headache, tiredness; injection-site reactions; ovarian hyperstimulation syndrome; rarely diarrhoea, depression, irritability, breast pain; ectopic pregnancy and ovarian torsion reported

Dose

• By subcutaneous injection, according to patient’s response

Ovitrelle® (Serono) Injection, choriogonadotropin alfa, net price 6500-unit/0.5 mL (250-micrograms/0.5 mL) prefilled syringe = £33.31
**FOLLITROPIN ALFA and BETA**

(Recombinant human follicle stimulating hormone)

**Indications**  see notes above

**Cautions**  see under Human Menopausal Gonadotrophins; acute porphyria (section 9.8.2)

**Contra-indications**  see under Human Menopausal Gonadotrophins

**Side-effects**  see under Human Menopausal Gonadotrophins

**Dose**

- **By subcutaneous or intramuscular injection,** according to patient’s response

---

**Follitropin alfa**

**Gonal-F®** (Serono)

Injection, powder for reconstitution, follitropin alfa. Net price 75-unit amp = £22.31; 450 units/0.75 mL multidose vial = £133.86; 1050 units/1.75 mL, multidose vial = £312.34 (all with solvent). For subcutaneous injection

Injection, prefilled pen, follitropin alfa 600 units/mL, net price 0.5 mL (300 units) = £97.08, 0.75 mL (450 units) = £145.62, 1.5 mL (900 units) = £291.24. For subcutaneous injection

**Follitropin alfa with lutropin alfa**

**Pergoveris®** (Serono)

Injection, powder for reconstitution, follitropin alfa 150 units (11 micrograms), lutropin alfa 75 units (3 micrograms), net price per vial (with solvent) = £60.29. For subcutaneous injection

**Electrolytes Na < 1 mmol/vial**

---

**Follitropin beta**

**Puregon®** (Organon)

Injection, follitropin beta 100 units/mL, net price 0.5-mL (50-unit) vial = £18.74; 200 units/mL, 0.5-mL (100-unit) vial = £37.48; 300 units/mL, 0.5-mL (150-unit) vial = £50.62; 400 units/mL, 0.5-mL (200-unit) vial = £67.49; 0.36-mL (300-unit) cartridge = £101.23, 0.72-mL (600-unit) cartridge = £202.47, 1.08-mL (900-unit) cartridge = £303.66. (cartridges for use with Puregon® pen). For subcutaneous (cartridges and vials) or intramuscular injection (vials)

**Excipients** may include neomycin and streptomycin

---

**HUMAN MENOPAUSAL GONADOTROPHINS**

**Indications**  see notes above

**Cautions**  rule out infertility caused by hypothyroidism, adrenocortical deficiency, hyperprolactinaemia, or tumours of the pituitary or hypothalamus

**Contra-indications**  ovarian cysts (not caused by polycystic ovarian disease); tumours of pituitary, hypothalamus, breast, uterus, ovaries, testes or prostate; undiagnosed vaginal bleeding; tumours of hypothalamus and pituitary; ovarian, uterine or mammary carcinoma

**Side-effects**  nausea, vomiting, abdominal and pelvic pain; headache, somnolence; injection-site reactions; ovarian hyperstimulation syndrome, ovarian cyst, breast pain, ectopic pregnancy; thromboembolism, adnexal torsion, and haemoperitoneum

**Dose**

- **By subcutaneous injection,** in conjunction with follicle-stimulating hormone, according to response

---

**LUTROPIN ALFA**

(Recombinant human luteinising hormone)

**Indications**  see notes above

**Cautions**  rule out infertility caused by hypothyroidism, adrenocortical deficiency, hyperprolactinaemia, or tumours of the pituitary or hypothalamus

**Contra-indications**  ovarian enlargement or cyst (unless caused by polycystic ovarian disease); undiagnosed vaginal bleeding; tumours of hypothalamus and pituitary; ovarian, uterine or mammary carcinoma

**Side-effects**  nausea, vomiting, abdominal and pelvic pain; headache, somnolence; injection-site reactions; ovarian hyperstimulation syndrome, ovarian cyst, breast pain, ectopic pregnancy; thromboembolism, adnexal torsion, and haemoperitoneum

**Dose**

- **By subcutaneous injection,** in conjunction with follicle-stimulating hormone, according to response

---

**Growth hormone**

Growth hormone is used to treat deficiency of the hormone in children and in adults (see NICE guidance below). In children it is used in Prader-Willi syndrome, Turner’s syndrome and in chronic renal insufficiency; growth hormone has also recently been licensed for use in short children considered small for gestational age at birth.
Growth hormone of human origin (HGH; somatropin) has been replaced by a growth hormone of human sequence, somatropin, produced using recombinant DNA technology.

### NICE guidance
**Somatropin in children with growth failure (May 2002)**

Treatment with somatropin is recommended for children with:
- proven growth-hormone deficiency;
- Turner’s syndrome;
- Prader-Willi syndrome;
- chronic renal insufficiency before puberty.

Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

Treatment should be discontinued if the response is poor (i.e., an increase in growth velocity of less than 50% from baseline) in the first year of therapy. In children with chronic renal insufficiency, treatment should be stopped after renal transplantation and not restarted for at least a year.

**Somatropin for adults with growth hormone deficiency (August 2003)**

Somatropin is recommended in adults only if the following 3 criteria are fulfilled:
- Severe growth hormone deficiency, established by an appropriate method;
- Impaired quality of life, measured by means of a specific questionnaire;
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months. Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient’s physician consider it appropriate.

Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

**Mecasermin**, a human insulin-like growth factor-I (rIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency (section 6.7.4).

**SOMATROPIN**

**Synthetic Human Growth Hormone**

**Indications** see under Dose

**Cautions** diabetes mellitus (adjustment of antidiabetic therapy may be necessary), papilloedema (see under Side-effects), relative deficiencies of other pituitary hormones (notably hypothyroidism)—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value), history of malignant disease, disorders of the ephipysis of the hip (monitor for limping), resolved intracranial hypertension (monitor closely), initiation of treatment close to puberty not recommended in child born small for gestational age; Silver-Russell syndrome; rotate subcutaneous injection sites to prevent lipoatrophy; breast-feeding (Appendix 5); **Interactions**: Appendix 1 (somatropin)

**Contra-indications** evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting); not to be used after renal transplantation or for growth promotion in children with closed ephiphyses (or near closure in Prader-Willi syndrome); severe obesity or severe respiratory impairment in Prader-Willi syndrome; pregnancy (interrupt treatment if pregnancy occurs, Appendix 4)

**Side-effects** headache, fundoscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); fluid retention (peripheral oedema), arthralgia, myalgia, carpal tunnel syndrome, paraesthesia, antibody formation, hypothyroidism, insulin resistance, hyperglycaemia, hypoglycaemia, reactions at injection site; leukaemia in children with growth hormone deficiency also reported

**Dose**
- Gonadal dysgenesis (Turner’s syndrome), by subcutaneous injection, 45–50 micrograms/kg daily or 1.4 mg/m daily
- Deficiency of growth hormone in children, by subcutaneous or intramuscular injection, 23–39 micrograms/kg daily or 0.7–1 mg/m daily
- Growth disturbance in short children born small for gestational age whose growth has not caught up by 4 years or later, by subcutaneous injection, 35 micrograms/kg daily or 1 mg/m daily
- Prader-Willi syndrome, by subcutaneous injection in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet, 35 micrograms/kg daily or 1 mg/m daily; max. 2.7 mg daily
- Chronic renal insufficiency in children (renal function decreased to less than 50%), by subcutaneous injection, 45–50 micrograms/kg daily or 1.4 mg/m daily (higher doses may be needed) adjusted if necessary after 6 months
- Adult growth hormone deficiency, by subcutaneous injection, initially 150–300 micrograms daily, gradually increased if required to max. 1 mg daily; use minimum effective dose (requirements may decrease with age)

**Note** Dose formerly expressed in units; somatropin 1 mg = 3 units

**Genotropin® (Pharmacia)**

**Injection**, two-compartment cartridge containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) cartridge = £1122.87, 12-mg (36-unit) cartridge = £278.20. For use with Genotropin® Pen® device (available free of charge from clinics). For subcutaneous injection

**MiniQuick injection**, two-compartment single-dose syringe containing powder for reconstitution, somatropin (rbe) and diluent, net price 0.2-mg (0.6-unit)

**Genotropin®** (Pharmacia) **Pen®**
BNF 57 6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens

syringe = £4.64; 0.4-mg (1.2-unit) syringe = £9.27; 0.6-mg (1.8-unit) syringe = £13.91; 0.8-mg (2.4-unit) syringe = £18.55; 1-mg (3-unit) syringe = £23.18; 1.2-mg (3.6-unit) syringe = £27.82; 1.4-mg (4.2-unit) syringe = £32.46; 1.6-mg (4.8-unit) syringe = £37.09; 1.8-mg (5.4-unit) syringe = £41.73; 2-mg (6-unit) syringe = £46.37. For subcutaneous injection

Humatrope® (Lilly) (BNF

Injection, powder for reconstitution, somatropin (rbe), net price 6-mg (18-unit) cartridge = £137.25; 12-mg (36-unit) cartridge = £274.50; 24-mg (72-unit) cartridge = £549.00; all supplied with diluent. For subcutaneous or intramuscular injection; cartridges for subcutaneous injection

Norditropin® (Novo Nordisk) (BNF

SimplexXx injection, somatropin (epr) 3.3 mg (10 units)/mL, net price 1.5-mL (5-mg, 15-unit) cartridge = £115.90; 6.7 mg (20 units)/mL, 1.5-mL (10-mg, 30-unit) cartridge = £231.80; 10 mg (30 units)/mL, 1.5-mL (15-mg, 45-unit) cartridge = £347.70. For use with appropriate NordiPen® (Ferring) device (available free of charge from clinics). For subcutaneous injection

NutropinAQ® (Ipsen) (BNF

Injection, somatropin (rbe), net price 10 mg (30 units) 2-ml cartridge = £230.00. For use with NutropinAQ® Pen (Serono) device (available free of charge from clinics). For subcutaneous injection

Omnitrope® (Sandoz) ▼ (BNF

Injection, powder for reconstitution, somatropin (rbe), net price 5-mg (15-unit) vial (with diluent) = £91.33. For use with Omnitrope Pen L (Novo Nordisk) and Omnitrope Pen (Novo Nordisk) 10 (Serono) devices respectively. For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p 2)

Note: Biosimilar medicine, see p. 1

Saizen® (Serono) (BNF

Injection, powder for reconstitution, somatropin (rnc), net price 1.33-mg (4-unit) vial (with diluent) = £29.28; 3.33-mg (10-unit) vial (with diluent) = £73.20. For subcutaneous or intramuscular injection

Click.easy®, powder for reconstitution, somatropin (rnc), net price 8-mg (24-unit) vial (in Click.easy® device with diluent) = £185.44. For use with One.click® (Ferring) autoinjector device or Cool.Click® (Sandoz) needle-free device (both available free of charge from clinics). For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p 2)

Zomacton® (Ferring) (BNF

Injection, powder for reconstitution, somatropin (rbe), net price 4-mg (12-unit) vial (with diluent) = £81.32. For use with ZomaJet® 2 (Ferring) needle-free device or with Auto-Jector® (Ferring) (both available free of charge from clinics) or with needles and syringes. For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p 2)

PEGVISOMANT

Indications see notes above

Caution liver disease (monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop); diabetes mellitus (adjustment of antidiabetic therapy may be necessary); possible increase in female fertility

Contra-indications pregnancy and breast-feeding

Side-effects diarrhea, constipation, nausea, vomiting, abdominal distension, dyspepsia, flatulence, elevated liver enzymes; hypertension; headache, asthenia, dizziness, drowsiness, tremor, sleep disturbances; influenza-like syndrome, weight gain, hyperglycaemia, hypoglycaemia; arthralgia, myalgia; injection-site reactions, sweating, pruritus, rash; fatigue; hypercholesterolaemia; less commonly thrombocytopenia, leucopenia, leucocytosis, bleeding tendency

Dose

• By subcutaneous injection, initially 80 mg, then 10 mg daily, increased in steps of 5 mg daily according to response; max. 30 mg daily; CHILD not recommended

Somavert® (Pfizer) ▼ (BNF

Injection, powder for reconstitution, pegvisomant, net price 10-mg vial = £50.00; 15-mg vial = £75.00; 20-mg vial = £100.00 (all with solvent)

Thyrotrophin

Thyrotrophin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone). It is licensed for use with or without radiodiode imaging, together with serum thyroglobulin testing, for the detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients. It is also licensed to increase radioiodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients.

THYROTROPIN ALFA

(Recombinant human thyroid stimulating hormone, rhTSH)

Indications see notes above and product literature

Caution presence of thyroglobulin autoantibodies may give false negative results

Contra-indications hypersensitivity to bovine or human thyrotrophin; pregnancy; breast-feeding

Side-effects nausea, vomiting; headache, dizziness, fatigue; less commonly asthenia, paraesthesia, back pain, influenza-like symptoms, rash, urticaria; rarely diarrhoea; very rarely palpitation, flushing, dyspnoea, pain at site of metastases, tremor, arthralgia, myalgia,
6 Endocrine system

Protirelin
By intravenous injection.

Dose
- By intramuscular injection into the gluteal muscle, 900 micrograms every 24 hours for 2 doses, consult product literature

Thyrogen® (Genzyme) (hosp.
Injection, powder for reconstitution, thyrotropin alfa 900 micrograms/vial, net price = £232.50

Hypothalamic hormones

Gonadorelin when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. Gonadorelin analogues are indicated in endometriosis and infertility (section 6.7.2) and in breast and prostate cancer (section 8.3.4).

Protirelin is a hypothalamic releasing hormone which stimulates the release of thyrotrophin from the pituitary. It is licensed for the diagnosis of mild hyperthyroidism or hypothyroidism, but its use has been superseded by immunoassays for thyroid-stimulating hormone.

GONADORELIN
(Gonadotrophin-releasing hormone; GnRH; LH–RH)

Indications see preparations below
Cautions pituitary adenoma
Side-effects rarely, nausea, headache, abdominal pain, increased menstrual bleeding; rarely, hypersensitivity reaction on repeated administration of large doses; irritation at injection site
Dose
- See under preparations

HRF® (Intrapharm) (hosp.
Injection, powder for reconstitution, gonadorelin. Net price 100-microgram vial (with diluent) = £13.72 (hosp. only)
Excipients include benzyl alcohol (avoid in neonates, see Excipients p. 2)
Dose for assessment of pituitary function (adults), by subcutaneous or intravenous injection, 100 micrograms

PROTIRELIN
(Thyrotrophin-releasing hormone; TRH)

Indications assessment of thyroid function and thyroid stimulating hormone reserve
Cautions severe hypopituitarism, myocardial ischaemia, bronchial asthma and obstructive airways disease, pregnancy, breast-feeding (Appendix 5)
Side-effects after rapid intravenous administration desire to micturate, flushing, dizziness, nausea, strange taste; transient increase in pulse rate and blood pressure; rarely bronchospasm
Dose
- By intravenous injection, 200 micrograms; CHILD under 12 years 1 microgram/kg
Protirelin (Cambridge) (hosp.
Injection, protirelin 100 micrograms/mL. Net price 2-ml amp = £14.43

Posterior pituitary hormones and antagonists

Diabetes insipidus Vasopressin (antidiuretic hormone, ADH) is used in the treatment of pituitary (‘cranial’) diabetes insipidus as is its analogue desmopressin. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose of 2 micrograms intramuscularly or 20 micrograms intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides (section 2.2.1) e.g. chlorothalidone 100 mg twice daily reduced to maintenance dose of 50 mg daily.

Chlorpropamide (section 6.1.2.1) is also useful in partial pituitary diabetes insipidus, and probably acts by sensitising the renal tubules to the action of remaining endogenous vasopressin; it is given in doses of up to 350 mg daily in adults and 200 mg daily in children, care being taken to avoid hypoglycaemia. Carbamazepine (section 4.8.1) is also sometimes useful (in a dose of 200 mg once or twice daily) [unlicensed]; its mode of action may be similar to that of chlorpropamide.

Other uses Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. For a comment on use of desmopressin in nocturnal enuresis see section 7.4.2.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin, a derivative of vasopressin, is used similarly.

Oxytocin, another posterior pituitary hormone, is indicated in obstetrics (section 7.1.1).

VASOPRESSIN

Indications pituitary diabetes insipidus; bleeding from oesophageal varices
Cautions heart failure, hypertension, asthma, epilepsy, migraine or other conditions which might be aggra-

6.5.2 Posterior pituitary hormones and antagonists

Diabetes insipidus Vasopressin (antidiuretic hormone, ADH) is used in the treatment of pituitary (‘cranial’) diabetes insipidus as is its analogue desmopressin. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose of 2 micrograms intramuscularly or 20 micrograms intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides (section 2.2.1) e.g. chlorothalidone 100 mg twice daily reduced to maintenance dose of 50 mg daily.

Chlorpropamide (section 6.1.2.1) is also useful in partial pituitary diabetes insipidus, and probably acts by sensitising the renal tubules to the action of remaining endogenous vasopressin; it is given in doses of up to 350 mg daily in adults and 200 mg daily in children, care being taken to avoid hypoglycaemia. Carbamazepine (section 4.8.1) is also sometimes useful (in a dose of 200 mg once or twice daily) [unlicensed]; its mode of action may be similar to that of chlorpropamide.

Other uses Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. For a comment on use of desmopressin in nocturnal enuresis see section 7.4.2.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin, a derivative of vasopressin, is used similarly.

Oxytocin, another posterior pituitary hormone, is indicated in obstetrics (section 7.1.1).
vated by water retention; renal impairment (see also Contra-indications); pregnancy (Appendix 4); avoid fluid overload

**Contra-indications** vascular disease (especially disease of coronary arteries) unless extreme caution, chronic nephritis (until reasonable blood nitrogen concentrations attained)

**Side-effects** fluid retention, pallor, tremor, sweating, vertigo, headache, nausea, vomiting, belching, abdominal cramps, desire to defaecate, hypersensitivity reactions (including anaphylaxis), constriction of coronary arteries (may cause anginal attacks and myocardial ischaemia), peripheral ischaemia and rarely gangrene

**Dose**
- **By subcutaneous or intramuscular injection**, diabetes insipidus, 5–20 units every four hours
- **By intravenous infusion**, initial control of variceal bleeding, 20 units over 15 minutes

**Synthetic vasopressin**

**Pitressin**<sup>(Goldshield)</sup> \( \text{AM} \)

Injection, argipressin (synthetic vasopressin)

20 units/mL. Net price 1-mL amp = £17.14 (hosp. only)

**DESMOPRESSIN**

**Indications** see under Dose

**Cautions** see under Vasopressin; less pressor activity, but still considerable caution in renal impairment (Appendix 3), in cardiovascular disease and in hypertension (not indicated for nocturnal enuresis or nocturia in these circumstances); elderly (avoid for nocturnal enuresis and nocturia in those over 65 years); also considerable caution in cystic fibrosis; in nocturia and nocturnal enuresis limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards; in nocturia periodic blood pressure and weight checks needed to monitor for fluid overload; pregnancy (Appendix 4) interactions: Appendix 1 (desmopressin)

**Hyponatraemic convulsions** The CSM has advised that patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal). The risk of hyponatraemic convulsions can also be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)

**Contra-indications** cardiac insufficiency and other conditions treated with diuretics; psychogenic polydipsia and polydipsia in alcohol dependence

**Side-effects** fluid retention, and hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake; stomach pain, headache, nausea, vomiting, allergic reactions, and emotional disturbance in children also reported; epistaxis, nasal congestion, rhinitis with nasal spray

**Dose**
- **By mouth** (as desmopressin acetate)
  - Diabetes insipidus, treatment, \textit{ADULT} and \textit{CHILD} initially 300 micrograms daily (in 3 divided doses); maintenance, 300–600 micrograms daily in 3 divided doses; range 0.2–1.2 mg daily
  - Primary nocturnal enuresis (if urine concentrating ability normal), \textit{ADULT} (under 65 years) and \textit{CHILD} over 5 years (preferably over 7 years) 200 micrograms at bedtime, only increased to 400 micrograms if lower dose not effective (\textbf{important}: see also Cautions); withdraw for at least 1 week for reassessment after 3 months
  - Postoperative polyuria or polydipsia, adjust dose according to urine osmolality
    - **Sublingually** (as desmopressin base)
      - Diabetes insipidus, treatment, \textit{ADULT} and \textit{CHILD} initially 180 micrograms daily in 3 divided doses; range 120–720 micrograms daily
      - Polyuria or polydipsia after hypophysectomy, adjust dose according to urine osmolality
    - **Intranasally** (as desmopressin acetate)
      - Diabetes insipidus, diagnosis, \textit{ADULT} and \textit{CHILD} 20 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)
      - Diabetes insipidus, treatment, \textit{ADULT} 10–40 micrograms daily (in 1–2 divided doses); \textit{CHILD} 5–20 micrograms daily; infants may require lower doses
      - Nocturia associated with multiple sclerosis (when other treatments have failed), \textit{ADULT} (under 65 years) 10–20 micrograms at bedtime (\textbf{important}: see also Cautions), dose not to be repeated within 24 hours
      - Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration), \textit{ADULT} 40 micrograms; \textit{INFANT} under 1 year 10 micrograms (restrict fluid intake to 50% at next 2 feeds to avoid fluid overload), \textit{CHILD} 1–15 years 20 micrograms
      - Mild to moderate haemophilia and von Willebrand’s disease, \textit{ADULT} 300 micrograms (one 150-microgram spray into each nostril) 30 minutes before surgery or when bleeding; may be repeated at intervals of 12 hours (or at intervals of at least 3 days if self-administered)
      - Fibrinolytic response testing, \textit{ADULT} 300 micrograms (one 150-microgram spray into each nostril); blood sampled after 1 hour for fibrinolytic activity
      - **By injection** (as desmopressin acetate)
        - Diabetes insipidus, diagnosis (subcutaneous or intramuscular), \textit{ADULT} and \textit{CHILD} 2 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)
        - Diabetes insipidus, treatment (subcutaneous, intramuscular or intravenous), \textit{ADULT} 1–4 micrograms daily; \textit{INFANT} and \textit{CHILD} 400 nanograms
        - Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration) (subcutaneous or intramuscular), \textit{ADULT} and \textit{CHILD} 2 micrograms; \textit{INFANT} 400 nanograms (restrict fluid intake to 50% at next 2 feeds)
        - Mild to moderate haemophilia and von Willebrand’s disease, \textit{subcutaneous or intravenous}, \textit{ADULT} and \textit{CHILD} over 1 month 300 nanograms/kg as a single dose immediately before surgery or after trauma; may be repeated at intervals of 12 hours
        - Fibrinolytic response testing, (subcutaneous or intravenous), \textit{ADULT} and \textit{CHILD} 300 nanograms/kg; blood sampled after 20 minutes for fibrinolytic activity
        - Lumbar-puncture-associated headache, consult product literature
Desmopressin acetate (Non-proprietary) (Ferring)
Nasal spray, desmopressin acetate 10 micrograms/ metered spray, net price 6-mL unit (60 metered sprays) = £27.04. Counselling, fluid intake, see above
Brands include Presepinex
Note Children requiring dose of less than 10 micrograms should be given DDAVP intranasal solution

DDAVP® (Ferring) (Ferring)
Tablets, both scored, desmopressin acetate 100 micrograms, net price 90-tab pack = £45.48; 200 micrograms, 90-tab pack = £90.96. Counselling, fluid intake, see above
Sublingual tablets (DDAVP® Melt), desmopressin (as acetate) 60 micrograms, net price 100-tab pack = £50.53; 120 micrograms, 100-tab pack = £101.07; 240 micrograms, 100-tab pack = £202.14. Label: 26, counselling, fluid intake, see above
Intranasal solution, desmopressin acetate 100 micrograms/mL. Net price 2.5-mL dropper bottle and catheter = £9.72. Counselling, fluid intake, see above
Injection, desmopressin acetate 4 micrograms/mL. Net price 1-mL amp = £1.10

Desmotabs® (Ferring) (Ferring)
Tablets, scored, desmopressin acetate 200 micrograms, net price 30-tab pack = £30.34. Counselling, fluid intake, see above

DesmoMelt® (Ferring) (Ferring)
Sublingual tablets, desmopressin (as acetate) 120 micrograms, net price 30-tab pack = £30.34; 240 micrograms, 30-tab pack = £60.68. Label: 26, counselling, fluid intake, see above

Desmospray® (Ferring) (Ferring)
Nasal spray, desmopressin acetate 10 micrograms/ metered spray. Net price 6-mL unit (60 metered sprays) = £26.04. Counselling, fluid intake, see above
Note Children requiring dose of less than 10 micrograms should be given DDAVP intranasal solution

Octin® (Ferring) (Ferring)
Nasal spray, desmopressin acetate 150 micrograms/ metered spray, net price 2.5-mL unit (25 metered sprays) = £600.00. Counselling, fluid intake, see above
Injection, desmopressin acetate 15 micrograms/mL, net price 1-mL amp = £20.00

TERLIPRESSIN
Indications bleeding from oesophageal varices
Cautions see under Vasopressin
Contra-indications see under Vasopressin
Side-effects see under Vasopressin, but effects milder
Dose
• By intravenous injection, 2 mg followed by 1 or 2 mg every 4 to 6 hours until bleeding is controlled, for up to 72 hours

Glypressin® (Ferring) (Ferring)
Injection, terlipressin, powder for reconstitution. Net price 1-mg vial with 5 mL diluent = £19.44 (hosp. only)

Antidiuretic hormone antagonists
Demeclocycline (section 5.1.3) can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline is thought to act by directly blocking the renal tubular effect of antidiuretic hormone. Initially 0.9–1.2 g is given daily in divided doses, reduced to 600–900 mg daily for maintenance.

6.6 Drugs affecting bone metabolism

6.6.1 Calcitonin and parathyroid hormone

6.6.2 Bisphosphonates and other drugs affecting bone metabolism

See also calcium (section 9.5.1.1), phosphorus (section 9.5.2), vitamin D (section 9.6.4), and oestrogens in postmenopausal osteoporosis (section 6.4.1.1).

Osteoporosis
Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements (section 9.5.1.1 and section 9.6.4). Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

Postmenopausal osteoporosis The bisphosphonates (alendronic acid, disodium etidronate, and risedronate, section 6.6.2) are effective for preventing postmenopausal osteoporosis. Hormone replacement therapy (HRT section 6.4.1.1) is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should not be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Calcitonin (section 6.6.1) may be considered for those at high risk of osteoporosis for whom a bisphosphonate is unsuitable. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.
Postmenopausal osteoporosis may be treated with a bisphosphonate (section 6.6.2). The bisphosphonates (such as alendronate, etidronate, and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable calci-triol (section 9.6.4), calcitonin or strontium ranelate (section 6.6.2) may be considered. Calcitonin [unlicensed indication] may also be useful for pain relief for up to 3 months after a vertebral fracture if other analgesics are ineffective. Parathyroid hormone, and teriparatide (section 6.6.1) have been introduced for the treatment of postmenopausal osteoporosis.

Raloxifene (section 6.4.1.1) is licensed for the prophylaxis and treatment of vertebral fractures in postmeno-pausal women.

### NICE guidance

**Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women** (October 2008)

Alendronate is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:

- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m², ankylosing spondylitis, Crohn’s disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) and confirmed osteoporosis
- Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis
- Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis

**Risedronate or etidronate** are recommended as alternatives for women:

- in whom alendronate is contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance

**Strontium ranelate** or **raloxifene** are recommended as alternatives for women:

- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance

**Teriparatide** is recommended as an alternative for women:

- in whom alendronate and either risedronate or etidronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance

### Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis (section 3.2).

Patients taking (or who are likely to take) an oral cortico-steroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking oral corticosteroids who have sustained a low-trauma fracture should receive treatment for osteoporosis. The
therapeutic options for prophylaxis and treatment of corticosteroid-induced osteoporosis are the same:

- a bisphosphonate (section 6.6.2);
- calcitriol [unlicensed indication] (section 9.6.4);
- hormone replacement (HRT in women (section 6.4.1), testosterone in men [unlicensed indication] (section 6.4.2)).

### 6.6.1 Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homoeostasis. Calcitonin (salmon) (salcatonin, synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in some patients with hypercalcaemia (notably when associated with malignant disease). Calcitonin is licensed for treatment of Paget's disease of bone. It can also be used in the prevention and treatment of postmenopausal osteoporosis (see section 6.6).

Recombinant parathyroid hormone is used for the treatment of postmenopausal osteoporosis. Teriparatide (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis. The Scottish Medicines Consortium, p. 3 has advised (February 2007) that parathyroid hormone (Preoact®) should be initiated by specialists experienced in the treatment of osteoporosis.

Cinacalcet (section 9.5.1.2) is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

### CALCITONIN (SALMON)/SALCATONIN

**Indications** see under Dose

**Cautions** history of allergy (skin test advised); renal impairment; heart failure; pregnancy (Appendix 4), breast-feeding (Appendix 5)

**Contra-indications** hypocalcaemia

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; flushing; dizziness, headache, taste disturbances; musculoskeletal pain; with nasal spray nose and throat irritation, rhinitis, sinusitis and epistaxis; less commonly diuresis, oedema, cough, visual disturbances, injection-site reactions, rash, hypersensitivity reactions including pruritus

**Dose**

- Hypercalcaemia of malignancy (see also section 9.5.1.2), ADULT over 18 years, by subcutaneous or intramuscular injection, 100 units every 6–8 hours adjusted according to response; max. 400 units every 6–8 hours; in severe or emergency cases, by intravenous infusion, up to 10 units/kg over at least 6 hours
- Paget's disease of bone, ADULT over 18 years, by subcutaneous or intramuscular injection, 50 units 3 times weekly to 100 units daily adjusted according to response
- Postmenopausal osteoporosis to reduce risk of vertebral fractures, intranasally, 200 units (1 spray) into one nostril daily, with dietary calcium and vitamin D supplements (section 9.5.1.1 and section 9.6.4)
- Prevention of acute bone loss due to sudden immobility, ADULT over 18 years, by scubcutaneous or intramuscular injection, 100 units daily in 1–2 divided doses for 2–4 weeks, reduced to 50 units daily at start of mobilisation and continued until fully mobile

### PARATHYROID HORMONE

(Human recombinant parathyroid hormone)

**Indications** treatment of osteoporosis in postmenopausal women at high risk of fractures (to reduce the risk of vertebral fractures) (see also notes above)

**Cautions** monitor serum or urinary calcium concentration at 1, 3 and 6 months after initiation of treatment (consult product literature for guidance if serum calcium concentration raised); active or previous urolithiasis; concomitant cardiac glycosides; renal impairment (Appendix 3)

**Contra-indications** previous radiation therapy to skeleton, pre-existing hypercalcaemia, metabolic bone disease (including hyperparathyroidism and Paget's disease), unexplained raised levels of alkaline phosphatase; avoid in severe hepatic impairment; pregnancy; breast-feeding

**Side-effects** nausea, vomiting, dyspepsia, constipation, diarrhoea; palpitation; headache, dizziness, fatigue, asthenia; transient hypercalcaemia, hypercalciuria; muscle cramp, pain in extremities, back pain; injection-site reactions; less commonly abdominal pain, altered sense of smell, taste disturbance, anorexia, influenza, hyperuricaemia

**Dose**

- By subcutaneous injection, 100 micrograms daily, max. duration of treatment 24 months

**Preoact®** (Nycomed) ▼ (NVI)

**Injection**, dual-chamber cartridge containing powder for reconstitution, parathyroid hormone (rdna) and diluent, net price 1.61-mg (14-dose) cartridge = £130.20. For use with Preoact® pen device.

### TERIPARATIDE

**Indications** treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures; treatment of corticosteroid-induced osteoporosis; see also notes above

**Cautions** moderate renal impairment (avoid if severe)

**Contra-indications** pre-existing hypercalcaemia, skeletal malignancies or bone metastases, metabolic bone diseases, including Paget's disease and hyperparathyroidism, unexplained raised alkaline phosphatase, previous radiation therapy to the skeleton; pregnancy; breast-feeding

**Side-effects** gastro-intestinal disorders (including nausea, reflux and haemorrhoids); palpitation; dys-
Bisphosphonates

Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover. Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; alendronic acid or risedronate sodium are considered the drugs of choice for these conditions, but disodium etidronate may be considered if these drugs are unsuitable or not tolerated (see also section 6.6).

Bisphosphonates are also used in the treatment of Paget’s disease, hypercalcaemia of malignancy (section 9.5.1.2), and in bone metastases in breast cancer (section 8.3.4.1). Disodium etidronate can impair bone mineralisation when used continuously or in high doses (such as in the treatment of Paget’s disease).

Osteonecrosis of the jaw Osteonecrosis of the jaw has been reported in patients receiving intravenous bisphosphonates and, rarely, in those taking oral bisphosphonates. Adequate oral hygiene should be maintained during and after treatment with bisphosphonates. Ideally in patients with concomitant risk factors (such as cancer, chemotherapy treatment, corticosteroid treatment, or poor oral hygiene), remedial dental work should be carried out before starting bisphosphonate treatment.

**ALENDRONIC ACID**

**Indications** see under Dose

**Cautions** upper gastro-intestinal disorders (dysphagia, symptomatic oesophageal disease, gastritis, duodenitis, or ulcers—see also under Contra-indications and Side-effects); history (within 1 year) of ulcers, active gastro-intestinal bleeding, or surgery of the upper gastro-intestinal tract; renal impairment (Appendix 3); correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting and monitor serum-calcium concentration during treatment; consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); exclude other causes of osteoporosis; atypical stress fractures reported (discontinue unless benefits of continued treatment clearly outweigh risks); interactions: Appendix 1 (bisphosphonates)

**Contra-indications** abnormalities of oesophagus and other factors which delay emptying (e.g. stricture or achalasia), hypocalcaemia, pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Side-effects** oesophageal reactions (see below), abdominal pain and distension, dyspepsia, regurgitation, melaena, diarrhoea or constipation, flatulence, musculoskeletal pain, headache; rarely rash, pruritus, erythema, photosensitivity, uveitis, scleritis, transient decrease in serum calcium and phosphate; nausea, vomiting, gastritis, peptic ulceration, hypersensitivity reactions (including urticaria and angioedema), and atypical stress fractures with long-term use also reported; myalgia, malaise, and fever at initiation of treatment; very rarely severe skin reactions (including Stevens-Johnson syndrome), osteonecrosis (see notes above)

**Oesophageal reactions** Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain

**Dose**

- Treatment of postmenopausal osteoporosis and osteoporosis in men, 10 mg daily or (in postmenopausal osteoporosis) 70 mg once weekly
- Prevention of postmenopausal osteoporosis, 5 mg daily
- Prevention and treatment of corticosteroid-induced osteoporosis, 5 mg daily (postmenopausal women not receiving hormone replacement therapy, 10 mg daily)

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet

**Alendronic acid (Non-proprietary) Tablets, alendronic acid (as sodium alendronate)**

- 10 mg, net price 28-tab pack = £2.75. Counselling, administration

**Fosamax® (MSD) Tablets, alendronic acid (as sodium alendronate)**

- 10 mg, 28-tab pack = £23.12. Counselling, administration

**Alendronic Acid Once-Weekly (Non-proprietary) Tablets, alendronic acid (as sodium alendronate)**

- 70 mg, net price 4-tab pack = £3.66. Counselling, administration

**Fosamax® Once Weekly (MSD) Tablets, alendronic acid (as sodium alendronate)**

- 70 mg, net price 4-tab pack = £22.80. Counselling, administration

**With colecalciferol**

For caution, contra-indications, and side-effects of colecalciferol, see section 9.6.4

**Fosavance® (MSD)**

- 70 mg, colecalciferol 70 micrograms (2 800 units), net price 4-tab pack = £3.66. Counselling, administration

**Note** 3-ml prefilled pen intended for 28 doses

---

**Forsteo® (Lilly)**

- **Injection**, teriparatide 250 micrograms/mL, net price 3-mL prefilled pen = £271.88

---

BNF 57 6.6.2 Bisphosphonates and other drugs affecting bone metabolism 417
**6.6.2 Bisphosphonates and other drugs affecting bone metabolism**

**Didronel PMO**

Dose: treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency. 1 tablet once weekly.

Counselling: Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.

**DISODIUM ETIDRONATE**

Indications: see under Dose.

Cautions: consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); renal impairment (avoid if creatinine clearance less than 20 mL/minute—Appendix 3); interactions: Appendix 1 (bisphosphonates).

Contra-indications: pregnancy (Appendix 4) and breast-feeding (Appendix 5); not indicated for osteoporosis in presence of hypercalcaemia or hypercalciuria or for osteomalacia.

Side-effects: nausea, diarrhoea or constipation, abdominal pain; increased bone pain in Paget’s disease, also increased risk of fractures with high doses in Paget’s disease (discontinue if fractures occur); rarely exacerbation of asthma, skin reactions (including angioedema, rash, urticaria and pruritus), transient hyperphosphataemia, headache, paraesthesia, peripheral neuropathy reported; blood disorders (including leucopenia, agranulocytosis and pancytopenia) also reported; very rarely osteonecrosis (see notes above).

Dose:

- Paget’s disease of bone, by mouth, 5 mg/kg as a single daily dose for up to 6 months; doses above 10 mg/kg daily for up to 3 months may be used with caution but doses above 20 mg/kg daily are not recommended; after interval of not less than 3 months may be repeated where evidence of reactivation—including biochemical indices (avoid premature retreatment).

Monitoring: Serum phosphate, serum alkaline phosphatase and (if possible) urinary hydroxyproline should be measured before starting and at intervals of 3 months—consult product literature for further details.

- Osteoporosis, see under Didronel PMO®

  Counselling: Avoid food for at least 2 hours before and after oral treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids.

Didronel® (Procter & Gamble Pharm.) Tablets, disodium etidronate 200 mg. Net price 60-tab pack = £20.68. Counselling, food and calcium (see above).

- With calcium carbonate

  For cautions and side-effects of calcium carbonate see section 9.5.1.1.

Didronel PMO® (Procter & Gamble Pharm.) Tablets, 14 white, disodium etidronate 400 mg; 76 pink, effervescent, calcium carbonate 1.25 g (Coact®). Net price per pack = £21.12. Label: 10, patient information leaflet, counselling, food and calcium (see above).

Dose: treatment of osteoporosis, prevention of bone loss in postmenopausal women (particularly if hormone replacement therapy inappropriate), and prevention and treatment of corticosteroid-induced osteoporosis, given in 90-day cycles. 1 Didronel tablet daily for 14 days, then 1 Coact tablet daily for 76 days.

**DISODIUM PAMIDRONATE**

Didronil pamidronate was formerly called aminoxypropyldenediphosphonate disodium (APD)

Indications: see under Dose.

Cautions: renal impairment (Appendix 3); assess renal function before each dose; ensure adequate hydration; hepatic impairment (Appendix 2); cardiac disease (especially in elderly); previous thyroid surgery (risk of hypocalcaemia); monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes; avoid concurrent use with other bisphosphonates; consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); interactions: Appendix 1 (bisphosphonates).

Driving: Patients should be warned against driving or operating machinery immediately after treatment (somnolence or dizziness can occur).

Contra-indications: pregnancy (Appendix 4); breast-feeding (Appendix 5).

Side-effects: hypophosphataemia, fever and influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes); nausea, vomiting, anorexia, abdominal pain, diarrhoea, constipation; symptomatic hypocalcaemia (paraesthesia, tetany), hypomagnesaemia, headache, insomnia, drowsiness; hypertension; anaemia, thrombocytopenia, lymphocytopenia; rash; arthralgia, myalgia, bone pain; rarely muscle cramps, dyspnoea, agitation, confusion, diziness, lethargy; leucopenia, hypotension, pruritus, hyperkalaemia or hypokalaemia, and hypernatraemia; osteonecrosis (see also notes above), isolated cases of seizures, hallucinations, haematuria, acute renal failure, deterioriation of renal disease, convulsions and other ocular symptoms; atrial fibrillation, and reactivation of herpes simplex and zoster also reported; also injection-site reactions.

Dose:

- By slow intravenous infusion (via cannula in a relatively large vein), see also Appendix 6

  Hypercalcaemia of malignancy, according to serum calcium concentration 15–60 mg in single infusion or in divided doses over 2–4 days; max. 90 mg per treatment course.

  Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma, 90 mg every 4 weeks (or every 3 weeks to coincide with chemotherapy in breast cancer).

  Paget’s disease of bone, 30 mg once a week for 6 weeks (total dose 180 mg) or 30 mg in first week then 60 mg every other week (total dose 210 mg); max. total 360 mg (in divided doses of 60 mg) per treatment course; may be repeated every 6 months.

- CHILD not recommended.

Calcium and vitamin D supplements: Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget’s disease.

Disodium pamidronate (Non-proprietary) Concentrate for intravenous infusion, disodium pamidronate 3 mg/mL, net price 5-mL vial = £27.50, 10-mL vial = £55.00; 6 mg/mL, 10-mL vial = £95.00; 9 mg/mL, 10-mL vial = £165.00.

Aredia Dry Powder® (Novantis) Injection, powder for reconstitution, disodium pamidronate, for use as an infusion. Net price 15-mg vial =
IBANDRONIC ACID

**Indications** see under Dose

**Cautions** consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); renal impairment (Appendix 3); monitor renal function and serum calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); interactions: Appendix 1 (bisphosphonates)

**Contra-indications** pregnancy (Appendix 4); breastfeeding (Appendix 5)

**Side-effects** hypocalcaemia, hypophosphataemia, influenza-like symptoms (including fever, chills, and muscle pain), bone pain; oesophageal reactions (see below), diarrhoea, nausea, vomiting, gastritis, abdominal pain, dyspepsia, pharyngitis; headache, asthenia, rash; rarely anaemia, hypersensitivity reactions (pruritus, bronchospasm and angioedema reported); urticaria; injection-site reactions; very rarely osteonecrosis (see notes above)

**Oesophageal reactions** Severe oesophageal reactions reported with all oral bisphosphonates; patients should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

**Dose**
- Reduction of bone damage in bone metastases in breast cancer, by mouth, 50 mg daily, or by intravenous infusion, 6 mg every 3–4 weeks
- Hypercalcaemia of malignancy by intravenous infusion, according to serum calcium concentration, 2–4 mg in single infusion
- Treatment of postmenopausal osteoporosis, by mouth, 150 mg once a month or by intravenous injection over 15–30 seconds, 3 mg every 3 months
- **CHILD** not recommended

**Counselling** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk, also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising

**Bondronat** (Roche) ▼ (Procter & Gamble Pharm.)

- Tablets, f/c, ibandronic acid 50 mg, net price 28-tab pack = £195.00. Counselling, administration
- Concentrate for intravenous infusion, ibandronic acid 1 mg/mL, net price 2-ML amp = £94.86, 6-ML vial = £195.00

**Bonviva** (Roche) ▼ (Procter & Gamble Pharm.)

- Tablets, f/c, ibandronic acid 150 mg, net price 1-tab pack = £21.45, 3-tab pack = £64.35. Counselling, administration
- Injection, ibandronic acid 1 mg/mL, net price 3-ML prefilled syringe = £80.00

RISEDRONATE SODIUM

**Indications** see under Dose

**Cautions** oesophageal abnormalities and other factors which delay transit or emptying (e.g. stricture or achalasia—see also under Side-effects); renal impairment (Appendix 3); correct hypocalcaemia before starting, correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment; consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above).

**Interactions** Appendix 1 (bisphosphonates)

**Contra-indications** hypocalcaemia (see Cautions above), pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances (including abdominal pain, dyspepsia, nausea, diarrhoea, constipation); dizziness, headache; influenza-like symptoms, musculoskeletal pain; rarely oesophageal stricture, oesophagitis, oesophageal ulcer, dysphagia, gastritis, duodenitis, glossitis, peripheral oedema, weight loss, myasthenia, arthralgia, anæmia, bronchitis, sinusitis, rash, nocturia, amblyopia, corneal lesion, dry eye, tinnitus, iritis; very rarely hypersensitivity reactions including angioedema, osteonecrosis (see notes above)

**Dose**
- Paget’s disease of bone, 30 mg daily for 2 months; may be repeated if necessary after at least 2 months
- Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, 5 mg daily or 35 mg once weekly
- Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women, 5 mg daily
- **CHILD** not recommended

**Counselling** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk, also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising

**Actonel** (Procter & Gamble Pharm.)

- Tablets, f/c, risedronate sodium 5 mg (yellow), net price 28-tab pack = £19.10; 30 mg (white), 28-tab pack = £152.81. Counselling, administration, food and calcium (see above)

**Actonel Once a Week** (Procter & Gamble Pharm.)

- Tablets, f/c, risedronate sodium 35 mg (orange), net price 4-tab pack = £20.30. Counselling, administration, food and calcium (see above)

**With calcium carbonate and colecalciferol**

For cautions, contra-indications, and side-effects of calcium carbonate, see section 9.5.1.1 and of colecalciferol, see section 9.6.4

**Actonel® Combi** (Procter & Gamble Pharm.)

- Tablets, 4 orange, f/c, risedronate sodium 35 mg (Actonel Once a Week®).

**Granules**, 24 sachets, effervescent, lemon flavour, calcium carbonate 2.5 g (calcium 1 g or Ca 25 mmol) and colecalciferol 22 micrograms (880 units), net price per pack = £20.30. Counselling, administration, food and calcium (see above)

**Dose** treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, given in weekly cycles, 1 Actonel Once a Week® tablet on the first day followed by 1 calcium and colecalciferol sachet daily for 6 days

**Counselling** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately
6.6.2 Bisphosphonates and other drugs affecting bone metabolism

**SODIUM CLODRONATE**

**Indications** see under Dose

**Cautions** monitor renal and hepatic function and white cell count; also monitor serum calcium and phosphate periodically; renal dysfunction reported in patients receiving concomitant NSAIDs; maintain adequate fluid intake during treatment; consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3); interactions: Appendix 1 (bisphosphonates)

**Contra-indications** acute gastro-intestinal inflammatory conditions; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** nausea, diarrhoea; skin reactions; bronchospasm; very rarely osteonecrosis (see notes above)

**Dose**

- Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma, by mouth, 1.6 g daily in single or 2 divided doses increased if necessary to a max. of 3.2 g daily
- Hypercalcaemia of malignancy, by slow intravenous infusion, 300 mg daily for max. 7–10 days or by single-dose infusion of 1.5 g

**Bonefos®** (Bayer)

Capsules, yellow, sodium clodronate 400 mg, net price 120-cap pack = £161.97. Counselling, food and calcium

Tablets, f/c, scored, sodium clodronate 800 mg, net price 60-tab pack = £169.62. Counselling, food and calcium

Concentrate (= intravenous solution), sodium clodronate 60 mg/mL, for dilution and use as infusion. Net price 5-mL amp = £12.82

**Clasteon®** (Beacon)

Capsules, blue/white, sodium clodronate 400 mg, net price 30-cap pack = £40.49, 120-cap pack = £161.97. Counselling, food and calcium

**Loron®** (Roche)

Loron 520 mg, f/c, scored, sodium clodronate 520 mg. Net price 60-tab pack = £161.99. Label: 10, patient information leaflet, counselling, food and calcium

**Dose** 2 tablets daily in single or two divided doses; may be increased to max. 4 tablets daily

**Side-effects** stomach pain, nausea, diarrhoea; rarely asthenia, dizziness, headache and skin reactions; very rarely osteonecrosis (see notes above)

**Dose**

- 400 mg daily as a single dose for 12 weeks; may be repeated if necessary after 6 months

**Counselling** Avoid food for 2 hours before and after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake

**TILUDRONIC ACID**

**Indications** Paget’s disease of bone

**Cautions** renal impairment (monitor renal function regularly, see under Contra-indications); correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting; avoid concomitant use of indomethacin; consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); interactions: Appendix 1 (bisphosphonates)

**Contra-indications** renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); juvenile Paget’s disease, pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Side-effects** stomach pain, nausea, diarrhoea; rarely asthenia, dizziness, headache and skin reactions; very rarely osteonecrosis (see notes above)

**Dose**

- 400 mg daily as a single dose for 12 weeks; may be repeated if necessary after 6 months

**Counselling** Avoid food for 2 hours before and after treatment, particularly calcium-containing products e.g. milk; also avoid antacids

**Skelid®** (Sanofi-Synthelabo)

Tablets, tiludronic acid (as tiludronate disodium) 200 mg. Net price 28-tab pack = £99.00. Counselling, food and calcium

**ZOLEDRONIC ACID**

**Indications** see under Preparations

**Cautions** correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting; monitor serum electrolytes, calcium, phosphate and magnesium; assess renal function before each dose; ensure adequate hydration; renal impairment (Appendix 3); severe hepatic impairment (Appendix 2); cardiac disease (avoid fluid overload); consider preventive dental treatment before initiating bisphosphonate (risk of osteonecrosis of the jaw, see notes above); interactions: Appendix 1 (bisphosphonates)

**Contra-indications** pregnancy (Appendix 4), breast-feeding (Appendix 5)

**Side-effects** hypophosphataemia, anaemia, influenza-like symptoms including bone pain, myalgia, arthralgia, fever and rigors; gastro-intestinal disturbances; atrial fibrillation; headache, dizziness, conjunctivitis, renal impairment (rarely acute renal failure); less commonly anorexia, taste disturbance, dry mouth, stomatitis, chest pain, hypertension, hypotension, dyspnoea, cough, paraesthesia, tremor, anxiety, lethargy, sleep disturbance, blurred vision, weight gain, pruritus, rash, sweating, muscle cramps, haematuria, proteinuria, urinary frequency, hypersensitivity reactions (including angiooedema), asthenia, peripheral oedema, thrombocytopenia, leucopenia, hypomagnesaemia, hypokalaemia, also injection-site reactions; rarely bradycardia, confusion, hyperkalaemia, hypernatraemia, pancytopenia, osteonecrosis of the jaw (see also notes above); very rarely uveitis and episcleritis

**Dose**

- See under Preparations

**Aclasta®** (Novartis)

**Intravenous infusion**, zoledronic acid 50 micrograms/mL, net price 100-mL bottle = £283.74

**Dose** Treatment of Paget’s disease of bone, by intravenous infusion, 5 mg as a single dose over at least 15 minutes

**Note** At least 300 mg elemental calcium twice daily (with vitamin D, section 9.6.4) for at least 10 days is recommended following infusion

**Treatment of postmenopausal osteoporosis and osteoporosis in men, by intravenous infusion, 5 mg over at least 15 minutes once a year**

**Note** In patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50 000–125 000 units of vitamin D (section 9.6.4)
Strontium ranelate

Strontium ranelate stimulates bone formation and reduces bone resorption. It is licensed for the treatment of postmenopausal osteoporosis. The Scottish Medicines Consortium has advised (July 2005) that strontium ranelate should be restricted to use when bisphosphonates are contra-indicated or not tolerated and then only in women aged over 75 years with a previous fracture and low bone mineral density or in other women at equivalent risk.

**Indications**
treatment of postmenopausal osteoporosis to reduce risk of vertebral and hip fractures

**Cautions**
predisposition to thromboembolism; interferes with colorimetric measurements of calcium in blood and urine; renal impairment (Appendix 3); interactions: Appendix 1 (strontium ranelate)

**Contra-indications**
pregnancy, breast-feeding

**Side-effects**
nausea, diarrhoea; venous thromboembolism; headache; dermatitis, eczema; very rarely vomiting, abdominal pain, stomatitis, and hypersensitivity reactions, including rash, pruritus, urticaria and angioedema—see Severe Allergic Reactions, below

**Dose**
- 2 g once daily in water, preferably at bedtime

**Counselling**
Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules

**Protelos** (Servier) ▼ (Yuk)
Granules, yellow, strontium ranelate, 2 g/sachet, net price 28-sachets = £25.60. Label: 5, 13, counselling, food and calcium

**Excipients** include aspartame (section 9.4.1)
Bromocriptine and cabergoline have been associated with pleuritis, pleural effusion, cardiac valvulopathy, pericardial effusion, constrictive pericarditis, and retroperitoneal, pleural, and pulmonary fibrosis (see Fibrotic Reactions).

**Fibrotic reactions**

The CSM (updated by MHRA/CHM July and October 2008) has advised that ergot-derived dopamine-receptor agonists, bromocriptine, cabergoline, lisuride [discontinued], and pergolide have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for chronic endocrine disorders (excludes suppression of lactation) or Parkinson’s disease; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis, by echocardiography (within 3–6 months of initiating treatment and subsequently at 6-12 month intervals).

**Sudden onset of sleep**

Excessive daytime sleepiness and sudden onset of sleep can occur with dopaminergic drugs. Patients starting treatment with these drugs should be warned of the possibility of these effects and of the need to exercise caution when driving or operating machinery. Patients who have suffered excessive sedation or sudden onset of sleep should refrain from driving or operating machines until those effects have stopped recurring.

**Suppression of lactation**

Although bromocriptine and cabergoline are licensed to suppress lactation, they are not recommended for routine suppression (or for the relief of symptoms of postpartum pain and engagement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

**BROMOCRIPTINE**

**Indications**

see notes above and under Dose; parkinsonism (section 4.9.1)

**Cautions**

see notes above; also specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma; contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration); avoid breast-feeding for about 5 days if lactation prevention fails; hepatic impairment (Appendix 2); interactions: Appendix 1 (bromocriptine)

**Contra-indications**

see notes above; also hypertension in postpartum women or in puerperium (see also below)

**Postpartum or puerperium** Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unrelenting headache, or signs of CNS toxicity develop

**Side-effects**

see notes above; also drowsiness (see also Sudden Onset of Sleep, above), nasal congestion; *less commonly* vomiting, postural hypotension, fatigue, dizziness, dry mouth; also, particularly with *high doses*, confusion, psychomotor excitement, hallucinations, rarely diarrhoea, gastro-intestinal bleeding, gastric ulcer, abdominal pain, tachycardia, bradycardia, arrhythmia, insomnia, psychosis, visual disturbances, tinnitus; *very rarely* vasospasm of fingers and toes particularly in patients with Raynaud’s syndrome, and effects like neuroleptic malignant syndrome on withdrawal; urinary incontinence, leucopenia, thrombocytopenia, hyponatraemia, reversible hearing loss, increased libido, and hypersexuality also reported

**Dose**

- Prevention or suppression of lactation (but see notes above and under Cautions), 2.5 mg on day 1 (prevention) or daily for 2–3 days (suppression); then 2.5 mg twice daily for 14 days
- Hypogonadism, galactorrhoea, infertility, initially 1–1.25 mg at bedtime, increased gradually; usual dose 7.5 mg daily in divided doses, increased if necessary to max. 30 mg daily, usual dose in infertility without hyperprolactinaemia, 2.5 mg twice daily
- Acromegaly, initially 1–1.25 mg at bedtime, increase gradually to 5 mg every 6 hours
- Prolactinoma, initially 1–1.25 mg at bedtime; increased gradually to 5 mg every 6 hours (occasional patients may require up to 30 mg daily)
- **CHILD** under 15 years, not recommended

**Bromocriptine** (Non-proprietary)

Tablets, bromocriptine (as mesilate) 2.5 mg, net price 30-tab pack = £21.52. Label: 21, counselling, hypotensive reactions, driving, see notes above

**Parlodex** (Meda)

Tablets, both scored, bromocriptine (as mesilate) 1 mg, net price 100-tab pack = £9.90; 2.5 mg, 30-tab pack = £5.78. Label: 21, counselling, hypotensive reactions, driving, see notes above

**Capsules**, bromocriptine (as mesilate) 5 mg (blue/white), net price 100-cap pack = £37.57; 10 mg (white), 100-cap pack = £69.50. Label: 21, counselling, hypotensive reactions, driving, see notes above

**CABERGOLINE**

**Indications**

see notes above and under Dose

**Cautions**

see notes above; also severe hepatic impairment (Appendix 2); monthly pregnancy tests during the amenorrhoeic period; advise non-hormo-
nal contraception if pregnancy not desired (see also Contra-indications, below); interactions: Appendix 1 (cabergoline)

**Contra-indications** see notes above; history of puerperal psychosis; exclude pregnancy before starting and discontinue 1 month before intended conception (ovulatory cycles persist for 6 months)—discontinue if pregnancy occurs during treatment (specialist advice needed; Appendix 4); avoid breastfeeding if lactation prevention fails (Appendix 5); history of pulmonary, pericardial, or retroperitoneal fibrotic disorders (see Fibrotic Reactions in notes above); cardiac valvulopathy

**Side-effects** see notes above; also drowsiness (see also Sudden Onset of Sleep, above); dyspepsia, gastritis, epigastric and abdominal pain, angina, syncope, depression, confusion, hallucinations, breast pain; rarely vomiting, palpitation, epistaxis, digital vasospasm, hot flushes, transient hemianopia, muscle weakness; also reported cardiac valvulopathy, erythromelalgia

**Dose**
- Prevention of lactation (but see notes above and under Contra-indications), during first day postpartum, 1 mg as a single dose; suppression of established lactation (but see notes above) 250 micrograms every 12 hours for 2 days
- Hyperprolactinaemic disorders, 500 micrograms weekly (as a single dose or as 2 divided doses on separate days) increased at monthly intervals in steps of 500 micrograms until optimal therapeutic response (usually 1 mg weekly, range 0.25–2 mg weekly) with monthly monitoring of serum prolactin levels; reduce initial dose and increase more gradually if patient intolerant; over 1 mg weekly give as divided doses; up to 4.5 mg weekly has been used in hyperprolactinaemic patients
- Parkinsonism, section 4.9.1
- **CHILD** under 16 years, not recommended

**Cabergoline** (Non-proprietary) 
**Tablet**, scored, cabergoline 500 micrograms, net price 8-tab pack = £30.97. Label: 21, counselling, hypotensive reactions, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**Dostinex** (Pharmacia) 
**Tablets**, scored, cabergoline 500 micrograms. Net price 8-tab pack = £30.04. Label: 21, counselling, hypotensive reactions, driving, see notes above

**Note** Dispense in original container (contains desiccant)

---

**6.7.2 Drugs affecting gonadotrophins**

Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with anti-oestrogenic and anti-progestogenic activity. It is licensed for the treatment of endometriosis and for the relief of severe pain and tenderness in benign fibrocystic breast disease where other measures have proved unsatisfactory. It may also be effective in the long-term management of hereditary angioedema [unlicensed indication].

**Gestrinone** has general actions similar to those of danazol and is indicated for the treatment of endometriosis.

**Cetrorelix and ganirelix** are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle-stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

---

**CETREOLIX**

**Indications** adjunct in the treatment of female infertility (under specialist supervision)

**Contra-indications** pregnancy, breast-feeding (Appendix 3), moderate renal impairment (Appendix 3), moderate hepatic impairment (Appendix 2)

**Side-effects** nausea, headache, injection site reactions; rarely hypersensitivity reactions

**Dose**
- By subcutaneous injection into the lower abdominal wall, either 250 micrograms in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation); continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction)
- or 3 mg on day 7 of ovarian stimulation with gonadotrophins; if ovulation induction not possible on day 5 after 3-mg dose, additional 250 micrograms once daily until day of ovulation induction

**Cetrotide** (Serono) 
**Injection**, powder for reconstitution, cetrotrelax (as acetate), net price 250-micrograms vial = £24.00; 3-mg vial = £168.00 (both with solvent)
**DANAZOL**

**Indications** see notes above and under Dose

**Cautions** cardiac, hepatic, or renal impairment (avoid if severe), elderly, polycythaemia, epilepsy, diabetes mellitus, hypertension, migraine, lipoprotein disorder, history of thrombosis or thromboembolic disease; withdraw if virilisation (may be irreversible on continued use); non-hormonal contraceptive methods should be used, if appropriate; **interactions**: Appendix 1 (danazol)

**Contra-indications** pregnancy (Appendix 4), ensure that patients with amenorrhoea are not pregnant; breast-feeding (Appendix 5); severe hepatic, renal or cardiac impairment; thromboembolic disease; undiagnosed genital bleeding; androgen-dependent tumours; acute porphyria (section 9.8.2)

**Side-effects** nausea, dizziness, skin reactions including rashes, photosensitivity and exfoliative dermatitis, fever, backache, nervousness, mood changes, anxiety, changes in libido, vertigo, fatigue, epigastric and pleuritic pain, headache, weight gain; menstrual disturbances, vaginal dryness and irritation, flushing and reduction in breast size; musculo-skeletal spasm, joint pain and swelling, hair loss; androgenic effects including acne, oily skin, oedema, hirsutism, voice changes and rarely clitoral hypertrophy (see also Cautions); temporary alteration in lipoproteins and other metabolic changes, insulin resistance; thomboctic events; leucopenia, thrombocytopenia, eosinophilia, reversible erythrocytosis or polycythaemia reported; headache and visual disturbances may indicate benign intracranial hypertension; rarely cholesterol jaundice, pancreatitis, peliosis hepatis and benign hepatic adenomata

**Dose**

**Note** In women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- Endometriosis, 200–800 mg daily in up to 4 divided doses, adjusted to achieve amenorrhoea, usually for 3–6 months
- Severe pain and tenderness in benign fibrocystic disease; nervousness, depression, change in appetite; weight gain, hirsutism, voice change; liver enzyme disturbances; headache; gastro-intestinal disturbances; change in libido, flushing, decrease in breast size; androgenic effects including acne, oily skin, oedema, hirsutism, voice changes and rarely clitoral hypertrophy (see also Cautions); temporary alteration in lipoproteins and other metabolic changes, insulin resistance; thrombotic events; leucopenia, thrombocytopenia, eosinophilia, reversible erythrocytosis or polycythaemia reported; headache and visual disturbances may indicate benign intracranial hypertension; rarely cholesterol jaundice, pancreatitis, peliosis hepatis and benign hepatic adenomata

**Danazol (Non-proprietary)**

- **Capsules**, danazol 100 mg, net price 28-cap pack = £16.54, 60-cap pack = £17.04; 200 mg, 56-cap pack = £67.61

**Danol** (Sanofi-Synthelabo)

- **Capsules**, danazol 100 mg (grey/white), net price 60-cap pack = £17.04; 200 mg (pink/white), 60-cap pack = £33.75

**GANIRELIX**

**Indications** adjunct in the treatment of female infertility (under specialist supervision)

**Contra-indications** pregnancy (Appendix 4), breast-feeding (Appendix 5); renal impairment (avoid if creatinine clearance less than 20 mL/minute; Appendix 3); moderate hepatic impairment (Appendix 2)

**Side-effects** nausea, headache, malaise, injection-site reactions; **very rarely** hypersensitivity reactions including rash, facial oedema, and dyspnoea also reported

**Dose**

- By subcutaneous injection preferably into the upper leg (rotate injection sites to prevent lipatrophy), 250 micrograms in the morning (or each afternoon) starting on day 6 of ovarian stimulation with gonadotrophins; continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction)

**Orgalutran** (Organon) (BNF)

**Injection**, ganirelix, 500 micrograms/mL, net price 0.5-mL prefilled syringe = £22.32

**GESTRINONE**

**Indications** endometriosis

**Cautions** cardiac dysfunction; renal impairment (avoid if creatinine clearance less than 10 mL/minute); **interactions**: Appendix 1 (gestrinone)

**Contra-indications** pregnancy (use non-hormonal method of contraception); breast-feeding (Appendix 5); severe cardiac or hepatic impairment; metabolic or vascular disorders associated with previous sex hormone treatment

**Side-effects** spotting; acne, oily skin, fluid retention, weight gain, hirsutism, voice change; liver enzyme disturbances; headache; gastro-intestinal disturbances; change in libido, flushing, decrease in breast size; nervousness, depression, change in appetite; muscle cramp

**Dose**

- 2.5 mg twice weekly starting on first day of cycle with second dose 3 days later, repeated on same two days preferably at same time each week; duration of treatment usually 6 months

**Missed doses** One missed dose—2.5 mg as soon as possible and maintain original sequence; two or more missed doses—discontinue, re-start on first day of new cycle (following negative pregnancy test)

**Dimetriose** (Sanofi-Aventis) (BNF)

- **Capsules**, gestrinone 2.5 mg, net price 8-cap pack = £103.91

**Gonadorelin analogues**

Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, anaemia due to uterine fibroids (together with iron supplementation), breast cancer (section 8.3.4.1), prostate cancer (section 8.3.4.2) and before intra-uterine surgery. Use of leuprorelin and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.
Cautions  Non-hormonal, barrier methods of contraception should be used during entire treatment period with gonadorelin analogues; also use with caution in patients with metabolic bone disease because decrease in bone mineral density can occur.

Contra-indications  Gonadorelin analogues are contra-indicated for use longer than 6 months in the treatment of endometriosis (do not repeat), where there is undiagnosed vaginal bleeding, in pregnancy (Appendix 4; exclude pregnancy—also give first injection during menstruation or shortly afterwards for 1 month beforehand) and in breast-feeding.

Side-effects  Side-effects of the gonadorelin analogues related to the inhibition of oestrogen production include menopausal-like symptoms (e.g. hot flushes, increased sweating, vaginal dryness, dyspareunia and loss of libido) and a decrease in trabecular bone density; these effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone). Side-effects of gonadorelin analogues also include headache (rarely migraine) and hypersensitivity reactions including urticaria, pruritus, rash, asthma and anaphylaxis; when treating urine fibroids, bleeding associated with fibroid degeneration can occur; spray formulations can cause irritation of the nasal mucosa including nose bleeds; local reactions at injection site can occur; other side-effects also reported with some gonadorelin analogues include palpatation, hypertension, ovarian cysts (may require withdrawal), changes in breast size, musculoskeletal pain or weakness, visual disturbances, paraesthesia, changes in scalp and body hair, oedema of the face and extremities, weight changes, and mood changes including depression.

BUSERELIN

Indications  see under Dose; prostate cancer (section 8.3.4.2)

Cautions  see notes above; polycystic ovarian disease; diabetes

Contra-indications  see notes above; hormone-dependent tumours

Side-effects  see notes above; initially withdrawal bleeding and subsequently breakthrough bleeding, leucorrhoea; nausea, vomiting, constipation, diarrhoea; anxiety, memory and concentration disturbances, sleep disturbances, nervousness, dizziness, drowsiness; breast tenderness, lactation; abdominal pain; fatigue; increased thirst, changes in appetite; acne, dry skin, splitting nails, dry eyes; altered blood lipids, leucopenia, thrombocytopenia; hearing disturbances; reduced glucose tolerance

Dose  
- Endometriosis, intranasally, 300 micrograms (one 150-microgram spray in each nostril) 3 times daily (starting on days 1 or 2 of menstruation); max. duration of treatment 6 months (do not repeat)
- Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), by subcutaneous injection, 200–500 micrograms daily given as a single injection (occasionally up to 500 micrograms twice daily may be needed) starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Intranasally, 150 micrograms (one spray in one nostril) 4 times daily during waking hours (occasionally up to 300 micrograms 4 times daily may be needed) starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Counselling  Avoid use of nasal decongestants before and for at least 30 minutes after treatment

Suprecur® (Aventis Pharma)  Nasal spray, buserelin (as acetate) 150 micrograms/metered spray. Net price 2 × 100-dose pack (with metered dose pumps) = £91.19. Counselling, nasal decongestants

Injection, buserelin (as acetate) 1mg/mL. Net price 5.5-mL vial = £28.64

GOSERELIN

Indications  see under Dose; prostate cancer (section 8.3.4.2); early and advanced breast cancer (section 8.3.4.1)

Cautions  see notes above; polycystic ovarian disease; diabetes

Contra-indications  see notes above; breast-feeding (Appendix 5)

Side-effects  see notes above; withdrawal bleeding

Dose  
- By subcutaneous injection into anterior abdominal wall (as Zoladex®)  Endometriosis, 3.6 mg every 28 days; max. duration of treatment 6 months (do not repeat)  
  - Endometrial thinning before intra-uterine surgery, 3.6 mg (may be repeated after 28 days if uterus is large or to allow flexible surgical timing)  
  - Before surgery in women who have anaemia due to uterine fibroids, 3.6 mg every 28 days (with supplementary iron); max. duration of treatment 3 months  

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), after exclusion of pregnancy, 3.6 mg to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Preparation  Section 8.3.4.2

LEUPRORELIN ACETATE

Indications  see under Dose; prostate cancer (section 8.3.4.2)

Cautions  see notes above; monitor liver function; family history of osteoporosis; chronic use of other drugs which reduce bone density including alcohol and tobacco; diabetes
Contra-indications see notes above; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see notes above; breast tenderness; nausea, vomiting, diarrhoea, anorexia; fever, chills; sleep disturbances, dizziness, fatigue, leucopenia, thrombocytopenia, altered blood lipids, pulmonary embolism; spinal fracture, paralysis, hypotension and worsening of depression also reported

Dose
- By subcutaneous or intramuscular injection (as Prostapo SR)
  Endometriosis, 3.75 mg as a single dose in first 5 days of menstrual cycle then every month for max. 6 months (course not to be repeated)
  Endometrial thinning before intra-uterine surgery, 3.75 mg as a single dose (given between days 3 and 5 of menstrual cycle) 5–6 weeks before surgery
  Reduction of size of uterine fibroids and of associated bleeding before surgery, 3.75 mg as a single dose every month usually for 3–4 months (max. 6 months)
- By intramuscular injection (as Prostapo 3)
  Endometriosis, 11.25 mg as a single dose in first 5 days of menstrual cycle then every 3 months for max. 6 months (course not to be repeated)

Preparations
- Section 8.3.4.2

NAFARELIN

Indications see under Dose

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; acne

Dose
- Endometriosis, women over 18 years, 200 micrograms twice daily as one spray in one nostril in the morning and one spray in the other nostril in the evening (starting on days 2–4 of menstruation), max. duration of treatment 6 months (do not repeat)
- Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under specialist supervision), 400 micrograms (one spray in each nostril) twice daily starting in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity); discontinue if down-regulation not achieved within 12 weeks

Counselling
- Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration

Synarel (Pharmacia) (Ferring)
- Nasal spray, nafarelin (as acetate) 200 micrograms/metered spray. Net price 30-dose unit = £32.28; 60-dose unit = £55.66. Label: 10, patient information leaflet, counselling, see above

TRIPTORELIN

Indications endometriosis, precocious puberty, reduction in size of uterine fibroids; advanced prostate cancer (section 8.3.4.2)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also gastro-intestinal disturbances; in precocious puberty, withdrawal bleeding may occur in the first month of treatment; asthenia

Dose
- See under preparations below

Decapeptyl SR (Ipsen) (Ferring)
- Injection, (powder for suspension), m/r, triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00
- Dose by intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3 mg every 4 weeks starting during first 5 days of menstrual cycle, for uterine fibroids continue treatment for at least 3 months; max. duration of treatment 6 months (not to be repeated)
- Note Each vial includes an overage to allow accurate administration of 3-mg dose

Injection, (powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00
- Dose by intramuscular injection, endometriosis, 11.25 mg every 3 months starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)
- Precocious puberty, 11.25 mg every 3 months; discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys
- Note Each vial includes an overage to allow accurate administration of 11.25-mg dose

Gonapeptyl Depot (Ferring)
- Injection, (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £85.00
- Dose by subcutaneous or deep intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3.75 mg every 4 weeks starting during first 5 days of menstrual cycle, max. duration of treatment 6 months (not to be repeated)
- Precocious puberty, body-weight over 30 kg, initially 3.75 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight 20–30 kg, initially 2.5 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight under 20 kg, initially 1.875 mg every 2 weeks for 3 doses, then every 3–4 weeks; discontinue when bone maturation consistent with age over 12 years in girls or over 13 years in boys

Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics (section 4.7.1); moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol (section 6.7.2) is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen (section 8.3.4.1) may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.
Metyrapone and trilostane

Metyrapone is a competitive inhibitor of 11β-hydroxylase in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. It may be used as a test of anterior pituitary function.

Although most types of Cushing’s syndrome are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing’s syndrome to prepare the patient for surgery. The dosages used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Trilostane reversibly inhibits 3β-hydroxysteroid dehydrogenase / delta 5-4 isomerase in the adrenal cortex; the resulting inhibition of the synthesis of mineralocorticoids and glucocorticoids may be useful in Cushing’s syndrome and primary hyperaldosteronism. Trilostane appears to be less effective than metyrapone for Cushing’s syndrome (where it is tailored to corticosteroid production). It also has a minor role in postmenopausal breast cancer that has relapsed following initial oestrogen antagonist therapy (corticosteroid replacement therapy is also required). Ketoconazole (section 5.2) is also used by specialists for the management of Cushing’s syndrome [unlicensed indication].

### METYRAPONE

**Indications** see notes above and under Dose (specialist supervision in hospital)

**Cautions** gross hypopituitarism (risk of precipitating acute adrenal failure); hypertension on long-term administration; hypothyroidism or hepatic impairment (delayed response); many drugs interfere with diagnostic estimation of steroids; avoid in acute porphyria (section 9.8.2)

**Driving** Drowsiness may affect the performance of skilled tasks (e.g. driving)

**Contra-indications** adrenocortical insufficiency (see Cautions); pregnancy (Appendix 4), breastfeeding (Appendix 5)

**Side-effects** occasional nausea, vomiting, dizziness, headache, hypotension, sedation; rarely abdominal pain, allergic skin reactions, hypoadrenalinism, hirsutism

**Dose**

- Differential diagnosis of ACTH-dependent Cushing’s syndrome, 750 mg every 4 hours for 6 doses; **CHILD** 15 mg/kg (minimum 250 mg) every 4 hours for 6 doses
- Management of Cushing’s syndrome, range 0.25–6 g daily, tailored to cortisol production; see notes above
- Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) 3 g daily in divided doses

### TRILOSTANE

**Indications** see notes above and under Dose (specialist supervision)

**Cautions** breast cancer (concurrent corticosteroid replacement therapy needed, see under Dose), adrenal cortical hyperfunction (tailored to cortisol and electrolytes, concurrent corticosteroid therapy may be needed, see under Dose); hepatic and renal impairment; **interactions**: Appendix 1 (trilostane)

**Contra-indications** pregnancy (use non-hormonal method of contraception; Appendix 4); breast-feeding; children

**Side-effects** flushing, tingling and swelling of mouth, rhinorrhea, nausea, vomiting, diarrhoea, and rashes reported; rarely granulocytopenia

**Dose**

- Adrenal cortical hyperfunction, 240 mg daily in divided doses for at least 3 days then tailored according to response with regular monitoring of plasma electrolytes and circulating corticosteroids (both mineralocorticoid and glucocorticoid replacement therapy may be needed); usual dose: 120–480 mg daily (may be increased to 960 mg)
- Postmenopausal breast cancer (with glucocorticoid replacement therapy) following relapse to initial oestrogen receptor antagonist therapy, initially 240 mg daily increased every 3 days in steps of 240 mg to a maintenance dose of 960 mg daily (720 mg daily if not tolerated)

### MECASERMIN

(Remcombinant human insulin-like growth factor-I; rhIGF-I)

**Indications** see notes above

**Cautions** correct hypothyroidism before initiating treatment; diabetes mellitus (adjustment of antidiabetic therapy may be necessary), monitor ECG before and on termination of treatment (and during treatment if ECG abnormal), papilloedema (see under Side-effects), monitor for disorders of the epiphysis of the hip (monitor for limping), monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions); pregnancy (Appendix 4)

**Contra-indications** evidence of tumour activity (discontinue treatment), breast-feeding

Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotropic effects of human growth hormone and is used to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.
Side-effects  headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); cardiomegaly, ventricular hypertrophy, tachycardia; convulsions, sleep apnoea, night terrors, dizziness, nervousness; tonsillar hypertrophy (see Cautions above); hypoglycaemia (especially in first month, and in younger children), hyperglycaemia, gynaecomastia; arthralgia, myalgia; visual disturbance, impaired hearing; antibody formation; injection-site reactions (rotate site)

Dose  
- By subcutaneous injection, ADOLESCENT and CHILD over 2 years, initially 40 micrograms/kg twice daily for 1 week, if tolerated increase dose in steps of 40 micrograms/kg to max. 120 micrograms/kg twice daily; discontinue if no response within 1 year

Counselling  Dose should be administered just before or after food; do not increase dose if a dose is missed

Note Reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

Increlex® (Ipsen)  Injection, mecasermin 10 mg/mL, net price 4-mL vial = £384.00. Counselling, administration

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)
7 Obstetrics, gynaecology, and urinary-tract disorders

7.1 Drugs used in obstetrics

7.1.1 Prostaglandins and oxytocics

7.1.1.1 Ductus arteriosus

7.1.2 Mifepristone

7.1.3 Myometrial relaxants

7.2 Treatment of vaginal and vulval conditions

7.2.1 Preparations for vaginal and vulval changes

7.2.2 Vaginal and vulval infections

7.3 Contraceptives

7.3.1 Combined hormonal contraceptives

7.3.2 Progestogen-only contraceptives

7.3.2.1 Oral progestogen-only contraceptives

7.3.2.2 Parenteral progestogen-only contraceptives

7.3.2.3 Intra-uterine progestogen-only device

7.3.3 Spermicidal contraceptives

7.3.4 Contraceptive devices

7.3.5 Emergency contraception

7.4 Drugs for genito-urinary disorders

7.4.1 Drugs for urinary retention

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

7.4.3 Drugs used in urological pain

7.4.4 Bladder instillations and urological surgery

7.4.5 Drugs for erectile dysfunction

For hormonal therapy of gynaecological disorders see section 6.4.1 (including HRT), section 6.5.1 and section 6.7.2.

Because of the complexity of dosage regimens in obstetrics, in all cases detailed specialist literature should be consulted.

7.1.1 Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin, carbetocin, ergometrine, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

Induction of abortion

Gemeprost, administered vaginally as pessaries is the preferred prostaglandin for the medical induction of late therapeutic abortion. Gemeprost ripens the cervix before surgical abortion, particularly in primigravida. The prostaglandin misoprostol (section 7.1.2) is given by mouth or by vaginal administration to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic dinoprostone is rarely used nowadays.

Pre-treatment with mifepristone (section 7.1.2) can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Induction and augmentation of labour

Dinoprostone is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin (Synthocinon®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol is given orally or vaginally for the induction of labour [unlicensed indication].
Prevention and treatment of haemorrhage

Bleeding due to incomplete abortion can be controlled with ergometrine and oxytocin (Syntometrine®) given intramuscularly; the dose is adjusted according to the patient’s condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; ergometrine 500 micrograms with oxytocin 5 units (Syntometrine® 1 mL) is given by intramuscular injection on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, oxytocin may be given alone by intramuscular injection [unlicensed], particularly if ergometrine is inappropriate (e.g. in pre-eclampsia); oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocics are drugs used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin 5–10 units by slow intravenous injection, followed in severe cases by intravenous infusion of oxytocin 5–30 units in 500 mL infusion fluid at a rate that controls uterine atony or
- ergometrine by intramuscular injection or
- ergometrine 250–500 micrograms by intravenous injection (use with caution—risk of hypertension) or
- ergometrine 500 micrograms with oxytocin 5 units (Syntometrine® 1 mL) by intramuscular injection

Carboprost has an important role in severe postpartum haemorrhage unresponsive to ergometrine and oxytocin.

Misoprostol [unlicensed] may be an alternative in postpartum haemorrhage unresponsive to ergometrine, oxytocin, and carboprost.

CARBETOCIN

**Indications** prevention of uterine atony after caesarean section

**Cautions** hypotension; cardiovascular disease (avoid if severe); migraine; asthma

**Contra-indications** pre-eclampsia and eclampsia; epilepsy; hepatic impairment; renal impairment

**Side-effects** nausea, vomiting, abdominal pain, metallic taste; flushing, hypotension, chest pain; dyspnoea; headache, tremor, dizziness; anaemia; back pain; pruritus; feeling of warmth, chills; tachycardia and sweating also reported

**Dose**

- By intravenous injection, a single dose of 100 micrograms, as soon as possible after delivery, preferably before removal of placenta

**Pabal® (Feringa)** ▼ [PA]

**Injection**, carbetocin 100 micrograms/mL, net price 1 mL amp = £18.00

CARBOPROST

**Indications** postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

**Cautions** history of glaucoma or raised intra-ocular pressure, asthma, hypertension, hypotension, anaemia, jaundice, diabetes, epilepsy, uterine scars; excessive dosage may cause uterine rupture; interactions: Appendix 1 (prostaglandins)

**Contra-indications** untreated pelvic infection; cardiac, renal, pulmonary, or hepatic disease

**Side-effects** nausea, vomiting and diarrhoea, hyperthermia and flushing, bronchospasm; less frequent effects include raised blood pressure, dyspnoea, and pulmonary oedema; chills, headache, diaphoresis, dizziness; cardiovascular collapse also reported; erythema and pain at injection site reported

**Dose**

- By deep intramuscular injection, 250 micrograms repeated if necessary at intervals of 1½ hours (in severe cases the interval may be reduced but should not be less than 15 minutes); total dose should not exceed 2 mg (8 doses)

**Hembrate® (Pharmacia)** [PA]

**Injection**, carboprost as trometamol salt (tromethamine salt) 250 micrograms/mL, net price 1 mL amp = £18.20 (hosp. only)

DINOPROSTONE

**Indications** see notes above and under preparations below

**Cautions** history of asthma, glaucoma and raised intra-ocular pressure; hypertension; history of epilepsy; uterine scarring; monitor uterine activity and fetal status (particular care if history of uterine hypertony); uterine rupture; see also notes above; monitor for disseminated intravascular coagulation after parturition; risk factors for disseminated intravascular coagulation; effect of oxytocin enhanced (care needed in monitoring uterine activity when used in sequence); interactions: Appendix 1 (prostaglandins)

**Contra-indications** active cardiac, pulmonary, renal or hepatic disease; placenta praevia or unexplained vaginal bleeding during pregnancy, ruptured membranes, major cephalopelvic disproportion or fetal malpresentation, history of caesarean section or major uterine surgery, untreated pelvic infection, fetal distress, grand multiparas and multiple pregnancy, history of difficult or traumatic delivery; avoid extra-amniotic route in cervicitis or vaginitis

**Side-effects** nausea, vomiting, diarrhoea; other side-effects include uterine hypertonus, severe uterine contractions, pulmonary or amniotic fluid embolism, abruptio placenta, fetal distress, maternal hypertension, bronchospasm, rapid cervical dilation, fever, backache; uterine hypercontractility with or without fetal bradycardia, low Apgar scores; cardiac arrest, uterine rupture, stillbirth or neonatal death also reported; vaginal symptoms (warmth, irritation, pain); after intravenous administration—flushing, shivering, headache, dizziness, temporary pyrexia and raised white blood cell count; disseminated intravascular coagulation reported; also local tissue reaction and erythema after intravenous administration and possibility of infection after extra-amniotic administration
Ergometrine

- See under preparations, below

**Important** Do not confuse dose of Prostin E2 vaginal gel with that of Prostin E2 vaginal tablets—not bioequivalent.

**Propess** *(Ferring) (NH)*

**Pessaries** (within retrieval device), releasing dinoprostone approx. 10 mg over 24 hours; net price 1-pessary pack = £30.00

**Dose** by vagina, cervical ripening and induction of labour at term, 1 pessary (in retrieval device) inserted high into posterior fornix and removed when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 doses (dose not to be repeated)

**Prostin E2** *(Pharmacia) (NH)*

**Intravenous solution** for dilution and use as an infusion, dinoprostone 1 mg/mL, net price 0.75-mL amp = £8.52; 10 mg/mL, 0.5-mL amp = £18.40 (both hosp. only; rarely used, consult product literature for dose and indications)

**Extra-amniotic solution** dinoprostone 10 mg/mL. Net price 0.5-mL amp (with diluent) = £18.40 (hosp. only; less commonly used nowadays, consult product literature for dose and indications)

**Vaginal gel,** dinoprostone 400 micrograms/mL, net price 2.5-mL (1 mg) = £13.28; 800 micrograms/mL, 2.5-mL (2 mg) = £13.28

**Dose** by vagina, induction of labour, inserted high into posterior fornix (avoid administration into cervical canal), 1 mg (unfavourable primigravida 2 mg), followed after 6 hours by 1–2 mg if required, max. gel 3 mg (unfavourable primigravida 4 mg)

**Vaginal tablets,** dinoprostone 3 mg. Net price 8-vaginal tab pack = £106.23

**Dose** by vagina, induction of labour, inserted high into posterior fornix, 3 mg, followed after 6–8 hours by 3 mg if labour is not established; max. 6 mg [vaginal tablets]

**Note** Prostin E2 Vaginal Gel and Vaginal Tablets are not bioequivalent

**ERGOMETRINE MALEATE**

**Indications** see notes above

**Cautions** cardiac disease; hypertension; multiple pregnancy; acute porphyria (section 9.8.2); hepatic impairment (avoid if severe; Appendix 2); renal impairment (avoid if severe; Appendix 3); interactions: Appendix 1 (ergot alkaloids)

**Contra-indications** induction of labour, first and second stages of labour, vascular disease, severe cardiac disease, sepsis, severe hypertension, eclampsia

**Side-effects** nausea, vomiting, headache, dizziness, tinnitus, abdominal pain, chest pain, palpitation, dyspnoea, bradycardia, transient hypertension, vasoconstriction, stroke, myocardial infarction and pulmonary oedema also reported

**Dose**

- See notes above

**Ergometrine** *(Non-proprietary) (NH)*

**Injection,** ergometrine maleate 500 micrograms/mL. Net price 1-mL amp = 60p

**With oxytocin**

**Syntometrine** *(Alliance) (NH)*

**Injection,** ergometrine maleate 500 micrograms, oxytocin 5 units/mL. Net price 1-mL amp = £1.31

**Dose** by intramuscular injection, 1 mL, by intravenous injection, no longer recommended

---

**GEMEPROST**

**Indications** see under Dose

**Cautions** obstructive airways disease, cardiovascular insufficiency, raised intra-ocular pressure, cervices or vaginitis; interactions: Appendix 1 (prostaglandins)

**Important** For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Mifepristone and Note below

**Contra-indications** unexplained vaginal bleeding, uterine scarring, placenta praevia

**Side-effects** vaginal bleeding and uterine pain; nausea, vomiting, or diarrhoea; headache, muscle weakness, dizziness, flushing, chills, backache, dyspnoea, chest pain, palpitation and mild pyrexia; uterine rupture reported (most commonly in multi- parae or if history of uterine surgery or if given with intravenous oxytocics); also reported severe hypotension, coronary artery spasm and myocardial infarction

**Dose**

- By vagina, cervical ripening prior to first trimester surgical abortion, 1 mg inserted into posterior fornix 3 hours before surgery

- Second trimester abortion, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations; second course may begin 24 hours after start of treatment (if treatment fails pregnancy should be terminated by another method)

- Second trimester intra-uterine death, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations only; monitor for coagulopathy

**Note** If used in combination with mifepristone, carefully monitor blood pressure and pulse for 5 hours

**Gemeprost** *(Sanofi-Aventis) (NH)*

**Pessaries,** gemeprost 1 mg. Net price 5-pessary pack = £215.00

---

**OXYTOCIN**

**Indications** see under Dose and notes above

**Cautions** induction or enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant), secondary uterine inertia, mild or moderate pregnancy-induced hypertension or cardiac disease, women over 35 years or with history of lower-uterine segment caesarean section (see also under Contra-indications below); risk factors for disseminated intravascular coagulation, monitor for disseminated intravascular coagulation after parturition; avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication—see also Appendix 6); effects enhanced by concomitant prostaglandins (very careful monitoring of uterine activity); caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors); see also interactions: Appendix 1 (oxytocin)

**Contra-indications** hypertonic uterine contractions, fetal distress; any condition where spontaneous labour or vaginal delivery inadvisable; avoid prolonged administration in oxytocin-resistant uterine inertia, severe pre-eclamptic toxemia, or severe cardiovascular disease

**Side-effects** nausea, vomiting; arrhythmia; headache; rarely disseminated intravascular coagulation, rash, and anaphylactoid reactions (with dyspnoea, hypertension, or shock); uterine spasm (may occur at low doses), uterine hyperstimulation (usually with exces-
sive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture; water intoxication and hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid (see also under Dose below); placental abruption and amniotic fluid embolism also reported on overdose.

**Dose**
- Induction of labour for medical reasons or stimulation of labour in hypotonic uterine inertia, by intravenous infusion (not to be started for at least 6 hours after administration of vaginal prostaglandin), initially 0.001–0.004 units/minute, increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute; max. 5 units in 1 day (may be repeated next day starting again at 0.001–0.004 units/minute).
- **Important** Careful monitoring of fetal heart rate and uterine motility essential for dose titration (avoid intravenous injection during labour); discontinue immediately in uterine hyperactivity or fetal distress.
- Caesarean section, by slow intravenous injection immediately after delivery, 5 units.
- Prevention of postpartum haemorrhage, after delivery of placenta, by slow intravenous injection, 5 units (if infusion used for induction or enhancement of labour, increase rate during third stage and for next few hours).
- **Important** Avoid rapid intravenous injection (may transiently reduce blood pressure).
- **Note** Can be given in a dose of 10 units by intramuscular injection [unlicensed route] instead of oxytocin with ergometrine (Syntometrine), see notes above.
- Treatment of postpartum haemorrhage, by slow intravenous injection, 5–10 units, followed if necessary by intravenous infusion, 0.02–0.04 units/minute or faster.
- **Important** Prolonged intravenous administration at high doses with large volume of fluid (as possible in inevitable or missed abortion or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.
- **Note** Oxytocin doses in the BNF may differ from those in the product literature.

**Syntocinon** ([Alliance](https://www.alliancepharmaceuticals.com))
- **Injection**, oxytocin, net price 5 units/mL, 1-mL amp = 89p; 10 units/mL, 1-mL amp = £1.01
- **With ergometrine**
  - See **Syntometrine**®, p. 431

---

## 7.1.1 Ductus arteriosus

### Maintenance of patency

Alprostadil (prostaglandin E₁) is used to maintain patency of the ductus arteriosus in neonates with congenital heart defects, prior to corrective surgery in centres where intensive care is immediately available. See BNF for Children (section 2.14) for further advice on maintaining the patency of the ductus arteriosus.

### ALPROSTADIL

**Indications** congenital heart defects in neonates prior to corrective surgery; erectile dysfunction (section 7.4.5)

**Cautions** see notes above; history of haemorrhage, avoid in hyaline membrane disease, monitor arterial pressure; interactions: Appendix 1 (prostaglandins)

**Side-effects** apnoea (particularly in neonates under 2 kg), flushing, bradycardia, hypotension, tachycardia, cardiac arrest, oedema, diarrhoea, fever, convulsions, disseminated intravascular coagulation, hypokalaemia; cortical proliferation of long bones and weakening of the wall of the ductus arteriosus and of pulmonary artery may follow prolonged use; gastrointestinal obstruction reported

**Dose**
- By intravenous infusion, initially 10 nanograms/kg/minute, adjusted according to response in steps of 5–10 nanograms/kg/minute, max. 100 nanograms/kg/minute (but associated with increased side-effects)
- **Note** Alprostadil doses in BNF may differ from those in product literature.

**Prostin VR** ([Pharmacia](https://www.pharmacia.com))
- **Intravenous solution**, alprostadil 500 micrograms/mL in alcohol. For dilution and use as an infusion. Net price 1-mL amp = £7.519 (hosp. only)

### Closure of ductus arteriosus

**Indometacin** (indomethacin) is used to close a patent ductus arteriosus in premature babies, probably by inhibiting prostaglandin synthesis. See BNF for Children (section 2.14) for further advice on closure of the ductus arteriosus.

### INDOMETACIN

(Indomethacin)

**Indications** patent ductus arteriosus in premature babies (under specialist supervision in neonatal intensive care unit); uncomplicated premature labour [unlicensed indication] (section 7.1.3); rheumatoid disease (section 10.1.1)

**Cautions** may mask symptoms of infection; may reduce urine output by 50% or more (monitor carefully)—see also under Anuria or Oliguria, below) and precipitate renal impairment especially if extracellular volume depleted, heart failure, sepsis, or hepatic impairment, or if receiving nephrotoxic drugs; may induce hyponatraemia; monitor renal function and electrolytes; inhibition of platelet aggregation (monitor for bleeding); interactions: Appendix 1 (NSAIDs) Anuria or oliguria If anuria or marked oliguria (urinary output less than 0.6 mL/kg/hour) at time of scheduled second or third dose, delay until renal function returns to normal

**Contra-indications** untreated infection, bleeding (especially with active intracranial haemorrhage or gastro-intestinal bleeding); thrombocytopenia, coagulation defects, necrotising enterocolitis, renal impairment
**Side-effects** haemorrhagic, renal, gastro-intestinal (including necrotising enterocolitis), metabolic, and coagulation disorders; pulmonary hypertension, intracranial bleeding, fluid retention, and exacerbation of infection

**Dose**

- **By intravenous injection**, over 20–30 minutes (using a suitable syringe driver), 3 doses at intervals of 12–24 hours (provided urine output remains adequate), **NEONATE under 48 hours**, 200 micrograms/kg then 100 micrograms/kg then 100 micrograms/kg; **NEONATE 2–7 days**, 200 micrograms/kg then 200 micrograms/kg then 200 micrograms/kg; **NEONATE over 7 days**, 200 micrograms/kg then 250 micrograms/kg then 250 micrograms/kg; solution prepared with 1–2 mL sodium chloride 0.9% or water for injections (not glucose and no preservatives)

If ductus arteriosus reopens a second course of 3 injections may be given 48 hours after first course

**Indocid PDA** (IDIS) **Injection**, powder for reconstitution, indometacin (as sodium trihydrate). Net price 3 × 1-mg vials = £43.50 (hosp. only)

### 7.1.2 Mifepristone

**Mifepristone**, an antiprogestogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix. For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]). Guidelines of the Royal College of Obstetricians and Gynaecologists (September 2004) include the following [unlicensed] regimens for inducing medical abortion:

- For gestation up to 9 weeks, mifepristone 200 mg by mouth followed 1–3 days later by misoprostol 800 micrograms vaginally; in women at more than 7 weeks gestation (49–63 days), if the abortion has not occurred 4 hours after misoprostol, a further dose of misoprostol 400 micrograms may be given vaginally or by mouth

- For gestation between 9 and 13 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally followed if necessary by a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms vaginally or by mouth

- For gestation between 15 and 24 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally then a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms by mouth

**Indications** see under dose

**Caution** asthma (avoid if severe and uncontrolled); haemorrhagic disorders and anticoagulant therapy; prosthetic heart valve or history of endocarditis (see section 5.1.2); risk factors for or existing cardiovascular disease; adrenal suppression (may require corticosteroid); **interactions**: Appendix 1 (mifepristone)

**Important** For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Gemeprost

**Contra-indications** uncontrolled severe asthma; suspected ectopic pregnancy (use other specific means of termination); chronic adrenal failure; acute porphyria (section 9.8.2); hepatic impairment; renal impairment; breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal cramps; uterine contractions, vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery); less commonly hypersensitivity reactions including rash and urticaria; rarely hypotension, malaise, headache, fever, hot flushes, dizziness, and chills; infections (including toxic shock syndrome) also reported

**Dose**

- Medical termination of intra-uterine pregnancy of up to 49 days gestation, **by mouth**, mifepristone 600 mg as a single dose under medical supervision followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg **by vagina** or misoprostol 400 micrograms **by mouth** [unlicensed]; alternative regimen, mifepristone 200 mg **by mouth** as a single dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg **by vagina**; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion (if treatment fails essential that pregnancy be terminated by another method) and to assess vaginal bleeding

- Medical termination of intra-uterine pregnancy of 50–63 days gestation, **by mouth**, mifepristone 600 mg (200 mg also effective) as a single dose under medical supervision, followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg **by vagina**; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion (if treatment fails essential that pregnancy be terminated by another method) and to assess vaginal bleeding

- Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation, **by mouth**, mifepristone 200 mg as a single dose under medical supervision 36–48 hours before procedure

- Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin), **by mouth**, mifepristone 600 mg (200 mg may be effective) as a single dose under medical supervision followed 36–48 hours later by gemeprost 1 mg **by vagina** every 3 hours up to max. 5 mg or misoprostol (see above [unlicensed]); if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg **by vagina** up to max. 5 mg (if treatment fails pregnancy should be terminated by another method); follow-up visit after appropriate interval to assess vaginal bleeding recommended

**Note** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension)

- Labour induction in fetal death **in utero** where prostaglandin or oxytocin inappropriate, **by mouth**, mifepristone 600 mg daily as a single dose for 2 days under medical supervision; if labour not started within 72 hours of first dose, another method should be used

**Mife glyne** (Exelgyn) **Tablets**, yellow, mifepristone 200 mg. Net price 3-tab pack = £41.83 (supplied to NHS hospitals and premises approved under Abortion Act 1967). Label: 10, patient information leaflet
7 Obstetrics, gynaecology, and urinary-tract disorders

7.1.3 Myometrial relaxants

Tocolytic drugs postpone premature labour and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban, is licensed for the inhibition of uncomplicated premature labour between 24 and 33 weeks of gestation. Atosiban may be preferable to a beta agonist because it has fewer side-effects.

The dihydropyridine calcium-channel blocker nifedipine (section 2.6.2) also has fewer side-effects than a beta agonist. Nifedipine [unlicensed indication] can be given initially in a dose of 20 mg followed by 10–20 mg 3–4 times daily adjusted according to uterine activity.

A beta agonist (ritodrine, salbutamol or terbutaline) is used for inhibiting uncomplicated premature labour between 24 and 33 weeks of gestation and it may permit a delay in delivery of at least 48 hours. Prolonged therapy should be avoided since risk to the mother increases after 48 hours and there is a lack of evidence of benefit from further treatment; maintenance treatment is therefore not recommended.

Indometacin (indomethacin) (section 10.1.1), a cyclooxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

**Atosiban**

**ATOSIBAN**

**Indications** uncomplicated premature labour (see notes above)

**Cautions** monitor blood loss after delivery; intra-uterine growth restriction; abnormal placental site; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

**Contra-indications** eclampsia and severe pre-eclampsia, intra-uterine infection, intra-uterine fetal death, antepartum haemorrhage (requiring immediate delivery), placenta praevia, abruptio placenta, intra-uterine growth restriction with abnormal fetal heart rate, premature rupture of membranes after 30 weeks’ gestation

**Side-effects** nausea, vomiting, tachycardia, hypotension, headache, dizziness, hot flushes, hyperglycaemia, injection-site reaction; less commonly pruritus, rash, fever, insomnia

**Dose**
- By intravenous injection, initially 6.75 mg over 1 minute, then by intravenous infusion 18 mg/hour for 3 hours, then 6 mg/hour for up to 45 hours; max. duration of treatment 48 hours

**Tractocile® (Ferring)**

**Injection**, atosiban (as acetate) 7.5 mg/mL, net price 0.9-mL (6.75-mg) vial = £18.60

**Concentrate for intravenous infusion**, atosiban (as acetate) 7.5 mg/mL, net price 5-mL vial = £53.35

**Beta, agonists**

**Cautions** Beta agonists should be used with caution in patients with suspected cardiovascular disease (such patients should be assessed by a cardiologist before initiating therapy—see also Contra-indications, below), hypertension, mild to moderate pre-eclampsia, hyperthyroidism, and hypokalaemia (particular risk with potassium-depleting diuretics—see also CSM advice, p. 153). It is important to monitor pulse rate (should not exceed 140 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), and the patient’s fluid and electrolyte status (avoid overhydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs). Beta agonists should also be used with caution in diabetes—monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially with intravenous beta agonists).

**Contra-indications** Beta agonists are contra-indicated in cardiac disease and in patients with significant risk factors for myocardial ischaemia; they should also be avoided in antepartum haemorrhage, intra-uterine infection, intra-uterine fetal death, placenta praevia, abruptio placenta, threatened miscarriage, cord compression, and eclampsia or severe pre-eclampsia.

**Side-effects** Side-effects of the beta agonists include nausea, vomiting, pulmonary oedema (see Cautions above and under Ritodrine dose), palpitation, tachycardia, arrhythmias, myocardial ischaemia, peripheral vasodilation, headache, tremor, hyperglycaemia, hypokalaemia (see Cautions), muscle cramps and tension, and hypersensitivity reactions (including angioedema, urticaria, rash, bronchospasm, hypotension, and collapse).

**RITODRINE HYDROCHLORIDE**

**Indications** uncomplicated premature labour (see notes above)

**Cautions** see notes above; **interactions**: Appendix 1 (sympathomimetics and sympathomimetics, beta )

**Contra-indications** see notes above

**Side-effects** see notes above; also reported flushing, sweating; salivary gland enlargement; leucopenia and agranulocytosis on prolonged administration (several weeks); liver function abnormalities (including increased transaminases and hepatitis)

**Dose**
- By intravenous infusion (important: minimum fluid volume, see below), initially 50 micrograms/minute, increased gradually according to response by 50 micrograms/minute every 10 minutes until contractions stop or maternal heart rate reaches 140 beats per minute; continue for 12–48 hours after contractions cease (usual rate 150–350 micrograms/minute); max. rate 350 micrograms/minute; or by intramuscular injection, 10 mg every 3–8 hours continued for 12–48 hours after contractions
by intravenous infusion  

**Dose**  
see notes above; also reported sleep disturbances and behavioural disturbances  

**Side-effects**  
see notes above  

**Contra-indications**  
see notes above; see also Oestrogens for HRT (section 6.4.1.1); pregnancy and breastfeeding  

**Cautions**  
complicated premature labour (see Indications).  

**Interactions:** Venusam (Alphapharm)  
10 mg, net price 90-tab pack = £30.40  

**Injection**, ritodrine hydrochloride 10 mg/mL, net price 5-mL amp = £3.55  

**SALBUTAMOL**  
(Albuterol)  

**Indications**  
uncomplicated premature labour (see notes above); asthma (section 3.1.1)  

**Cautions**  
see notes above; interactions: Appendix 1 (sympathomimetics, beta)  

**Contra-indications**  
see notes above  

**Side-effects**  
see notes above  

**Dose**  
- By intravenous infusion, initially 10 micrograms/minute, increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (max. rate 45 micrograms/minute); maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours; then by mouth (but see notes above), 4 mg every 6–8 hours  

**Preparations**  
Section 3.1.1.1  

**TERBUTALINE SULPHATE**  

**Indications**  
uncomplicated premature labour (see notes above); asthma (section 3.1.1)  

**Cautions**  
see notes above; interactions: Appendix 1 (sympathomimetics, beta)  

**Contra-indications**  
see notes above  

**Side-effects**  
see notes above; also reported sleep disturbances and behavioural disturbances  

**Dose**  
- By intravenous infusion, 5 micrograms/minute for 20 minutes, increased every 20 minutes in steps of 2.5 micrograms/minute until contractions have ceased (more than 10 micrograms/minute should seldom be given—20 micrograms/minute should not be exceeded), continue for 1 hour then decrease every 20 minutes in steps of 2.5 micrograms/minute to lowest dose that maintains suppression, continue at this level for 12 hours then by mouth (but see notes above), 5 mg every 8 hours for as long as is desirable to prolong pregnancy (or alternatively follow the intravenous infusion by subcutaneous injection) 250 micrograms every 6 hours for a few days then by mouth (as above)  

**Preparations**  
Section 3.1.1.1  

**OESTROGENS, TOPICAL**  

**Indications**  
see notes above  

**Cautions**  
see notes above; see also Oestrogens for HRT (section 6.4.1.1); interrupt treatment periodically to assess need for continued treatment  

**Contra-indications**  
see notes above; see also Oestrogens for HRT (section 6.4.1.1); pregnancy and breastfeeding  

**Side-effects**  
see notes above; see also Oestrogens for HRT (section 6.4.1.1); local irritation
Ortho-Gynest® (Janssen-Cilag) (Fr)

Intravaginal cream, estradiol 0.01%. Net price 80 g with applicator = £2.53
Excipients include arachis (peanut) oil
Condoms damages latex condoms and diaphragms
Dose insert 1 applicatorful daily, preferably in evening; reduced to 1 applicatorful twice a week; attempts to reduce or discontinue should be made at 3–6 month intervals with re-examination

Vaginal candidiasis almost invariably associated with vaginal infection
Candidal vulvitis
Fungal infections

Non-hormonal preparations for vaginal atrophy
Replens MD® and Sylik® are acidic, non-hormonal vaginal moisturisers; Replens MD® provides a high moisture content for up to 3 days.

Oral treatment of vaginal infection with oral fluconazole or itraconazole (section 5.2) is also effective; oral ketoconazole has been associated with fatal hepatotoxicity (see section 5.2 for CSM warning).

Vulvovaginal candidiasis in pregnancy Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus and possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of re-infection and, if symptomatic, should be treated with cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis. Some recommended regimens [all unlicensed] include:
- fluconazole (section 5.2) by mouth 100 mg (as a single dose) every week for 6 months
- clotrimazole vaginally 500-mg pessary (as a single dose) every week for 6 months
- itraconazole (section 5.2) by mouth 400 mg (as 2 divided doses on one day) every month for 6 months.
7.2.2 Vaginal and vulval infections

**Thrush Cream** (topical), clotrimazole 2%, net price 20 g = £3.99

- **Exipients** include benzyl alcohol, ceteareth 20, polysorbates
- **Condoms** damages latex condoms and diaphragms
- **Dose** apply to anogenital area 2–3 times daily

**Vaginal cream (10% VC®)** (Pharm), clotrimazole 10%. Net price 5-g applicator pack = £5.62

- **Exipients** include benzyl alcohol, ceteareth 20, polysorbates
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 5 g at night as a single dose; can be repeated once if necessary

**Note** Brands for sale to the public include Canesten Internal Cream

**Cream Combi**, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) and 10-g topical cream = £5.76

- **Exipients** include benzyl alcohol, ceteareth 20, polysorbates
- **Condoms** damages latex condoms and diaphragms
- **Dose** see under individual components

**Pessaries**, clotrimazole 100 mg, net price 6 pessaries with applicator = £3.63; 200 mg, 3 pessaries with applicator = £3.63

- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 200 mg for 3 nights or 100 mg for 6 nights; course can be repeated once if necessary

**Pessary**, clotrimazole 500 mg. Net price 1 with applicator = £3.25

- **Exipients** none as listed in section 13.1.3
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 1 pessary at night as a single dose; can be repeated once if necessary

**Combi**, clotrimazole 500-mg pessary and cream (topical) 2%. Net price 1 pessary and 10-g cream = £5.21

- **Condoms** damages latex condoms and diaphragms
- **Dose** see under individual components

**Ecostatin®** (Squibb)

- **Cream** (topical), econazole nitrate 1%. Net price 15 g = £1.49; 30 g = £2.75
- **Exipients** include butylated hydroxyanisole, fragrance
- **Condoms** damages latex condoms and diaphragms
- **Dose** apply to anogenital area twice daily

**Pessaries** (Pharm), econazole nitrate 150 mg. Net price 3 with applicator = £3.35

- **Exipients** none as listed in section 13.1.3
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 1 pessary for 3 nights; course can be repeated once if necessary

**Pessary (Ecostatin-1®)** (Pharm), econazole nitrate 150 mg, formulated for single-dose therapy. Net price 1 pessary with applicator = £3.35

- **Exipients** none as listed in section 13.1.3
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 1 pessary at night as a single dose; can be repeated once if necessary

**Twinpack** (Pharm), econazole nitrate 150-mg pessaries and cream 1%. Net price 3 pessaries and 15-g cream = £4.35

- **Condoms** damages latex condoms and diaphragms
- **Dose** see under individual components

**Gyno-Daktarin®** (Janssen-Cilag) (Pharm)

- **Intravaginal cream**, miconazole nitrate 2%. Net price 78 g with applicators = £4.60
- **Exipients** include butylated hydroxyanisole
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 5-g applicatorful once daily for 10–14 days or twice daily for 7 days; course can be repeated once if necessary; topical, apply to anogenital area twice daily

**Ovule (= vaginal capsule)** (Gyno-Daktarin 1®), miconazole nitrate 1.2 g in a fatty basis. Net price 1 ovule = £3.12

- **Exipients** include hydroxybenzazides (parabens)
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 1 ovule at night as a single dose; can be repeated once if necessary

**Gyno-Pevaryl®** (Janssen-Cilag) (Pharm)

- **Cream**, econazole nitrate 1%. Net price 15 g = £1.40; 30 g = £3.21
- **Exipients** none as listed in section 13.1.3
- **Condoms** damages latex condoms and diaphragms
- **Dose** insert 5-g applicatorful intravaginally and apply to vulva at night for at least 14 nights; course can be repeated once if necessary

**Pessaries**, econazole nitrate 150 mg. Net price 3 pessaries = £2.95

- **Exipients** none as listed in section 13.1.3
- **Condoms** damages latex condoms and diaphragms
- **Dose** ADULT and ADOLESCENT over 16 years, insert 1 pessary for 3 nights; course can be repeated once if necessary

**Pessary (Gyno-Pevaryl®)**, econazole nitrate 150 mg, formulated for single-dose therapy. Net price 1 pessary with applicator = £3.13

- **Exipients** none as listed in section 13.1.3
- **Condoms** damages latex condoms and diaphragms
- **Dose** ADULT and ADOLESCENT over 16 years, insert 1 pessary at night as a single dose; can be repeated once if necessary

**Nizoral®** (Janssen-Cilag) (Pharm)

- **Cream** (topical), ketoconazole 2%. Net price 30 g = £3.54
- **Exipients** include polysorbates, propylene glycol, stearyl alcohol
- **Condoms** effect on latex condoms and diaphragms not yet known
- **Dose** apply to anogenital area once or twice daily

**Other infections**

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

**Trichomonal infections** commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole or tinidazole (section 5.1.11). **Bacterial infections** with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream and metronidazole gel are indicated for bacterial vaginosis. The antiviral drugs aciclovir, foscarnet, and valaciclovir can be used in the treatment of genital infection due to *herpes simplex* virus, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms. See section 5.3.2.1 for systemic preparations, and section 13.10.3 for topical preparations.

**PREPARATIONS FOR OTHER VAGINAL INFECTIONS**

**Dalacin®** (Pharmacia) (Pharm)

- **Cream**, clindamycin 2% (as phosphate). Net price 40-g pack with 7 applicators = £10.86
- **Exipients** include benzy alcohol, ceteareth 20, polysorbates, propylene glycol
- **Condoms** damages latex condoms and diaphragms
Obstetrics, gynaecology, and urinary-tract disorders

1. See Department of Health Guidance (July 2004): Best of combined oral contraceptives include: most effective preparations for general use. Advantages progestogen ('combined oral contraceptives') are the Oral contraceptives containing an oestrogen and a progestogen in each active tablet are termed ‘monophasic’; those with varying amounts of the two hormones according to the stage of the cycle are termed ‘biphasic’ and ‘triphasic’. A transdermal patch containing an oestrogen with a progestogen is also available.

Choice The oestrogen content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen.

- **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable. It is recommended that the combined oral contraceptive is not continued beyond 50 years of age since more suitable alternatives exist.
- **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phased preparations) are appropriate for standard use—but see Risk of Venous Thromboembolism below. Phased preparations are generally reserved for women who **either** do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens desogestrel, drospirenone, and gestodene (in combination with ethinylestradiol) may be considered for women who have side-effects (such as acne, headache, depression, weight gain, breast symptoms, and breakthrough bleeding) with other progestogens. However, women should be advised that desogestrel and gestodene have also been associated with an increased risk of **venous thromboembolism**. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous. The progestogen nor-eldigestrom is combined with ethinylestradiol in a transdermal patch.

**Risk of venous thromboembolism** There is an increased risk of venous thromboembolic disease (particularly during the first year) in users of oral contraceptives but this risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors for venous thromboembolism (e.g. obesity). The incidence of venous thromboembolism in healthy, non-pregnant women who are not taking an oral contraceptive is about 5–10 cases per 100 000 women per year. For those using combined oral contraceptives containing second-generation progestogens, e.g. levonorgestrel, this incidence is about 15 per 100 000 women per year of use. The risk of venous thromboembolism with transdermal patches may be slightly increased compared with combined oral contraceptives that contain levonorgestrel. Some studies have reported a greater risk of venous thromboembolism in women using combined oral contraceptives containing the third-generation progestogens desogestrel and gestodene; the incidence in these women is about 25 per

---

Side-effects Irritation, cervicitis and vaginitis; poorly absorbed into the blood—very low likelihood of systemic effects (section 5.1.6).

Dose Bacterial vaginosis, insert 5-g applicatorful at night for 3–7 nights.

**Zidoval** (3M) (see section 5.1.11 for systemic effects)

**Vaginal gel**, metronidazole 0.75%. Net price 40-g pack with 5 applicators = £4.31.

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol.

Cautions Not recommended during menstruation; some absorption may occur, see section 5.1.11 for systemic effects.

Side-effects Local effects including irritation, candidiasis, abnormal discharge, pelvic discomfort.

Dose Bacterial vaginosis, insert 5-g applicatorful at night for 5 nights.

---

**7.3 Contraceptives**

| 7.3.1 Combined hormonal contraceptives |
| 7.3.2 Progestogen-only contraceptives |
| 7.3.3 Spermicidal contraceptives |
| 7.3.4 Contraceptive devices |
| 7.3.5 Emergency contraception |

The Fraser Guidelines should be followed when prescribing contraception for women under 16 years.

**Hormonal contraception** is the most effective method of fertility control, but has major and minor side-effects, especially for certain groups of women.

**Intra-uterine devices** are a highly effective method of contraception but may produce undesirable local side-effects. They are most suitable for older parous women, but less appropriate for younger nulliparous women and for those with an increased risk of pelvic inflammatory disease.

**Barrier methods** alone (condoms, diaphragms, and caps) are less effective but can be very reliable for well-motivated couples if used in conjunction with a spermicide. Occasionally sensitivity reactions occur. A female condom (Femidom®) is also available; it is prelubricated but does not contain a spermicide.

**7.3.1 Combined hormonal contraceptives**

Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are the most effective preparations for general use. Advantages of combined oral contraceptives include:

- Reliable and reversible;
- Reduced dysmenorrhea and menorrhagia;
- Reduced incidence of menopausal tension;
- Less symptomatic fibroids and functional ovarian cysts;
- Less benign breast disease;
- Reduced risk of ovarian and endometrial cancer;
- Reduced risk of pelvic inflammatory disease, which may be a risk with intra-uterine devices.

---

1. See Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health. Available at www.dh.gov.uk
100 000 women per year of use. The absolute risk of venous thromboembolism in women using combined oral contraceptives containing these third-generation progestogens is very small and well below the risk associated with pregnancy. The incidence of venous thromboembolism in women using a combined oral contraceptive containing drospirenone is in the same range as that for users of combined oral contraceptives containing other progestogens, including levonorgestrel.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Travel

Women taking oral contraceptives, or using the patch, are at an increased risk of deep-vein thrombosis during travel involving long periods of immobility (over 5 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Missed pill

The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets).

Emergency contraception (section 7.3.5) is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Note

The Faculty of Sexual and Reproductive Healthcare offers 2 different types of missed pill advice depending on the ethinylestradiol content of the contraceptive pill. The missed pill information above offers the same advice regardless of the ethinylestradiol content of the contraceptive pill; it is a simplified, more cautious version of advice issued by The Faculty of Sexual and Reproductive Healthcare.

Delayed application or detached patch

If a patch is partly detached for less than 24 hours, reap ply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual change day. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If intercourse has occurred during this extended patch-free interval, a possibility of fertilisation should be considered. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch change day remains the same and no additional contraception is required.
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual ‘change day’, after day 28; no additional contraception is required.

Diarrhoea and vomiting

Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery (see also under Missed pill, above). If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Interactions

The effectiveness of both combined and progestogen-only oral contraceptives can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine, griseofulvin, modafinil, nelfinavir, nevirapine, oxcarbazepine, phenytoin, phenobarbital, primidone, ritonavir, St John’s Wort, topiramate, and, above all, rifabutin and rifampicin). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

For a short course of an enzyme-inducing drug, the dose of combined oral contraceptives should be adjusted to provide ethinylestradiol 50 micrograms or more daily [unlicensed use]; furthermore, additional contraceptive precautions should be taken whilst taking the enzyme-inducing drug and for 4 weeks after stopping it.

Women requiring a long-term course of an enzyme-inducing drug should be encouraged to consider a contraceptive method that is unaffected by the interacting drug. In women unable to use an alternative method of contraception (for rifampicin and rifabutin see also below), a regimen of combined oral contraceptives should be taken which provides a daily intake of ethinylestradiol 50 micrograms or more [unlicensed use]; ‘tricycling’ (i.e. taking 3 or 4 packets of monophasic tablets without a break followed by a short tablet-free interval of 4 days) is recommended (but women should...
be warned of uncertainty about the effectiveness of this regimen. Rifampicin and rifabutin are such potent enzyme-inducing drugs that an alternative method of contraception (such as an IUD) is always recommended. Since enzyme activity does not return to normal for several weeks after stopping an enzyme-inducing drug, appropriate contraceptive measures are required for 4 to 8 weeks after stopping.

The effectiveness of contraceptive patches can also be reduced by drugs that induce hepatic enzyme activity. Additional contraceptive precautions are required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch treatment, a new treatment cycle should be started immediately without a patch-free break. For women taking enzyme-inducing drugs over a long period, another method of contraception should be considered.

Some antibacterials that do not induce liver enzymes (e.g. amoxicillin, doxycycline) may reduce the efficacy of combined oral contraceptives by impairing the bacterial flora responsible for recycling ethinylenestradiol from the large bowel. Additional contraceptive precautions should be taken whilst taking a short course of an antibacterial drug that is not enzyme-inducing and for 7 days after stopping. If these 7 days run beyond the end of a packet the next packet should be started immediately without a break (in the case of ED tablets the inactive ones should be omitted). If the antibacterial course exceeds 3 weeks, the bacterial flora develop antibacterial resistance and additional precautions become unnecessary unless a new antibacterial is prescribed; additional precautions are also unnecessary if a woman starting a combined oral contraceptive has been on a course of antibacterial therapy for 3 weeks or more.

It is possible that some antibacterials affect the efficacy of contraceptive patches. Additional contraceptive precautions are recommended during concomitant use and for 7 days after discontinuation of an antibacterial that is not enzyme-inducing (except tetracycline). If concomitant administration runs beyond the 3 weeks of patch treatment, a new treatment cycle should be started immediately without a patch-free break. If the antibacterial course exceeds 3 weeks, additional precautions become unnecessary unless a new antibacterial is prescribed; additional precautions are also unnecessary if a woman starting a contraceptive patch has been on a course of antibacterial therapy for 3 weeks or more.

**Surgery** Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A depot injection of a progestogen-only contraceptive may be offered and the oestrogen-containing contraceptive restarted later—if preferred before the next injection would be due. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives (whether by mouth or by injection).

**Reason to stop immediately** Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occurs:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment (see Cautions and Contra-indications under Combined Hormonal Contraceptives below or under Oestrogens for HRT (section 6.4.1.1)).

**COMBINED HORMONAL CONTRACEPTIVES**

**Indications** contraception; menstrual symptoms (section 6.4.1.2)

**Contra-indications**

- Use with caution if any of the following factors present but avoid if two or more factors present:
  - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - obesity—body mass index above 30 kg/m² (avoid if body mass index above 30 kg/m²);
  - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
  - history of superficial thrombophlebitis;
  - age over 35 years (avoid if over 50 years);
  - smoking.

**Risk factors for venous thromboembolism** See also notes above. Use with caution if any of the following factors present but avoid if two or more factors present:

- family history of venous thromboembolism in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- obesity—body mass index above 30 kg/m² (avoid if body mass index above 30 kg/m²);
- long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- history of superficial thrombophlebitis;
- age over 35 years (avoid if over 50 years);
- smoking.

**Risk factors for arterial disease** Use with caution if any of the following factors present but avoid if two or more factors present:

- family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- diabetes mellitus (avoid if diabetes complications present);
- hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg).
• smoking (avoid if smoking 40 or more cigarettes daily);
• age over 35 years (avoid if over 50 years);
• obesity (avoid if body mass index above 39 kg/m);
• migraine—see below.

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour—see also Reason to stop immediately in notes above); contra-indicated in
• migraine with typical focal aura,
• severe migraine regularly lasting over 72 hours despite treatment,
• migraine treated with ergot derivatives; use with caution in
• migraine without focal aura,
• migraine controlled with SHT agonist (section 4.7.4.1).

Contra-indications see notes above; also pregnancy (Appendix 4); personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus; sclerosing treatment for varicose veins; migraine (but see above); transient cerebral ischaemic attacks without headaches; liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal); systemic lupus erythematosus; acute porphyria (section 9.8.2), liver tumour; gallstones; active trophoblastic disease (until return to normal of urine and plasma gonadotrophin concentration); history of haemolytic uraemic syndrome or history during pregnancy of pruritus, cholestasis jaundice, oedema, pemphigoid gestations; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding; breast-feeding (until weaning or for 6 months after birth—Appendix 5)

Side-effects see notes above; also nausea, vomiting, abdominal cramps, changes in body-weight, liver impairment, hepatic tumours; fluid retention, thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB; see also notes above), hypertension, changes in lipid metabolism; headache, depression, oedema, nervousness, irritability; changes in libido, breast tenderness, enlargement, and secretion; reduced menstrual loss, ‘spotting’ in early cycles, absence of withdrawal bleeding, amenorrhoea after discontinuation, changes in vaginal discharge, cervical erosion, contact lenses may irritate, visual disturbances; leg cramps; skin reactions, chloasma, photosensitivity; rarely gallstones and systemic lupus erythematosus

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The risk of cervical cancer with transdermal patches is not yet known.

Note The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium

Dose
• By mouth, each tablet should be taken at approximately same time each day; if delayed by longer than 24 hours contraceptive protection may be lost
• 21-day combined (monophasic) preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); first course usually started on day 1 of cycle—if starting on day 4 of cycle or later additional precautions (barrier methods) necessary during first 7 days

Every day (ED) combined (monophasic) preparations, 1 active tablet starting on day 1 of cycle (see also under preparations below)—if starting on day 4 of cycle or later additional precautions (barrier methods) necessary during first 7 days; withdrawal bleeding occurs when inactive tablets being taken; subsequent courses repeated without interval

Biphasic and triphasic preparations, see under individual preparations below

Changing to combined preparation containing different phases 21-day combined preparations: continue current pack until last tablet and start first tablet of new brand the next day. If a 7-day break is taken before starting new brand, additional precautions (barrier methods) should be used during first 7 days of taking the new brand.

Every Day (ED) combined preparations: start the new brand (first tablet of a 21-day preparation or the first active tablet of an ED preparation) the day after taking the last active tablet of previous brand (omitting the inactive tablets).

Changing from progestogen-only tablet Start on day 1 of menstruation or any day if amenorrhoea present and pregnancy has been excluded.

Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days.

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days.

Not recommended if woman breast-feeding—oral progestogen-only contraceptive preferred.

After abortion or miscarriage Start same day.

• By transdermal application, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle.

Note If first patch applied later than day 1, additional precaution (abstinence or barrier methods) should be used for the next 7 days

Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days

Changing from progestogen-only method From an implant, apply first patch on the day implant removed; from an injection, apply first patch when next injection due; from oral progestogen, first patch may be started on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days

After abortion or miscarriage Before 20 weeks’ gestation—oral progestogen-only contraceptive preferred. After 20 weeks’ gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch
### Low strength (oral)

**Ethinylestradiol with Norethisterone**

*Loestrin 20° (Galén)*

- **Tablets**, blue, norethisterone acetate 1 mg, ethinylestradiol 20 micrograms. Net price 3 × 21-tab pack = £7.20
- **Dose** 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Ethinylestradiol with Desogestrel**

- **See Risk of Venous Thromboembolism in notes above before prescribing**

*Mericon° (Organon)*

- **Tablets**, desogestrel 150 micrograms, ethinylestradiol 20 micrograms. Net price 3 × 21-tab pack = £7.97
- **Dose** 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Ethinylestradiol with Drospirenone**

*Yaz° (Bayer)*

- **Tablets**, 1/5 c, pink, drospirenone 3 mg, ethinylestradiol 20 micrograms, white inactive tablets. Net price 3 × 28-tab (4 are inactive) pack = £19.80
- **Cautions** use with care if increased plasma-potassium concentration might be hazardous; renal impairment (Appendix 3)
- **Dose** 1 tablet daily for 28 days starting on day 1 of cycle with active tablet (withdrawal bleeding begins when inactive tablets being taken), subsequent courses repeated without interval; for starting routines see also under Dose above

**Ethinylestradiol with Gestodene**

- **See Risk of Venous Thromboembolism in notes above before prescribing**

*Femodette° (Schering Health)*

- **Tablets**, s/c, gestodene 75 micrograms, ethinylestradiol 20 micrograms, net price 3 × 21-tab pack = £9.45
- **Dose** 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

*Sunya 20/75° (Stragen)*

- **Tablets**, s/c, gestodene 75 micrograms, ethinylestradiol 20 micrograms, net price 3 × 21-tab pack = £6.62
- **Dose** 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Low strength (transdermal)**

**Ethinylestradiol with Norelgestromin**

*Eva° (Janssen-Cilag)*

- **Patches**, self-adhesive (releasing ethinylestradiol approx. 20 micrograms/24 hours and norelgestromin approx. 150 micrograms/24 hours); net price 9-patch pack = £16.26. Counselling, administration
- **Dose** 1 patch to be applied once weekly for three weeks, followed by a 7-day patch-free interval; subsequent courses repeated after 7-day patch-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above
- **Note** Adhesives or bandages should not be used to hold patch in place. If patch no longer sticky do not reapply but use a new patch.

*The Scottish Medicines Consortium has advised (September 2003) that Eva patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives*

**Standard strength**

**Ethinylestradiol with Levonorgestrel**

*Logynon° (Schering Health)*

- **6 light brown tablets**, ethinylestradiol 30 micrograms, levonorgestrel 50 micrograms;
- **5 white tablets**, ethinylestradiol 40 micrograms, levonorgestrel 75 micrograms;
- **10 ochre tablets**, ethinylestradiol 30 micrograms, levonorgestrel 125 micrograms.
- **Net price** 3 × 21-tab pack = £4.12
- **Dose** 1 tablet daily for 21 days, starting with light brown tablet marked 1 on day 1 of cycle; repeat after 7-day tablet-free interval

*Logynon ED° (Schering Health)*

- **6 light brown tablets**, ethinylestradiol 30 micrograms, levonorgestrel 50 micrograms;
- **5 white tablets**, ethinylestradiol 40 micrograms, levonorgestrel 75 micrograms;
- **10 ochre tablets**, ethinylestradiol 30 micrograms, levonorgestrel 125 micrograms;
- **7 white, inactive tablets**.
- **Net price** 3 × 28-tab pack = £4.12
- **Dose** 1 tablet daily for 28 days, starting on day 1 of cycle with active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval, for starting routines see under Dose above

*Microgynon 30° (Schering Health)*

- **Tablets**, s/c, levonorgestrel 150 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £2.99
- **Dose** 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

*Microgynon 30 ED° (Schering Health)*

- **Tablets**, beige, levonorgestrel 150 micrograms, ethinylestradiol 30 micrograms, white inactive tablets. Net price 3 × 28-tab (7 are inactive) pack = £2.69
- **Dose** 1 tablet daily for 28 days starting on day 1 of cycle with active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval, for starting routines see also under Dose above

*Ovranette° (Wyeth)*

- **Tablets**, levonorgestrel 150 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £2.29
- **Dose** 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

**Ethinylestradiol with Norethisterone**

*BiNovum° (Janssen-Cilag)*

- **7 white tablets**, ethinylestradiol 35 micrograms, norethisterone 500 micrograms;
- **14 peach tablets**, ethinylestradiol 35 micrograms, norethisterone 1mg.
- **Net price** 3 × 21-tab pack = £2.08
- **Dose** 1 tablet daily for 21 days, starting with white tablet on day 1 of cycle; repeat after 7-day tablet-free interval

*Brevino° (Pharmacia)*

- **Dose** 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above
7.3.2 Progestogen-only contraceptives

Loestrin 30® (Galén) (FW)
Tablets, pale green, norethisterone acetate 1.5 mg, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £3.90
Dose 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Norimin® (Pharmacia) (FW)
Tablets, norethisterone 1 mg, ethinylestradiol 35 micrograms. Net price 3 × 21-tab pack = £2.28
Dose 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Ovysmen® (Janssen-Cilag) (FW)
Tablets, norethisterone 500 micrograms, ethinylestradiol 35 micrograms. Net price 3 × 21-tab pack = £1.58
Dose 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Synphase® (Pharmacia) (FW)
7 blue tablets, ethinylestradiol 35 micrograms, norethisterone 500 micrograms;
9 white tablets, ethinylestradiol 35 micrograms, norethisterone 1 mg;
5 blue tablets, ethinylestradiol 35 micrograms, norethisterone 500 micrograms.
Net price 21-tab pack = £1.20
Dose 1 tablet daily for 21 days, starting with blue tablet marked 1 on day 1 of cycle; repeat after 7-day tablet-free interval

TriNovum® (Janssen-Cilag) (FW)
7 white tablets, ethinylestradiol 35 micrograms, norethisterone 500 micrograms;
7 light peach tablets, ethinylestradiol 35 micrograms, norethisterone 750 micrograms;
7 peach tablets, ethinylestradiol 35 micrograms, norethisterone 1 mg.
Net price 3 × 21-tab pack = £2.89
Dose 1 tablet daily for 21 days, starting with white tablet on day 1 of cycle; repeat after 7-day tablet-free interval

Ethinylestradiol with Norgestimate
Cilest® (Janssen-Cilag) (FW)
Tablets, blue, norgestimate 250 micrograms, ethinylestradiol 35 micrograms. Net price 3 × 21-tab pack = £5.97, 6 × 21-tab pack = £11.94
Dose 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Ethinylestradiol with Desogestrel
See Risk of Venous Thromboembolism in notes above before prescribing

Marvelon® (Organon) (FW)
Tablets, desogestrel 150 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £6.70
Dose 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Ethinylestradiol with Drospirenone
Yasmin® (Bayer) (FW)
Tablets, f/c, yellow, drospirenone 3 mg, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £14.70

Caution use with care if increased plasma-potassium concentration might be hazardous; renal impairment (Appendix 3)
Dose 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Note The Scottish Medicines Consortium has advised (March 2003) that Yasmin is not recommended

Ethinylestradiol with Gestodene
See Risk of Venous Thromboembolism in notes above before prescribing

Femodone® (Schering Health) (FW)
Tablets, s/c, gestodene 75 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £7.18
Dose 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Femodone® ED (Schering Health) (FW)
Tablets, s/c, gestodene 75 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 28-tab (7 are inactive) pack = £7.18
Dose 1 tablet daily for 28 days, starting on day 1 of cycle with active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting routines see under Dose above

Katya 30/75® (Stragen) (FW)
Tablets, s/c, gestodene 75 micrograms, ethinylestradiol 30 micrograms. Net price 3 × 21-tab pack = £5.03
Dose 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Triadene® (Schering Health) (FW)
6 beige tablets, ethinylestradiol 30 micrograms, gestodene 50 micrograms;
5 dark brown tablets, ethinylestradiol 40 micrograms, gestodene 70 micrograms;
10 white tablets, ethinylestradiol 30 micrograms, gestodene 100 micrograms.
Net price 3 × 21-tab pack = £9.54
Dose 1 tablet daily for 21 days, starting with beige tablet marked ‘start’ on day 1 of cycle; repeat after 7-day tablet-free interval

Mestranol with Norethisterone
Norinyl®-1 (Pharmacia) (FW)
Tablets, norethisterone 1 mg, mestranol 50 micrograms. Net price 3 × 21-tab pack = £2.19
Dose 1 tablet daily for 21 days; subsequent courses repeated after 7-day tablet-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Ethinylestradiol with cyproterone acetate
See Co-cyprindiol (section 13.6.2)
past history or predisposition to venous thrombosis), but have a higher failure rate than combined preparations. They are suitable for older women, for heavy smokers, and for those with hypertension, valvular heart disease, diabetes mellitus, and migraine. Menstrual irregularities (oligomenorrhoea, menorrhagia) are more common but tend to resolve on long-term treatment.

**Interactions** Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an additional or alternative contraceptive method is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards—see p. 439 and Appendix 1 (progestogens).

**Surgery** All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined oral contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

**Starting routine** One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

**Changing from a combined oral contraceptive** Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

**After childbirth** Start any time after 3 weeks postpartum (increased risk of breakthrough bleeding if started earlier)—lactation is not affected.

**Missed pill** The following advice is now recommended by family planning organisations: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours (12 hours for Cerazette®) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception (see p. 448) if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for Cerazette®) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

**Diarrhoea and vomiting** Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours (12 hours for Cerazette®) of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery (see also under Missed pill above).

---

**ORAL PROGESTOGEN-ONLY CONTRACEPTIVES**

*(Progestogen-only pill, ‘POP’)*

**Indications** contraception

**Cautions** arterial disease; sex-steroid dependent cancer; past ectopic pregnancy; malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration); functional ovarian cysts; active liver disease; recurrent cholestatic jaundice; history of jaundice in pregnancy; interactions: see notes above and Appendix 1 (progestogens)

**Other conditions** The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory

**Contra-indications** pregnancy; undiagnosed vaginal bleeding; severe arterial disease; liver tumour; acute porphyria (section 9.8.2); history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

**Side-effects** menstrual irregularities (see also notes above); nausea, vomiting, headache, dizziness, breast discomfort, depression, skin disorders, disturbance of appetite, weight changes, changes in libido

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. The CSM has advised that a possible small increase in the risk of breast cancer should be weighed against the benefits

**Dose**

- 1 tablet daily at same time each day, starting on day 1 of cycle then continuously; if administration delayed for 3 hours (12 hours for Cerazette®) or more it should be regarded as a ‘missed pill’, see notes above

**Cerazette®** *(Pharmacia)*

- Tablets, 1/c, desogestrel 75 micrograms. Net price 3 × 28-tab pack = £8.85
- The Scottish Medicines Consortium has advised (September 2003) that Cerazette® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom these preparations are contra-indicated

**Femulen®** *(Pharmacia)*

- Tablets, etynodiol diacetate 500 micrograms. Net price 3 × 28-tab pack = £3.31

**Micronor®** *(Janssen-Cilag)*

- Tablets, norethisterone 350 micrograms. Net price 3 × 28-tab pack = £1.76

**Noriday®** *(Pharmacia)*

- Tablets, norethisterone 350 micrograms. Net price 3 × 28-tab pack = £2.10

---

**7.3.2.2 Parenteral progestogen-only contraceptives**

Medroxyprogesterone acetate *(Depo-Provera®)* is a long-acting progestogen given by intramuscular injection; it is as effective as the combined oral preparations
but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Heavy bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium (the first dose is best delayed until 6 weeks after birth). If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of heavy or prolonged bleeding may be increased).

Reduction in bone mineral density and, rarely, osteoporosis and osteoporotic fractures have also been reported with medroxyprogesterone acetate. The reduction in bone mineral density occurs in the first 2–3 years of use and then stabilises. See also CSM advice below.

**CSM advice**

The CSM has advised that:

- in adolescents, medroxyprogesterone acetate (Depo-Provera®) be used only when other methods of contraception are inappropriate;
- in all women, benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against risks;
- in women with risk factors for osteoporosis a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An etonogestrel-releasing implant (Implanon®), consisting of a single flexible rod, is also available; the rod is inserted subdermally into the lower surface of the upper arm and it provides effective contraception for up to 3 years. The manufacturer advises that in heavier women, blood etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement should be considered in such patients—however evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of Implanon® is rapidly reversed on removal of the implant. The doctor or nurse administering (or removing) the implant should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

The cautions, contra-indications, and side-effects of oral progestogen-only contraceptives apply to parenteral progestogen-only contraceptives, except that parenteral preparations reliably inhibit ovulation and therefore protect against ectopic pregnancy and functional ovarian cysts.

**Interactions**

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. However, effectiveness of norethisterone and etonogestrel (but not medroxyprogesterone acetate) may be reduced by enzyme-inducing drugs; additional contraceptive precautions should be taken whilst taking the enzyme-inducing drug and for 4 weeks after stopping it or an alternative contraceptive method should be considered if long-term use of the enzyme-inducing drug is contemplated.

**Parentreral Progestogen-Only Contraceptives**

**Indications**

Contraception, see also notes above and under preparations (roles vary according to preparations)

**Cautions**

see notes above and under preparations; possible risk of breast cancer, see oral progestogen-only contraceptives (section 7.3.2.1); history during pregnancy of pruritus or of deterioration of osteoporosis, disturbances of lipid metabolism; interactions: see notes above and Appendix 1 (progestogens)

**Counselling**

Full counselling backed by patient information leaflet required before administration

**Contra-indications**

see notes above; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

**Side-effects**

see notes above; injection-site reactions

**Cervical cancer**

Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives, see p. 440. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

**Dose**

- See under preparations

### Injectable preparations

**Depo-Provera®** *(Pfizer)*

**Injection** (aqueous suspension), medroxyprogesterone acetate 150 mg/mL, net price 1-mL prefilled syringe = £6.01, 1-mL vial = £6.01. Counselling, see patient information leaflet

**Dose** by deep intramuscular injection, 150 mg within first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding); for long-term contraception, repeated every 12 weeks (if interval greater than 12 weeks and 5 days, rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection)

**Noristerat®** *(Schering Health)*

**Injection** (oily), norethisterone enantate 200 mg/mL, net price 1-mL amp = £3.59. Counselling, see patient information leaflet

**Dose** by deep intramuscular injection given very slowly into gluteal muscle, short-term contraception, 200 mg within first 5 days of cycle or immediately after parturition (duration 8 weeks); may be repeated once after 8 weeks (withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment)

### Implants

**Implanon®** *(Organon)*

**Implant**, containing etonogestrel 68 mg in each flexible rod, net price = £81.00. Counselling, see patient information leaflet

**Dose** by subcutaneous implantation, no previous hormonal contraception. 1 implant inserted during first 5 days of cycle; parturition or abortion in second trimester, 1 implant inserted between days 21–28 after delivery or abortion (if inserted after 28 days additional precautions necessary for next 7 days); abortion in first trimester, 1 implant inserted immediately, changing from other contraceptive, consult product literature; remove within 3 years of insertion
The progestogen-only intra-uterine system, Mirena®, releases levonorgestrel directly into the uterine cavity. It is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. This may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time (section 6.4.1.2).

Cautions and contra-indications Generally the cautions and contra-indications for the progestogen-only intra-uterine system are as for standard intra-uterine devices (section 7.3.4), but the risk of ectopic pregnancy is considerably smaller. Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Since levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

Side-effects Initially, changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) are common; endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and mood changes, and in the bleeding pattern usually occurs a few months after insertion and bleeding may often become very light or absent. Functional ovarian cysts (usually asymptomatic) can occur and usually resolve spontaneously (ultrasound monitoring recommended).
**7.3.4 Contraceptive devices**

**Intra-uterine devices**

The intra-uterine device (IUD) is suitable for older parous women and as a second-line contraceptive in young nulliparous women who should be carefully screened because they have an increased background risk of pelvic inflammatory disease.

Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper. Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause. The intra-uterine device Gyne-T 380® (Janssen-Cilag) is no longer available, but some women may have the device in place until 2009. The intra-uterine devices Multiload® Cu250 and Multiload® Cu250 Short (Organon) have been discontinued, but some women may have the devices in place until 2011.

A frameless, copper-bearing intra-uterine device (GyneFix®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus. The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed by the patient information leaflet.

The timing and technique of fitting an intra-uterine device are critical for its subsequent performance and call for proper training and experience. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation. The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted disease. Women are considered to be at a higher risk of sexually transmitted diseases if:

- they are under 25 years old or
- they are over 25 years old and
  - have a new partner or
  - have had more than one partner in the past year or
  - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered. If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible.

**Indications**

see notes above

**Cautions**

see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.3.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; valvular heart disease or history of endocarditis (Table 2, section 5.1); drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression); epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution; gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to see doctor promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible); remove if pregnancy occurs; if pregnancy occurs, increased likelihood that it may be ectopic

**Contra-indications**

pregnancy, severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration), pelvic inflammatory disease, established or marked immunosuppression; copper devices: copper allergy, Wilson’s disease, medical diathery

**Side-effects**

uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; on insertion: pain (alleviated by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack

**Flexi-T 300 (FP)**

Intra-uterine device, copper wire, surface area approx. 300 mm wound on vertical stem of T-shaped plastic carrier, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47.

For uterine length over 5 cm; replacement every 5 years (see also notes above)

**Flexi-T + 380 (FP)**

Intra-uterine device, copper wire, surface area approx. 380 mm wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £10.06.

For uterine length over 6 cm; replacement every 5 years (see also notes above)

**GyneFix (FP)**

Intra-uterine device, 6 copper sleeves with surface area of 330 mm on polypropylene thread, net price = £26.64.

Suitable for all uterine sizes; replacement every 5 years

**Load 375 (Durbin)**

Intra-uterine device, copper wire, surface area approx. 375 mm, wound on vertical stem of U-shaped plastic carrier, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.48.

For uterine length over 7 cm; replacement every 5 years (see also notes above)

**Mini TT 380 Slimline (Durbin)**

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area

---

**Intra-uterine contraceptive devices**

**Indications**

see notes above

**Cautions**

see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.3.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; valvular heart disease or history of endocarditis (Table 2, section 5.1); drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression); epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution; gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to see doctor promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible); remove if pregnancy occurs; if pregnancy occurs, increased likelihood that it may be ectopic

**Contra-indications**

pregnancy, severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration), pelvic inflammatory disease, established or marked immunosuppression; copper devices: copper allergy, Wilson’s disease, medical diathery

**Side-effects**

uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; on insertion: pain (alleviated by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack

**Flexi-T 300 (FP)**

Intra-uterine device, copper wire, surface area approx. 300 mm wound on vertical stem of T-shaped plastic carrier, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47.

For uterine length over 5 cm; replacement every 5 years (see also notes above)

**Flexi-T + 380 (FP)**

Intra-uterine device, copper wire, surface area approx. 380 mm wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £10.06.

For uterine length over 6 cm; replacement every 5 years (see also notes above)

**GyneFix (FP)**

Intra-uterine device, 6 copper sleeves with surface area of 330 mm on polypropylene thread, net price = £26.64.

Suitable for all uterine sizes; replacement every 5 years

**Load 375 (Durbin)**

Intra-uterine device, copper wire, surface area approx. 375 mm, wound on vertical stem of U-shaped plastic carrier, impregnated with barium sulphate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.48.

For uterine length over 7 cm; replacement every 5 years (see also notes above)

**Mini TT 380 Slimline (Durbin)**

Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area
T Obsetrics, gynaecology, and urinary-tract disorders

Type A Diaphragm with Flat Metal Spring
Silicone Contraceptive Pessary
Type C Contraceptive Pessary
Type B Contraceptive Pessary
Other contraceptive devices

TT 380 Slimline (Durbin)
Intra-uterine device, copper wire wound on vertical stem of T-shaped plastic carrier, impregnated with barium sulphate for radio-opacity, threads attached to base of vertical stem, net price = £10.29
For uterine length 6.5–9 cm, replacement every 10 years (see notes above)

Silicone contraceptive caps
Silicone Contraceptive Pessary
Other contraceptive devices

Fertility (Ovulation) Thermometer (Zeal)
Mercury in glass thermometer, range 35 to 39°C (graduated in 0.1°C), net price = £1.94
For monitoring ovulation for the fertility awareness method of contraception

Hormonal methods
Hormonal emergency contraception involves the use of levonorgestrel. It is effective if taken within 72 hours (3 days) of unprotected intercourse; taking the dose as soon as possible increases efficacy. Levonorgestrel may also be used between 72 and 120 hours after unprotected intercourse [unlicensed use] but efficacy decreases with time. Hormonal emergency contraception is less effective than insertion of an intra-uterine device (see below).

If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given. If an antiemetic is required domperidone is preferred.

When prescribing hormonal emergency contraception the doctor should explain:
• that the next period may be early or late;
• that a barrier method of contraception needs to be used until the next period;
• the need to return promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy (and also in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned).

Intra-uterine pregnancy despite treatment: see Appendix 4 (levonorgestrel).

Interactions The effectiveness of hormonal emergency contraception is reduced by enzyme-inducing drugs; a copper intra-uterine device can be offered instead or the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.
**LEVONORGESTREL**

**Indications** emergency contraception

**Cautions** see notes above; past ectopic pregnancy; severe malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration); pregnancy (see notes above and Appendix 4); breast-feeding (Appendix 5); interactions: see notes above and Appendix 1 (progestogens)

**Contra-indications** acute porphyria (section 9.8.2)

**Side-effects** menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting

**Dose**
- 1.5 mg as a single dose as soon as possible after coitus (preferably within 12 hours but no later than after 72 hours)

1. **Levonelle® One Step** (Schering Health)
   Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

1. Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society of Great Britain

**Levonelle® 1500** (Schering Health)

Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £5.11

**Intra-uterine device**

Insertion of an intra-uterine device is more effective than the hormonal methods of emergency contraception. A copper intra-uterine contraceptive device (section 7.3.4) can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted diseases should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin 1 g as a single dose). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation).

**7.4 Drugs for genito-urinary disorders**

**7.4.1 Drugs for urinary retention**

**Acute retention** is painful and is treated by catheterisation.

**Chronic retention** is painless and often long-standing. Catheterisation is unnecessary unless there is deterioration of renal function. After the cause has initially been established and treated, drugs may be required to increase detrusor muscle tone.

**Benign prostatic hyperplasia** is treated either surgically or medically with alpha-blockers (see below). Dutasteride and finasteride (section 6.4.2) are alternatives to alpha-blockers, particularly in men with a significantly enlarged prostate.

**Alpha-blockers**

The selective alpha-blockers, _alfuzosin, doxazosin, indoramin, prazosin, tamsulosin_ and _terazosin_ relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

**Cautions** Since selective alpha-blockers reduce blood pressure, patients receiving antihypertensive treatment may require reduced dosage and specialist supervision. Caution may be required in the elderly and in patients with hepatic impairment (Appendix 2) and renal impairment (Appendix 3). For interactions see Appendix 1 (alpha-blockers).

**Contra-indications** Alpha-blockers should be avoided in patients with a history of postural hypotension and micturition syncope.

**Side-effects** Side-effects of selective alpha-blockers include drowsiness, hypotension (notably postural hypotension), syncope, asthenia, depression, headache, dry mouth, gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, constipation), oedema, blurred vision, rhinitis, erectile disorders (including priapism), tachycardia, and palpitations. Hypersensitivity reactions including rash, pruritus and angioedema have also been reported.

**ALFUZOSIN HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see notes above

**Contra-indications** see notes above; severe hepatic impairment

**Side-effects** see notes above; also flushes and chest pain

**Dose**
- 2.5 mg 3 times daily, max. 10 mg daily; **ELDERLY** initially 2.5 mg twice daily

**First dose effect** First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

For drugs used in the treatment of urinary-tract infections see section 5.1.13.
Alfuzosin hydrochloride (Non-proprietary) [PH1]
Tablets, I/c, alfuzosin hydrochloride 2.5 mg, net price 60-tab pack = £21.20. Label: 3, counselling, see dose above

Xatral® (Sanofi-Synthelabo) [PH1]
Tablets, I/c, alfuzosin hydrochloride 2.5 mg, net price 60-tab pack = £21.20. Label: 3, counselling, see dose above

Modulated release
Besavar® XL (Winthrop) [PH1]
Tablets, m/r, yellow/white, alfuzosin hydrochloride 10 mg, net price 30-tab pack = £13.28. Label: 3, 21, 25, counselling, see above
Dose benign prostatic hyperplasia 10 mg once daily
Acute urinary retention associated with benign prostatic hyperplasia in men over 65 years, 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

Xatral® XL (Sanofi-Synthelabo) [PH1]
Tablets, m/r, yellow/white, alfuzosin hydrochloride 10 mg, net price 10-tab pack = £4.42, 30-tab pack = £13.28. Label: 3, 21, 25, counselling, see above
Dose benign prostatic hyperplasia 10 mg once daily
Acute urinary retention associated with benign prostatic hyperplasia in men over 65 years, 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

DOXAZOSIN
Indications see notes above and section 2.5.4
Cautions see notes above and section 2.5.4
Contra-indications see notes above
Side-effects see notes above and section 2.5.4
Dose
● Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

INDORAMIN
Indications see notes above and section 2.5.4
Cautions see notes above and section 2.5.4
Contra-indications see notes above
Side-effects see notes above and section 2.5.4
Dose
● 20 mg twice daily; increased if necessary by 20 mg every 2 weeks to max. 100 mg daily in divided doses; ELDERY, 20 mg at night may be adequate

Doralese® (Chemidex) [PH1]
Tablets, yellow, I/c, indoramin 20 mg, net price 60-tab pack = £25.85. Label: 2

PRAZOSIN
Indications see notes above and section 2.5.4
Cautions see notes above and section 2.5.4
Contra-indications see notes above and section 2.5.4
Side-effects see notes above and section 2.5.4; also paraesthesia, arthralgia, epistaxis, nervousness, dyspnœa, hallucinations, and alopecia
Dose
● Initially 500 micrograms twice daily for 3–7 days, subsequently adjusted according to response; usual maintenance (and max.) 2 mg twice daily; ELDERY initiate with lowest possible dose
First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

Preparations
Section 2.5.4

TAMSULOSIN HYDROCHLORIDE
Indications see notes above
Cautions see notes above; also cataract surgery (risk of intra-operative floppy iris syndrome)
Contra-indications see notes above; severe hepatic impairment
Side-effects see notes above
Dose
● 400 micrograms daily as a single dose
Tamsulosin hydrochloride (Non-proprietary) [PH1]
Capsules, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-cap pack = £6.11. Label: 25
Brands include Bazetham MR, Contiflo XL, Diffundox XL, Omnic MR, Stronazon MR, Tabphyn MR
Flomaxtra® XL (Astellas) [PH1]
Tablets, m/r, tamsulosin hydrochloride 400 micrograms. Net price 30-tab pack = £17.55. Label: 25

TERAZOSIN
Indications see notes above and section 2.5.4
Cautions see notes above and section 2.5.4
Contra-indications see notes above
Side-effects see notes above and section 2.5.4; also weight gain, paraesthesia, dyspnœa, thrombocytopenia, nervousness, decreased libido, back pain and pain in extremities
Dose
● Initially 1 mg at bedtime; if necessary dose may be doubled at intervals of 1–2 weeks according to response, up to max. 10 mg once daily; usual maintenance 5–10 mg daily
First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely
Terazosin (Non-proprietary) [PH1]
Tablets, terazosin (as hydrochloride) 2 mg, net price 28-tab pack = £2.27; 5 mg, 28-tab pack = £2.85; 10 mg, 28-tab pack = £7.71. Label: 3, counselling, see dose above
Hytrin® (Ampidipharm) [PH1]
Tablets, terazosin (as hydrochloride) 2 mg (yellow) net price, 28-tab pack = £4.57; 5 mg (tan), 28-tab pack = £8.57; 10 mg (blue), 28-tab pack = £17.14; starter pack (for benign prostatic hyperplasia) of 7 × 1-mg tab with 14 × 2-mg tab and 7 × 5-mg tab = £10.97. Label: 3, counselling, see dose above

Parasympathomimetics
The parasympathomimetic bethanechol increases detrusor muscle contraction. However, it has only a
limited role in the relief of urinary retention; its use has been superseded by catheterisation.

Distigmine inhibits the breakdown of acetylcholine. It may help patients with an upper motor neurone neurogenic bladder.

## BETHANECHOL CHLORIDE

### Indications

Urinary retention, but see notes above

### Cautions

Autonomic neuropathy (use lower initial dose); interactions: Appendix 1 (parasympathomimetics)

### Contra-indications

Peptic ulcer; intestinal or urinary obstruction; conditions where increased motility of the urinary or gastro-intestinal tract could be harmful; cardiovascular disorders (including recent myocardial infarction, bradycardia, and heart block); hypotension; obstructive airways disease; epilepsy; parkinsonism; hyperthyroidism; pregnancy (Appendix 4); breastfeeding

### Side-effects

Nausea, vomiting, diarrhoea, abdominal pain, increased salivation, eructation; flushing, hypertension, bradycardia; bronchoconstriction, rhinorrhea; headache; increased lacrimation; increased sweating

### Dose

- 10–25 mg 3–4 times daily half an hour before food

**Myotonic®** (Glenwood) Tablets, scored, bethanechol chloride 10 mg, net price 20 = £1.01; 25 mg, 20 = £1.30. Label: 22

## DISTIGMINE BROMIDE

### Indications

Postoperative urinary retention (see notes above); neurogenic bladder; myasthenia gravis (section 10.2.1)

### Cautions

Peptic ulcer; conditions where increased motility of the urinary or gastro-intestinal tract could be harmful; oesophagitis; cardiovascular disease; bronchospasm; epilepsy; parkinsonism; pregnancy (Appendix 4); breastfeeding; interactions: Appendix 1 (parasympathomimetics)

### Contra-indications

Intestinal or urinary obstruction; severe circulatory insufficiency; asthma

### Side-effects

Abdominal pain, diarrhoea, increased salivation; bradycardia, AV block, hypotension; dyspnoea; muscle twitching; increased lacrimation, miosis; increased sweating

### Dose

- Urinary retention, 5 mg daily, half an hour before breakfast
- Neurogenic bladder, 5 mg daily or on alternate days, half an hour before breakfast

**Ucbretid®** (Rhône-Poulenc Rorer) Tablets, scored, distigmine bromide 5 mg, net price 30-tab pack = £14.22. Label: 22

## Drugs for urinary frequency, enuresis, and incontinence

### Urinary incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine, an inhibitor of serotonin and noradrenaline re-uptake can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Involuntary detrusor contractions cause urgency and urge incontinence, usually with frequency and nocturia. Antimuscarinic drugs reduce these contractions and increase bladder capacity. Oxybutynin also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine are comparable to those of modified-release oxybutynin. Flavoxate has less marked side-effects but it is also less effective. Darifenacin, fesoterodine, propiverine, solifenacin, and trospium are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continued antimuscarinic drug therapy should be reviewed after 3–6 months.

The **Scottish Medicines Consortium** (p. 3) has advised (June 2008) that fesoterodine (Toviaz®) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

Propantheline and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine is limited by its potential to cause cardiac side-effects.

Purified bovine collagen implant (Contigen®, Bard) is indicated for **urinary incontinence** caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

### Cautions

Antimuscarinic drugs should be used with caution in the elderly (especially if frail), in those with autonomic neuropathy, and in those susceptible to angle-closure glaucoma. They should also be used with caution in hiatus hernia with reflux oesophagitis, hepatic impairment (Appendix 2), and renal impairment (Appendix 3). Antimuscarinics can worsen hyperthyroidism, coronary artery disease, congestive heart failure, hypertension, prostatic hyperplasia, arrhythmias, and tachycardia. For interactions see Appendix 1 (antimuscarinics).

### Contra-indications

Antimuscarinic drugs should be avoided in patients with myasthenia gravis, significant bladder outflow obstruction or urinary retention, severe...
ulcerative colitis, toxic megacolon, and in gastro-intestinal obstruction or intestinal atony.

**Side-effects** Side-effects of antimuscarinic drugs include dry mouth, gastro-intestinal disturbances including constipation, flatulence, taste disturbances, blurred vision, dry eyes, drowsiness, dizziness, fatigue, difficulty in micturition (less commonly urinary retention), palpitation, and skin reactions (including dry skin, rash, and photosensitivity); also headache, diarrhoea, angioedema, arrhythmias, and tachycardia. Central nervous system stimulation, such as restlessness, disorientation, hallucination, and convulsion may occur; children are at higher risk of these effects. Antimuscarinic drugs can reduce sweating, leading to heat sensations and fainting in hot environments or in patients with fever, and very rarely may precipitate angle-closure glaucoma.

**DARIFENACIN**

**Indications** urinary frequency, urgency, and incontinence

**Cautions** see notes above; breast-feeding (Appendix 5)

**Contra-indications** see notes above; pregnancy (Appendix 4)

**Side-effects** see notes above; also less commonly ulcerative stomatitis, oedema, hypertension, dysphonia, cough, rhinitis, weakness, insomnia, impotence, and vaginitis

**Dose**

- **ADULT** over 18 years, 7.5 mg once daily, increased if necessary after 2 weeks to 15 mg once daily

**Emselex**

- **Novatis** ▼ *(Novartis)*

**Tablets** m/r, darifenacin (as hydrobromide) 7.5 mg (white), net price 28-tab pack = £26.13; 15 mg (peach), 28-tab pack = £26.13. Label: 3, 25

**Note** The Scottish Medicines Consortium has advised (May 2007) that darifenacin (**Emselex**) is accepted for restricted use as a second-line drug for the symptomatic treatment of urge incontinence, urinary frequency, and urgency in patients with overactive bladder syndrome

**DULOXETINE**

**Indications** moderate to severe stress urinary incontinence in women; major depressive disorder (section 4.3.4); diabetic neuropathy (section 4.3.4); generalised anxiety disorder (section 4.3.4)

**Cautions** elderly; cardiac disease; hypertension (avoid if uncontrolled); history of mania; history of seizures; raised intra-ocular pressure, susceptibility to angle-closure glaucoma; bleeding disorders or concomitant use of drugs that increase risk of bleeding; interactions: Appendix 1 (duloxetine)

**Withdrawal** Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks

**Contra-indications** hepatic impairment; renal impairment (avoid if creatinine clearance less than 30 mL/minute); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** nausea, vomiting, dyspepsia, constipation, diarrhoea, abdominal pain, weight changes, decreased appetite, flatulence, dry mouth; palpitation, hot flush; insomnia, abnormal dreams, paraesthesia, drowsiness, anxiety, headache, dizziness, fatigue, weakness, tremor, nervousness, anorexia; sexual dysfunction; visual disturbances; sweating, pruritus; less commonly gastritis, haliotosis, hepatitis, bruxism, tachycardia, hypertension, postural hypotension, syncope, raised cholesterol, vertigo, taste disturbance, cold extremities, impaired temperature regulation, impaired attention, movement disorders, muscle twitching, musculoskeletal pain, thirst, stomatitis, hypothroidism, urinary disorders, and photosensitivity; rarely mania and angle-closure glaucoma; also reported supraventricular arrhythmia, chest pain, hallucinations, suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy, p. 206), seizures, hypersensitivity reactions including urticaria, angioedema, rash (including Stevens-Johnson syndrome) and anaphylaxis, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 206)

**Dose**

- **ADULT** over 18 years, 40 mg twice daily, assess for benefit and tolerability after 2–4 weeks

**Note** Initial dose of 20 mg twice daily for 2 weeks can minimise side-effects

**Yentreve**

- **Lilly** ▼ *(Pfizer)*

**Capsules** duloxetine (as hydrochloride) 20 mg (blue), net price 28-cap pack = £15.40, 56-cap pack = £30.80; 40 mg (orange/blue), 56-cap pack = £30.80. Label: 2

**Cymbalta**

- **Lilly** ▼ *(BMS)*

**Section 4.3.4 (major depressive episode, generalised anxiety disorder, and diabetic neuropathy)**

**FESOTERODINE**

**Indications** urinary frequency, urgency, and urge incontinence

**Cautions** see notes above; gastro-oesophageal reflux

**Contra-indications** see notes above; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see notes above; also insomnia; less commonly nasal dryness, pharyngolaryngeal pain, cough, and vertigo

**Dose**

- **ADULT** over 18 years, 4 mg once daily, increased if necessary to max. 8 mg once daily; assess for benefit after 8 weeks

**Note** Max. 4 mg daily with concomitant atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nelfinavir, ritonavir, saquinavir, or telithromycin; in patients with hepatic or renal impairment, consult product literature before concomitant use of amphotericin, aprepitant, atazanavir, clarithromycin, diltiazem, erythromycin, fosamprenavir, indinavir, itraconazole, ketoconazole, nelfinavir, ritonavir, saquinavir, telithromycin, verapamil, or grapefruit juice

**Toviaz**

- **Pfizer** ▼ *(Pfizer)*

**Tablets** m/r, ti, f/c, fesoterodine fumarate 4 mg (light blue), net price 28-tab pack = £29.03; 8 mg (blue), 28-tab pack = £29.03. Label: 3, 25

**FLAVOXATE HYDROCHLORIDE**

**Indications** urinary frequency and incontinence, dysuria, urgency; bladder spasms due to catheterisation, cystoscopy, or surgery

**Cautions** see notes above; pregnancy (Appendix 4), breast-feeding (Appendix 5)

**Contra-indications** see notes above; gastro-intestinal haemorrhage

**Side-effects** see notes above; also vertigo, eosinophilia, leucopenia, urticaria, erythema, and pruritus
Dose
- ADULT and ADOLESCENT over 12 years, 200 mg 3 times daily

Urispas 200® (Recordati) Tablets, f/c, flavoxate hydrochloride 200 mg, net price 90-tab pack = £11.87

**OXIBUTYNIN HYDROCHLORIDE**

**Indications** urinary frequency, urgency and incontinence, neurogenic bladder instability, and nocturnal enuresis associated with overactive bladder

**Cautions** see notes above; pregnancy (Appendix 4); acute porphyria (section 9.8.2)

**Contra-indications** see notes above; breast-feeding (Appendix 5)

**Side-effects** see notes above; also less commonly anorexia, facial flushing; rarely night terrors; application site reactions with patches

**Dose**
- ADULT and CHILD over 12 years, initially 5 mg 2–3 times daily, increased if necessary to max. 5 mg 4 times daily; ELDERLY initially 2.5–3 mg twice daily, increased to 5 mg twice daily according to response and tolerance; CHILD 5–12 years, neurogenic bladder instability, 2.5–3 mg twice daily, increased to 5 mg 2–3 times daily; CHILD under 5 years, see BNF for Children; CHILD 7–18 years, nocturnal enuresis associated with overactive bladder, 2.5–3 mg twice daily increased to 5 mg 2–3 times daily (last dose before bedtime)

**Oxybutynin Hydrochloride** (Non-proprietary) Tablets, oxybutynin hydrochloride 2.5 mg, net price 56-tab pack = £7.24; 3 mg, 56-tab pack = £9.15; 5 mg, 56-tab pack = £10.21, 84-tab pack = £2.96. Label: 3

**Cystrin®** (Sanofi-Synthelabo) Tablets, oxybutynin hydrochloride 3 mg, net price 56-tab pack = £9.15; 5 mg (scored), 84-tab pack = £22.88. Label: 3

**Ditropan®** (Sanofi-Synthelabo) Tablets, both blue, scored, oxybutynin hydrochloride 2.5 mg, net price 84-tab pack = £6.86; 5 mg, 84-tab pack = £13.34. Label: 3

**Elixir** oxybutynin hydrochloride 2.5 mg/5 mL. Net price 150-mL pack = £5.74. Label: 3

**Modified release**

**Lyrinel XL** (Janssen-Cilag) Tablets, m/r, oxybutynin hydrochloride 5 mg (yellow), net price 30-tab pack = £11.48; 10 mg (pink), 30-tab pack = £22.95. Label: 3, 25

**Dose** Initially 5 mg once daily, adjusted according to response in steps of 5 mg at weekly intervals; max. 20 mg once daily; CHILD over 6 years, neurogenic bladder instability; initially 5 mg once daily, adjusted according to response in steps of 5 mg at weekly intervals; max. 15 mg once daily

**Note** Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of Lyrinel XL

**Transdermal preparations**

**Kentera®** (Recordati) Patches, self-adhesive, oxybutynin 36 mg (releasing oxybutynin approx. 3.9 mg/24 hours), net price 8-patch pack = £27.20. Label: 3, counselling, administration

**Dose** ADULT over 18 years, urinary frequency, urgency and incontinence, apply 1 patch twice weekly to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days)

**Note** The Scottish Medicines Consortium has advised (July 2005) that Kentera should be restricted for use in patients who benefit from oral oxybutynin but cannot tolerate its side-effects

**PROPANTHELINE BROMIDE**

**Indications** adult enuresis

**Cautions** see notes above; ulcerative colitis, pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Contra-indications** see notes above

**Side-effects** see notes above; also facial flushing

**Dose**
- Initially 15 mg 3 times daily at least one hour before food and 30 mg at bedtime, subsequently adjusted according to response (max. 120 mg daily)

**Preparations**
Section 1.2

**PROPIVERINE HYDROCHLORIDE**

**Indications** urinary frequency, urgency and incontinence; neurogenic bladder instability

**Cautions** see notes above

**Contra-indications** see notes above; moderate to severe hepatic impairment; pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Side-effects** see notes above

**Dose**
- 15 mg 1–3 times daily, increased if necessary to max. 15 mg 4 times daily; CHILD not recommended

**Detrnorm®** (Amdipharm) Tablets, pink, s/c, propiverine hydrochloride 15 mg, net price 56-tab pack = £24.45. Label: 3

**Modified release**

**Detrnorm® XL** (Amdipharm) Capsules, orange/white, m/r, propiverine hydrochloride 30 mg, net price 28-cap pack = £24.45. Label: 3, 25

**Dose** urinary frequency, urgency, and incontinence, 30 mg once daily; CHILD not recommended

**SOLIFENACIN SUCCINATE**

**Indications** urinary frequency, urgency and urge incontinence

**Cautions** see notes above; neurogenic bladder disorder; pregnancy (Appendix 4)

**Contra-indications** see notes above; severe hepatic impairment (Appendix 2); haemodialysis; breast-feeding (Appendix 5)

**Side-effects** see notes above; also gastro-oesophageal reflux; oedema

**Dose**
- 5 mg daily, increased if necessary to 10 mg once daily; CHILD not recommended

**Note** Max. 5 mg daily with concomitant itraconazole, ketoconazole, nelfinavir or ritonavir

**Vesicare®** (Astellas) Tablets, f/c, solifenacin succinate 5 mg (yellow), net price 30-tab pack = £27.62; 10 mg (pink), 30-tab pack = £35.91. Label: 3
7 Obstetrics, gynaecology, and urinary-tract disorders

7.4.3 Drugs used in urological pain

TOLTERODINE TARTRATE

**Indications** urinary frequency, urgency and incontinence

**Cautions** see notes above; history of QT-interval prolongation; concomitant use with other drugs known to prolong QT interval

**Contra-indications** see notes above; pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Side-effects** see notes above; also chest pain, peripheral oedema; sinusitis, bronchitis; paraesthesia, fatigue, vertigo, weight gain; flushing also reported

**Dose**
- **ADULT** over 18 years, 2 mg twice daily; reduce to 1 mg twice daily if necessary to minimise side-effects

Nocturnal enuresis

Nocturnal enuresis is a common occurrence in young children but persists in as many as 5% by 10 years of age. Treatment is not appropriate in children under 5 years and it is usually not needed in those aged under 7 years and in cases where the child and parents are not anxious about the bedwetting; however, children over 10 years usually require prompt treatment. An enuresis alarm should be first-line treatment for well-motivated children aged over 7 years because it may achieve a more sustained reduction of enuresis than use of drugs. Use of an alarm may be combined with drug therapy if either method alone is unsuccessful.

Drug therapy is not usually appropriate for children under 7 years of age; it can be used when alternative measures have failed, preferably on a short-term basis, to cover periods away from home for example. The possible side-effects of the various drugs should be borne in mind when they are prescribed.

Desmopressin (section 6.5.2), an analogue of vasopressin, is used for nocturnal enuresis; it is given by oral or by sublingual administration. Particular care is needed to avoid fluid overload. Treatment should not be continued for longer than 3 months without stopping for 1 week for full re-assessment. Desmopressin should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects.

Tricyclics (section 4.3.1) such as amitriptyline, imipramine, and less often nortriptyline can be used, but behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a full physical examination is made and the child is fully re-assessed; toxicity following overdosage with tricyclics is of particular concern.

DRUGS USED IN UROLOGICAL PAIN

Alkalisation of urine

Alkalisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of cystitis caused by lower urinary tract infections. Sodium bicarbonate is used as a urinary alkalinising agent in some metabolic and renal disorders (section 9.2.1.3).

POTASSIUM CITRATE

**Indications** relief of discomfort in mild urinary-tract infections; alkalinisation of urine

**Cautions** renal impairment (avoid if creatinine clearance less than 10 mL/minute); Appendix 3), cardiac disease; elderly; **interactions**: Appendix 1 (potassium salts)

**Side-effects** hyperkalaemia on prolonged high dosage, mild diuresis

**Potassium Citrate Mixture BP**

(Potassium Citrate Oral Solution)

**Oral solution**, potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K+/10 mL.

**Dose** 10 mL 3 times daily well diluted with water

**Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections**

**SODIUM BICARBONATE**

**Indications** relief of discomfort in mild urinary-tract infections; alkalinisation of urine
Mycotic infections. 50 micrograms/mL (section 5.2) may be of value in continuous bladder irrigation with amphotericin, considered as a mechanical irrigant. Sodium chloride solution 0.9% (section 8.1.1) is used for recurrent superficial bladder infections (section 8.1.2), and mitomycin (section 8.1.2), and thiotepa (section 8.1.2) is also used for some papillary tumours.

Instillation of epirubicin (section 8.1.2) is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin (section 8.1.2) is also used for some papillary tumours.

Instillation of BCG (Bacillus Calmette-Guérin), a live attenuated strain derived from Mycobacterium bovis (section 8.2.4), is licensed for the treatment of primary or recurrent bladder carcinoma in-situ and for the prevention of recurrence following transurethral resection.

Interstitial cystitis Dimethyl sulfoxide (dimethyl sulfoxide) may be used for symptomatic relief in patients with interstitial cystitis (Hunner’s ulcer). 50 mL of a 50% solution (Rimso-50®—available on named-patient basis from Britannia) is instilled into the bladder, retained for 15 minutes, and voided by the patient. Treatment is repeated at intervals of 2 weeks. Bladder spasm and hypersensitivity reactions may occur and long-term use requires ophthalmic, renal, and hepatic assessment at intervals of 6 months. Interactions: see Appendix 1 (dimethyl sulfoxide).

SODIUM CITRATE

Indications relief of discomfort in mild urinary-tract infections

Cautions renal impairment; cardiac disease; hypertension; pregnancy; patients on a sodium-restricted diet; elderly

Side-effects mild diuresis

Note Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

Other preparations for urinary disorders

A terpene mixture (Rowatinex®) is claimed to be of benefit in urolithiasis for the expulsion of calculi.

Rowatinex® (Rowa), yellow, e/c, anethol 4 mg, borneol 10 mg, camphene 15 mg, cineole 3 mg, fenchone 4 mg, pinene 31 mg. Net price 50 = £7.35. Label: 25

Dose 1–2 capsules 3–4 times daily before food. CHILD not recommended

BNF 57 7.4.4 Bladder instillations and urological surgery

Bladder infection Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine (section 13.11.2) can be used in the management of common infections of the bladder but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin 50 micrograms/mL (section 5.2) may be of value in mycotic infections.

Dissolution of blood clots Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Bladder cancer Bladder instillations of doxorubicin (section 8.1.2), mitomycin (section 8.1.2), and thiotepa (section 8.1.1) are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Interleukin-2 therapy Interferon-α is licensed for the treatment of recurrent superficial bladder cancer and for prophylaxis of recurrent bladder carcinoma following transurethral resection.
Drugs for erectile dysfunction

7.4.5 Drugs for erectile dysfunction

Reasons for failure to produce a satisfactory erection include psychogenic, vascular, neurogenic, and endocrine abnormalities; impotence can also be drug-induced. Intracavernosal injection or urethral application of vasoactive drugs under careful medical supervision is used for both diagnostic and therapeutic purposes.

Erectile disorders may also be treated with drugs given for both diagnostic and therapeutic purposes.

Intracavernosal injection or urethral application of vasoactive drugs under careful medical supervision is used for both diagnostic and therapeutic purposes.

Priapism

If priapism occurs with alprostadil, treatment should not be delayed more than 6 hours and is as follows:

Initial therapy by penile aspiration—using aseptic technique—should not be delayed more than 6 hours and is as follows:

1. If aspiration is unsuccessful a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.

2. If aspiration and lavage of corpora are unsuccessful, cautious intracavernosal injection of a sympathomimetic (section 2.7.2) with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (extreme caution: coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) as follows:

   - intracavernosal injections of phenylephrine 100–200 micrograms (0.5–1 mL of a 200 microgram/mL solution) every 5–10 minutes; max. total dose 100 micrograms [unlicensed indication] [important: if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection (section 2.7.2) to 5 mL with sodium chloride 0.9%]; alternatively

   - intracavernosal injections of adrenaline 10–20 micrograms (0.5–1 mL of a 20 microgram/mL solution) every 5–10 minutes; max. total dose 100 micrograms [unlicensed indication] [important: if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL, section 3.4.3) injection to 5 mL with sodium chloride 0.9%]; alternatively

   - intracavernosal injection of metaraminol (caution: has been associated with fatal hypertensive crises); metaraminol 1 mg (0.1 mL of 10 mg/mL metaraminol injection, section 2.7.2) is diluted to 50 mL with sodium chloride injection 0.9% and given carefully by slow injection into the corpora in 5 mL injections every 15 minutes [unlicensed indication].

   If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle. If sympathomimetics unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

Prescribing on the NHS

Drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances (see individual preparations). The Department of Health (England) has recommended that treatment should also be available from specialist services (commissioned by Health Authorities and Primary Care Groups, and operating under local agreement) when the condition is causing severe distress; specialist centres should use form FP10(HP) or form HBP in Scotland or form WP10HP in Wales and endorse them ‘SLS’ if the treatment is to be dispensed in the community. The following criteria should be considered when assessing distress:

- significant disruption to normal social and occupational activities;
- a marked effect on mood, behaviour, social and environmental awareness;
- a marked effect on interpersonal relationships.

Alprostadil

Alprostadil (prostaglandin E1) is given by intracavernosal injection or intraurethral application for the management of erectile dysfunction (after exclusion of treatable medical causes); it is also used as a diagnostic test.

**ALPROSTADIL**

**Indications** erectile dysfunction (including aid to diagnosis); neonatal congenital heart defects (section 7.1.1.1)

**Cautions** priapism—patients should be instructed to report any erection lasting 4 hours or longer—for management, see section 7.4.5; anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie’s disease develop); interactions: Appendix 1 (prostaglandins)

**CATHETER PATENCY SOLUTIONS**

Chlorhexidine 0.02%

Brands include Uriflex C®, 100-mL sachets = £2.40; Uro-Tainer Chlorhexidine®, 100-mL sachets = £2.60

Sodium chloride 0.9%

Brands include OptiFlo S®, 50- and 100-mL sachets = £3.20; Uriflex S®, 100-mL sachet = £2.40; Uriflex SP®, with integral drug additive port, 100-mL sachet = £2.40; Uro-Tainer Sodium Chloride®, 50- and 100-mL sachets = £3.23; Uro-Tainer M®, with integral drug additive port, 50- and 100-mL sachets = £2.90

Solution G

Citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%. Brands include OptiFlo G®, 50- and 100-mL sachets = £3.40; Uriflex G®, 100-mL sachet = £2.40; Uro-Tainer® Twin Suby G, 2 x 30-mL = £4.42

Solution R

Citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%. Brands include OptiFlo R®, 50- and 100-mL sachets = £3.40; Uriflex R®, 100-mL sachet = £2.40; Uro-Tainer® Twin Solutio R, 2 x 30-mL = £4.42

**7.4.5 Drugs for erectile dysfunction**
Contra-indications predisposition to prolonged erection (as in sickle cell anaemia, multiple myeloma or leukaemia); not for use with other agents for erectile dysfunction, in patients with penile implants or when sexual activity medically inadvisable; urethral application also contra-indicated in urethral stricture, severe hypospadias, severe curvature, balanitis, urethritis

Side-effects hypotension, hypertension; dizziness, headache; penile pain, other localised pain (buttocks, leg, testicular, abdominal); influenza-like syndrome; urethral burning, urethral bleeding; injection site reactions including penile fibrosis, penile oedema, penile rash, haematoma, haemosiderin deposits; less commonly nausea, dry mouth, vasodilatation, syncope, suprapubcentricular extrasyosyle, rapid pulse, asthenia, leg cramps, pelvic pain, scrotal or testicular oedema, scrotal erythema, testicular thickening, micturition difficulties, haematuria, mydriasis, and sweating; local reactions including penile warmth, pruritus, irritation, penile numbness or sensitivity, balanitis, phimosis, priapism (see section 7.4.5 and under Cautions), abnormal ejaculation; rarely vertigo, urinary-tract infection, and hypersensitivity reactions (including rash, erythema, urticaria, and anaphylaxis)

Dose
- See under preparations below

Intracavernosal injection

Caverject® (Pharmacia) Injection, powder for reconstitution, alprostadil, net price 5-microgram vial = £7.73; 10-microgram vial = £9.24; 20-microgram vial = £11.94; 40-microgram vial = £21.58 (all with diluent-filled syringe, needles and swabs)

Caverject® Dual Chamber, double-cylinder cartridges (containing alprostadil and diluent), net price 10-microgram cartridge (for doses 2.5–10 micrograms) = £7.35; 20-microgram cartridge (for doses 5–20 micrograms) = £9.50 (both with needles)

Dose by direct intracavernosal injection, ADULT over 18 years, erectile dysfunction, first dose 2.5 micrograms, second dose 5 micrograms (if some response to first dose) or 7.5 micrograms (if no response to first dose), increasing in steps of 5–10 micrograms to obtain dose suitable for producing erection lasting not more than 1 hour (neurological dysfunction, first dose 1.25 micrograms, second dose 2.5 micrograms, third dose 5 micrograms, increasing in steps of 5–10 micrograms to obtain suitable dose), if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms; max. 40 micrograms; max. frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Note The first dose must be given by medically trained personnel; self-administration may only be undertaken after proper training

Urethral application

Counselling If partner pregnant barrier contraception should be used

MUSE® (Meda) Urethral application, alprostadil, net price 125-microgram single-use applicator = £9.89; 250-microgram single-use applicator = £10.76; 500-microgram single-use applicator = £10.76, 1-mg single-use applicator = £11.01 (all strengths also available in packs of 6 applicators)

Condoms no evidence of harm to latex condoms and diaphragms

Dose by direct urethral application, ADULT over 18 years, erectile dysfunction, initially 250 micrograms adjusted according to response (usual range 0.125–1 mg); max. 2 doses in 24 hours and 7 doses in 7 days

Note During initiation of treatment MUSE® should be used under medical supervision, self-administration may only be undertaken after proper training

Aid to diagnosis, 500 micrograms as a single dose

Phosphodiesterase type-5 inhibitors

Sildenafil, tadalafil and vardenafil are phosphodiesterase type-5 inhibitors licensed for the treatment of erectile dysfunction; they are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing sildenafil, tadalafil or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

Cautions Sildenafil, tadalafil, and vardenafil should be used with caution in cardiovascular disease, left ventricular outflow obstruction, anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease), and in those with a predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia).

Contra-indications Sildenafil, tadalafil, and vardenafil are contra-indicated in patients receiving nitrates, in patients in whom vasodilatation or sexual activity are inadvisable, or in patients with a previous history of non-arteritic anterior ischaemic optic neuropathy. In the absence of information, manufacturers contra-indicate these drugs in hypotension (avoid if systolic blood pressure below 90 mmHg), recent stroke, unstable angina, and myocardial infarction.

Side-effects The side-effects of sildenafil, tadalafil, and vardenafil include dyspepsia, nausea, vomiting,
headache (including migraine), flushing, dizziness, myalgia, back pain, visual disturbances (non-arteritic anterior ischaemic optic neuropathy has been reported—stop drug if sudden visual impairment occurs), and nasal congestion. Less common side-effects include painful red eyes, palpitation, hypotension, hypertension, epistaxis. Other side-effects reported rarely include syncope, hypersensitivity reactions (including rash, facial oedema, and Stevens-Johnson syndrome), and priapism. Serious cardiovascular events (including arrhythmia, unstable angina, and myocardial infarction), sudden hearing loss (discontinue drug and seek medical advice), and retinal vascular occlusion have also been reported.

**SILDENAFIL**

**Indications** erectile dysfunction; pulmonary hypertension (section 2.5.1)

**Cautions** see notes above; also hepatic impairment (Appendix 2—avoid if severe); renal impairment (Appendix 3); bleeding disorders or active peptic ulceration; **interactions:** Appendix 1 (sildenafil)

**Contra-indications** see notes above; also hereditary degenerative retinal disorders

**Side-effects** see notes above

**Dose**

- **ADULT** over 18 years initially 50 mg approx. 1 hour before sexual activity, subsequent doses adjusted according to response to 25–100 mg as a single dose as needed; max. 1 dose in 24 hours (max. single dose 100 mg)

**Note** Onset of effect may be delayed if taken with food

1 **Viagra** (Pfizer)  
Tablets, all blue, f/c, sildenafil (as citrate), 25 mg, net price 4-tab pack = £16.59, 8-tab pack = £33.19; 50 mg, 4-tab pack = £19.34, 8-tab pack = £38.67; 100 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

**Revatio** (Pfizer) ▼
Section 2.5.1 (pulmonary hypertension)

**TADALAFIL**

**Indications** erectile dysfunction

**Cautions** see notes above; also hepatic impairment (Appendix 2); renal impairment (Appendix 3); **interactions:** Appendix 1 (tadalafil)

**Contra-indications** see notes above; also moderate heart failure, uncontrolled arrhythmias, uncontrolled hypertension

**Side-effects** see notes above; also increased sweating and abdominal pain reported

1 except to treat erectile dysfunction in men who:

- have diabetes, multiple sclerosis, Parkinson’s disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
- are receiving dialysis for renal failure;
- have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
- were receiving Caverject, Erecnos, MUSE, Viagra, or Voidal for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
- are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

The prescription must be endorsed ‘SLS’.

**Dose**

- **ADULT** over 18 years, initially 10 mg at least 30 minutes before sexual activity, subsequent doses adjusted according to response to 20 mg as a single dose; max. 1 dose in 24 hours (but daily use not recommended)

**Note** Effect may persist for longer than 24 hours

1 **Cialis** (Lilly)  
Tablets, f/c, tadalafil 10 mg (light yellow), net price 4-tab pack = £24.99; 20 mg (yellow), 4-tab pack = £24.99; 8-tab pack = £49.97

**VARDENAFIL**

**Indications** erectile dysfunction

**Cautions** see notes above; also hepatic impairment (Appendix 2—avoid if severe); renal impairment (Appendix 3); bleeding disorders or active peptic ulceration; susceptibility to prolongation of QT interval (including concomitant use of drugs which prolong QT interval); **interactions:** Appendix 1 (vardenafil)

**Contra-indications** see notes above; also hereditary degenerative retinal disorders

**Side-effects** see notes above; also less commonly drowsiness, dyspnoea, increased lacrimation, photosensitivity; rarely anxiety, seizures, transient amnesia, hypertonia, and raised intra-ocular pressure

**Dose**

- **ADULT** over 18 years, initially 10 mg (elderly) and patients on alpha-blocker therapy 5 mg approx. 25–60 minutes before sexual activity, subsequent doses adjusted according to response up to max. 20 mg as a single dose; max. 1 dose in 24 hours

**Note** Onset of effect may be delayed if taken with high-fat meal

1 **Levitra** (Bayer)  
Tablets, all orange, f/c, vardenafil (as hydrochloride trihydrate) 5 mg, net price 4-tab pack = £16.58, 8-tab pack = £33.19; 10 mg, 4-tab pack = £22.24, 8-tab pack = £44.47; 20 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

**Papaverine and phentolamine**

Although not licensed the smooth muscle relaxant papaverine has also been given by intracavernosal injection for erectile dysfunction. Patients with neurological or psychogenic impotence are more sensitive to the effect of papaverine than those with vascular abnormalities. Phentolamine is added if the response is inadequate [unlicensed indication].

Persistence of the erection for longer than 4 hours is an emergency, see advice in section 7.4.5.
8 Malignant disease and immunosuppression

8.1 Cytotoxic drugs

8.1.1 Alkylating drugs
8.1.2 Anthracyclines and other cytotoxic antibiotics
8.1.3 Antimetabolites
8.1.4 Vinca alkaloids and etoposide
8.1.5 Other antineoplastic drugs

8.2 Drugs affecting the immune response

8.2.1 Antiproliferative immunosuppressants
8.2.2 Corticosteroids and other immunosuppressants
8.2.3 Rituximab and alemtuzumab
8.2.4 Other immunomodulating drugs

8.3 Sex hormones and hormone antagonists in malignant disease

8.3.1 Oestrogens
8.3.2 Progestogens
8.3.3 Androgens
8.3.4 Hormone antagonists
8.3.4.1 Breast cancer
8.3.4.2 Prostate cancer and gonadorelin analogues
8.3.4.3 Somatostatin analogues

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of sub-clinical metastatic disease is known to be high). All chemotherapy drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Guidelines for handling cytotoxic drugs:
1. Trained personnel should reconstitute cytotoxics;
2. Reconstitution should be carried out in designated areas;
3. Protective clothing (including gloves, gowns, and masks) should be worn;
4. The eyes should be protected and means of first aid should be specified;
5. Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard);
6. Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material;
7. Staff exposure to cytotoxic drugs should be monitored.
Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

**Side-effects of cytotoxic drugs**

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers’ product literature should be consulted for full details of side-effects associated with individual drugs.

**Extravasation of intravenous drugs**

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. For information on the prevention and management of extravasation injury, see section 10.3.

**Oral mucositis**

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil, methotrexate, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of anti-septic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

**Tumour lysis syndrome**

Tumour lysis syndrome can occur as a result of massive cell breakdown following treatment of cancer sensitive to the chemotherapy. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow.

**Hyperuricaemia**

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol (section 10.1.4) should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine or azathioprine should be reduced if allopurinol needs to be given concomitantly (see Appendix 1).

**Rasburicase**

Rasburicase (section 10.1.4), a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy, for details, see p. 575. It rapidly reduces plasma uric acid and may be of particular value in reducing complications following treatment of leukaemias or bulky lymphomas.

**Nausea and vomiting**

Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and, to a lesser extent, abdominal radiotherapy; it may lead to refusal of further treatment. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to individual susceptibility.

**Mildly emetogenic treatment**—fluorouracil, etoposide, methotrexate (less than 100 mg/m²), the vinca alkaloids, and abdominal radiotherapy.

**Moderately emetogenic treatment**—the taxanes, doxorubicin, intermediate and low doses of cyclophosphamide, mitoxantrone (mitozantrone), and high doses of methotrexate (0.1–1.2 g/m²).

**Highly emetogenic treatment**—cisplatin, dacarbazine, and high doses of cyclophosphamide.

**Prevention of acute symptoms**

For patients at low risk of emesis, pretreatment with domperidone or, in adults over 20 years, with metoclopramide, continued for up to 24 hours after chemotherapy, is often effective (section 4.6). If metoclopramide or domperidone are not sufficiently effective, additional drugs such as dexamethasone (6–10 mg by mouth) or lorazepam (1–2 mg by mouth) may be used.
For patients at high risk of emesis or when other treatment is inadequate, a specific (5HT) serotonin antagonist (section 4.6), usually given by mouth, is often highly effective, particularly when used with dexamethasone; adding the neurokinin receptor antagonist, aprepitant (section 4.6) can improve control of cisplatin-related nausea and vomiting.

Prevention of delayed symptoms. Dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide or prochlorperazine. The 5HT antagonists may be less effective for delayed symptoms.

Prevention of anticipatory symptoms. Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Bone-marrow suppression All cytotoxic drugs except vincristine and bleomycin cause bone-marrow depression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as Carmustine, lomustine, and melphalan. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Fever in a neutropenic patient (neutrophil count less than 1.0 × 10⁹/litre) requires immediate broad-spectrum antibacterial therapy. Patients at low risk (those receiving chemotherapy for solid tumours, lymphoma or chronic leukaemia) can be treated with oral ciprofloxacin with or without co-amoxiclav (initially in hospital). All other patients should receive parenteral broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors, section 9.1.6.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHLRA/CHM advice (p. 509) and NICE guidance (p. 510).

Alopecia Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Reproductive function Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester.

Contraceptive advice should be offered where appropriate before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug may have less effect on fertility, but those with an alkylating drug carry the risk of causing permanent male sterility (there is no effect on potency). Pre-treatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion-rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Thromboembolism Venous thromboembolism can be a complication of cancer itself, but chemotherapy can also increase the risk.

Drugs for cytotoxic-induced side-effects

Anthracrycline side-effects

Anthracrycline-induced cardiotoxicity The anthracrycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

Dexrazoxane, an iron chelator, is licensed for the prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic cancer patients who have previously received anthracycline therapy. Patients receiving dexrazoxane should still be monitored for cardiac toxicity. The myelosuppressive effects of dexrazoxane may be additive to those of chemotherapy.

Anthracrycline extravasation Dexrazoxane is licensed for the treatment of anthracycline extravasation. The first dose should be given as soon as possible and within six hours after the injury. For further information on the prevention and management of extravasation injury, see section 10.3.

Local guidelines for the management of extravasation should be followed or specialist advice sought.

---

**DEXRAZOXANE**

**Indications** see notes above and under preparations

**Cautions** monitor full blood count; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

**Contra-indications** pregnancy (Appendix 4); breastfeeding

**Side-effects** nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, stomatitis, dry mouth, anorexia; dyspnoea; dizziness, syncope, asthenia, paraesthesia, tremor, fatigue, drowsiness; pyrexia; vaginal haemorrhage; myalgia; bone-marrow suppression; conjunctivitis; alopecia, pruritus; peripheral oedema; injection-site reactions including phlebitis

**Dose**

- See under preparations

**Cardoxane® (Novartis) ▼ (FIN)

Intravenous infusion, powder for reconstitution, dexrazoxane (as hydrochloride), net price 500-mg vial = £156.57

Dose prevention of anthracycline-induced cardiotoxicity, ADULT over 18 years, by intravenous infusion (30 minutes prior to anthracycline administration), 20 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose

**Savene® (TopoTarget) ▼ (FIN)

Intravenous infusion, powder for reconstitution, dexrazoxane (as hydrochloride), net price 10 x 500-mg vials (with diluent) = £6750.00

Dose anthracycline extravasation, ADULT over 18 years, by intravenous infusion, 1 g/m² (max. 2 g) daily for 2 days, then 500 mg/m² for 1 day

Note Local coolants such as ice packs should be removed at least 15 minutes before administration
Chemotherapy-induced mucositis and myelosuppression

Folinic acid (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folic acid rescue’).

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim.

When folinic acid and fluorouracil are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salt of folinic acid is also licensed for rescue therapy following methotrexate therapy and for use with fluorouracil for colorectal cancer.

Palifermin, a human keratinocyte growth factor, is licensed for the management of oral mucositis in patients with haematological malignancies receiving myeloablative therapy with autologous haematopoietic stem-cell support.

CALCIUM FOLINATE
(Calcium leucovorin)

Indications see notes above

Cautions avoid simultaneous administration of methotrexate; not indicated for pernicious anaemia or other megaloblastic anaemias due to vitamin B deficiency; pregnancy (Appendix 4) and breast-feeding (Appendix 5); interactions: Appendix 1 (folic acid);

Side-effects hypersensitivity reactions; rarely pyrexia after parenteral use

Dose

Note Doses expressed as folinic acid

• Prevention of methotrexate-induced adverse effects, usually started 24 hours after start of methotrexate infusion, by intramuscular injection, or by intravenous injection, or by intravenous infusion, 15 mg, repeated every 6 hours for 24 hours (may be continued by mouth); consult local treatment protocol for further information.

• Suspected methotrexate overdosage, by intravenous injection or by intravenous infusion (at a max. rate of 160 mg/minute), initial dose equal to or exceeding dose of methotrexate; consult poisons information service (p. 27) for advice on continuing management.

• Adjunct to fluorouracil in colorectal cancer, consult product literature

Calcium Folinate (Non-proprietary) [TA]

Tablets, scored, folinic acid (as calcium salt) 15 mg, net price 10-tab pack = £39.20, 30-tab pack = £85.74. Brands include Referolinon

Note Not all strengths and pack sizes are available from all manufacturers

Injection, folinic acid (as calcium salt) 3 mg/mL, net price 1-mL amp = £4.00, 10-mL amp = £4.62; 7.5 mg/mL, net price 2-mL amp = £7.80; 10 mg/mL, net price 5-mL vial = £19.41, 10-mL vial = £35.09, 30-mL vial = £94.69, 35-mL vial = £90.98

Note Not all strengths and pack sizes are available from all manufacturers

CALCIUM LEVOFOLINATE
(Calcium levoleucovorin)

Indications see notes above

Cautions see Calcium Folinate

Side-effects see Calcium Folinate

Dose

Note Doses expressed as levofolic acid

• Prevention of methotrexate-induced adverse effects, usually started 24 hours after beginning of methotrexate infusion, by intramuscular injection, or by intravenous injection or by intravenous infusion, usually 7.5 mg every 6 hours for 10 doses

• Suspected methotrexate overdosage, by intravenous injection or by intravenous infusion (at a max. rate of 160 mg/minute), initial dose at least 50% of the dose of methotrexate; consult poisons information service (p. 27) for advice on continuing management.

• Adjunct to fluorouracil in colorectal cancer, consult product literature

Isovorin® (Wyeth) ▼ [TA]

Injection, levofolic acid (as calcium salt) 10 mg/mL, net price 2.5-mL vial = £12.09, 5-mL vial = £26.00, 17.5-mL vial = £84.63

DISODIUM FOLINATE

Indications see notes above

Cautions see Calcium Folinate

Side-effects see Calcium Folinate

Dose

• As an antidote to methotrexate, see Calcium Folinate

• Adjunct to fluorouracil in colorectal cancer, consult product literature

Sodiofolin® (Medac) ▼ [TA]

Injection, folinic acid (as disodium salt) 50 mg/mL, net price 2-mL vial = £35.09, 8-mL vial = £126.25, 18-mL vial = £284.07

PALIFERMIN

Indications see notes above

Cautions pregnancy (Appendix 4)

Contra-indications breast-feeding

Side-effects taste disturbance, thickening and discoloration of tongue; fever; oedema; arthralgia; rash, pruritus, erythema

Dose

• By intravenous injection, 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours before myeloablative therapy) then 3 further doses at least 24 hours after myeloablative therapy, starting on same day as (but after) stem-cell infusion; CHILD not recommended
Kepivance® (Amgen) ▼ (PaF)
Injection, powder for reconstitution, palifermin, net price 6.25-mg vial = £544.24

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide and ifosfamide; it is caused by the metabolite acrolein. Mesna reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

MESNA
Indications see notes above
Contra-indications hypersensitivity to thiol-containing compounds
Side-effects nausea, vomiting, colic, diarrhoea, fatigue, headache, limb and joint pains, depression, irritability, rash, hypotension and tachycardia; rarely hypersensitivity reactions (more common in patients with auto-immune disorders)
Dose
Note Doses calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment—for details consult product literature
• By mouth, dose is given 2 hours before oxazaphosphorine treatment and repeated 2 and 6 hours after treatment
• By intravenous injection, dose is given with oxazaphosphorine treatment and repeated 4 and 8 hours after treatment

Uromitexan® (Baxter) ▼ (PaF)
Tablets, t/c, mesna 400 mg, net price 10-tab pack = £23.20; 600 mg, 10-tab pack = £30.10
Injection, mesna 100 mg/mL. Net price 4-mL amp = £1.95; 10-mL amp = £4.38
Note For oral administration contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container

8.1.1 Alkylating drugs

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication. In addition to the side-effects common to many cytotoxic drugs (section 8.1), there are two problems associated with prolonged usage. Firstly, gametogenesis is often severely affected (section 8.1). Secondly, prolonged use of these drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

Cyclophosphamide is used for the treatment of chronic lymphocytic leukaemia, the lymphomas, soft-tissue and osteogenic sarcoma, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver. A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation) mesna (given initially intravenously then by mouth) can also help prevent cystitis—see under Urothelial Toxicity (section 8.1).

Ifosfamide is related to cyclophosphamide and is given intravenously; mesna (section 8.1) is routinely given with it to reduce urothelial toxicity.

Chlorambucil is used to treat chronic lymphocytic leukaemia, non-Hodgkin’s lymphoma, Hodgkin’s disease, and Waldenstrom’s macroglobulinaemia. It is given by mouth. Side-effects, apart from bone-marrow suppression, are uncommon. However, patients occasionally develop severe widespread rashes which can progress to Stevens-Johnson syndrome or to toxic epidermal necrolysis. If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.

Melphalan is licensed for the treatment of multiple myeloma, advanced ovarian adenocarcinoma, advanced breast cancer, childhood neuroblastoma, and polycythæmia vera. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities. Intestinal pneumonitis and life-threatening pulmonary fibrosis are associated with melphalan.

Busulfan (busulphan) is given by mouth to treat chronic myeloid leukaemia. Busulfan given by mouth or intravenously, followed by cyclophosphamide, is also licensed as conditioning treatment before haematopoietic stem-cell transplantation in adults and children. Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia. Rarely, progressive pulmonary fibrosis is associated with busulfan. Skin hyperpigmentation is a common side-effect of oral therapy.

Lomustine is a lipid-soluble nitrosourea and is given by mouth. It is used mainly to treat Hodgkin’s disease resistant to conventional therapy, malignant melanoma and certain solid tumours. Bone-marrow toxicity is delayed, and the drug is therefore given at intervals of 4 to 6 weeks. Permanent bone-marrow damage can occur with prolonged use. Nausea and vomiting are common and moderately severe.

Carmustine given intravenously has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin’s lymphomas, and brain tumours. Cumulative renal damage and delayed pulmonary fibrosis may occur with intravenous use. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

NICE guidance (carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma)
See p. 476

Estramustine is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect
and (by reducing testosterone concentration) a hormonal effect.

**Tresolusfan** is given by mouth or by intravenous or intraperitoneal administration and is used to treat ovarian cancer. Skin pigmentation is a common side-effect and allergic alveolitis, pulmonary fibrosis and haemorrhagic cystitis occur rarely.

**Thiotepa** is usually used as an intracavitary drug for the treatment of malignant effusions or bladder cancer (section 7.4.4). It is also occasionally used to treat breast cancer, but requires parenteral administration.

**Mitobronitol** is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies, see p. 939.

---

**BUSULFAN**

(Busulphan)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor cardiac function; previous radiation therapy; avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); interactions: Appendix 1 (busulfan)

**Contra-indications** pregnancy (Appendix 4); breastfeeding

**Side-effects** see section 8.1 and notes above; also hepatotoxicity (including hepatic veno-occlusive disease, hyperbilirubinaemia, jaundice and fibrosis), cardiac tamponade in thalassaemia; pneumonia; skin hyperpigmentation

**Dose**

• Chronic myeloid leukaemia, induction of remission, by mouth, 80 micrograms/kg daily (max. 4 mg); maintenance, usually 0.5–2 mg daily

• Conditioning treatment before haematopoietic stem-cell transplantation, by mouth or by intravenous infusion, consult product literature

**Busilvex**

(Fabre) ▼ PH

Concentrate for intravenous infusion, busulfan 6 mg/mL, net price 10-mL vial = £201.25

**Mylegran**

(GSK) ▼ PH

Tablets, f/c, busulfan 2 mg, net price 25-tab pack = £5.20

---

**CARMUSTINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above

**Contra-indications** pregnancy (Appendix 4), breast-feeding

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Glialdel**

(Link) ▼ PH

Implant, Carmustine 7.7 mg, net price = £650.38

---

**CHLORAMBUCIL**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; history of epilepsy and children with nephrotic syndrome (increased risk of seizures); hepatic impairment (Appendix 2); avoid in acute porphyria (section 9.8.2)

**Contra-indications** pregnancy (Appendix 4), breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

• Hodgkin’s disease, used alone, 200 micrograms/kg daily for 4–8 weeks

• Non-Hodgkin’s lymphoma, used alone, initially 100–200 micrograms/kg daily for 4–8 weeks then dose reduced or given intermittently

• Chronic lymphocytic leukaemia, initially 150 micrograms/kg daily until leucocyte count sufficiently reduced; maintenance (started 4 weeks after end of first course) 100 micrograms/kg daily

• Waldenstrom’s macroglobulinaemia, 6–12 mg daily until leucopenia occurs, then reduce to 2–8 mg daily

**Leukeran**

(GSK) ▼ PH

Tablets, f/c, brown, chlorambucil 2 mg, net price 25-tab pack = £8.36

---

**CYCLOPHOSPHAMIDE**

**Indications** see notes above; rheumatoid arthritis (section 10.1.3)

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); renal impairment (Appendix 3); avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (cyclophosphamide)

**Contra-indications** haemorrhagic cystitis; pregnancy (Appendix 4), breast-feeding (Appendix 5)

**Side-effects** see section 8.1 and notes above; also anorexia; cardiotoxicity at high doses; interstitial pulmonary fibrosis; inappropriate secretion of aldosterone; disturbances of carbohydrate metabolism; urothelial toxicity; pigmentation of palms, nails, and soles

**Cyclophosphamide**

(Non-proprietary) ▼ PH

Tablets, s/c, cyclophosphamide (anhydrous) 50 mg, net price 20 = £2.49. Label: 27

---

**ESTRAMUSTINE PHOSPHATE**

**Indications** prostate cancer

**Cautions** see section 8.1; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

**Contra-indications** peptic ulceration, cardiac disease

**Side-effects** see section 8.1; also gynaecomastia, altered liver function, cardiovascular disorders (angina and rare reports of myocardial infarction)

**Dose**

• 0.14–1.4 g daily in divided doses (usual initial dose 560 mg daily)

**Counselling** Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with dairy products

**Estracyt**

(Pharmacia) ▼ PH

Capsules, estramustine phosphate 140 mg (as disodium salt). Net price 100-cap pack = £171.28. Label: 23, counselling, see above
### Anthracyclines and Other Cytotoxic Antibiotics

**8.1.2** Anthracyclines and other cytotoxic antibiotics

**Indications** see notes above

**Cautions** see section 8.1 and notes above; achieve satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly); renal impairment (avoid if serum creatinine concentration greater than 120 micromol/litre; Appendix 3); **interactions:** Appendix 1 (ifosfamide)

**Contra-indications** myelosuppression; urinary-tract obstruction; acute infection (including urinary-tract infection); urothelial damage; hepatic impairment; pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above; also drowsiness, confusion, disorientation, restlessness, psychosis; urothelial toxicity, renal toxicity (see Cautions, above)

**Mitoxana** (Baxter) **Injection**, powder for reconstitution. Ifosfamide. Net price 1-g vial = £27.03; 2-g vial = £45.49 (hospital only)

**MELPHALAN**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; renal impairment; coeliac disease; pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**
- Used alone, 120–130 mg/m body-surface every 6–8 weeks
- Lomustine (Medac) **Injection**, blue/clear, lomustine 40 mg. Net price 20-cap pack = £396.19
- **Note** The brand name CCNU has been used for lomustine capsules

**THIOTEPA**

**Indications** see notes above and section 7.4.4

**Cautions** see section 8.1; **interactions:** Appendix 1 (thiotepa)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1

**Thiotepa** (Goldshield) **Injection**, powder for reconstitution. Thiotepa, net price 15-mg vial = £5.20

**TREOSULFAN**

**Indications** see notes above

**Cautions** see section 8.1

**Contra-indications** pregnancy; breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**
- Consult product literature
  - **Treasulfan** (Medac) **Injection**, treosulfan 250 mg. Net price 20 = £77.34 Label: 25
- **Injection**, powder for reconstitution. Treosulfan. Net price 1 g = £39.44; 5 g = £152.41 (both in infusion bottle with transfer needle)

**8.1.2 Anthracyclines and other cytotoxic antibiotics**

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be avoided as it may result in markedly enhanced toxicity.

Daunorubicin, doxorubicin, epirubicin and idarubicin are anthracycline antibiotics. Mitoxantrone (mitozantrone) is an anthracycline derivative.

Doxorubicin is used to treat the acute leukaemias, Hodgkin's and non-Hodgkin's lymphomas, paediatric malignancies and some solid tumours. It is given by injection into a fast-running infusion, commonly at 21-day intervals. Extravasation can cause severe tissue necrosis. Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose. Supraventricular tachycardia related to drug administration is an uncommon complication. Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m because symptomatic and potentially fatal heart failure is common above this dose. Patients with cardiac disease, hypertension, the elderly, and those who have received myocardial irradiation should be treated cautiously. Cardiac monitoring may assist in determining safe dosage. Some evidence suggests that weekly low-dose administration may be less cardiotoxic. Doxorubicin is also given by bladder instillation for the treatment of transitional cell carcinoma, papillary bladder tumours and carcinoma in situ.

Liposomal formulations of doxorubicin for intravenous use are also available. They may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3

**IFOSFAMIDE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly); renal impairment (avoid if serum creatinine concentration greater than 120 micromol/litre; Appendix 3); **interactions:** Appendix 1 (ifosfamide)

**Contra-indications** myelosuppression; urinary-tract obstruction; acute infection (including urinary-tract infection); urothelial damage; hepatic impairment; pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above; also drowsiness, confusion, disorientation, restlessness, psychosis; urothelial toxicity, renal toxicity (see Cautions, above)

**Mitoxana** (Baxter) **Injection**, powder for reconstitution. Ifosfamide. Net price 1-g vial = £27.03; 2-g vial = £45.49 (hospital only)

**LOMUSTINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above

**Contra-indications** severe renal impairment; coeliac disease; pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**
- Used alone, 120–130 mg/m body-surface every 6–8 weeks
- Lomustine (Medac) **Injection**, blue/clear, lomustine 40 mg. Net price 20-cap pack = £396.19
- **Note** The brand name CCNU has been used for lomustine capsules

**MELPHALAN**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; renal impairment (Appendix 3); **interactions:** Appendix 1 (melphalan)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**
- By mouth, multiple myeloma, dose may vary according to regimen; typical dose 150 micrograms/kg daily for 4 days, repeated every 6 weeks
- Ovarian adenocarcinoma, 200 micrograms/kg daily for 5 days, repeated every 4–8 weeks
- Advanced breast cancer, 150 micrograms/kg daily for 5 days, repeated every 6 weeks
- Polycythaemia vera, initially, 6–10 mg daily reduced after 5–7 days to 2–4 mg daily until satisfactory response then further reduce to 2–6 mg per week
- **By intravenous injection or infusion and regional arterial perfusion, consult product literature**

**Alkeran®** (GSK) **Injection**, powder for reconstitution. Melphalan 50 mg (as hydrochloride). Net price 50-mg vial (with solvent-diluent) = £27.61

**TREOSULFAN**

**Indications** see notes above

**Cautions** see section 8.1

**Contra-indications** pregnancy; breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**
- Consult product literature
  - **Treasulfan** (Medac) **Injection**, treosulfan 250 mg. Net price 20 = £77.34 Label: 25
- **Injection**, powder for reconstitution. Treosulfan. Net price 1 g = £39.44; 5 g = £152.41 (both in infusion bottle with transfer needle)
Malignant disease and immunosuppression

8.1.2 Anthracyclines and other cytotoxic antibiotics

Mitoxantrone (mitoxantrone) is structurally related to doxorubicin, and clinical trials suggest that it is as effective in the treatment of metastatic breast cancer. A maximum cumulative dose of 0.9–1 g/m² is recommended to help avoid cardiotoxicity. Like doxorubicin it is given intravenously and by bladder instillation.

Idarubicin has general properties similar to those of doxorubicin; it is mostly used in the treatment of haematological malignancies. Idarubicin is given intravenously and may also be given by mouth.

Daunorubicin also has general properties similar to those of doxorubicin. It should be given by intravenous infusion and is indicated for acute leukaemias. A liposomal formulation for intravenous use is licensed for AIDS-related Kaposi's sarcoma.

Use with trastuzumab

Concomitant use of anthracyclines with trastuzumab (section 8.1.5) is associated with cardiotoxicity; for details, see p. 485.

Bleomycin is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin's lymphoma and adult non-lymphocytic leukaemia. It is given intravenously and is well tolerated but myelosuppression and dose-related cardiotoxicity occur; cardiac examinations are recommended after a cumulative dose of 160 mg/m².

Bleomycin is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin's lymphoma. It causes little bone-marrow suppression but dermatological toxicity is common and increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques may occur. Mucositis is also relatively common and an association with Raynaud's phenomenon is reported. Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously. The principal problem associated with the use of bleomycin is progressive pulmonary fibrosis. This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units (see Bleomycin, below) and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug. Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100 000 units—see Bleomycin below) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

Bleomycin is principally used to treat paediatric cancers; it is given intravenously. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone-marrow toxicity and therefore it is usually administered at 6-weekly intervals. Prolonged use may result in permanent bone-marrow damage. It may also cause lung fibrosis and renal damage.

Dactinomycin is principally used to treat paediatric cancers; it is given intravenously. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone-marrow toxicity and therefore it is usually administered at 6-weekly intervals. Prolonged use may result in permanent bone-marrow damage. It may also cause lung fibrosis and renal damage.

Dactinomycin is principally used to treat paediatric cancers; it is given intravenously. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone-marrow toxicity and therefore it is usually administered at 6-weekly intervals. Prolonged use may result in permanent bone-marrow damage. It may also cause lung fibrosis and renal damage.

DACTINOMYCIN

(Actinomycin D)

Indications see notes above
Caution see section 8.1 and notes above; caution in handling—irritant to tissues
Contra-indications pregnancy (Appendix 4); breastfeeding
Side-effects see section 8.1 and notes above

Cosmegen Lyovac® (Ovation) Injection, powder for reconstitution, dactinomycin, net price 500-microgram vial = £6.75

DAUNORUBICIN

Indications see notes above
Caution see section 8.1 and notes above; renal impairment (Appendix 3); caution in handling—irritant to tissues
Contra-indications pregnancy (Appendix 4); breastfeeding
Side-effects see section 8.1 and notes above

Daunorubicin (Non-proprietary) Injection, powder for reconstitution, daunorubicin (as hydrochloride), net price 20-mg vial = £44.76

Note The brand name Cerubidin was formerly used.

Lipid formulation DaunoXome® (Diatos) Concentrate for intravenous infusion, daunorubicin encapsulated in liposomes. For dilution before use. Net price 50-mg vial = £137.67

For advanced AIDS-related Kaposi’s sarcoma.
DOXORUBICIN HYDROCHLORIDE

**Indications** see notes above and section 7.4.4

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); caution in handling—irritant to tissues; interactions: Appendix 1 (doxorubicin)

**Contra-indications** see notes above; severe hepatic impairment; severe myocardial insufficiency, recent myocardial infarction, severe arrhythmias; previous treatment with maximum cumulative doses of doxorubicin or other anthracyclines; intravascular use in urinary infections, bladder inflammation, and in urethral stenosis with catheterisation difficulties; pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Pharmorubicin** (Non-proprietary) (Pharmacia)

**Injection** powder for reconstitution, doxorubicin hydrochloride, net price 10-mg vial = £18.72; 50-mg vial = £96.86

**Note** The brand name Adriamycin was formerly used

**Mitoxantrone** (Mitoxantrone)

**Injection** powder for reconstitution, mitoxantrone hydrochloride, net price 5-mg vial = £20.60; 25-mL vial = £102.00, 100-mL vial = £412.00

**Lipid formulation**

**Caelyx** (Scherering-Plough) ▼ (Wyeth)

Concentrate for intravenous infusion, pegylated doxorubicin hydrochloride 2 mg/mL, encapsulated in liposomes. For dilution before use. Net price 10-mL vial = £382.51, 25-mL vial = £813.49

For AIDS-related Kaposi’s sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease, for advanced ovarian cancer when platinum-based chemotherapy has failed, for progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation, and as monotherapy for metastatic breast cancer in patients with increased cardiac risk

**Myocet** (Zeneus) ▼ (Wyeth)

**Injection** powder for reconstitution, doxorubicin hydrochloride (as doxorubicin–citrate complex) encapsulated in liposomes, net price 50-mg vial (with vials of liposomes and buffer) = £64.50

For use with cyclophosphamide for metastatic breast cancer in patients with increased cardiac risk

**EPIRUBICIN HYDROCHLORIDE**

**Indications** see notes above and section 7.4.4

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); caution in handling—irritant to tissues; interactions: Appendix 1 (epirubicin)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Pharmorubicin** Rapid Dissolution (Pharmacia) (Pharmacia)

**Injection** powder for reconstitution, epirubicin hydrochloride, net price 50-mg vial = £96.54

**Pharmorubicin** Solution for Injection (Pharmacia) (Pharmacia)

**Injection** epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £19.31, 25-mL vial = £96.54, 100-mL vial = £386.16

**IDARUBICIN HYDROCHLORIDE**

**Indications** advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines); acute leukaemias—see notes above

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3); caution in handling—irritant to tissues

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- **By mouth**, acute non-lymphocytic leukaemia, monotherapy, 30 mg/m³ daily for 3 days or in combination therapy, 15–30 mg/m³ daily for 3 days

- **Advanced breast cancer**, monotherapy, 45 mg/m³ as a single dose or 15 mg/m³ daily for 3 consecutive days; repeat every 3–4 weeks

**Note** Max. cumulative dose by mouth (for all indications) 400 mg/m³

- **By intravenous administration**, consult product literature

**Zavedos** (Pharmacia) (Wyeth)

**Capsules** idarubicin hydrochloride, 5 mg (red), net price 1-cap pack = £34.56; 10 mg (red/white), 1-cap pack = £69.12; 25 mg (white), 1-cap pack = £172.90. Label: 25

**Injection** powder for reconstitution, idarubicin hydrochloride, net price 5-mg vial = £87.36; 10-mg vial = £174.72

**MITOMYCIN**

**Indications** see notes above and section 7.4.4

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Mitomycin C Kyowa** (Kyowa Hakko) (Kyowa Hakko)

**Injection** powder for reconstitution, mitomycin. Net price 2-mg vial = £5.88; 10-mg vial = £19.37; 20-mg vial = £36.94; 40-mg vial = £73.88 (hosp. only)

**MITOXANTRONE** (Mitozantrone)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; intrathecal administration not recommended

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Mitoxantrone** (Non-proprietary) (Wyeth)

Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £100.00

**Onkotrone** (Baxter) (Wyeth)

Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £121.85, 12.5-mL vial = £152.33, 15-mL vial = £203.04
8.1.3 Antimetabolites

Antimetabolites are incorporated into new nuclear material or combine irreversibly with vital cellular enzymes, preventing normal cellular division.

**Methotrexate** inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines. It is given by mouth, intravenously, intramuscularly, or intrathecally.

Methotrexate is used as maintenance therapy for childhood acute lymphoblastic leukaemia, and as a therapy for established meningeal cancer or lymphoma. Methotrexate causes myelosuppression, mucositis, and rarely pneumonitis. It is contra-indicated in significant renal impairment because it is excreted primarily by the kidney. It is also contra-indicated in patients with severe hepatic impairment. It should also be avoided in the presence of significant pleural effusion or ascites because it can accumulate in these fluids, and its subsequent return to the circulation may cause myelosuppression. Systemic toxicity may follow intrathecal administration and blood counts should be carefully monitored.

Folinic acid (section 8.1) following methotrexate administration helps to prevent methotrexate-induced mucositis or myelosuppression.

**Capecitabine**, which is metabolised to fluorouracil, is given by mouth. It is licensed for adjuvant treatment of advanced colon cancer following surgery, for monotherapy or combination therapy of metastatic colorectal cancer, and for first-line treatment of advanced gastric cancer in combination with a platinum-based regimen. Capecitabine is also licensed for second-line treatment of locally advanced or metastatic breast cancer either in combination with docetaxel (where previous therapy included an anthracycline) or alone (after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated).

**NICE guidance**

Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer (April 2006)

Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer.

**NICE guidance**

Capecitabine and tegafur with uracil for metastatic colorectal cancer (May 2003)

Capecitabine or tegafur with uracil (in combination with folinic acid) is an option for the first-line treatment of metastatic colorectal cancer.

**Fludarabine** is licensed for the initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first-line treatment in patients with sufficient bone-marrow reserves; it is given by mouth, by intravenous injection, or by intravenous infusion. Fludarabine is well tolerated but it does cause myelosuppression, which may be cumulative. Immunosuppression is also common (see panel on cladribine and fludarabine below) and co-trimoxazole is often used to prevent pneumocystis infection. Immune-mediated haemolytic anaemia, thrombocytopenia, and neutropenia are less common side-effects.

The Scottish Medicines Consortium has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

**NICE guidance**

Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007)

Fludarabine monotherapy, is not recommended for the first-line treatment of chronic lymphocytic leukaemia.

**Cytarabine** acts by interfering with pyrimidine synthesis. It is given subcutaneously, intravenously, or intrathecally. Its predominant use is in the induction of remission of acute myeloblastic leukaemia. It is a potent myelosuppressant and requires careful haematological monitoring. A liposomal formulation of cytarabine for intrathecal use is licensed for lymphomatous meningitis.

**Cladribine** is given by intravenous infusion for the treatment of hairy cell leukaemia. It is also given for chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent. Cladribine produces severe myelosuppression, with neutropenia, anaemia, and thrombocytopenia; haemolytic anaemia has also been reported. High doses of cladribine have been associated with acute renal failure and severe neurotoxicity.
**Cladribine** and **fludarabine** have a potent and prolonged immunosuppressive effect. Patients treated with cladribine or fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

**Clofarabine** is licensed for the treatment of acute lymphoblastic leukaemia in patients aged 1 to 21 years who have relapsed or are refractory after receiving at least two previous regimens. It is given by intravenous infusion.

**Nelarabine** is licensed for the treatment of T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens. It is given by intravenous infusion. Neurotoxicity is common with nelarabine and close monitoring for neurological adverse events is strongly recommended—discontinue if neurotoxicity occurs.

The Scottish Medicines Consortium (p. 3) has advised (March 2008) that nelarabine (Atriasene®) is accepted for restricted use within NHS Scotland, within the licensed indication, for the treatment of T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma when used to bridge to stem cell transplantation.

**Gemcitabine** is used intravenously, it is given alone for palliative treatment or with cisplatin as first-line treatment for locally advanced or metastatic non-small cell lung cancer. It is also used in the treatment of locally advanced or metastatic pancreatic cancer (see NICE guidance below). Combined with cisplatin, gemcitabine is also licensed for the treatment of advanced bladder cancer. Combined with paclitaxel, gemcitabine is also licensed for the treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (see NICE guidance below). Gemcitabine is generally well tolerated but it can cause mild gastro-intestinal side-effects and rashes; renal impairment, pulmonary toxicity and influenza-like symptoms have also been reported. Haemolytic uraemic syndrome has been reported rarely and gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

The Scottish Medicines Consortium has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

**Fluorouracil** is usually given intravenously because absorption following oral administration is unpredictable. It is used to treat a number of solid tumours, including gastro-intestinal tract cancers and breast cancer. It is commonly used with folic acid in advanced colorectal cancer. It may also be used topically for certain malignant and pre-malignant skin lesions. Toxicity is unusual, but may include myelosuppression, mucositis, and rarely a cerebellar syndrome. On prolonged infusion, a desquamative hand-foot syndrome may occur.

**Pemetrexed** inhibits thymidylate transferase and other folate-dependent enzymes. It is licensed for use with cisplatin for the treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (see NICE guidance, below). Pemetrexed is also licensed for use with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology, and as monotherapy for its second-line treatment (but see NICE guidance, below). Pemetrexed is given by intravenous infusion. Common adverse effects include myelosuppression, gastro-intestinal toxicity, and skin disorders.

The Scottish Medicines Consortium (p. 3) has advised (July 2005) that pemetrexed (Alimta®) in combination with cisplatin is accepted for restricted use within NHS Scotland for the treatment of chemotherapy-naive patients with stage III/IV unresectable malignant pleural mesothelioma.

The Scottish Medicines Consortium (p. 3) has advised (August 2008) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology, and as monotherapy for its second-line treatment (but see NICE guidance, below). Pemetrexed is given by intravenous infusion. Common adverse effects include myelosuppression, gastro-intestinal toxicity, and skin disorders.

**Gemcitabine for the treatment of pancreatic cancer (May 2001)**

Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks]. Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma.

**Fluorouracil** is usually given intravenously because absorption following oral administration is unpredictable. It is used to treat a number of solid tumours, including gastro-intestinal tract cancers and breast cancer. It is commonly used with folic acid in advanced colorectal cancer. It may also be used topically for certain malignant and pre-malignant skin lesions. Toxicity is unusual, but may include myelosuppression, mucositis, and rarely a cerebellar syndrome. On prolonged infusion, a desquamative hand-foot syndrome may occur.

**Pemetrexed** inhibits thymidylate transferase and other folate-dependent enzymes. It is licensed for use with cisplatin for the treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (see NICE guidance, below). Pemetrexed is also licensed for use with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology, and as monotherapy for its second-line treatment (but see NICE guidance, below). Pemetrexed is given by intravenous infusion. Common adverse effects include myelosuppression, gastro-intestinal toxicity, and skin disorders.

The Scottish Medicines Consortium (p. 3) has advised (July 2005) that pemetrexed (Alimta®) in combination with cisplatin is accepted for restricted use within NHS Scotland for the treatment of chemotherapy-naive patients with stage III/IV unresectable malignant pleural mesothelioma.

The Scottish Medicines Consortium (p. 3) has advised (August 2008) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology, and as monotherapy for its second-line treatment (but see NICE guidance, below). Pemetrexed is given by intravenous infusion. Common adverse effects include myelosuppression, gastro-intestinal toxicity, and skin disorders.

**Gemcitabine for the treatment of metastatic breast cancer (January 2007)**

Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel plus capecitabine are also considered appropriate.
8 Malignant disease and immunosuppression

**mercaptopurine** is used as maintenance therapy for the acute leukaemias and in the management of ulcerative colitis and Crohn's disease (section 1.5.3). Azathioprine, which is metabolised to mercaptopurine, is generally used as an immunosuppressant (section 8.2.1 and section 10.1.3). The dose of both drugs should be reduced if the patient is receiving allopurinol since it interferes with their metabolism.

**Tegafur** (in combination with uracil) is given by mouth, together with calcium folinate, in the management of metastatic colorectal cancer. Tegafur is a produg of fluorouracil; uracil inhibits the degradation of fluorouracil. Tegafur (with uracil) has been shown to be of similar efficacy as a combination of fluorouracil and folinic acid for metastatic colorectal cancer. For NICE guidance on capecitabine and tegafur with uracil for metastatic colorectal cancer, see above.

**Tygocin** (thioguanine) is given by mouth for the treatment of acute leukaemias and chronic myeloid leukaemia. It can be given at various stages of treatment in short-term cycles. Long-term therapy is no longer recommended because of the high risk of liver toxicity; treatment with thioguanine should be discontinued if liver toxicity develops.

**NICE guidance**

**Pemetrexed for the treatment of non-small cell lung cancer (August 2007)**

Pemetrexed is not recommended for the treatment of locally advanced or metastatic non-small cell lung cancer.

Patients currently receiving pemetrexed should have the option to continue therapy until they and their clinicians consider it appropriate to stop.

Raltitrexed, a thymidylate synthase inhibitor, is given intravenously for palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used. It is probably of similar efficacy to fluorouracil. Raltitrexed is generally well tolerated, but can cause marked myelosuppression and gastro-intestinal side-effects.

**NICE guidance**

**irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer**

See p. 478

**CAPECITABINE**

**Indications** see notes above

Cautions see section 8.1: history of significant cardiovascular disease, arrhythmias; monitor plasma-calcium concentration; diabetes mellitus; renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); interactions: Appendix 1 (fluorouracil)

Contra-indications hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding

Side-effects see section 8.1 and notes above; hand-foot (desquamative) syndrome; diarrhoea

Dose

- Stage III colon cancer, adjuvant following surgery, ADULT over 18 years 1.25 g/m twice daily for 14 days, followed by a 7-day interval, given as 3-week cycles for a total of 8 cycles
- Metastatic colorectal cancer, monotherapy, ADULT over 18 years 1.25 g/m twice daily for 14 days; subsequent courses repeated after a 7-day interval
- Metastatic colorectal cancer, in combination therapy, ADULT over 18 years 0.8–1 g/m twice daily for 14 days, subsequent courses repeated after a 7-day interval or 625 mg/m twice daily given continuously
- Advanced gastric cancer, in combination with a platinum-based regimen, ADULT over 18 years 0.8–1 g/m twice daily for 14 days, subsequent courses repeated after a 7-day interval or 625 mg/m twice daily given continuously
- Locally advanced or metastatic breast cancer, monotherapy or in combination with docetaxel, ADULT over 18 years 1.25 g/m twice daily for 14 days; subsequent courses repeated after a 7-day interval

Note Adjust dose according to tolerability—consult product literature

Xeloda® (Roche) ▼ £165.00 Tablets, 500 mg, net price 60-tab pack = £44.47; 500 mg, 120-tab pack = £295.06. Label: 21

**CLOFARABINE**

Indications see notes above

Cautions see section 8.1 and notes above; use irradiated blood only; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Contra-indications pregnancy (Appendix 4); breast-feeding

Side-effects see section 8.1 and notes above; also constipation, diarrhoea, abdominal pain, flatulence; oedema, tachycardia, cough, dyspnoea; dizziness, insomnia, anxiety, headache; chills, asthenia, malaise; myalgia, arthralgia; sweating, rash, pruritus, and purpura

Leustat® (Janssen-Cilag) ▼ Concentrate for intravenous infusion, cladribine 1 mg/mL. For dilution and use as an infusion, net price 10-mL vial = £169.53

For hairy cell leukaemia and for B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent

Litak® (Lipomed) ▼ Injection (for subcutaneous use only—no dilution required), cladribine 2 mg/mL, net price 5-mL vial = £165.00

For hairy cell leukaemia

**EVOTRA** (Bioenvision) ▼ £1200.00 Concentrate for intravenous infusion, clofarabine 1 mg/mL, net price 20-mL vial = Electrolytes Na 3.08 mmol/vial

**CLADRIBINE**

Indications see notes above

Cautions see section 8.1 and notes above; use irradiated blood only; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Contra-indications pregnancy (Appendix 4); breast-feeding

Side-effects see section 8.1; also jaundice; tachycardia, flushing, hypotension, pericardial effusion, haematemesis; dyspnoea, cough; anxiety, agitation, dizziness, drowsiness, headache, paraesthesia, peripheral neuropathy, restlesslessness; rash, pruritus, sweating

**CAPECITABINE**

Indications see notes above

Cautions see section 8.1; history of significant cardiovascular disease, arrhythmias; monitor plasma-calcium concentration; diabetes mellitus; renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); interactions: Appendix 1 (fluorouracil)

Contra-indications hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding

Side-effects see section 8.1 and notes above; hand-foot (desquamative) syndrome; diarrhoea

Dose

- Stage III colon cancer, adjuvant following surgery, ADULT over 18 years 1.25 g/m twice daily for 14 days, followed by a 7-day interval, given as 3-week cycles for a total of 8 cycles
- Metastatic colorectal cancer, monotherapy, ADULT over 18 years 1.25 g/m twice daily for 14 days; subsequent courses repeated after a 7-day interval
**FLUDARABINE PHOSPHATE**

**Indications**  see notes above

**Cautions** see section 8.1 and notes above; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to skin cancer; renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); interactions: Appendix 1 (fludarabine)

**Contra-indications** haemolytic anaemia, pregnancy (Appendix 4); breast-feeding

**Side-effects**  see section 8.1 and notes above; also local irritation with topical preparation

**Dose**
- By mouth, maintenance 15 mg/kg weekly; max. in one day 1 g
- By intravenous injection or infusion, consult product literature

**FLUOROURACIL**

**Indications**  see notes above; pre-malignant and malignant skin lesions (section 13.8.1)

**Cautions** see section 8.1 and notes above; caution in handling—irritant to tissues; hepatic impairment (Appendix 2); interactions: Appendix 1 (fluorouracil)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects**  see section 8.1 and notes above; also local irritation with topical preparation

**Dose**
- By mouth, maintenance 15 mg/kg weekly; max. in one day 1 g
- By intravenous injection or infusion, consult product literature

**GEMCITABINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects**  see section 8.1 and notes above

**MERCAPTOPURINE**

**Indications** acute leukaemias and chronic myeloid leukaemia; inflammatory bowel disease [unlicensed indication] (section 1.5.3)

**Cautions** see section 8.1 and notes above; monitor liver function—hepatic impairment (Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (mercaptopurine)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects**  see section 8.1 and notes above; also hepatotoxicity; rarely intestinal ulceration, pancreatitis

**Dose**
- Initially 2.5 mg/kg daily

**METHOTREXATE**

**Indications** see notes above and under Dose; Crohn's disease [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.3)

**Cautions** see section 8.1, notes above and section 10.1.3; hepatic impairment (Appendix 2); renal impairment (avoid if creatinine clearance less than 20 mL/minute; Appendix 3); interactions: Appendix 1 (methotrexate)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects**  see section 8.1, notes above and section 10.1.3
8.1.3 Antimetabolites

**Dose**

- By mouth, leukaemia in children (maintenance), 15 mg/m weekly in combination with other drugs

**Important**

Note that the above dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

- By intravenous injection or infusion, or by intramuscular injection, or intrathecal administration, consult product literature

**Methotrexate** (Non-proprietary)

**Injection**, methotrexate (as sodium salt) 2.5 mg/mL, net price 2-mL vial = £2.62; 25 mg/mL, 2-mL vial = £6.22, 20-mL vial = £25.07

**Injection**, methotrexate 100 mg/mL (not for intrathecal use), net price 10-mL vial = £78.33, 50-mL vial = £380.07

**Oral preparations** Section 10.1.3

**NELARABINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; previous or concurrent intrathecal chemotherapy or craniospinal irradiation (increased risk of neurotoxicity)

**Driving** May affect performance of skilled tasks (e.g. driving)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1; also abdominal pain, constipation, taste disturbance, anorexia, diarrhea, hypotension, oedema; pleural effusion, wheezing, dyspnoea, cough; confusion, seizures, amnesia, drowsiness, peripheral neurological disorders, hypoaesthesia, paraesthesia, ataxia, demyelination, tremor, dizziness, headache, asthenia, fatigue; pyrexia; electrolyte disturbances; blurred vision; muscle weakness, myalgia, arthralgia; benign and malignant tumours also reported

**Atriance** (GSK) ▼ (Novartis)

**Intravenous infusion**, nedarabine 5 mg/mL, net price 50-mL vial = £222.00

**Electrolytes** Na 3.75 mmol/vial

**PEMETREXED**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; history of cardiovascular disease; diabetes; prophylactic folic acid and vitamin B supplementation required (consult product literature); renal impairment (avoid if creatinine clearance less than 45 mL/minute; Appendix 3)

**Contra-indications** pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see section 8.1 and notes above; also dehydration, hepatitis, colitis, myocardial infarction, transient ischaemic attack, interstitial pneumonitis, and acute renal failure also reported

**Alimta** (Lilly) ▼

**Injection**, powder for reconstitution, pemetrexed 500 mg (as disodium), net price 500-mg vial = £800.00

**RALTITREXED**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); renal impairment (avoid if creatinine clearance less than 25 mL/minute; Appendix 3)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Tomudex** (AstraZeneca) ▼

**Injection**, powder for reconstitution, raltitrexed. Net price 2-mg vial = £121.86

**TEGAFUR WITH URACIL**

**Indications** see notes above

**Cautions** see section 8.1; cardiac disease; renal impairment; hepatic impairment (avoid if severe—Appendix 2); interactions: Appendix 1 (fluorouracil)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- **ADULT**, tegafur 300 mg/m (with uracil 672 mg/m ) daily in 3 divided doses for 28 days; subsequent courses repeated after 7-day interval; for dose adjustment due to toxicity, consult product literature

**Uftoral** (Merck Serono) ▼

**Capsules**, tegafur 100 mg, uracil 224 mg, net price 36-cap pack = £96.12, 120-cap pack = £320.40. Label: 23

**TIOGUANINE** (Thioguanine)

**Indications** see notes above

**Cautions** see section 8.1 and notes above; monitor liver function weekly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (tioguanine)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Dose**

- **100–200 mg/m daily**

**Lanvis** (GSK) ▼

**Tablets**, yellow, scored, thioguanine 40 mg. Net price 25-tab pack = £45.41
8.1.4 Vinca alkaloids and etoposide

The vinca alkaloids, vinblastine, vincristine, and vindesine, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer). Vinorelbine is a semi-synthetic vinca alkaloid, it is given intravenously or orally for the treatment of advanced breast cancer (see also NICE guidance below) and for advanced non-small cell lung cancer.

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine; it occurs less often with vindesine, vinblastine, and vinorelbine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.

Myelosuppression is the dose-limiting side-effect of vinblastine, vindesine, and vinorelbine; vincristine causes negligible myelosuppression. The vinca alkaloids may cause reversible alopecia. They cause severe local irritation and care must be taken to avoid extravasation.

The Scottish Medicines Consortium (p. 3) has advised (May 2005 and August 2007) that vinorelbine capsules (Navelbine®) are accepted for restricted use within NHS Scotland for treatment of advanced non-small cell lung cancer and advanced breast cancer within the licensed indications, as an alternative to the intravenous formulation of vinorelbine.

NICE guidance

Vinorelbine for advanced breast cancer (December 2002)

Vinorelbine monotherapy is an option for the second-line (or subsequent) treatment of advanced breast cancer where anthracycline-based regimens have failed or are unsuitable. Vinorelbine monotherapy is not recommended as first-line treatment for advanced breast cancer. Insufficient information is available to recommend the routine use of vinorelbine in combination with other therapies for advanced breast cancer.

Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days. It has particularly useful activity in small cell carcinoma of the bronchus, the lymphomas, and testicular cancer. Toxic effects include alopecia, myelosuppression, nausea, and vomiting.

### ETOPOSIDE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; renal impairment (Appendix 3); interactions: Appendix 1 (etoposide)

**Contra-indications** see section 8.1 and notes above; severe hepatic impairment; pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above; irritant to tissues

- By mouth, 120–240 mg/m² daily for 5 days
- By intravenous infusion, consult product literature

**Etoposide (Non-proprietary)**

Concentrate for intravenous infusion, etoposide 20 mg/mL, net price 5-mL vial = £12.15, 10-mL vial = £29.00. 25-mL vial = £60.75

Brands include: Etoposin

**Etopophos®** (Bristol-Myers Squibb)

Injection, powder for reconstitution, etoposide (as phosphate), net price 100-mg vial = £27.78 (hosp. only)

**Vepesid®** (Bristol-Myers Squibb)

Capsules, both pink, etoposide 50 mg, net price 20 = £105.97; 100 mg, 10-cap pack = £92.60 (hosp. only). Label: 23

### VINBLASTINE SULPHATE

**Indications** see notes above

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); caution in handling; interactions: Appendix 1 (vinblastine)

**Contra-indications** see section 8.1 and notes above; pregnancy (Appendix 4); breast-feeding

**Important** Intrathecal injection contra-indicated

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Vinblastine (Non-proprietary)**

Injection, vinblastine sulphate 1 mg/mL. Net price 10-mL vial = £13.09

**Velbe®** (Genus)

Injection, powder for reconstitution, vinblastine sulphate. Net price 10-mg amp = £14.15

### VINCristine sulphate

**Indications** see notes above

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); neuromuscular disease; caution in handling; interactions: Appendix 1 (vincristine)

**Contra-indications** see section 8.1 and notes above; pregnancy (Appendix 4); breast-feeding

**Important** Intrathecal injection contra-indicated

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Vincristine (Non-proprietary)**

Injection, vincristine sulphate 1 mg/mL. Net price 1-mL vial = £10.92; 2-mL vial = £21.17; 5-mL vial = £44.16

**Oncovin®** (Genus)

Injection, vincristine sulphate 1 mg/mL. Net price 1-mL vial = £14.18; 2-mL vial = £28.05
8.1.5 Other antineoplastic drugs

**VINDESINE SULPHATE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); neuromuscular disease; caution in handling

**Contra-indications** see section 8.1 and notes above; pregnancy (Appendix 4); breast-feeding

**Important** Intrathecal injection contra-indicated

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Eldisine** (Genus) 5-mL vial = £139.98

Injection, powder for reconstitution, vindesine sulphate, net price 5-mg vial = £78.30 (hosp. only)

**VINORELBINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); caution in handling

**Contra-indications** see section 8.1 and notes above; pregnancy (Appendix 4); breast-feeding

**Important** Intrathecal injection contra-indicated

**Side-effects** see section 8.1 and notes above; irritant to tissues

**Dose**
- By mouth, 60 mg/m² once weekly for 3 weeks, increased if tolerated to 80 mg/m² once weekly; max. 160 mg once weekly
- By intravenous injection or infusion, consult product literature

**Vinorelbine** (Non-proprietary) 5-mL vial = £153.98

Concentrate for intravenous infusion, vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £32.95, 5-mL vial = £153.98

**Navelbine** (Fabre) 5-mL vial = £170.98

Concentrate for intravenous infusion, vinorelbine (as tartrate) 10 mg/mL. Net price 1-mL vial = £29.75; 5-mL vial = £139.98

Capsules 5-mg vial = £43.98; 30 mg (pink), 1-cap pack = £65.98. Label: 21, 25

**Bevacizumab**

Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor. It is licensed for the treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy (but see NICE guidance below). It is also licensed for first-line treatment of metastatic breast cancer in combination with paclitaxel and for advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a. Bevacizumab, in combination with platinum-based chemotherapy, is licensed for first-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology. Bevacizumab is given by intravenous infusion.

The Scottish Medicines Consortium (p. 3) has advised (February 2008 and May 2008) that bevacizumab (Avastin®) is not recommended for use within NHS Scotland for the treatment of advanced or metastatic renal cell carcinoma or for metastatic carcinoma of the colon or rectum, within the licensed indications.

**AMSACRINE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; reduce dose in renal or hepatic impairment; also caution in handling—irritant to skin and tissues

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Amsidine** (Goldshield) 13.5-mL diluent vial = £54.08 (hosp. only)

Concentrate for intravenous infusion, amsacrine 5 mg (as lactate)/mL, when reconstituted by mixing two solutions. Net price 1.5-mL (75-mg) amp with 13.5-mL diluent vial = £54.08 (hosp. only)

**Note** Use glass apparatus for reconstitution

**Arsenic trioxide**

Arsenic trioxide is licensed for acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy.

**ARSENIC TRIOXIDE**

**Indications** see notes above

**Cautions** see section 8.1; correct electrolyte abnormalities before treatment; ECG required before and during treatment—consult product literature; avoid concomitant administration with drugs causing QT interval prolongation, hypokalaemia, and hypomagnesaemia; previous treatment with anthracyclines (increased risk of QT interval prolongation); renal impairment (Appendix 3)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1; leucocyte activation syndrome (requires immediate treatment—consult product literature); hyperglycaemia, hypokalaemia, leucocytosis, QT interval prolongation, atrial fibrillation, atrial flutter, haemorrhage, dyspnoea, pleuritic pain, musculoskeletal pain, paraesthesia, fatigue

**Trisenox** (Cephalon) 13.5-mL diluent vial = £54.08 (hosp. only)

Concentrate for intravenous infusion, arsenic trioxide 1 mg/mL, net price 10-mL amp = £250.90

**Amsacrine**

Amsacrine has an action and toxic effects similar to those of doxorubicin (section 8.1.2) and is given intravenously. It is occasionally used in acute myeloid leukaemia. Side-effects include myelosuppression and mucositis; electrolytes should be monitored as fatal arrhythmias have occurred in association with hypokalaemia.

**Side-effects** see notes above; leucocyte activation syndrome (requires immediate treatment—consult product literature); hyperglycaemia, hypokalaemia, leucocytosis, QT interval prolongation, atrial fibrillation, atrial flutter, haemorrhage, dyspnoea, pleuritic pain, musculoskeletal pain, paraesthesia, fatigue

**Important** Intrathecal injection contra-indicated

**Capsules** vinorelbine (as tartrate) 20 mg (brown), net price 1-cap pack = £43.98; 30 mg (pink), 1-cap pack = £65.98. Label: 21, 25

**Side-effects** see section 8.1; correct electrolyte abnormalities before treatment; ECG required before and during treatment—consult product literature; avoid concomitant administration with drugs causing QT interval prolongation—irritant to skin and tissues

**Important** Intrathecal injection contra-indicated

**Bevacizumab**

Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor. It is licensed for the treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy (but see NICE guidance below). It is also licensed for first-line treatment of metastatic breast cancer in combination with paclitaxel and for advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a. Bevacizumab, in combination with platinum-based chemotherapy, is licensed for first-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology. Bevacizumab is given by intravenous infusion.

The Scottish Medicines Consortium (p. 3) has advised (February 2008 and May 2008) that bevacizumab (Avastin®) is not recommended for use within NHS Scotland for the treatment of advanced or metastatic renal cell carcinoma or for metastatic carcinoma of the colon or rectum, within the licensed indications.
NICE guidance
Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007)
- Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is not recommended for the first-line treatment of metastatic colorectal cancer;
- Cetuximab in combination with irinotecan is not recommended for the second-line or subsequent treatment of metastatic colorectal cancer after the failure of an irinotecan-containing chemotherapy regimen;
- Patients currently receiving bevacizumab or cetuximab should have the option to continue therapy until they and their consultants consider it appropriate to stop.

BEVACIZUMAB
Indications see notes above
Cautions see section 8.1; intra-abdominal inflammation (risk of gastro-intestinal perforation); increased risk of fistulas (discontinue permanently if tracheoesophageal or grade 4 fistula develops); withhold treatment for elective surgery and avoid for at least 28 days after major surgery or until wound fully healed; history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome); uncontrolled hypertension; monitor blood pressure; history of arterial thromboembolism; history of cardiovascular disease (increased risk of cardiovascular events especially in the elderly); monitor for congestive heart failure; increased risk of haemorrhage (especially in the elderly); monitor for reversible posterior leucoencephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension)
Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5); untreated CNS metastases
Side-effects see section 8.1; gastro-intestinal perforation, intestinal obstruction, abdominal pain, diarrhoea, constipation, taste disturbances; mucocutaneous bleeding, haemorrhage, hypoxia, arterial thromboembolism, congestive heart failure, syncope, supraventricular tachycardia, hypertension (see also Cautions); dyspnoea, rhinitis; anorexia, drowsiness, headache, peripheral neuropathy; anemia, lethargy; pyrexia; proteinuria; dehydration; eye disorders; fistulas; pulmonary hypertension, impaired wound healing, hand-foot syndrome, exfoliative dermatitis, dry skin, and skin discoloration also reported
Avastin® (Roche) ▼ £924.40
Concentrate for intravenous infusion, bevacizumab 25 mg/mL, net price 4-ml (100-mg) vial = £242.66, 16-ml (400-mg) vial = £924.40

Bexarotene
Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. It is associated with little myelosuppression or immunosuppression. Bexarotene can cause regression of cutaneous T-cell lymphoma. The main adverse effects are hyperlipidaemia, hypothyroidism, leucopenia, headache, rash, and pruritus.
The Scottish Medicines Consortium has advised (November 2002) that bexarotene is recommended for restricted use as a second-line treatment for patients with advanced cutaneous T-cell lymphoma.

BEXAROTENE
Indications skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment
Cautions see section 8.1 and notes above; hyperlipidaemia (avoid if uncontrolled), hypothyroidism (avoid if uncontrolled); hypersensitivity to retinoids; interactions: Appendix 1 (bexarotene)
Contra-indications see section 8.1 and notes above; history of pancreatitis, hypervitaminosis A, hepatic impairment; pregnancy (Appendix 4); breast-feeding
Side-effects see section 8.1 and notes above
Dose
- Initially 300 mg/m² daily as a single dose with a meal; adjust dose according to response
Targettin® (Zeneus) £937.50
Capsules, bexarotene 75 mg in a liquid suspension, net price 100-cap pack = £937.50

Bortezomib
Bortezomib, a proteasome inhibitor, is licensed as monotherapy for the treatment of multiple myeloma which has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, bone-marrow transplantation. It is also licensed for use in combination with melphalan and prednisolone for the treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with bone marrow transplant. Bortezomib is given by intravenous injection.
The Scottish Medicines Consortium (p. 3) has advised (July 2007) that bortezomib (Velcade®) is not recommended for use within NHS Scotland for multiple myeloma within the licensed indication.

NICE guidance
Bortezomib monotherapy for relapsed multiple myeloma (October 2007)
Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:
- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) and
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.
Patients currently receiving bortezomib monotherapy who do not meet the above criteria should have the option to continue therapy until they and their clinicians consider it appropriate to stop.

8.1.5 Other antineoplastic drugs
Cetuximab

Cetuximab is licensed, in combination with irinotecan, for the treatment of metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor in whom previous chemotherapy, that has included irinotecan, has failed (but see NICE guidance under Bevacizumab on p. 474). Cetuximab is also licensed, in combination with radiotherapy, for the treatment of locally advanced squamous cell cancer of the head and neck.

Cetuximab is given by intravenous infusion. Patients must receive an antihistamine before the first infusion; an antihistamine is also recommended before subsequent infusions of cetuximab. Resuscitation facilities should be available and treatment should be initiated by a specialist.

Erbitux® (Merck) ▼ (F Hoffman-La Roche)

Intravenous infusion, cetuximab 5 mg/mL, net price
20-mL vial = £159.02, 100-mL vial = £795.10

Crisantaspase

Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi. It is given intramuscularly, intravenously, or subcutaneously almost exclusively in acute lymphoblastic leukaemia. Facilities for the management of anaphylaxis should be available. Side-effects also include nausea, vomiting, fever, pancreatitis, CNS depression, neurotoxicity, liver function changes, coagulation disorders, and blood lipid changes; careful monitoring is therefore necessary and the urine is tested for glucose because of a risk of hyperglycaemia.

Dacarbazine and temozolomide

Dacarbazine is used to treat metastatic melanoma and, in combination therapy, soft tissue sarcomas. It is also a component of a commonly used combination for Hodgkin’s disease (ABVD—doxorubicin [previously Adriamycin®], bleomycin, vinblastine, and dacarbazine). It is given intravenously. The predominant side-effects are myelosuppression and severe nausea and vomiting.

Temozolomide is structurally related to dacarbazine. It is given by mouth and is licensed for the initial treatment of glioblastoma multiforme (in combination with radiotherapy) and for second-line treatment of malignant glioma.

NICE guidance

Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001)

Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy.

Carmustine implants and temozolomide

Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007)

Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1. Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma only for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres.
Mitotane

Mitotane is licensed for the symptomatic treatment of advanced or inoperable adrenocortical carcinoma. It selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy (section 6.3.1); the dose of glucocorticoid should be increased in case of shock, trauma, or infection. Gastro-intestinal side-effects such as anorexia, nausea, and vomiting, and endocrine side-effects, such as hypogonadism and thyroid disorders, are very common with mitotane; neurotoxicity occurs in many patients.

Malignant disease and immunosuppression

Panitumumab

Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR). It is indicated as monotherapy for the treatment of EGFR expressing metastatic colorectal cancer with non-mutated KRAS gene after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens. Panitumumab is given by intravenous infusion. The Scottish Medicines Consortium (p. 3) has advised (May 2008) that panitumumab (Vectibix®) is not recommended for use within NHS Scotland for colorectal cancer.
8.1.5 Other antineoplastic drugs

**PANITUMUMAB**

**Indications** see notes above

**Cautions** monitor for dermatological reactions (may require temporary or permanent discontinuation—consult product literature); pulmonary disease—discontinue if pneumonitis or lung infiltrates occur; monitor for hypomagnesaemia and hypocalcaemia

**Contra-indications** interstitial pulmonary disease; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see section 8.1; also infusion-related reactions: diarrhoea, dry mouth and nose; dyspnoea, cough; fatigue, headache; hypomagnesaemia, hypocalcaemia, hypokalaemia, dehydration; ocular disorders (including conjunctivitis, increased lacrimation, dry eyes, ocular hyperaemia); skin reactions (including rash, erythema, pruritus, dry skin, and exfoliation), mucosal inflammation, hypertrichosis, and nail disorders

**Vectibix** (Amgen) ▼ (HII)

Concentrate for intravenous infusion, panitumumab 20 mg/mL, net price 5-mL vial = £299.00, 20-mL vial = £1196.00

**Electrolytes** Na 0.75 mmol/vial

**PENTOSTATIN**

**Pentostatin** is highly active in hairy cell leukaemia. It is given intravenously on alternate weeks and is capable of inducing prolonged complete remission. It is potentially toxic, causing myelosuppression, immunosuppression and a number of other side-effects which may be severe. Its use is probably best confined to specialist centres.

**Indications** see notes above

**Cautions** see section 8.1 and notes above; interactions: Appendix 1 (pentostatin)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Nipent** (Hospira) ▼ (HII)

Injection, powder for reconstitution, pentostatin. Net price 10-mg vial = £863.78

**Platinum compounds**

**Carboplatin** is widely used in the treatment of advanced ovarian cancer and lung cancer (particularly the small cell type). It is given intravenously. The dose of carboplatin is determined according to renal function rather than body surface area. Carboplatin can be given on an outpatient basis and is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

**Cisplatin** is used alone or in combination for the treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (but carboplatin is preferred for ovarian cancer). It is given intravenously. Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting. Cisplatin is toxic, causing nephrotoxicity (monitoring of renal function is essential), ototoxicity, peripheral neuropathy, hypomagnesaemia and myelosuppression. It is, however, increasingly given in a day-care setting.

**Oxaliplatin** is licensed in combination with fluorouracil and folinic acid, for the treatment of metastatic colorectal cancer and as adjuvant treatment of colon cancer after resection of the primary tumour; it is given by intravenous infusion. Neurotoxic side-effects (including sensory peripheral neuropathy) are dose limiting. Other side-effects include gastro-intestinal disturbances, ototoxicity, and myelosuppression. Manufacturers advise renal function monitoring in moderate impairment.

**NICE guidance**

Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005)

A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently. Raltitrexed is not recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies.

**NICE guidance**

Paclitaxel for ovarian cancer (January 2003)

*Either* paclitaxel in combination with a platinum compound (cisplatin or carboplatin) or a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery).

**NICE guidance**

Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005)

Paclitaxel, combined with a platinum compound (carboplatin or cisplatin), is an option for advanced cancer that relapses 6 months or more after completing initial platinum-based chemotherapy. Paclitaxel alone is an option for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy. Pegylated liposomal doxorubicin is an option for advanced ovarian cancer that does not respond to, or relapses within 12 months of completing initial platinum-based chemotherapy. Paclitaxel alone or pegylated liposomal doxorubicin are options for advanced ovarian cancer in patients who are allergic to platinum compounds. Topotecan alone is an option only for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy or in those allergic to platinum compounds and for whom paclitaxel alone or pegylated liposomal doxorubicin are inappropriate.
CARBOPLATIN

**Indications** see notes above

**Cautions** see section 8.1 and notes above; renal impairment (avoid if creatinine clearance less than 20 mL/minute; Appendix 3); interactions: Appendix 1 (platinum compounds)

**Contra-indications** see section 8.1; acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Carboplatin** (Non-proprietary)

**Injection**, carboplatin 10 mg/mL, net price 5-mL vial = £22.04, 15-mL vial = £56.29, 45-mL vial = £168.85, 60-mL vial = £244.88

Paraplatin® (Bristol-Myers Squibb) (MW)

Concentrate for intravenous infusion, carboplatin 10 mg/mL, net price 5-mL vial = £21.26, 60-mL vial = £244.88

CISPLATIN

**Indications** see notes above

**Cautions** see section 8.1 and notes above; interactions: Appendix 1 (platinum compounds)

**Contra-indications** see section 8.1; peripheral neuropathy with functional impairment; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Cisplatin** (Non-proprietary) (MW)

**Injection**, cisplatin 1 mg/mL, net price 10-mL vial = £5.85, 50-mL vial = £24.50, 100-mL vial = £50.22

**Injection**, powder for reconstitution, cisplatin, net price 50-mg vial = £17.00

OXALIPLATIN

**Indications** metastatic colorectal cancer in combination with fluorouracil and folinic acid; colon cancer—see notes above

**Cautions** see section 8.1 and notes above; interactions: Appendix 1 (platinum compounds)

**Contra-indications** see section 8.1; peripheral neuropathy with functional impairment; renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Oxaliplatin** (Non-proprietary) (MW)

**Injection**, powder for reconstitution, oxaliplatin, net price 50-mg vial = £156.75, 100-mg vial = £313.50

**Injection**, oxaliplatin 5 mg/mL, net price 10-mL vial = £165.00, 20-mL vial = £330.00

Porfimer sodium and temoporfin

Porfimer sodium and temoporfin are used in the photodynamic treatment of various tumours. The drugs accumulate in malignant tissue and are activated by laser light to produce a cytotoxic effect. Porfimer sodium is licensed for photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer. Temoporfin is licensed for photodynamic therapy of advanced head and neck cancer.

The Scottish Medicines Consortium has advised (May 2004) that temoporfin is not recommended for the palliative treatment of advanced head and neck cancer.

PORFIMER SODIUM

**Indications** non-small cell lung cancer; oesophageal cancer; see notes above

**Cautions** see section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days

**Contra-indications** see section 8.1; severe hepatic impairment; tracheo-oesophageal or broncho-oesophageal fistula; acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see section 8.1; photosensitivity (see Cautions above—sunscreens offer no protection), constipation

**Photofrin®** (Sinclair) (MW)

**Injection**, powder for reconstitution, porfimer sodium, net price 15-mg vial = £154.00, 75-mg vial = £770.00

TEMOPORFIN

**Indications** advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments

**Cautions** see section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 15 days after administration; avoid prolonged exposure of injection site arm to direct sunlight for 6 months after administration, if extravasation occurs protect area from light for at least 3 months; interactions: Appendix 1 (temoporfin)

**Contra-indications** see section 8.1; acute porphyria (section 9.8.2) or other diseases exacerbated by light; elective surgery or ophthalmic slit-lamp examination for 30 days after administration; concomitant photosensitising treatment; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see section 8.1; also constipation, dysphagia; haemorrhage, oedema; giddiness, trismus, facial pain; injection site pain, blistering, scarring, erythema, skin necrosis, hyperpigmentation, photosensitivity (see Cautions above; sunscreens ineffective)

**Foscan®** (Biolitec) (MW)

**Injection**, temoporfin 4 mg/mL, net price 5-mL vial = £440.00

Procarbazine

Procarbazine is most often used in Hodgkin’s disease. It is given by mouth. Toxic effects include nausea, myelosuppression, and a hypersensitivity rash preventing further use of this drug. It is a mild monoamine-oxidase inhibitor and dietary restriction is rarely considered necessary. Alcohol ingestion may cause a disulfiram-like reaction.

**Procarbazine** (Sanofi-Aventis)

Concentrate for intravenous infusion, procarbazine, net price 20-mg vial = £22.04, 15-mL vial = £56.29, 45-mL vial = £168.85, 60-mL vial = £220.00

Foscarbin

Foscarbin is recommended for the palliative treatment of advanced head and neck cancer.
8 Malignant disease and immunosuppression

8.1.5 Other antineoplastic drugs

if creatinine clearance less than 10 mL/minute; Appendix 3; Interactions: Appendix 1 (procarbazine)

Contra-indications pregnancy (Appendix 4); breast-feeding

Side-effects see section 8.1 and notes above

Dose

- Used alone, initially 50 mg daily, increased by 50 mg to 250–300 mg daily in divided doses; mainte-
nance (on remission) 50–150 mg daily to cumulative total of at least 6 g

Procarbazine (Cambridge) (NH)
Capsules, ivory, procarbazine (as hydrochloride)
50 mg, net price 50-cap pack = £181.04. Label: 4

Protein kinase inhibitors

Dasatinib, erlotinib, imatinib, lapatinib, nilotinib, sorafenib, sunitinib, and temsirolimus are protein kinase inhibi-
tors.

Dasatinib, a tyrosine kinase inhibitor, is licensed for the treatment of chronic myeloid leukaemia in those who have resistance to or intolerance of previous therapy, including imatinib. It is also licensed for acute lympho-
blastic leukaemia in those who have resistance to or intolerance of previous therapy.

The Scottish Medicines Consortium (p. 3) has advised (April 2007) that dasatinib (Sprycel®) is accepted for restricted use within NHS Scotland, within the licensed indication, for the treatment of chronic myeloid leuk-
aemia in patients who are in the chronic phase of the disease.

Erlotinib, a tyrosine kinase inhibitor, is licensed in combination with gemcitabine for the treatment of metastatic pancreatic cancer. It is also licensed for the treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy.

The Scottish Medicines Consortium (p. 3) has advised (June 2006) that erlotinib (Tarceva®) is accepted for restricted use for the treatment of locally advanced or metastatic non-small cell lung cancer, after failure of at least one chemotherapy regimen. Erlotinib is restricted to use in patients who would otherwise be eligible for treatment with docetaxel monotherapy.

Imatinib, a tyrosine kinase inhibitor, is licensed for the treatment of newly diagnosed chronic myeloid leuk-
aemia where bone marrow transplantation is not con-
sidered first-line treatment, and for chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis (see NICE guidance below). It is also licensed for c-kit (CD117)-
positive unrectatable or metastatic malignant gastro-
intestinal stromal tumours (GIST). Imatinib is licensed for the treatment of newly diagnosed acute lympho-
blastic leukaemia in combination with other chemother-
apy, and as monotherapy for relapsed or refractory acute lymphoblastic leukaemia. Imatinib is also licensed for the treatment of unrectatable dermatofibrosarcoma protubersan and for patients with recurrent or meta-
static dermatofibrosarcoma protuberas who cannot
have surgery.

Imatinib is also licensed for the treatment of myelodys-
plastic/myeloproliferative diseases associated with pla-
telet-derived growth factor receptor gene rearrange-
ment and for the treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia.

The Scottish Medicines Consortium (p. 3) has advised (March 2002) that imatinib (Glivec®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).

NICE guidance

Imatinib for chronic myeloid leukaemia
(October 2003)

Imatinib is recommended as first-line treatment for Philadelphia-chromosome-positive chronic myeloid leukaemia in the chronic phase and as an option for patients presenting in the accelerated phase or with blast crisis, provided that imatinib has not been used previously.

Where imatinib has failed to stop disease progres-
sion from chronic phase to accelerated phase or to
blast crisis, continued use is recommended only as part of further clinical study.

Lapatinib, a tyrosine kinase inhibitor, is licensed in combination with capecitabine for the treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2). It is indicated for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab.

Nilotinib, a tyrosine kinase inhibitor, is licensed for the treatment of chronic myeloid leukaemia in those who have resistance to or intolerance of previous therapy, including imatinib.

The Scottish Medicines Consortium (p. 3) has advised (February 2008) that nilotinib (Tasigna®) is accepted for restricted use within NHS Scotland for the treatment of chronic-phase chronic myeloid leukaemia in adults resistant to or intolerant of at least one previous therapy, including imatinib.

Sorafenib, an inhibitor of multiple kinases, is licensed for the treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is contra-indicated. It is also licensed for the treatment of hepatocellular carcinoma.

The Scottish Medicines Consortium (p. 3) has advised (October 2006) that sorafenib (Nexavar®) is not recommended for use within NHS Scotland for the treatment of advanced renal cell carcinoma.

Sunitinib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic renal cell carci-
noma. It is also licensed for the treatment of unrectatable or metastatic malignant gastro-intestinal stromal tumours (GIST) after failure of imatinib.

The Scottish Medicines Consortium (p. 3) has advised (June 2007) that sunitinib (Sutent®) is not recommended for use within NHS Scotland for the treatment of advanced or metastatic renal cell carcinoma.

Temsirolimus is a protein kinase inhibitor licensed for the first-line treatment of advanced renal cell carci-
noma. Hypersensitivity reactions occur commonly with temsirolimus, usually during administration of the first dose. Symptoms include flushing, chest pain, dys-
pnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before
starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

### DASATINIB

**Indications** see notes above

**Cautions** see section 8.1; susceptibility to QT-interval prolongation; hypokalaemia; hypomagnesaemia; hepatic impairment (Appendix 2); pregnancy (Appendix 4 and section 8.1); **interactions**: Appendix 1 (dasatinib)

**Contra-indications** breast-feeding

**Side-effects** see section 8.1; also diarrhoea, anorexia, weight gain, abdominal pain, taste disturbance, constipation, dyspepsia, colitis, gastritis, arrhythmias, congestive cardiac failure, chest pain, flushing, haemorrhage (including gastro-intestinal and CNS haemorrhage), palpitation; dyspnoea, cough, oedema (including pleural effusion); depression, dizziness, headache, insomnia, neuropathy; influenza-like symptoms; musculoskeletal pain; visual disturbances; acne, dry skin, sweating, pruritus, urticaria; *less commonly* pancreatitis, hepatitis, cholestasis, hypertension, hypotension, transient ischaemic attack, thrombophlebitis, syncope, pulmonary hypertension, asthma, convulsions, amnesia, tremor, drowsiness, vertigo, gynaecomastia, irregular menstruation, urinary frequency, proteinuria, hypocalcaemia, rhabdomyolysis, tinnitus, hypersensitivity reactions (including dermatitis, photosensitivity), pigmentation and nail disorders

**Dose**
- Chronic phase chronic myeloid leukaemia, **ADULT** over 18 years 100 mg once daily, increased if necessary to max. 140 mg once daily
- Accelerated and blast phase chronic myeloid leukaemia, **ADULT** over 18 years 70 mg twice daily, increased if necessary to max. 100 mg twice daily
- Acute lymphoblastic leukaemia, **ADULT** over 18 years 70 mg twice daily increased if necessary to max. 100 mg twice daily

*Sprycel*® (Bristol-Myers Squibb) ▼ (©)

**Tablets** 7.5 mg, net price 56-tab pack = £1216.43; 50 mg, 56-tab pack = £2432.85; 70 mg, 56-tab pack = £2432.85. Label: 25

### ERLOTINIB

**Indications** see notes above

**Cautions** see section 8.1; pre-existing liver disease or concomitant use with hepatotoxic drugs—monitor liver function; hepatic impairment (Appendix 2); **interactions**: Appendix 1 (erlotinib)

**Contra-indications** renal impairment (avoid if creatinine clearance less than 15 mL/minute; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see section 8.1; diarrhoea, abdominal pain, dyspepsia, flatulence; anorexia, depression, headache; fatigue, rigor; conjunctivitis; rash, pruritus, dry skin; *less commonly* intestinal life disease—discontinue if unexplained symptoms such as dyspnoea, cough or fever occur; *rarely* hepatic failure

**Dose**
- Non-small cell lung cancer, 150 mg once daily
- Pancreatic cancer, 100 mg once daily in combination with gemcitabine

**Tarceva®** (Roche) ▼ (©)

**Tablets** 125 mg, white-yellow, erlotinib (as hydrochloride) 25 mg, net price 30-tab pack = £378.33; 100 mg, 30-tab pack = £1324.14; 150 mg, 30-tab pack = £1631.53. Label: 23

### IMATINIB

**Indications** see notes above

**Cautions** see section 8.1; cardiac disease; monitor for fluid retention; monitor liver function; hepatic impairment (Appendix 2); renal impairment (Appendix 3); **interactions**: Appendix 1 (imatinib)

**Contra-indications** pregnancy (Appendix 4 and section 8.1); breast-feeding

**Side-effects** see section 8.1; also abdominal pain, appetite changes, constipation, diarrhoea, flatulence, gastro-oesophageal reflux, taste disturbance, weight changes, dry mouth, oedema (including pulmonary oedema, pleural effusion, and ascites), flushing, haemorrhage; cough, dyspnoea; dizziness, headache, insomnia, hypoaesthesia, paraesthesia, fatigue; influenza-like symptoms; cramps, arthralgia, visual disturbances, increased lacrimation, conjunctivitis, dry eyes; epistaxis; dry skin, sweating, rash, pruritus, photosensitivity; *less commonly* gastric ulceration, pancreatitis, hepatic dysfunction (*rarely* hepatic failure, hepatic necrosis), dysphagia, heart failure, tachycardia, palpitation, syncope, hypertension, hypotension, cold extremities, cough, acute respiratory failure, depression, drowsiness, anxiety, peripheral neuropathy, tremor, migraine, impaired memory, vertigo, gynaecomastia, menorrhagia, irregular menstruation, sexual dysfunction, electrolyte disturbances, renal failure, urinary frequency, gout, tinnitus, hearing loss; skin hyperpigmentation; *rarely* intestinal obstruction, gastro-intestinal perforation, inflammatory bowel disease, arrhythmia, atrial fibrillation, myocardial infarction, angina, pulmonary fibrosis, pulmonary hypertension, increased intracranial pressure, convulsions, confusion, haemolytic anaemia, aseptic necrosis of bone, cataract, glaucoma, angioedema, exfoliative dermatitis, and Stevens-Johnson syndrome

**Dose**
- Chronic phase chronic myeloid leukaemia, **ADULT** over 18 years 100–400 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses); **CHILD** (chronic and advanced phase) 2–18 years 340 mg/m² (max. 800 mg) daily (in 2 divided doses), increased to 570 mg/m² (max. 800 mg) daily if necessary (consult product literature)
- Accelerated and blast crisis chronic myeloid leukaemia, **ADULT** 600 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses)
- Acute lymphoblastic leukaemia, **ADULT** 600 mg once daily
- Gastro-intestinal stromal tumours, **ADULT** 400 mg once daily
- Dermatofibrosarcoma protuberans, **ADULT** 800 mg daily in 2 divided doses
- Myelodysplastic/myeloproliferative diseases, **ADULT** 400 mg once daily
- Advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia, **ADULT** 100–400 mg once daily
Glivec® (Novartis) ▼ (Novartis)
Tablets, f/c, imatinib (as mesilate) 100 mg (yellow-brown, scored), net price 60-tab pack = £802.04; 400 mg (yellow), 30-tab pack = £1604.08. Label: 21, 27

Counselling Tablets may be dispersed in water or apple juice

LAPATINIB

Indications see notes above

Cautions see section 8.1; low gastric pH (reduced absorption); monitor left ventricular function; monitor for pulmonary toxicity; monitor liver function before treatment and at monthly intervals; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4 and section 8.1); interactions: Appendix 1 (lapatinib)

Contra-indications breast-feeding

Side-effects see section 8.1; anorexia, diarrhoea (treat promptly); decreased left ventricular ejection fraction; fatigue; rash; hyperbilirubinaemia, hepatotoxicity; less commonly interstitial lung disease

Dose

• ADULT over 18 years, 1.25 g once daily as a single dose

Counselling Always take at the same time in relation to food: either one hour before or one hour after food

Tyverb® (GSK) ▼ (Novartis)
Tablets, yellow, f/c, lapatinib 250 mg, net price 70-tab pack = £804.30. Counselling, administration

NILOTINIB

Indications see notes above

Cautions see section 8.1; history of pancreatitis; susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); hepatic impairment (Appendix 2); pregnancy (Appendix 4 and section 8.1); interactions: Appendix 1 (nilotinib)

Contra-indications breast-feeding (Appendix 5)

Side-effects see section 8.1; also abdominal pain, constipation, diarrhoea, dyspepsia, flatulence, anorexia, weight changes; palpitation, QT-interval prolongation, hypertension, oedema, flushing; dyspepsia, cough, dysphonia; headache, fatigue, asthenia, dizziness, paraesthesia, insomnia, vertigo; hypomagnesaemia, hyperkalaemia, blood glucose changes; bone pain, arthralgia, muscle spasm; urticaria, erythema, hyperhidrosis, dry skin, rash, pruritus; less commonly interstitial lung disease

Dose

• ADULT over 18 years, 400 mg twice daily

Sorafenib

Indications see notes above

Cautions major surgical procedures; cardiac ischaemia; hepatic impairment (Appendix 2); pregnancy (Appendix 4); interactions: Appendix 1 (sorafenib)

Contra-indications breast-feeding

Side-effects see section 8.1; also diarrhoea, constipation, dyspepsia, dysphagia, anorexia, hypertension, haemorrhage, flushing, hoarseness, fatigue, asthenia, depression, peripheral neuropathy, fever, erectile dysfunction, hypophosphataemia, arthralgia, myalgia, tinnitus, rash, pruritus, erythema, dry skin, desquamation, acne, hand-foot skin reaction; less commonly reversible posterior leucoencephalopathy, myocardial infarction, congestive heart failure, hypertensive crisis, and gastrointestinal perforations

Dose

• ADULT over 18 years, 400 mg twice daily

Nexavar® (Bayer) ▼ (Novartis)
Tablets, f/c, red, sorafenib (as tosylate) 200 mg, net price 112-tab pack = £2504.60. Label: 23

SUNITINIB

Indications see notes above

Cautions see section 8.1; cardiovascular disease—discontinue if congestive heart failure develops; susceptibility to QT-interval prolongation; hypertension; increased risk of bleeding; monitor for hypothyroidism; pregnancy (Appendix 4 and section 8.1); interactions: Appendix 1 (sunitinib)

Contra-indications breast-feeding

Side-effects see section 8.1; also abdominal pain, anorexia, taste disturbance, dehydration, hypertension, oedema; dyspepsia; fatigue, dizziness, head-ache, paraesthesia, hypothyroidism; arthralgia, myalgia; increased lacrimation; epistaxis; skin, hair, and urine discoloration, hand-foot syndrome, dry skin, and rash; gastro-intestinal perforation, pancreatitis, hepatic failure, and seizures reported

Dose

• 50 mg daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle; adjust dose in steps of 12.5 mg according to tolerability; dose range 25–75 mg daily

Sutent® (Pfizer) ▼ (Pfizer)
Capsules, sunitinib (as malate) 12.5 mg (orange), net price 28-caps pack = £784.70; 25 mg (caramel), 28-caps pack = £1569.40; 50 mg (caramel/orange), 28-caps pack = £3138.80. Label: 14

TEMSIROLIMUS

Indications see notes above

Cautions see notes above; monitor respiratory function; monitor blood lipids; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (temsirolimus)

Contra-indications pregnancy (Appendix 4); breast-feeding

Side-effects see section 8.1; also abdominal pain, diarrhoea, anorexia, taste disturbance; hypertension, oedema, thrombophlebitis; cough, dyspnoea, chest
pain, interstitial lung disease, hypersensitivity reactions (see notes above); asthenia; increased susceptibility to infection (including urinary-tract infection and pneumonia), pyrexia; hyperglycaemia; renal failure; hypophosphataemia, hypokalaemia, hyper-cholesterolaemia, hyperlipidaemia; arthralgia; eye disorders; rhinitis, epistaxis; skin disorders (including rash and acne), folliculitis, impaired wound healing; less commonly intestinal perforation and intracerebral bleeding.

**Dose**

- By intravenous infusion (over 30–60 minutes), **ADULT over 18 years, 25 mg once weekly**

**Torisel®** (Wyeth) ▼ (Rx)

Concentrate for intravenous infusion, temsirolimus 25 mg/mL, net price 1.2-mL amp (with diluent) = £620.00

Excipients include propylene glycol and ethanol.

---

**Taxanes**

**Paclitaxel** is a member of the taxane group of drugs. It is given by intravenous infusion. Paclitaxel given with carboplatin or cisplatin is used for the treatment of ovarian cancer (see NICE guidance p. 478); the combination is also considered appropriate for women whose ovarian cancer is initially considered inoperable. Paclitaxel is also used in the secondary treatment of metastatic breast cancer (see NICE guidance below). There is limited evidence to support its use in non-small cell lung cancer. Routine premedication with a corticosteroid, an antihistamine and a histamine H₁-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication, although more commonly only bradycardia or asymptomatic hypotension occur. Other side-effects of paclitaxel include myelosuppression, peripheral neuropathy, and cardiac conduction defects with arrhythmias (which are nearly always asymptomatic). It also causes alopecia and muscle pain; nausea and vomiting is mild to moderate.

**Docetaxel** is licensed for use in locally advanced or metastatic breast cancer and non-small cell lung cancer resistant to other cytotoxic drugs (see NICE guidance on breast cancer, below) or for initial chemotherapy in combination with other cytotoxic drugs. It is also licensed for hormone-resistant prostate cancer, for use with other cytotoxic drugs for gastric adenocarcinoma and head and neck cancer, and for adjuvant treatment of operable node-positive breast cancer. Its side-effects are similar to those of paclitaxel but persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment; hypersensitivity reactions also occur. Dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

The *Scottish Medicines Consortium* (p. 3) has advised that docetaxel (*Taxotere®*) in combination with cisplatin and 5-fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable (May 2007) and resectable (June 2008) locally advanced squamous cell carcinoma of the head and neck.

---

### NICE guidance

**Docetaxel for the adjuvant treatment of early node-positive breast cancer (September 2006)**

Docetaxel, in combination with doxorubicin and cyclophosphamide, is an option for the adjuvant treatment of women with early node-positive breast cancer.

**Docetaxel for the adjuvant treatment of early node-positive breast cancer (September 2006)**

Docetaxel is not recommended for the adjuvant treatment of early node-positive breast cancer.

**Taxanes for the treatment of breast cancer (September 2001)**

Both docetaxel and paclitaxel are options for the treatment of advanced breast cancer where initial cytotoxic chemotherapy (including an anthracycline) has failed or is inappropriate. See p. 478.

**Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006)**

Docetaxel is an option for hormone-refractory metastatic prostate cancer and a Karnofsky score of at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks].

### DOCETAXEL

**Indications** adjuvant treatment of operable node-positive breast cancer, in combination with doxorubicin and cyclophosphamide; with doxorubicin for initial chemotherapy of locally advanced or metastatic breast cancer; monotherapy for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed; with capecitabine for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed; with trastuzumab for initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2; locally advanced or metastatic non-small cell lung cancer where first-line chemotherapy has failed; with cisplatin for unresectable, locally advanced or metastatic non-small cell lung cancer; with prednisolone for hormone-refractory metastatic prostate cancer; with cisplatin and fluorouracil for initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction; with cisplatin and fluorouracil for induction treatment of advanced squamous cell cancer of the head and neck.
locally advanced squamous cell carcinoma of the head and neck

**Cautions** see section 8.1 and notes above; hepatic impairment (Appendix 2); interactions: Appendix 1 (docetaxel)

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Taxotere** (Sanofi-Aventis) (UK)
Concentrate for intravenous infusion, docetaxel 40 mg/mL. Net price 0.5-mL vial = £162.75, 2-mL vial = £354.75 (both with diluent) (hosp. only)

**PACLITAXEL**

**Indications** ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin; metastatic ovarian cancer where platinum-containing therapy has failed; locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate); adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide; non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate; advanced AIDS-related Kaposi’s sarcoma where liposomal anthracycline therapy has failed

**Cautions** see section 8.1 and notes above; interactions: Appendix 1 (paclitaxel)

**Contra-indications** see section 8.1 and notes above; severe hepatic impairment; pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Paclitaxel** (Non-proprietary) (UK)
Concentrate for intravenous infusion, paclitaxel 6 mg/mL, net price 5-mL vial = £111.41, 16.7-mL vial = £333.91, 25-mL vial = £500.86, 50-mL vial = £1001.72
Excipients include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

**Taxol** (Bristol-Myers Squibb) (UK)
Concentrate for intravenous infusion, paclitaxel 6 mg/mL, net price 5-mL vial = £116.05, 16.7-mL vial = £347.82, 25-mL vial = £521.73, 50-mL vial = £1043.46 (hosp. only)
Excipients include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

**Topoisomerase I inhibitors**

Irinotecan and topotecan inhibit topoisomerase I, an enzyme involved in DNA replication.

**Irinotecan** is licensed for metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed. It is also licensed in combination with cetuximab for the treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan. Irinotecan is also licensed in combination with 5-fluorouracil, folinic acid and bevacizumab for the first-line treatment of metastatic carcinoma of the colon or rectum. Irinotecan is given by intravenous infusion.

**IRINOTECAN HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; raised plasma-bilirubin concentration (see under Contra-indications and Appendix 2)

**Contra-indications** see section 8.1 and notes above; also chronic inflammatory bowel disease, bowel obstruction; plasma-bilirubin concentration greater than 3 times the upper limit of reference range; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above; also acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature), interstitial pulmonary disease

**Campto** (Pfizer) (UK)
Concentrate for intravenous infusion, irinotecan hydrochloride 20 mg/mL, net price 2-mL vial = £130.00; 5-mL vial = £290.00

**TOPOTECAN**

**Indications** see notes above

**Cautions** see section 8.1 and notes above; renal impairment (avoid infusion if creatinine clearance less than 20 mL/minute; avoid oral route if creatinine clearance less than 60 mL/minute; Appendix 3)

**Contra-indications** see section 8.1 and notes above; severe hepatic impairment; pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Hycamtin** (GSK) (UK)
Capsules, topotecan (as hydrochloride) 250 micrograms (white), net price 10-cap pack = £75.00; 1 mg (pink), 10-cap pack = £300.00

Intravenous infusion, powder for reconstitution, topotecan (as hydrochloride), net price 1-mg vial = £97.65; 4-mg vial = £290.62

**NICE guidance (irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer)**
See p. 478

**NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)**
See p. 478

**Topotecan** is given by intravenous infusion or orally in metastatic ovarian cancer when first-line or subsequent therapy has failed.

In addition to dose-limiting myelosuppression, side-effects of irinotecan and topotecan include gastrointestinal effects (delayed diarrhoea requiring prompt treatment may follow irinotecan treatment), asthenia, alopecia, and anorexia.

The Scottish Medicines Consortium has advised (November 2007) that topotecan is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who are cisplatin-naive.

**Topoisomerase I inhibitors**

Irinotecan and topotecan inhibit topoisomerase I, an enzyme involved in DNA replication.

**Irinotecan** is licensed for metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed. It is also licensed in combination with cetuximab for the treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan. Irinotecan is also licensed in combination with 5-fluorouracil, folinic acid and bevacizumab for the first-line treatment of metastatic carcinoma of the colon or rectum. Irinotecan is given by intravenous infusion.

**Contra-indications** pregnancy (Appendix 4); breast-feeding

**Side-effects** see section 8.1 and notes above

**Taxotere** (Sanofi-Aventis) (UK)
Concentrate for intravenous infusion, docetaxel 40 mg/mL. Net price 0.5-mL vial = £162.75, 2-mL vial = £354.75 (both with diluent) (hosp. only)
Trabectedin

Trabectedin is licensed for the treatment of advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated.

Trabectedin is given by intravenous infusion. Dexamethasone by intravenous infusion should be given concomitantly for its antiemetic and hepatoprotective effects.

The Scottish Medicines Consortium (p. 3) has advised (January 2008) that trabectedin (Yondelis®) is not recommended for use within NHS Scotland for the treatment of advanced soft tissue sarcoma.

TRABECTEDIN

Indications see notes above

Cautions see section 8.1 and notes above; measure creatine phosphokinase, renal function and hepatic function before starting (consult product literature); monitor haematological and hepatic parameters weekly during first 2 cycles and at least once between treatments in subsequent cycles; concomitant use with hepatotoxic drugs (avoid alcohol); hepatic impairment (Appendix 2)

Contra-indications raised bilirubin; renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see section 8.1; also abdominal pain, constipation, diarrhoea, dyspepsia, taste disturbance, hepatobiliary disorders; hypotension, oedema, flushing; dyspnoea, cough; headache, insomnia, peripheral neuropathy, paraesthesia, dizziness, anorexia, asthenia, fatigue; pyrexia; hypokalaemia, dehydration, increased blood creatine phosphokinase; myalgia, arthralgia, back pain

Yondelis® (Pharma Mar) ▼ (Ph)

Injection, powder for reconstitution, trabectedin, net price 250-microgram vial = £263.00; 1-mg vial = £1366.00

Trastuzumab

Trastuzumab is licensed for the treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (see NICE guidance, below).

Trastuzumab is also licensed, in combination with paclitaxel or docetaxel, for metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate.

Trastuzumab is also licensed, in combination with an aromatase inhibitor, for metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab.

Trastuzumab is also licensed as monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane; women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy.

Trastuzumab is given by intravenous infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

NICE guidance

Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006)

Trastuzumab is an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant), and radiotherapy (if appropriate).

Use with anthracyclines Concomitant use of trastuzumab with anthracyclines (section 8.1.2) is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If an anthracycline needs to be used, cardiac function should be monitored closely.

TRASTUZUMAB

Indications see notes above and product literature

Cautions see section 8.1 and notes above; symptomatic heart failure, history of hypertension, coronary artery disease, uncontrolled arrhythmias; pregnancy (Appendix 4)

Cardiotoxicity Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature

Contra-indications see section 8.1 and notes above; severe dyspnoea at rest; breast-feeding (Appendix 5)

Side-effects infusion-related side-effects including chills, fever, hypersensitivity reactions such as anaphylaxis, urticaria, and angioedema; gastrointestinal symptoms; cardiotoxicity (see also above), chest pain, hypotension; pulmonary events (possibly delayed onset); headache, taste disturbance, anxiety, malaise, depression, insomnia, drowsiness, dizziness, paraesthesia, tremor, asthenia, peripheral neuropathy, hypotonia; mastitis, urinary-tract infection; leukopenia, ecchymosis, oedema, weight loss; arthralgia, myalgia, arthritis, bone pain, leg cramps; rash, pruritus, sweating, dry skin, alopecia, acne, nail disorders

Herceptin® (Roche) ▼ (Vain)

Intravenous infusion, powder for reconstitution, trastuzumab, net price 150-mg vial = £407.40

Tretinoin

Tretinoin is licensed for the induction of remission in acute promyelocytic leukaemia. It is used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it.

TRETINOIN

Note Tretinoin is the acid form of vitamin A

Indications see notes above; acne (section 13.6.1); photodamage (section 13.8.1)
Malignant disease and immunosuppression

Immunomodulators may be used to initiate treatment both. Specialist management is required and other drug (azathioprine or mycophenolate mofetil), (ciclosporin or tacrolimus), corticosteroid combined with a calcineurin inhibitor organ transplant patients are usually maintained on a chronic inflammatory and autoimmune diseases. Solid organ transplant recipients and to treat a variety of immunosuppressants are used to suppress rejection in renal, hepatic or cardiac transplanta-

Bioavailability

Different formulations of the same immunosuppres-
sant may vary in bioavailability and to avoid reduced effect or excessive side-effects, it is important not to change formulation except on the advice of a transplant specialist.

Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised—important: for advice on measles and chickenpox (varicella) exposure, see Immunoglobulins (section 14.5). For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1. For general comments and warnings relating to corticosteroids and immunosuppressants, see section 6.3.2 (under Prednisolone).

Pregnancy

Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant; there is no evidence that azathioprine is teratogenic. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of these drugs during pregnancy needs to be supervised in specialist units. Manufacturers contra-indicate the use of tacrolimus and mycophenolate in pregnancy (Appendix 4).

8.2 Drugs affecting the immune response

8.2.1 Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol is given concurrently.

Blood tests and monitoring for signs of myelosuppres-

Mycophenolate mofetil is metabolised to mycophene-

nolic acid which has a more selective mode of action than azathioprine. It is licensed for the prophylaxis of acute rejection in renal, hepatic or cardiac transplanta-

tion when used in combination with ciclosporin and corticosteroids. There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection epi-

8.2.2 Corticosteroids and other immunosuppressants

8.2.3 Rituximab and alemtuzumab

8.2.4 Other immunomodulating drugs

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are usually maintained on a corticosteroid combined with a calcineurin inhibitor (ciclosporin or tacrolimus), or with an antiproliferative drug (azathioprine or mycophenolate mofetil), or with both. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

8.2.1 Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol is given concurrently.

Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment with azathioprine. The enzyme thiopurine methyltransferase (TPMT) metabolises azathioprine; the risk of myelosuppression is increased in those with a low activity of the enzyme, particularly in the very few individuals who are homozygous for low TPMT activity.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine. It is licensed for the prophylaxis of acute rejection in renal, hepatic or cardiac transplantation when used in combination with ciclosporin and corticosteroids. There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection epi-
AZATHIOPRINE

Indications  see notes above; inflammatory bowel disease [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3)

Cautions  monitor for toxicity throughout treatment; monitor full blood count weekly (more frequently with higher doses or if hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months; hepatic impairment (Appendix 2); renal impairment (Appendix 3); reduce dose in elderly; pregnancy (see section 8.2)—treatment should not generally be initiated during pregnancy; breast-feeding (Appendix 5); interactions: Appendix 1 (azathioprine)

Bone marrow suppression  Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection

Contra-indications  hypersensitivity to azathioprine or mercaptopurine

Side-effects  hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis—calling for immediate withdrawal); dose-related bone marrow suppression (see also Cautions); liver impairment, cholestatic jaundice, hair loss and increased susceptibility to infections and colitis in patients also receiving corticosteroids; nausea; rarely pancreatitis, pneumonitis, hepatic veno-occlusive disease

Dose  • By mouth, or (if oral administration not possible— intravenous solution very irritating, see below) by intravenous injection over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion), or by intravenous infusion

Autoimmune conditions, 1–3 mg/kg daily, adjusted according to response (consider withdrawal if no improvement in 3 months)

Suppression of transplant rejection, initially up to 5 mg/kg then 1–4 mg/kg daily according to response

Note  Intravenous injection is alkaline and very irritant, see below)

Bone marrow suppression (including bone marrow suppression e.g. inexplicable bruising or bleeding, infection)

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding

Contra-indications pregnancy (exclude before starting and avoid for 6 weeks after discontinuation) (Appendix 4); breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances (including diarrhoea, vomiting, and abdominal pain), gastrointestinal ulceration and bleeding, abnormal liver function tests, hepatitis, jaundice, pancreatitis; oedema, tachycardia, hypertension, hypotension, vasodilatation; cough, dyspnoea; insomnia, agitation, tremor, dizziness, headache; influenza-like syndrome, infections (viral, bacterial, and fungal); hyperglycaemia; renal impairment; increased risk of malignancies, particularly of the skin; blood disorders (including leucopenia, anaemia, thrombocytopenia, pancytopenia), disturbances of electrolytes and blood lipids; arthralgia; alopecia, acne, and rash; progressive multifocal leuкоencephalopathy reported

Dose  • Renal transplantation, by mouth, 1 g twice daily starting within 72 hours of transplantation or by intravenous infusion, 1 g twice daily starting within 24 hours of transplantation for max. 14 days (then transfer to oral therapy); child and adolescent 2–18 years, by mouth 600 mg/m² twice daily (max. 2 g daily)

Note  Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m²

• Cardiac transplantation, by mouth, 1.5 g twice daily starting within 5 days of transplantation

• Hepatic transplantation, by intravenous infusion, 1 g twice daily starting within 24 hours of transplantation for 4 days (up to max. 14 days), then by mouth, 1.5 g twice daily as soon as is tolerated

CellCept® (Roche) Capsules, blue/brown, mycophenolate mofetil

250 mg, net price 100-cap pack = £87.33

Tablets, lavender, mycophenolate mofetil 500 mg, net price 50-tab pack = £87.33

Cautions  full blood counts every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops); elderly (increased risk of infection, gastrointestinal haemorrhage and pulmonary oedema); children (higher incidence of side-effects may call for temporary reduction of dose or interruption); active serious gastrointestinal disease (risk of haemorrhage, ulceration and perforation); delayed graft function; increased susceptibility to skin cancer (avoid exposure to strong sunlight); interactions: Appendix 1 (mycophenolate)

Malignant disease and immunosuppression

Notes  patients also receiving corticosteroids; nausea; rarely pancreatitis, pneumonitis, hepatic veno-occlusive disease
**8.2.2 Corticosteroids and other immunosuppressants**

**Prednisolone** (section 6.3.2) is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin’s disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being (see also Prescribing in Palliative Care, p. 17).

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

**Ciclosporin** (cyclosporin), a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-competitive but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

**Sirolimus** is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products.

**Antithymocyte immunoglobulin (rabbit)**

**Indications** see notes above

**Cautions** see notes above; monitor blood count; pregnancy (Appendix 4)

**Contra-indications** infection; breast-feeding (Appendix 5)

**Side-effects** nausea, vomiting, dysphagia, diarrhoea; hypotension; infusion-related reactions (including cytokine release syndrome and anaphylaxis, see notes above), serum sickness; fever, shivering, increased susceptibility to infection; increased susceptibility to malignancy; lymphopenia, neutropenia, thrombocytopenia; myalgia; pruritus, rash

**Dose**
- Heart transplantation, by intravenous infusion over at least 6 hours, 1–2.5 mg/kg daily for 3–5 days
- Renal transplantation, by intravenous infusion over at least 6 hours, 1–1.5 mg/kg daily for 3–9 days
- Corticosteroid-resistant renal graft rejection, by intravenous infusion over at least 6 hours, 1.5 mg/kg daily for 7–14 days

**Note** To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

**Thymoglobulin®** (Genzyme) ▼ Intravenous infusion, powder for reconstitution, rabbit anti-human thymocyte immunoglobulin, net price 25-mg vial = £168.18

**Basiliximab**

**Indications** see notes above

**Contra-indications** pregnancy (Appendix 4) and breast-feeding

**Side-effects** rarely severe hypersensitivity reactions; cytokine release syndrome also reported; for side-effects, see notes above; monitor blood count; infection; breast-feeding (Appendix 5)

**Dose**
- Renal transplantation, by intravenous infusion over at least 6 hours, 1 mg/kg daily for 4 days
- Intravenous infusion over at least 6 hours, 1.5 mg/kg daily for 7–14 days

**Note** To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

**Mycophenolic acid**

**Myfortic®** (Novartis) Tablets, e/c, mycophenolic acid (as mycophenolate sodium) 180 mg (green), net price 120-tab pack = £99.71; 360 mg (orange), 120-tab pack = £199.41.

**Label:** 25

**Dose** renal transplantation, 720 mg twice daily starting within 72 hours of transplantation

**Equivalence to mycophenolate mofetil** Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

**Sirolimus** is a potent non-calcineurin inhibiting immunosuppressant licensed for renal transplantation. It can cause hyperlipidaemia.

**Basiliximab** is a monoclonal antibody that prevents T-lymphocyte proliferation; it is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppressive regimens; its use should be confined to specialist centres.

**Antithymocyte immunoglobulin (rabbit)** is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability may be increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

**Tacrolimus** is a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant; hypertrichosis appears to be less of a problem than with ciclosporin.

**Mycophenolate mofetil** [mycophenolic acid also chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant; hypertrichosis appears to be less of a problem than with ciclosporin.]

**Corticosteroid-resistant renal graft rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children, see above] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney, or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor.
effects of regimen see under Ciclosporin (below) and Prednisolone (section 6.3.2).

**Dose**
- By intravenous injection or by intravenous infusion, 20 mg within 2 hours before transplant surgery and 20 mg 4 days after surgery; withhold second dose if severe hypersensitivity or graft loss occurs; CHILD and ADOLESCENT 1–17 years, body-weight under 35 kg, 10 mg within 2 hours before transplant surgery and 10 mg 4 days after surgery; body-weight over 35 kg, adult dose

Simulect® (Novartis) Injection, powder for reconstitution, basiliximab, net price 10-mg vial = £758.69, 20-mg vial = £842.38 (both with water for injections). For intravenous infusion

---

**CICLOSPORIN**

(Cyclosporin)

**Indications** see notes above, and under Dose; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); atopic dermatitis and psoriasis (section 13.5.3).

**Cautions** monitor kidney function—dose dependent on renal function (dosage adjustment based on bilirubin increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients; monitor liver function (dosage adjustment based on bilirubin and liver enzymes may be needed); monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives; hyperuricaemia; monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia); monitor serum magnesium; measure blood lipids before treatment and thereafter as appropriate; pregnancy (see p. 486) and breast-feeding (Appendix 5); acute porphyria (section 9.8.2); use with tacrolimus specifically contra-indicated; for patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer); avoid excessive exposure to UV light, including sunlight; interactions: Appendix 1 (ciclosporin); Additional cautions in nephrotic syndrome Contra-indicated in uncontrolled hypertension, uncontrolled infections, and malignancy; reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement; in renal impairment initially 2.5 mg/kg daily; in long-term management, perform renal biopsies at yearly intervals; Additional cautions Atopic Dermatitis and Psoriasis, section 13.5.3; Rheumatoid Arthritis, section 10.1.3.

**Side-effects** gastro-intestinal disturbances, gingival hyperplasia, hepatic dysfunction, anorexia, hypertension; tremor, headache, paraesthesia, fatigue; renal dysfunction (renal structural changes on long-term administration, see also under Cautions), hyperuricaemia, hyperkalaemia, hypomagnesaemia, hyperlipaemia; muscle cramps, myalgia; hypertrichosis; less commonly oedema, weight gain, encaphalopathy or demyelination especially in liver transplant patients, anaemia, thrombocytopenia, rash; rarely pancreatitis, motor polyneuropathy, menstrual disturbances, gynaecomastia, microangiopathic haemolytic anaemia, haemolytic uraemic syndrome, hyperglaemia, muscle weakness, myopathy; visual disturbances secondary to benign intracranial hypertension (discontinue), also anaphylaxis reported with infusion.

---

**Dose**
- Organ transplantation, used alone, ADULT and CHILD over 3 months 10–15 mg/kg by mouth 4–12 hours before transplantation followed by 10–15 mg/kg daily for 1–2 weeks postoperatively then reduced gradually to 2–6 mg/kg daily for maintenance (dose should be adjusted according to blood-ciclosporin concentration and renal function); dose lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours.

- Bone-marrow transplantation, prevention and treatment of graft-versus-host disease, ADULT and CHILD over 3 months 3–5 mg/kg daily by intravenous infusion over 2–6 hours from day before transplantation to 2 weeks postoperatively (or 12.5–15 mg/kg daily by mouth) then 12.5 mg/kg daily by mouth for 3–6 months then tailed off (may take up to a year after transplantation).

- Nephrotic syndrome, by mouth, 5 mg/kg daily in 2 divided doses; CHILD 6 mg/kg daily in 2 divided doses; maintenance treatment reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis).

**Conversion** Any conversion between brands should be undertaken very carefully and the manufacturer contacted for further information. Currently only Neoral remains available for oral use; Sandimmune capsules and oral solution and SangCya oral solution are available on named-patient basis only for patients who cannot be transferred to another brand of oral ciclosporin.

Because of differences in bioavailability, the brand of oral ciclosporin to be dispensed should be specified by the prescriber.

**Neoral®** (Novartis) capsules, ciclosporin 10 mg (yellow/white), net price 60-cap pack = £18.98; 25 mg (blue/grey), 30-cap pack = £19.10; 50 mg (yellow/white), 30-cap pack = £37.40; 100 mg (blue/grey), 30-cap pack = £70.99.

Counselling, administration
- Oral solution, yellow, sugar-free, ciclosporin 100 mg/mL, net price 50 mL = £106.37.

Counselling, administration
- Counselling Total daily dose should be taken in 2 divided doses. Avoid grapefruit or grapefruit juice for 1 hour before dose.

Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking and rinse mouth for 3–6 hours then tapered off (may take up to a year after transplantation).

**Sandimmune** (Novartis) Concentrate for intravenous infusion (oily), ciclosporin 50 mg/mL. To be diluted before use. Net price 1-mL amp = £1.94; 5-mL amp = £9.17

Excipients include polysorbate castor oil (risk of anaphylaxis, see Excipients, p 2).

**Note** Observe patients for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

---

**SIROLIMUS**

**Indications** prophylaxis of organ rejection in kidney allograft recipients (initially in combination with ciclosporin and corticosteroid, then with corticosteroid only); see also under Dose

**Cautions** monitor kidney function when given with ciclosporin; Afro-Caribbean patients may require...
Malignant disease and other immunosuppressants

Contra-indications

hypoalbuminemia (section 13.5.3)

rejection resistant to conventional immunosuppressive regimes used)

When changing between oral solution and tablets, measurement of serum 'trough' blood-sirolimus concentration after 1–2 weeks is recommended

Note

expectoration, renal failure, pulmonary hypertension, pleural effusion, pericardial effusion, pancreatitis, pulmonary embolism, rare bleeding, disseminated intravascular coagulation, sepsis, severe atopic eczema (section 13.5.3)

Driving

MHRA/CHM advice (December 2008)

Prograf and Advagraf (tacrolimus): serious medication errors

It is important to note the correct use of these medicines:

- Prograf is an immediate-release formulation that is taken twice daily, once in the morning and once in the evening.
- Advagraf is a prolonged-release formulation that is taken once daily in the morning.

Prograf and Advagraf are not interchangeable; switching between Prograf and Advagraf requires careful therapeutic monitoring. Substitution should be made only under the close supervision of a transplant specialist.

Prograf® (Astellas)  
Capsules, tacrolimus 500 micrograms (yellow), net price 50-cap pack = £65.69; 1 mg (white), 50-cap pack = £85.22, 100-cap pack = £170.43; 5 mg (greyish-red), 50-cap pack = £314.84. Label: 23, counselling, driving

Concentrate for intravenous infusion, tacrolimus 5 mg/mL. To be diluted before use. Net price 1-mL amp = £62.05

Excipients include polysorbate 80 (risk of anaphylaxis, see Excipients, p. 2)

Dose

Liver transplantation, starting 12 hours after transplantation, requires a prolonged-release formulation that is taken once daily in the morning.

Prograf and Advagraf are not interchangeable; switching between Prograf and Advagraf requires careful therapeutic monitoring. Substitution should be made only under the close supervision of a transplant specialist.

TACROLIMUS

Indications

prophylaxis of organ rejection in liver, kidney, and heart allograft recipients and allograft rejection resistant to conventional immunosuppressive regimes, see also notes above: moderate to severe atopic eczema (section 13.5.3)

Cautions

see under Ciclosporin; also monitor ECG (important: also echocardiography, see CSM warning below), visual status, blood glucose, haematological and neurological parameters and whole blood 'trough' concentrations of tacrolimus (especially during episodes of diarrhoea); hepatic impairment (Appendix 2); interactions: Appendix 1 (tacrolimus)

Driving May affect performance of skilled tasks (e.g. driving)

Contra-indications

hypersensitivity to macrolides; pregnancy (exclude before starting—if contraception needed non-hormonal methods should be used, Appendix 4); breast-feeding (Appendix 5); avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin)

Side-effects

gastro-intestinal disturbances including dyspepsia, and inflammatory and ulcerative disorders; hepatic dysfunction, jaundice, bile-duct and gall-bladder abnormalities; hypertension (less frequently hypotension), tachycardia, angina, arrhythmias, thromboembolic and ischaemic events, rarely myocardial hypertrophy, cardiomyopathy (important: see CSM warning below), dyspnoea, pleural effusion, tremor, headache, insomnia, paraesthesia, confusion, depression, dizziness, anxiety, convulsions, incoordination, encephalopathy, psychosis, visual and hearing abnormalities; haematological effects including anaemia, leucocytosis, leucopenia, thrombocytopenia, pancytopenia, coagulation disorders; altered acid-base balance and glucose metabolism, electrolyte disturbances including hyperkalaemia (less frequently hypokalaemia); altered renal function including increased serum creatinine; hypophosphataemia, hypercalcemia, hyperuricaemia; muscle cramps, arthralgia; pruritus, alopecia, rash, sweating, acne, photosensitivity; susceptibility to lymphoma and other malignancies particularly of the skin, less commonly ascites, pancreatitis, atelectasis, kidney damage and renal failure, myasthenia, hirsutism; rarely Stevens-Johnson syndrome

CSM Warning

Cardiomyopathy has been reported in children given tacrolimus after transplantation. Patients should be monitored carefully by echocardiography for trophic changes; dose reduction or discontinuation should be considered if these occur

Dose

See under preparations

MHRA/CHM advice (December 2008)

Prograf and Advagraf (tacrolimus): serious medication errors

It is important to note the correct use of these medicines:

- Prograf is an immediate-release formulation that is taken twice daily, once in the morning and once in the evening.
- Advagraf is a prolonged-release formulation that is taken once daily in the morning.

Prograf and Advagraf are not interchangeable; switching between Prograf and Advagraf requires careful therapeutic monitoring. Substitution should be made only under the close supervision of a transplant specialist.

TACROLIMUS

Indications

prophylaxis of organ rejection in liver, kidney, and heart allograft recipients and allograft rejection resistant to conventional immunosuppressive regimes, see also notes above: moderate to severe atopic eczema (section 13.5.3)

MHRA/CHM advice (December 2008)

Prograf and Advagraf (tacrolimus): serious medication errors

It is important to note the correct use of these medicines:

- Prograf is an immediate-release formulation that is taken twice daily, once in the morning and once in the evening.
- Advagraf is a prolonged-release formulation that is taken once daily in the morning.

Prograf and Advagraf are not interchangeable; switching between Prograf and Advagraf requires careful therapeutic monitoring. Substitution should be made only under the close supervision of a transplant specialist.
of a specialist. See section 10.1.3 for the role of rituximab in rheumatoid arthritis.

Rituximab should be used with caution in patients receiving cardiotoxic chemotherapy or with a history of cardiovascular disease because exacerbation of angina, arrhythmia, and heart failure have been reported. Transient hypotension occurs frequently during infusion and antihypertensives may need to be withheld for 12 hours before infusion. Patients should be monitored for neurological deficits; if progressive multifocal leucoencephalopathy is suspected, suspend treatment until excluded.

Infusion-related side-effects (including cytokine release syndrome) are reported commonly with rituximab and occur predominantly during the first infusion; they include fever and chills, nausea and vomiting, allergic reactions (such as rash, pruritus, angioedema, bronchospasm and dyspnoea), flushing and tumour pain. Patients should be given an analgesic and an antihistamine before each dose of rituximab to reduce these effects. Premedication with a corticosteroid should also be considered. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred 1–2 hours after infusion of rituximab. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

### NICE guidance

**Rituximab for the treatment of follicular lymphoma (September 2006)**

Rituximab, in combination with cyclophosphamide, vincristine, and prednisolone is an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.
NICE guidance

Rituximab for aggressive non-Hodgkin’s lymphoma (September 2003)

Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV. The use of rituximab for localised (stage I) disease should be limited to clinical trials.

Alemtuzumab, another monoclonal antibody that causes lysis of B lymphocytes, is licensed for use in patients with chronic lymphocytic leukaemia for whom fludarabine treatment is not appropriate. In common with rituximab, it causes infusion-related side-effects including cytokine release syndrome (see above) and premedication with an analgesic, an antihistamine, and a corticosteroid is recommended.

8.2.4 Other immunomodulating drugs

Interferon alfa

Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours. Interferon alfa preparations are also used in the treatment of chronic hepatitis B, and chronic hepatitis C ideally in combination with ribavirin (section 5.3.3). Side-effects are dose-related, but commonly include anorexia, nausea, influenza-like symptoms, and lethargy. Ocular side-effects and depression (including suicidal behaviour) have also been reported. Myelosuppression may occur, particularly affecting granulocyte counts. Cardiovascular problems (hypotension, hypertension, and arrhythmias), nephrotoxicity and hepatotoxicity have been reported. Hypertriglyceridaemia, sometimes severe, has been observed; monitoring of lipid concentration is recommended. Other side-effects include hypersensitivity reactions, thyroid abnormalities, hyperglycaemia, alopecia, psoriasiform rash, confusion, coma and seizures (usually with high doses in the elderly).

Polyethylene glycol-conjugated (‘pegylated’) derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b) are available; pegylation increases the persistence of the interferon in the blood. The peginterferons are licensed for the treatment of chronic hepatitis C, ideally in combination with ribavirin (see section 5.3.3). Peginterferon alfa-2a is also licensed for the treatment of chronic hepatitis B.

NICE guidance (adefovir dipivoxil and peginterferon alfa-2a for chronic hepatitis B)
See p. 348

NICE guidance (peginterferon alfa, interferon alfa, and ribavirin for chronic hepatitis C)
See p. 348

Interferon alfa

Indications see under preparations

Cautions consult product literature; interactions:
Appendix 1 (interferons)

Contra-indications consult product literature; avoid injections containing benzyl alcohol in neonates (see under preparations below); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects see notes above and consult product literature

Dose
Consult product literature

INTRON A® (Schering-Plough) (Roche)

Injection, interferon alfa-2b (rbe) 10 million units/mL, net price 1-mL vial = £43.17, 2.5-mL vial = £108.00.
For subcutaneous injection or intravenous infusion
Injection pen, interferon alfa-2b (rbe), net price 15 million units/mL, 1.5-mL cartridge = £77.76; 25 million units/mL, 1.5-mL cartridge = £129.60; 50 million units/mL, 1.5-mL cartridge = £259.20. For subcutaneous injection

Note Each 1.5-mL multidose cartridge delivers 6 doses of 0.2 mL i.e. a total of 1.2 mL.
For chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine), hairy cell leukaemia, follicular lymphoma, lymph or liver metastases of carcinoid tumour, chronic hepatitis B, chronic hepatitis C, adjunct to surgery in malignant melanoma and maintenance of remission in multiple myeloma

Roferon-A® (Roche) (Roche)

Injection, interferon alfa-2a (rbe). Net price 6 million units/mL, 0.5-mL (3 million-unit) prefilled syringe = £15.07; 9 million units/mL, 0.5-mL (4.5 million-unit) prefilled syringe = £22.60; 12 million units/mL, 0.5-mL (6 million-unit) prefilled syringe = £30.12; 18 mil-
lion units/mL, 0.5-mL (9 million-unit) prefilled syringe = £45.19; 36 million units/mL, 0.5-mL (18 million-unit) prefilled syringe = £90.39; 30 million units/mL, 0.6-mL (18 million-unit) cartridge = £90.39, for use with Roferon pen device. For subcutaneous injection (cartridges, vials, and prefilled syringes) and intra-muscular injection (cartridges and vials) Excipients include benzenyl alcohol (avoid in neonates, see Excipients, p. 2)

For AIDS-related Kaposi’s sarcoma, hairy cell leukaemia, chronic myelogenous leukaemia, recurrent or metastatic renal cell carcinoma, progressive cutaneous T-cell lymphoma, chronic hepatitis B and chronic hepatitis C, follicular non-Hodgkin’s lymphoma, adjunct to surgery in malignant melanoma

PEGINTERFERON ALFA

Indications see under preparations
Cautions consult product literature; interactions: Appendix 1 (interferons)
Contra-indications consult product literature
Side-effects see notes above and consult product literature

Dose
• Consult product literature

Pegasys® (Roche) \(\text{INF}\)
Injection, peginterferon alfa-2a, net price 135-microgram prefilled syringe = £114.39, 180-microgram prefilled syringe = £132.06. For subcutaneous injection
Combined with ribavirin for chronic hepatitis C, as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3), as monotherapy for chronic hepatitis B

ViraferonPeg® (Schering-Plough) \(\text{INF}\)
Injection, powder for reconstitution, peginterferon alfa-2b (rbe), net price 50-microgram vial = £82.78, 80-microgram vial = £100.44, 100-microgram vial = £125.55, 120-microgram vial = £150.66, 150-microgram vial = £188.33 (all with injection equipment and water for injections). For subcutaneous injection
Combined with ribavirin for chronic hepatitis C, as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3)

Interferon beta

Interferon beta is licensed for use in patients with relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided. Not all patients respond and a deterioration in the bouts has been observed in some. It is also licensed for use in patients with a single demyelinating event with an active inflammatory process, if it is severe enough to require treatment with an intravenous corticosteroid, and they are at high risk of developing multiple sclerosis. Interferon beta-1b is also licensed for use in patients with secondary progressive multiple sclerosis but its role in this condition has not been confirmed.

Interferon beta should not be used in those with severe depressive illness (or suicidal ideation), or in decompensated liver disease. Caution is advised in those with severe hepatic or renal impairment or a history of cardiac disorders, depressive disorders (avoid in severe depression or in those with suicidal ideation), seizures, or severe myelosupression. Patients should be monitored for signs of hepatic injury. Side-effects reported most frequently include irritation at injection site (including inflammation, hypersensitivity, necrosis) and influenza-like symptoms (fever, chills, myalgia, or malaise) but these decrease over time; nausea and vomiting occur occasionally. Other side-effects include hypersensitivity reactions (including anaphylaxis and urticaria), blood disorders, menstrual disorders, mood and personality changes, suicide attempts, confusion and convulsions; alopecia, hepatitis, and thyroid dysfunction have been reported rarely with interferon beta-1b.

NICE guidance

Interferon beta and glatiramer acetate for multiple sclerosis (January 2002)

Interferon beta and glatiramer acetate are not recommended for the treatment of multiple sclerosis in the NHS in England and Wales. Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

Provision of disease-modifying therapies for multiple sclerosis

The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk).

INTERFERON BETA

Indications see notes above and under preparations
Cautions see notes above and consult product literature
Contra-indications see notes above and consult product literature
Side-effects see notes above and consult product literature

Dose
• Consult product literature

Interferon beta-1a

Avonex® (Biogen) \(\text{INF}\)
Injection, interferon beta-1a 60 micrograms (12 million units)/mL, net price 0.5-mL (30-microgram, 6 million-unit) prefilled syringe = £163.50. For intra-muscular injection
8 Malignant disease and immunosuppression

Injection, powder for reconstitution, interferon beta-1a, net price 30-microgram (6 million-unit) vial with diluent = £163.50. For intramuscular injection

For relapsing, remitting multiple sclerosis or for a single demyelinating event with an active inflammatory process (if it is severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

Rebif® (Serono) \[\text{Bacillus Calmette-Guérin}\]

Injection, interferon beta-1a, net price 22-microgram (6 million-unit) prefilled syringe = £48.16; 44-microgram (12 million-unit) prefilled syringe = £57.32; starter pack of 6 x 8.8-microgram (2.4 million-unit) prefilled syringes with 6 x 22–microgram (6 million-unit) prefilled syringes = £586.19. For subcutaneous injection

For relapsing, remitting multiple sclerosis

Interferon beta-1b

Betaloven® (Schering Health) \[\text{Bacillus Calmette-Guérin}\]

Injection, powder for reconstitution, interferon beta-1b. Net price 300-microgram (9.6 million-unit) vial with diluent = £39.78. For subcutaneous injection

Note An autoinjector device (Betatject Light) is available from Schering Health

For relapsing, remitting multiple sclerosis, for secondary progressive multiple sclerosis with active disease, or for a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

Aldesleukin

Aldesleukin (recombinant interleukin-2) is licensed for metastatic renal cell carcinoma; it is usually given by subcutaneous injection. It is now rarely given by intravenous infusion because of an association with a capillary leak syndrome, which can cause pulmonary oedema and hypotension. Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival. Bone-marrow, hepatic, renal, thyroid, and CNS toxicity is common. It is for use in specialist units only. Interactions: Appendix 1 (aldesleukin)

Proleukin® (Novartis) \[\text{Bacillus Calmette-Guérin}\]

Injection, powder for reconstitution, aldesleukin. Net price 18.5-milligram vial = £72.60. For subcutaneous injection

Injection, powder for reconstitution, aldesleukin. Net price 18-milligram vial = £112.00. For intravenous infusion but see notes above

For metastatic renal cell carcinoma, excluding patients in whom all three of the following prognostic factors are present: performance status of Eastern Co-operative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment.

BCG bladder instillation

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from Mycobacterium bovis. It is licensed as a bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection.

Bacillus Calmette-Guérin

Indications see notes above; BCG immunisation (section 14.4)

Cautions screen for active tuberculosis (contra-indicated if tuberculosis confirmed); traumatic catheterisation or urethral or bladder injury (delay administration until mucosal damage healed)

Contra-indications impaired immune response, HIV infection, urinary-tract infection, severe haematuria, tuberculosis, fever of unknown origin; pregnancy and breast-feeding

Side-effects cystitis, dysuria, urinary frequency, haematuria, malaise, fever, influenza-like syndrome; also systemic BCG infection (with fatalities)—consult product literature; rarely hypersensitivity reactions (such as arthralgia and rash), orchitis, transient urethral obstruction, bladder contracture, renal abscess; ocular symptoms reported

Dose

· Consult product literature

ImmuCyst® (Cambridge) \[\text{Bacillus Calmette-Guérin}\]

Bladder instillation, freeze-dried powder containing attenuated Mycobacterium bovis prepared from the Connaught strain of bacillus of Calmette and Guérin, net price 81-milligram vial = £79.23

OncoTICE® (Organon) \[\text{Bacillus Calmette-Guérin}\]

Bladder instillation, freeze-dried powder containing attenuated Mycobacterium bovis prepared from the TICE strain of bacillus of Calmette and Guérin, net price 12.5-milligram vial = £80.00

Glatiramer acetate

Glatiramer is an immunomodulating drug comprising synthetic polypeptides. It is licensed for reducing the frequency of relapses in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years. Initiation of treatment with glatiramer should be supervised by a specialist.

NICE guidance (interferon beta and glatiramer for multiple sclerosis)

See p. 493

Provision of disease-modifying therapies for multiple sclerosis

See p. 493

Glatiramer Acetate

Indications see notes above

Cautions cardiac disorders; renal impairment (Appendix 3); breast-feeding (Appendix 5)

Contra-indications pregnancy (Appendix 4)

Side-effects flushing, chest pain, palpitation, tachycardia, and dyspnoea may occur within minutes of injection; nausea, constipation, diarrhoea; syncope, anxiety, asthenia, depression, dizziness, headache, tremor, sweating; oedema, lymphadenopathy; hyper-tonia, back pain, arthralgia, influenza-like symptoms; injection-site reactions, rash; rarely convulsions, hypersensitivity reactions
Lenalidomide and thalidomide

Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties. It is licensed, in combination with dexamethasone, for the treatment of multiple myeloma in patients who have received at least one previous therapy.

The most serious side-effects of lenalidomide are venous thromboembolism and severe neutropenia. Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

Thalidomide is used in combination with melphalan and prednisolone as first-line treatment for untreated multiple myeloma, in patients aged 65 years and over or those not eligible for high-dose chemotherapy. It has immunomodulatory and anti-inflammatory activity. Thalidomide can cause drowsiness, constipation, and on prolonged use peripheral neuropathy.

**Pregnancy**

For women of child-bearing potential, pregnancy must be excluded before starting treatment (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment (oral combined hormonal contraceptives and copper-releasing intrauterine devices not recommended) and men should use condoms during treatment and for at least 1 week after stopping. Women must be registered with a pregnancy prevention programme.

**Indications**

- **Thalidomide**: Patents and carers should be advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop
- **Lenalidomide**: Pregnancy (important teratogenic risk): see notes above and Appendix 4; breast-feeding (Appendix 5)

**Dose**

- **ADULT over 18 years**: 200 mg once daily at bedtime for 6-week cycle; max. 12 cycles
- **Thalidomide Pharamion®** (Celgene) ▼STM
  - **Capsules**, thalidomide 50 mg, net price 28-cap pack = £298.48. Label: 2, counselling, symptoms of peripheral neuropathy and thromboembolism (see above)
- **Note**: Patient, prescriber, and supplying pharmacy must be registered with Celgene Ltd and comply with a pregnancy prevention programme

Natalizumab

Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination. It is licensed for use in patients with highly active relapsing-remitting multiple sclerosis despite treatment with inter-

---

**BNF 57**

**8.2.4 Other immunomodulating drugs**
femon beta or those with rapidly evolving severe relapsing-remitting multiple sclerosis. Treatment with natalizumab should be initiated and supervised by a specialist.

Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML). Patients should be monitored for new or worsening neurological symptoms or signs of PML—treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Infusion-related side-effects include nausea, vomiting, flushing, headache, dizziness, fatigue, rashes, pyrexia, arthralgia, urticaria, and pruritus. Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion. Natalizumab should be discontinued permanently if hypersensitivity reaction occurs.

The Scottish Medicines Consortium has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

### Dose
- By intravenous infusion, ADULT over 18 years, 300 mg once every 4 weeks; discontinue if no response after 6 months

### Tysabri® *(Biogen)* ▼ *(Intravenous)*

Concentrate for intravenous infusion, natalizumab 20 mg/mL, net price 15-mL vial = £1130.00. Counseling, liver toxicity, progressive multifocal leucoencephalopathy, and hypersensitivity, patient alert card

### NICE guidance

**Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)**

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI. Patients currently receiving natalizumab who do not meet the above criteria, should have the option to continue therapy until they and their consultants consider it appropriate to stop.

### Natalizumab

**Indications**  see notes above

**Cautions**  see notes above and consult product literature; prior treatment with immunosuppressants; monitor liver function (see below)

**Liver toxicity**  Liver dysfunction reported; advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop; discontinue treatment if significant liver injury occurs

**Progressive multifocal leucoencephalopathy (PML)**  Patients should be given an alert card which includes information about the symptoms of PML; see also notes above

**Hypersensitivity reactions**  Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation)

**Contra-indications**  progressive multifocal leucoencephalopathy; active infection (see notes above); concurrent use of interferon beta or glatiramer acetate; immunosuppression; active malignancies; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects**  see notes above; also urinary-tract infection, nasopharyngitis, and arthralgia; less commonly hypersensitivity reactions (see above); liver toxicity also reported

### 8.3 Sex hormones and hormone antagonists in malignant disease

#### 8.3.1 Oestrogens

Diethylstilbestrol *(stilboestrol)* is sometimes used to treat prostate cancer, but it is not usually used first-line because of its side-effects. It is occasionally used in postmenopausal women with breast cancer. Toxicity is common and dose-related side-effects include nausea, fluid retention, and venous and arterial thrombosis. Impotence and gynaecomastia always occur in men, and withdrawal bleeding may be a problem in women. Hypercalcaemia and bone pain may also occur in breast cancer.

Ethynylestradiol *(ethinyloestradiol)* is the most potent oestrogen available; unlike other oestrogens it is only slowly metabolised in the liver. Ethynylestradiol is licensed for the palliative treatment of prostate cancer.

#### 8.3.2 Progestogens

#### 8.3.3 Androgens

#### 8.3.4 Hormone antagonists

Hormonal manipulation has an important role in the treatment of breast, prostate, and endometrial cancer, and a more marginal role in the treatment of hyperprolactaemia. These treatments are not curative, but may provide excellent palliation of symptoms in selected patients, sometimes for a period of years. Tumour response, and treatment toxicity should be carefully monitored and treatment changed if progression occurs or side-effects exceed benefit.

- Breast cancer, 10–20 mg daily
- Prostate cancer, 1–3 mg daily

**Preparations**
- Tablets, diethylstilbestrol 1 mg, net price 28 = £39.68; 5 mg, 28 = £230.92

**NORETHISTERONE**

**Indications** see notes above; other indications (section 6.4.1.2)

**Cautions** see section 6.4.1.2 and notes above; interactions: Appendix 1 (progestogens)

**Contra-indications** see section 6.4.1.2 and notes above

**Side-effects** see section 6.4.1.2 and notes above

**Dose**
- Breast cancer, 40 mg daily, increased to 60 mg daily if required

**Preparations**
- Section 6.4.1.2

**8.3.2 Progestogens**

Progestogens have a role in the treatment of endometrial cancer; their use in breast cancer and renal cell cancer has declined. Progestogens are now rarely used to treat prostate cancer. **Medroxyprogesterone** or **megestrol** are usually chosen and can be given orally; high-dose or parenteral treatment cannot be recommended. Side-effects are mild but may include nausea, fluid retention, and weight gain.

**MEDROXYPROGESTERONE ACETATE**

**Indications** see notes above; contraception (section 7.3.2.2); other indications (section 6.4.1.2)

**Cautions** see section 6.4.1.2 and notes above; interactions: Appendix 1 (progestogens)

**Contra-indications** see section 6.4.1.2 and notes above

**Side-effects** see section 6.4.1.2 and notes above; glucocorticoid effects at high dose may lead to a cushingoid syndrome

**Dose**
- See preparations below

**Provera® (Pharmacia)**
- Tablets, medroxyprogesterone acetate 100 mg (scored), net price 60-tab pack = £29.98, 100-tab pack = £49.94; 200 mg (scored), 30-tab pack = £29.65, 400 mg, 30-tab pack = £58.67

**MEGESTROL ACETATE**

**Indications** see notes above

**Cautions** see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above; interactions: Appendix 1 (progestogens)

**Contra-indications** see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above

**Side-effects** see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above

**Dose**
- Breast cancer, 160 mg daily in single or divided doses
- Endometrial cancer, 40–320 mg daily in divided doses

**Megace® (Bristol-Myers Squibb)**
- Tablets, scored, megestrol acetate 160 mg (off-white), 30-tab pack = £20.72

**8.3.3 Androgens**

Testosterone esters (section 6.4.2) have largely been superseded by other drugs for breast cancer.

**8.3.4 Hormone antagonists**

**8.3.4.1 Breast cancer**

The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these.

For operable breast cancer, treatment before surgery (neoadjuvant therapy) reduces the size of the tumour and facilitates breast-conserving surgery; hormone antagonist therapy (e.g. letrozole) is chosen for steroid hormone-receptor-positive breast cancer and chemotherapy for steroid hormone-receptor-negative tumours or for younger women.

**Early breast cancer** All women should be considered for adjuvant therapy following surgical removal of the tumour. Adjuvant therapy is used to eradicate the micrometastases that cause relapses. Choice of adjuvant treatment is determined by the risk of recurrence, steroid hormone-receptor status of the primary tumour, and menopausal status.

Adjuvant therapy comprises either cytotoxic chemotherapy or hormone-antagonist therapy. Women with steroid hormone-receptor-positive breast cancer are considered for hormone-antagonist therapy (preceded by cytotoxic chemotherapy if necessary) whilst women with steroid hormone-receptor-negative breast cancer should be considered for cytotoxic chemotherapy.

The oestrogen-receptor antagonist tamoxifen is effective in premenopausal, perimenopausal, and postmenopausal women. The aromatase inhibitors anastrozole, exemestane, and letrozole are effective in postmenopausal women only. Adjuvant hormone antagonist therapy reduces the risk of cancer in the other breast and should generally be continued for 5 years following...
removal of the tumour. In those considered for extended adjuvant therapy, 5 years of tamoxifen is followed by an aromatase inhibitor such as letrozole for a further 3 years.

Trastuzumab is licensed for use in early breast cancer which overexpresses human epidermal growth factor-2 (HER2) in women who have received surgery, chemotherapy and radiotherapy (as appropriate). Premenopausal women may also benefit from treatment with a gonadorelin analogue or ovarian ablation.

**Advanced breast cancer** Tamoxifen is used in post-menopausal women with oestrogen-receptor-positive tumours, long disease-free interval following treatment for early breast cancer, and disease limited to bone or soft tissues. However, aromatase inhibitors, such as anastrozole or letrozole, may be more effective and are regarded as preferred treatment in postmenopausal women. Ovarian ablation or the gonadorelin analogue goserelin (Zoladex®) (section 8.3.4.2) should be considered in premenopausal women. Progestogens such as medroxyprogesterone acetate continue to have a role in postmenopausal women with advanced breast cancer. They are as effective as tamoxifen, but they are not as well tolerated; they are less effective than the aromatase inhibitors.

Cytotoxic chemotherapy is preferred for advanced steroid hormone-receptor-negative tumours and for aggressive disease, particularly where metastases involve visceral sites (e.g. the liver) or where the disease-free interval following treatment for early breast cancer is short.

**Chemoprevention** Recent evidence suggests that tamoxifen prophylaxis can reduce breast cancer in women at high risk of the disease. However, the adverse effects of tamoxifen preclude its routine use in most women.

**Cytotoxic drugs used in breast cancer** An anthracycline combined with fluorouracil (section 8.1.3) and cyclophosphamide (section 8.1.1), and sometimes also with methotrexate (section 8.1.3) is effective. Cyclophosphamide, methotrexate, and fluorouracil can be useful if an anthracycline is inappropriate (e.g. in cardiac disease).

**Metastatic disease** The choice of chemotherapy regimen will be influenced by whether the patient has previously received adjuvant treatment and the presence of any co-morbidity.

For women who have not previously received chemotherapy, an anthracycline such as doxorubicin or epirubicin combined with cyclophosphamide is the standard initial therapy for metastatic breast disease. Patients with anthracycline-refractory or resistant disease should be considered for treatment with a taxane (section 8.1.5) either alone or in combination with trastuzumab if they have tumours that overexpress HER2. Other cytotoxic drugs with activity against breast cancer include capecitabine (section 8.1.3), mitoxantrone, mitomycin (both section 8.1.2), and vinorelbine (section 8.1.4). Trastuzumab alone (section 8.1.5) is an option for chemotherapy-resistant cancers that overexpress HER2.

**Oestrogen-receptor antagonists**

**Tamoxifen** is an oestrogen-receptor antagonist that is licensed for breast cancer and anovulatory infertility (section 6.5.1).

**Fulvestrant** is licensed for the treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy.

**Toremifene** is licensed for steroid hormone-receptor-positive metastatic breast cancer in postmenopausal women, but it is not often used.

**Aromatase inhibitors** Aromatase inhibitors act predominantly by blocking the conversion of androgens to oestrogens in the peripheral tissues. They do not inhibit ovari an oestrogen synthesis and should not be used in premenopausal women.

**Anastrozole** and letrozole are non-steroidal aromatase inhibitors; exemestane is a steroidal aromatase inhibitor. Anastrozole and letrozole are at least as effective as tamoxifen for first-line treatment of metastatic breast cancer in postmenopausal women. However, it is not yet known whether the benefits of aromatase inhibitors persist over the long term.

The Scottish Medicines Consortium (p. 3) has advised (August 2005 and October 2006) that anastrozole (Arimidex®) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

The Scottish Medicines Consortium (p. 3) has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

**Gonadorelin analogues** Goserelin (section 8.3.4.2), a gonadorelin analogue is licensed for the management of advanced breast cancer in premenopausal women.

**Other drugs used in breast cancer** Trilostane (section 6.7.3) is licensed for postmenopausal breast cancer. It is quite well tolerated but diarrhoea and abdominal discomfort may be a problem. Trilostane causes adrenal hypofunction and corticosteroid replacement therapy is needed.

The use of bisphosphonates (section 6.6.2) in patients with metastatic breast cancer may prevent skeletal complications of bone metastases.
pausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

Cautions laboratory test for menopause if doubt; susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

Contra-indications pregnancy and breast-feeding; moderate or severe hepatic disease; moderate or severe renal impairment; not for premenopausal women

Side-effects hot flushes, vaginal dryness, vaginal bleeding, hair thinning, anorexia, nausea, vomiting, diarrhoea, headache, arthralgia, bone fractures, rash (including Stevens-Johnson syndrome); asthenia and drowsiness—may initially affect ability to drive or operate machinery; slight increases in total cholesterol levels reported; very rarely allergic reactions including angioedema and anaphylaxis

Dose

- 1 mg daily

Arimidex® (AstraZeneca) Tablets, f/c, anastrozole 1 mg. Net price 28-tab pack = £68.56

EXEMESTANE

Indications adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed

Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (exemestane)

Contra-indications pregnancy and breast-feeding; not indicated for premenopausal women

Side-effects nausea, vomiting, abdominal pain, dyspepsia, constipation, anorexia; dizziness, fatigue, headache, depression, insomnia; hot flushes, sweating; fatigue, rash, less commonly drowsiness, asthenia, and peripheral oedema; rarely thrombocytopenia, leucopenia

Dose

- 25 mg daily

Aromasin® (Pharmacia) Tablets, s/c, exemestane 25 mg. Net price 30-tab pack = £88.80, 90-tab pack = £266.40. Label: 21

FULVестRANT

Indications treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

Cautions hepatic impairment (avoid if severe; Appendix 2)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects hot flushes, nausea, vomiting, diarrhoea, anorexia, headache, back pain, rash, asthenia, venous thromboembolism, injection-site reactions, urinary-tract infections; less commonly vaginal haemorrhage, vaginal candidiasis, leucorrhoea, hypersensitivity reactions including angioedema, urticaria

Dose

- By deep intramuscular injection, 250 mg into gluteal muscle every 4 weeks

Faslodex® (AstraZeneca) Injection (oily), fulvestrant 50 mg/mL, net price 5-mL (250-mg) prefilled syringe = £348.27

LETROZOLE

Indications adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women; advanced breast cancer in postmenopausal women (including those in whom other anti-oestrogen therapy has failed); early invasive breast cancer in postmenopausal women after standard adjuvant tamoxifen therapy; pre-operative treatment in postmenopausal women with localised hormone-receptor-positive breast cancer to allow subsequent breast conserving surgery

Cautions renal impairment (Appendix 3); susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

Contra-indications severe hepatic impairment; not indicated for premenopausal women; pregnancy (Appendix 4) and breast-feeding

Side-effects hot flushes, nausea, vomiting, fatigue, dizziness, headache, dyspepsia, constipation, diarrhoea, depression, anorexia, appetite increase, hypercholesterolaemia, alopecia, increased sweating, rash, peripheral oedema, musculoskeletal pain, osteoporosis, bone fracture; less commonly hypertension, palpitation, tachycardia, dyspnoea, cough, drowsiness, insomnia, anxiety, memory impairment, dysaesthesia, taste disturbance, pruritus, dry skin, urticaria, thrombophlebitis, abdominal pain, urinary frequency, urinary-tract infection, vaginal bleeding, vaginal discharge, breast pain, pyrexia, mucosal dryness, stomatitis, cataract, eye irritation, blurred vision, tumour pain, arthritis, leucopenia, general oedema; rarely pulmonary embolism, arterial thrombosis, cerebrovascular infarction

Dose

- 2.5 mg daily

Femara® (Novartis) Tablets, f/c, letrozole 2.5 mg. Net price 14-tab pack = £41.58, 28-tab pack = £83.16

TAMOXIFEN

Indications see under Dose and notes above; mastalgia [unlicensed indication] (section 6.7.2)

Cautions occasional cystic ovarian swellings in premenopausal women; increased risk of thromboembolic events when used with cytotoxics (see also below); breast-feeding (Appendix 5); endometrial changes (important: see below); porphyria (section 9.8.2); interactions: Appendix 1 (tamoxifen)

Endometrial changes Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.

Contra-indications pregnancy (exclude before commencing and advise non-hormonal contraception if appropriate—Appendix 4)

Side-effects hot flushes, vaginal bleeding and vaginal discharge (important: see also Endometrial Changes
under Cautions), suppression of menstruation in some premenopausal women, pruritus vulvae, gastro-intestinal disturbances, headache, light-headedness, tumour flare, decreased platelet counts; occasionally oedema, hypercalcaemia if bony metastases, alopecia, rashes, uterine fibroids; also visual disturbances (including corneal changes, cataracts, retinopathy); leucopenia (sometimes with anaemia and thrombocytoppenia), rarely neutropenia; hypertriglyceridaemia reported (sometimes with pancreatitis); thromboembolic events reported (see below); liver enzyme changes (rarely fatty liver, cholestasis, hepatitis); rarely interstitial pneumonitis, hypersensitivity reactions including angioedema, Stevens-Johnson syndrome, bullous pemphigoid; see also notes above.

**Risk of thromboembolism** Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility. Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

**Dose**
- Breast cancer, 20 mg daily
- CSA advice: The CSM has advised that tamoxifen in a dose of 20 mg daily substantially increases survival in early breast cancer, and that no further benefit has been demonstrated with higher doses. Patients should be told of the small risk of endometrial cancer (see under Cautions above) and encouraged to report relevant symptoms early. They can, however, be reassured that the benefits of treatment far outweigh the risks.
- Anovulatory infertility, 20 mg daily on days 2, 3, 4 and 5 of cycle; if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs.

**Tamoxifen** (Non-proprietary) Tablets, tamoxifen (as citrate) 10 mg, net price 30-tab pack = £1.83; 20 mg, 30-tab pack = £1.90; 40 mg, 30-tab pack = £6.24.

Oral solution, tamoxifen (as citrate) 10 mg/5 mL, net price 150 mL = £29.61.

Brands include Soltamox.

**Nolvadex-D** (AstraZeneca) Tablets, tamoxifen (as citrate) 20 mg, net-price 30-tab pack = £8.71.

**TOREMIFENE**

**Indications** hormone-dependent metastatic breast cancer in postmenopausal women

**Cautions** hypercalcaemia may occur (especially if bone metastases and usually at beginning of treatment); interactions: Appendix 1 (toremifene)

**Endometrial changes** There is a risk of increased endometrial changes including hyperplasia, polyps and cancer. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated.

**Contra-indications** endometrial hyperplasia, severe hepatic impairment (Appendix 2), history of severe thromboembolic disease; pregnancy and breast-feeding.

**Side-effects** hot flushes, vaginal bleeding or discharge (important: see also Cautions), dizziness, oedema, sweating, nausea, vomiting, chest or back pain, fatigue, headache, skin discoloration, weight increase, insomnia, constipation, dyspnoea, paresis, tremor, vertigo, pruritus, anorexia, corneal opacity (reversibility), asthenia; thromboembolic events reported; rarely dermatitis, alopecia, emotional lability, depression, jaundice, stiffness.

**Dose**
- 60 mg daily

**Fareston** (Orion) Tablets, toremifene (as citrate) 60 mg. Net price 30-tab pack = £30.37.

**8.3.4.2 Prostate cancer and gonadorelin analogues**

Metastatic cancer of the prostate usually responds to hormonal treatment aimed at androgen depletion. Standard treatments include bilateral subcapsular orchidectomy or use of a gonadorelin analogue (buserelin, goserelin, leuprolerein, or triptorelin). Response in most patients lasts for 12 to 18 months. No entirely satisfactory therapy exists for disease progression despite this treatment (hormone-refractory prostate cancer), but occasional patients respond to other hormone manipulation e.g. with an anti-androgen. Bone disease can often be palliated with irradiation or, if widespread, with strontium or prednisolone (section 6.3.2).

**Gonadorelin analogues**

Gonadorelin analogues are as effective as orchidectomy or diethylstilbestrol (section 8.3.1) but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of luteinising hormone release by the pituitary. During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide (see below) are recommended; anti-androgen treatment should be started 3 days before the gonadorelin analogue and continued for 3 weeks. Gonadorelin analogues are also used in women for breast cancer (section 8.3.4.1) and other indications (section 6.7.2).

**Cautions** Men at risk of tumour ‘flare’ (see above) should be monitored closely during the first month of therapy. Caution is required in patients with metabolic bone disease because reduced bone mineral density can occur. The injection site should be rotated.

**Side-effects** The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men and include hot flushes and sweating, sexual dysfunction, vaginal dryness or bleeding, and gynaecomastia or changes in breast size. Signs and symptoms of prostate or breast cancer may worsen initially (managed in prostate cancer with anti-androgens, see above). Other side-effects include hypersensitivity reactions (rashes, pruritus, asthma, and rarely anaphylaxis), injection site reactions (see Cautions), headache (rarely migraine), visual disturbances, dizziness, arthralgia and possibly myalgia, hair loss, peripheral oedema, gastro-intestinal disturbances, weight changes, sleep disorders, and mood changes.
Anti-androgens

Cyproterone acetate, flutamide and bicalutamide are anti-androgens that inhibit the tumour ‘flare’ which may occur after commencing gonadorelin analogue administration. Cyproterone acetate and flutamide are also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy. Bicalutamide is used for prostate cancer either alone or as an adjunct to other therapy, according to the clinical circumstances.

**BICALUTAMIDE**

**Indications** locally advanced prostate cancer at high risk of disease progression, either alone or as adjuvant treatment to prostatectomy or radiotherapy; locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate; advanced prostate cancer in combination with gonadorelin analogue or surgical castration

**Cautions** hepatic impairment (Appendix 2), also consider periodic liver function tests; **interactions:** Appendix 1 (bicalutamide)

**Side-effects** nausea, diarrhoea, cholestasis, jaundice; asthenia, weight gain, gynaecomastia, breast tenderness, hot flushes, impotence, decreased libido; anaemia; alopecia, dry skin, hirsutism, pruritus; less commonly vomiting, abdominal pain, dyspepsia, interstitial lung disease, pulmonary fibrosis, depression, haematuria, thrombocytopenia, hypersensitivity reactions including angioneurotic oedema and urticaria; rarely cardiovascular disorders (including angina, heart failure, and arrhythmias), and hepatic failure

**Dose**

- Locally advanced prostate cancer at high risk of disease progression, 150 mg once daily
- Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate, 150 mg once daily
- Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration, 50 mg once daily (started at the same time as surgical castration or at least 3 days before gonadorelin therapy, see also notes above)

**Note** The CSM has advised (October 2003) that bicalutamide should no longer be used for the treatment of localised prostate cancer

**Bicalutamide** (Non-proprietary) (AstraZeneca)

**Tablets**

- bicalutamide 50 mg, net price 28-tab pack = £114.92; 150 mg, 28-tab pack = £214.92
- Casodex® (AstraZeneca) (AstraZeneca)

**Tablets**

- f/c, bicalutamide 50 mg, net price 28-tab pack = £128.00; 150 mg, 28-tab pack = £240.00

**BUUSERELIN**

**Indications** advanced prostate cancer; other indications (section 6.7.2)

**Cautions** depression, see also notes above

**Side-effects** see notes above; worsening hypertension, palpitation, glucose intolerance, altered blood lipids, thrombocytopenia, leucopenia, nervousness, fatigue, memory and concentration disturbances, anxiety, increased thirst, hearing disorders, muscular-skeletal pain; nasal irritation, nose bleeds and altered sense of taste and smell (spray formulation only)

**CYPROTERONE ACETATE**

**Indications** prostate cancer, see under Dose and also notes above; other indications, see section 6.4.2

**Cautions** in prostate cancer, blood counts initially and throughout treatment; hepatic impairment (Appendix 2; see also under side-effects below); monitor hepatic function (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; risk of recurrence of thromboembolic disease; diabetes mellitus, sickle-cell anaemia, severe depression (in other indications some of these are contra-indicated, see section 6.4.2)

**Driving** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

**Contra-indications** none in prostate cancer; for contra-indications relating to other indications see section 6.4.2

**Side-effects** see section 6.4.2

**Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (usually after several months) in patients treated with cyproterone acetate 200–300 mg daily. Liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur—if confirmed cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk)

**Dose**

- Flare with initial gonadorelin therapy, 300 mg daily in 2–3 divided doses, reduced to 200 mg daily in 2–3 divided doses if necessary
- Long-term palliative therapy where gonadorelin analogue is contra-indicated, or where oral therapy preferred, 200–300 mg daily in 2–3 divided doses
- Hot flushes with gonadorelin therapy or after orchiectomy, initially 50 mg daily, adjusted according to response to 50–150 mg daily in 1–3 divided doses

**Cyproterone Acetate** (Non-proprietary) (Aventis Pharma) (Bayer)

**Tablets**

- cyproterone acetate 50 mg, net price 56-tab pack = £31.54; 100 mg, 84-tab pack = £77.50.
- Label: 21, counselling, driving

**Cypростat** (Bayer) (Bayer)

**Tablets**

- scored, cyproterone acetate 50 mg, net price 168-tab pack = £77.68; 100 mg, 84-tab pack = £77.68.
- Label: 21, counselling, driving

**FLUTAMIDE**

**Indications** advanced prostate cancer, see also notes above

**Dose**

- By subcutaneous injection, 500 micrograms every 8 hours for 7 days, then intranasally, 1 spray into each nostril 6 times daily (see also notes above)

**Counselling** Avoid use of nasal decongestants before and for at least 30 minutes after treatment.

**Suprefact®** (Aventis Pharma) (Aventis Pharma)

**Injection** buserelin (as acetate) 1 mg/mL. Net price 2 × 5.5-mL vial = £23.69

**Nasal spray** buserelin (as acetate) 100 micrograms/ metered spray. Net price treatment pack of 4 × 10-g bottle with spray pump = £87.68. Counselling, see above
Malignant disease and immunosuppression

**Cautions**
cardiac disease (oedema reported); hepatic impairment, also liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anorexia, jaundice, abdominal pain, unexplained influenza-like symptoms); avoid excessive alcohol consumption; **interactions**: Appendix 1

**Side-effects**
gynaecostasia (sometimes with galactorrhea); nausea, vomiting, diarrhoea, increased appetite, insomnia, tiredness; other side-effects reported include decreased libido, reduced sperm count, gastric and chest pain, hypertension, headache, dizziness, oedema, blurred vision, thirst, rash, pruritus, haemolytic anaemia, systemic lupus erythematosus-like syndrome, and lymphoedema; hepatic injury (with transaminase abnormalities, cholestatic jaundice, hepatic necrosis, hepatic encephalopathy and occasional fatality) reported

**Dose**
- 250 mg 3 times daily (see also notes above)

**Flutamide**

(Flutamide)

**Indications**
locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; advanced breast cancer; oestrogen-receptor-positive early breast cancer (section 8.3.4.1); endometriosis, endometrial thinning, uterine fibroids, assisted reproduction (section 6.7.2)

**Cautions**
see notes above; diabetes; risk of ureteric obstruction and spinal cord compression in men

**Contra-indications**
pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects**
see notes above; also dry mouth, transient hyperglycaemia (in patients with metastatic breast cancer)

**Dose**
- See under preparations below

**Prostap® SR**

(Wyeth)

**Injection**
(microsphere powder for reconstitution), leuprolrelin acetate, net price 3.75-mg vial with 1-mL vehicle-filled syringe = £125.40

**Dose**
prostate cancer (see indications), by subcutaneous or by intramuscular injection, 3.75 mg every 4 weeks

**Prostap® 3**

(Wyeth)

**Injection**
(microsphere powder for reconstitution), leuprolrelin acetate, net price 11.25-mg vial with 2-mL vehicle-filled syringe = £376.20

**Dose**
prostate cancer (see indications), by subcutaneous injection, 11.25 mg every three months

**GOSERELIN**

**Indications**
locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; endometriosis, endometrial thinning, uterine fibroids (section 6.7.2)

**Cautions**
see notes above and section 6.7.2; risk of ureteric obstruction and spinal cord compression in men

**Contra-indications**
pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects**
see notes above and section 6.7.2; also fatigue, muscle weakness, paraesthesia, hypertension, palpitation, alteration of glucose tolerance and of blood lipids; hypotension, jaundice, thrombocytopenia and leucopenia reported

**Dose**
- See under preparations below

**TRIPTORELIN**

**Indications**
prostate cancer; endometriosis, precocious puberty, reduction in size of uterine fibroids (section 6.7.2)

**Cautions**
see notes above; risk of ureteric obstruction and spinal cord compression in men

**Contra-indications**
pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects**
see notes above; also dry mouth, transient hypertension, paraesthesia, and increased dysuria

**Dose**
- See under preparations below

**Decapeptyl® SR**

(Ipsen)

**Injection**
(powder for suspension), m/r, triptorelin (as acetate), net price 3-mg vial with 1-mL vehicle-filled syringe = £169.00

**Dose**
locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, by intramuscular injection, 3 mg every 4 weeks

**Note**
each vial includes an overage to allow accurate administration of a 3-mg dose

**Injection**
(powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial with 2-mL vehicle-filled syringe = £207.00

**Dose**
locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, by intramuscular injection, 11.25 mg every 3 months (see also notes above)

**Note**
each vial includes an overage to allow accurate administration of an 11.25-mg dose

**Gonapente Depot®**

(Ferring)

**Injection**
(powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £85.00

**Dose**
advanced prostate cancer, by subcutaneous or deep intramuscular injection, 3.75 mg every 4 weeks (see also notes above)
8.3.4 Somatostatin analogues

**LANREOTIDE**

**Indications** see notes above

**Cautions** see notes above; pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (lanreotide)

**Side-effects** see notes above; also reported asthenia, fatigue, raised bilirubin; less commonly skin nodule, hot flushes, leg pain, malaise, headache, tenesmus, decreased libido, drowsiness, pruritus, increased sweating; rarely hypothyroidism (monitor as necessary)

**Dose** 

- See under preparations

**Somatuline® LA** (Ipsen) (mixture)

**Injection** (copolymer microparticles for aqueous suspension), lanreotide (as acetate) 30-mg vial (with vehicle) = £340.00

**Dose** by intramuscular injection, acromegaly and neuroendocrine (particularly carcinoid) tumours, initially 30 mg every 14 days, frequency increased to every 7–10 days according to response

Thyroid tumours, 30 mg every 14 days, frequency increased to every 10 days according to response

**SANDOSTATIN®** (Novartis) (mixture)

**Injection** (microsphere powder for aqueous suspension), octreotide (as acetate) 10-mg vial = £637.50; 20-mg vial = £850.00; 30-mg vial = £1062.50 (all supplied with 2.5-mL diluent-filled syringe)

**Dose** acromegaly (test dose by subcutaneous injection) 50–100 micrograms if subcutaneous octreotide not previously given), neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide, by deep intramuscular injection into gluteal muscle, initially 20 mg every 4 weeks for 3 months then adjusted according to response, max. 30 mg every 4 weeks

For acromegaly, start depot octreotide 1 day after the last dose of subcutaneous octreotide (for pituitary surgery give last dose of depot octreotide at least 3 weeks before surgery); for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

---

**OCTREOTIDE**

**Indications** see under Dose

**Cautions** see notes above; hepatic impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5); monitor thyroid function on long-term therapy; interactions: Appendix 1 (octreotide)

**Side-effects** see notes above; rarely altered liver function tests, hepatitis and transient alopecia

**Dose**

- Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas, by subcutaneous injection, initially 50 micrograms once or twice daily, gradually increased according to response to 200 micrograms 3 times daily (higher doses required exceptionally); maintenance doses variable; in carcinoid tumours discontinue after 1 week if no effect; if rapid response required, initial dose by intravenous injection (with ECG monitoring and after dilution to a concentration of 10–50% with sodium chloride 0.9% injection)

- Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective by subcutaneous injection, 100–200 micrograms 3 times daily; discontinue if no improvement within 3 months

- Prevention of complications following pancreatic surgery, consult product literature

---

**Somatuline AutoGel®** (Ipsen) **Injection**, prefilled syringe, lanreotide (as acetate) 60 mg = £573.00; 90 mg = £665.00; 120 mg = £989.00

**Dose** by deep subcutaneous injection into the gluteal region, acromegaly (if somatostatin analogue not given previously), initially 60 mg every 28 days, adjusted according to response; for patients treated previously with somatostatin analogue, consult product literature for initial dose

Neuroendocrine (particularly carcinoid) tumours, initially 60–120 mg every 28 days, adjusted according to response

---

**Somatuline®** (Ipsen) **Injection**, lanreotide (as acetate) 60 mg = £573.00; 90 mg = £665.00; 120 mg = £989.00

**Dose** by deep subcutaneous injection into the gluteal region, acromegaly (if somatostatin analogue not given previously), initially 60 mg every 28 days, adjusted according to response; for patients treated previously with somatostatin analogue, consult product literature for initial dose

Neuroendocrine (particularly carcinoid) tumours, initially 60–120 mg every 28 days, adjusted according to response

---

**Gallstones** have been reported after long-term treatment; hypoglycaemia has also been reported. Rarely, persistent hyperglycaemia occurs with chronic administration. Hypoglycaemia has also been reported. Gallstones have been reported after long-term treatment (abrupt withdrawal of short-acting octreotide—see Side-effects below). In insulinoma an increase in the depth and duration of hypoglycaemia may occur (observe patients when initiating treatment and changing doses). In diabetes mellitus, insulin or oral antidiabetic requirements may be reduced.

---

**SANDOSTATIN®** (Novartis) (mixture)

**Injection** (microsphere powder for aqueous suspension), octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £3.72; 100 micrograms/mL, 1-mL amp = £6.53; 200 micrograms/mL 5-mL vial = £69.66; 500 micrograms/mL, 1-mL amp = £33.87

---

**Depot preparation**

**Sandostatin LAR®** (Novartis) (mixture)

**Injection** (microsphere powder for aqueous suspension), octreotide (as acetate) 10-mg vial = £637.50; 20-mg vial = £850.00; 30-mg vial = £1062.50 (all supplied with 2.5-mL diluent-filled syringe)

**Dose** acromegaly (test dose by subcutaneous injection) 50–100 micrograms if subcutaneous octreotide not previously given), neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide, by deep intramuscular injection into gluteal muscle, initially 20 mg every 4 weeks for 3 months then adjusted according to response, max. 30 mg every 4 weeks

For acromegaly, start depot octreotide 1 day after the last dose of subcutaneous octreotide (for pituitary surgery give last dose of depot octreotide at least 3 weeks before surgery); for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide
Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

### 9.1.1 Iron-deficiency anaemias

#### 9.1.1.1 Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route. Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and cost.
The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulphate, 200 mg (= 65 mg elemental iron) three times daily; for prophylaxis of iron-deficiency anaemia, a dose of ferrous sulphate 200 mg once or twice daily may be effective. For treatment of iron-deficiency anaemia in children and for prophylaxis of iron-deficiency anaemia in babies of low birth weight, see BNF for Children.

### Iron content of different iron salts

</tbody>
</table>

**Therapeutic response** The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the reference range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

**Side-effects** Gastro-intestinal irritation can occur with iron salts. Nausea and epigastric pain are dose-related but the relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

Iron preparations taken orally can be constipating, particularly in older patients and occasionally lead to faecal impaction.

If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used but an improvement in tolerance may simply be a result of a lower iron content of different iron salts.

**Counselling** Although iron preparations are best absorbed on an empty stomach they may be taken after food to reduce gastro-intestinal side-effects; they may discolour stools.

**Compartment preparations** Preparations containing iron and folic acid are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy (see p. 508).

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias. Some oral preparations contain ascorbic acid to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins (except folic acid for pregnant women, see notes above and on p. 508).

### Modified-release preparations

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

#### FERROUS SULPHATE

**Indications** iron-deficiency anaemia

**Cautions** interactions: Appendix 1 (iron)

**Side-effects** see notes above

**Dose**
- See under preparations below and notes above

**Ferrograd Sulphate** (Non-proprietary)

| Tablets, coated, dried ferrous sulphate 200 mg (65 mg iron), net price 28-tab pack = £1.44 |

| Dose | ADULT and CHILD over 6 years, prophylactic, 0.6 mL daily; CHILD under 6 years, see BNF for Children |

**Ironorm** Drops (Wallace Mfg)

| Oral drops, ferrous sulphate 125 mg (25 mg iron)/mL, Net price 15-mL = £3.35 |

| Dose | ADULT and-child over 6 years, prophylactic, 0.6 mL daily; CHILD under 6 years, see BNF for Children |

**Ferrous Sulphate**

| Tablets, coated, dried ferrous sulphate 200 mg (65 mg iron), net price 28-tab pack = £1.44 |

| Dose | ADULT and CHILD over 6 years, prophylactic, 0.6 mL daily; CHILD under 6 years, see BNF for Children |

**With folic acid**

| Fefol® (Intrapharm) |

| Spansule® (= capsules m/r), clear/red, enclosing green and brown pellets, dried ferrous sulphate 150 mg (47 mg iron), Net price 30-cap pack = £1.65. |

| Dose | 1–2 capsule daily; CHILD over 1 year, 1 capsule daily; can be opened and sprinkled on food |

**With ascorbic acid**

| Ferrograd Folic® (Teofarma) |

| Tablets, f/c, m/r, red, dried ferrous sulphate 325 mg (105 mg iron) NET price 30-tab pack = £1.18. |

| Dose | ADULT and CHILD over 12 years, prophylactic and therapeutic, 1 tablet daily before food |

**With folic acid**

| Fefol® (Intrapharm) |

| Spansule® (= capsules m/r), clear/green, enclosing brown, yellow, and white pellets, dried ferrous sulphate 150 mg (47 mg iron), folic acid 500 micrograms. Net price 30-cap pack = £1.69. |

| Dose | 1 capsule daily |

**With ascorbic acid**

| Ferrograd Folic® (Teofarma) |

| Tablets, f/c, red/yellow, dried ferrous sulphate 325 mg (105 mg iron) for sustained release, folic acid 350 micrograms. Net price 30-tab pack = £1.32. |

| Dose | ADULT and CHILD over 12 years, 1 tablet daily before food |

**With folic acid**

| Fefol® (Intrapharm) |

| Spansule® (= capsules m/r), clear/green, enclosing brown, yellow, and white pellets, dried ferrous sulphate 150 mg (47 mg iron), folic acid 500 micrograms. Net price 30-cap pack = £1.69. |

| Dose | 1 capsule daily |

**With ascorbic acid**

| Ferrograd Folic® (Teofarma) |

| Tablets, f/c, red, dried ferrous sulphate 325 mg (105 mg iron) for sustained release, ascorbic acid 500 mg (as sodium salt). Net price 30-tab pack = £1.71. |

| Dose | ADULT and CHILD over 12 years, 1 tablet daily before food |
FERROUS FUMARATE

Indications  iron-deficiency anaemia

Cautions  interactions: Appendix 1 (iron)

Side-effects  see notes above

Dose
- See under preparations below and notes above

Fersaday® (Goldshield)

Tablets, brown, f/c, ferrous fumarate 322 mg (100 mg iron). Net price 28-tab pack = 79p
Dose  prophylactic, 1 tablet daily; therapeutic, 1 tablet twice daily

Fersamal® (Goldshield)

Tablets, brown, ferrous fumarate 210 mg (68 mg iron), net price 20 = 29p
Dose  prophylactic and therapeutic, 1–2 tablets 3 times daily, but see notes above

Syrup, brown, ferrous fumarate approx. 140 mg (45 mg iron)/5 mL, net price 200 mL = £3.11
Dose  prophylactic and therapeutic, 10–20 mL twice daily, but see notes above; CHILD see BNF for Children

Galfer® (Thornton & Ross)

Capsules, red/green, ferrous fumarate 305 mg (100 mg iron), net price 20 = 36p
Dose  ADULT and CHILD over 12 years, prophylactic, 1 capsule daily; therapeutic, 1 capsule twice daily

Syrup, brown, sugar-free ferrous fumarate 140 mg (45 mg iron)/5 mL, net price 300 mL = £4.86
Dose  ADULT and CHILD over 12 years, prophylactic, 10 mL once daily; therapeutic, 10 mL 1–2 times daily; PRETERM NEONATE and NEONATE, see BNF for Children, CHILD 1 month–12 years, prophylactic and therapeutic, 0.5 mL/kg/day in 2–3 divided doses; max. 20 mL/day

With folic acid

Galfer FA® (Thornton & Ross)

Capsules, red/yellow, ferrous fumarate 305 mg (100 mg iron), folic acid 350 micrograms. Net price 30-cap pack = £1.10
Dose  1 capsule daily before food

pregaday® (UCB Pharma)

Tablets, brown, f/c, ferrous fumarate equivalent to 100 mg iron, folic acid 350 micrograms. Net price 28-tab pack =£1.25
Dose  1 tablet daily

With vitamins B and C

Givitol® (Galen)

Capsules, red/maroon, ferrous fumarate 305 mg (100 mg iron) with vitamins B group and C. Net price 20 = 88p
Dose  1 capsule daily before food

FERROUS GLUCONATE

Indications  iron-deficiency anaemia

Cautions  interactions: Appendix 1 (iron)

Side-effects  see notes above

Dose
- See under preparations below and notes above

Ferrous Gluconate (Non-proprietary)

Tablets, red, coated, ferrous gluconate 300 mg (35 mg iron). Net price 20 = 73p
Dose  prophylactic, 2 tablets daily before food; therapeutic, 4–6 tablets daily in divided doses before food; CHILD 6–12 years, prophylactic and therapeutic, 1–3 tablets daily

POLYSACCHARIDE–IRON COMPLEX

Indications  iron-deficiency anaemia

Cautions  interactions: Appendix 1 (iron)

Side-effects  see notes above

Dose
- See under preparation below and notes above

Niferex® (TJomed)

Elixir, brown, sugar-free, polysaccharide–iron complex equivalent to 100 mg of iron/5 mL. Net price 240-mL pack = £8.06; 30-mL dropper bottle for paediatric use = £2.16. Counselling, use of dropper
Dose  prophylactic 2.5 mL daily; therapeutic, 5 mL 1–2 times daily (once daily if required during second and third trimester of pregnancy); PRETERM NEONATE, NEONATE, and INFANT (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily; CHILD 2–6 years 2.5 mL daily; 6–12 years 5 mL daily
1. except 30 mL paediatric dropper bottle for prophylaxis and treatment of iron deficiency in infants born prematurely; endorse prescription ‘SLS’

SODIUM FEREDETATE

(Sodium ironedetate)

Indications  iron-deficiency anaemia

Cautions  interactions: Appendix 1 (iron)

Side-effects  see notes above

Dose
- See under preparation below and notes above

Sytron® (Link)

Elixir, sugar free, sodium feredetate 190 mg equivalent to 27.5 mg of iron/5 mL, net price 100 mL = 89p
Dose  therapeutic, 5 mL increasing gradually to 10 mL 3 times daily; CHILD under 1 year, see BNF for Children; CHILD 1–5 years, therapeutic, 2.5 mL 3 times daily; 6–12 years, therapeutic; 5 mL 3 times daily

9.1.1.2 Parenteral iron

Iron can be administered parenterally as iron dextran, iron sucrose, or as ferric carboxymaltose. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance, p. 510).

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis (see also Erythropoietins, section 9.1.3).

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately.

Anaphylactoid reactions can occur with parenteral administration of iron complexes. Depending on the preparation, patients may be required to have a small test dose initially, see preparations for details; facilities for cardiopulmonary resuscitation must be available.
**FERRIC CARBOXYMALTOSE**
A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available; oral iron should not be given concomitantly; allergic disorders including asthma and eczema; injection (discontinue if ongoing bacteraemia); hepatic impairment (Appendix 2); pregnancy (Appendix 4)

**Side-effects** gastro-intestinal disturbances; headache, dizziness; rash, injection-site reactions; less commonly hypotension, flushing, chest pain, peripheral oedema, fatigue, paraesthesia, malaise, pyrexia, rigors, myalgia, arthralgia, back pain, pruritus, and urticaria

**Dose**  
- By slow intravenous injection or by intravenous infusion, ADULT and CHILD over 14 years, calculated according to body-weight and iron deficit, consult product literature

**Ferinject** (Syner-Med) ▼ (wh)

Injection, iron (as ferric carboxymaltose) 50 mg/mL, net price 2-mL vial = £21.75, 10-mL vial = £108.75

*Electrolytes Na 0.24 mmol/mL.*

**IRON DEXTRAN**
A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** oral iron not to be given until 5 days after last injection; pregnancy (Appendix 4)  
**Anaphylaxis** Anaphylactic reactions can occur with parenteral iron and a test dose is recommended before each dose; the patient should be carefully observed for 60 minutes after the first test dose and for 15 minutes after subsequent test doses (subsequent test doses not necessary for intra-muscular administration). Facilities for cardiopulmonary resuscitation must be available; risk of allergic reactions increased in immune or inflammatory conditions

**Contra-indications** history of allergic disorders including asthma, eczema and anaphylaxis

**Side-effects** less commonly nausea, vomiting, abdominal pain, flushing, dyspnoea, anaphylactic reactions (see Anaphylaxis above), fatigue, asthenia, and paraesthesia; confusion, arthralgia, and increased sweating also reported

**Dose**  
- By slow intravenous injection or by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature; CHILD not recommended

**Venofe®** (Syner-Med) ▼ (wh)

Injection, iron (as iron sucrose) 20 mg/mL, net price 5-mL amp = £7.08

**IRON SUCROSE**
A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron

**Indications** iron-deficiency anaemia, see notes above

**Cautions** oral iron therapy should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia); hepatic impairment (Appendix 2); pregnancy (Appendix 4)  
**Anaphylaxis** Anaphylactic reactions can occur with parenteral iron and a test dose is recommended before the first dose; the patient should be carefully observed for 15 minutes. Facilities for cardiopulmonary resuscitation must be available

**Contra-indications** history of allergic disorders including asthma, eczema and anaphylaxis

**Side-effects** taste disturbances; less commonly nausea, vomiting, abdominal pain, diarrhoea, hypotension, tachycardia, flushing, palpitation, chest pain, bronchospasm, dyspnoea, headache, dizziness, fever, myalgia, pruritus, rash, and injection-site reactions; rarely peripheral oedema, anaphylactic reactions (see Anaphylaxis above), fatigue, asthma, and paraesthesia; confusion, arthralgia, and increased sweating also reported

**Dose**  
- By slow intravenous injection or by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature; CHILD not recommended

**9.1.2 Drugs used in megaloblastic anaemias**

Most megaloblastic anaemias result from a lack of either vitamin B12 or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should be instituted only when the results of tests are available.

One cause of megaloblastic anaemia in the UK is pernicious anaemia in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B12. Vitamin B12 is also needed in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare syndrome of congenital transcobalamin II deficiency.

Vitamin B12 should be given prophylactically after total gastrectomy or total ileal resection (or after partial gastrectomy if a vitamin B12 absorption test shows vitamin B12 malabsorption).

Apart from dietary deficiency, all other causes of vitamin B12 deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B12 orally and none for vitamin B12 intrinsic factor complexes given by mouth. Vitamin B12 in larger oral doses of 1–2 mg daily [unlicensed] may be effective.
Hydroxocobalamin has completely replaced cyanocobalamin as the form of vitamin B of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B neuropathy.

Folic acid has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B is administered concurrently otherwise neuropathy may be precipitated (see above).

In folate-deficient megaloblastic anaemia (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores. For prophylaxis in chronic haemolytic states, folate acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

For prophylaxis in pregnancy, see Prevention of Neural Tube Defects below.

Folinic acid is also effective in the treatment of folate-deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs (see section 8.1); it is given as calcium folinate.

Prevention of neural tube defects Folic acid supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement at a dose of 400 micrograms daily before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.
- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines (see also section 4.6.1).
- Women in the high risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid 5 mg daily and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid 5 mg daily throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B or folic acid.

### HYDROXOCOBALAMIN

**Indications** see under dose below

**Cautions** should not be given before diagnosis fully established but see also notes above; **Interactions:** Appendix 1 (hydroxocobalamin)

**Side-effects** nausea, headache, dizziness; fever, hypersensitivity reactions including rash and pruritus; injection-site pain; hypokalaemia during initial treatment

**Dose**
- By intramuscular injection, pernicious anaemia and other macrocytic anaemias without neurological involvement, initially 1 mg 3 times a week for 2 weeks then 1 mg every 3 months
- Pernicious anaemia and other macrocytic anaemias with neurological involvement, initially 1 mg on alternate days until no further improvement, then 1 mg every 2 months
- Prophylaxis of macrocytic anaemias associated with vitamin B12 deficiency, 1 mg every 2–3 months
- Tobacco amylplia and Leber’s optic atrophy, initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, thereafter 1 mg every 1–3 months

**CHILD** see BNF for Children
- Cyanide poisoning [not licensed], see p. 34

### CYANOCOBALAMIN

**Indications** see notes above

**Dose**
- By mouth, vitamin B12 deficiency of dietary origin, 50–150 micrograms or more daily taken between meals; **CHILD** 50–105 micrograms daily in 1–3 divided doses
- By intramuscular injection, initially 1 mg repeated 10 times at intervals of 2–3 days, maintenance 1 mg every month, but see notes above

### CYANOCOBALAMIN

**Indications** see notes above

**Dose**
- By mouth, vitamin B12 deficiency of dietary origin, 50–150 micrograms or more daily taken between meals; **CHILD** 50–105 micrograms daily in 1–3 divided doses
- By intramuscular injection, initially 1 mg repeated 10 times at intervals of 2–3 days, maintenance 1 mg every month, but see notes above

**Cyanocobalamin** (Non-proprietary) 

**Injection**, hydroxocobalamin 1 mg/mL. Net price 1 mL amp = £2.46

**Note** The BP directs that when vitamin B12 injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

**Brands** include Cobalin-H, Neo-Cytamen

**Cyanocobalamin** (Non-proprietary) 

**Tablets**, cyanocobalamin 50 micrograms. Net price 50-tab pack = £5.67

**Brands** include Cytamen

**Liquid**, cyanocobalamin 35 micrograms/5 mL. Net price 200 mL = £2.77

**Brands** include Cytamen

**Injection**, cyanocobalamin 1 mg/mL. Net price 1 mL amp = £1.67

**Brands** include Cytamen

**Note** The BP directs that when vitamin B12 injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

1. **except to treat or prevent vitamin B12 deficiency in a patient who is a vegan or who has a proven vitamin B12 deficiency of dietary origin; endorse prescription ‘SLS’; currently available brands may not be suitable for vegans—cyanocobalamin injection may be a suitable alternative
FOLIC ACID

Indications see notes above and under dose

Cautions should never be given alone for pernicious anaemia and other vitamin-B deficiency states (may precipitate subacute combined degeneration of the spinal cord); interactions: Appendix 1 (folates)

Side-effects rarely gastro-intestinal disturbances

Dose

- Folate-deficient megaloblastic anaemia, by mouth, ADULT and CHILD over 1 year, 5 mg daily for 4 months (until term in pregnant women); up to 15 mg daily may be required in malabsorption states; maintenance, 5 mg every 1–7 days; CHILD under 1 year, 500 micrograms/kg daily for up to 4 months; maintenance 500 micrograms/kg every 1–7 days

- Prevention of neural tube defects, by mouth, see notes above

- Prevention of methotrexate-induced side-effects in rheumatic disease [unlicensed], by mouth, ADULT over 18 years 5 mg once weekly; CHILD 2–18 years see BNF for Children

- Prophylaxis in chronic haemolytic states, by mouth, ADULT 5 mg every 1–7 days depending on underlying disease

- Prophylaxis of folate deficiency in dialysis, by mouth, ADULT 5 mg every 1–7 days; CHILD 1–12 years 250 micrograms/kg (max. 10 mg) once daily, CHILD 12–18 years 5–10 mg once daily

Folic Acid (Non-proprietary) \( ^{\text{1}} \)

Tablets, folic acid 400 micrograms, net price 90-tab pack = £2.32; 5 mg, 28-tab pack = 88p

Syrup, folic acid 2.5 mg/5 mL, net price 150 mL = £9.16; 400 micrograms/5 mL, 150 mL = £1.40

Brands include Folicare, Lexpec (sugar-free)

Injection, folic acid 15 mg, net price 1-mL amp = £1.34

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 939

1. Can be sold to the public provided daily doses do not exceed 500 micrograms

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat symptomatic anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy. Epoetin beta is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unscreened formulations should be used in neonates because other preparations may contain benzyl alcohol (see Excipients, p. 2).

Darbepoetin, is a hyperglycosylated derivative of epoetin; it has a longer half-life and can be administered less frequently than epoetin.

Methodox polyethylene glycol-epoetin beta (pegzerepoetin alfa) is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients. Aluminium toxicity, concurrent infection, or other inflammatory disease can impair the response to erythropoietin.
9 Nutrition and blood

### 9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

BNF 57

See also MHRA/CHM advice above.

See also MHRA/CHM advice below.

#### DARBEPOETIN ALFA

**Indications** see under Dose below

**Cautions** see Epoetin; hepatic disease; pregnancy (Appendix 4)

**Contra-indications** see Epoetin; breast-feeding (Appendix 5)

**Side-effects** see Epoetin; also, oedema, injection-site pain; isolated reports of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue therapy)—see also CSM advice above

**Dose**

- Symptomatic anaemia associated with chronic renal failure in patients on dialysis (see also MHRA/CHM advice, above), ADULT and CHILD over 11 years, by subcutaneous or intravenous injection, initially 450 nanograms/kg once weekly, adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given once weekly or once every 2 weeks

- Symptomatic anaemia associated with chronic renal failure in patients not on dialysis (see also MHRA/CHM advice, above), ADULT and CHILD over 11 years, by subcutaneous or intravenous injection, initially 450 nanograms/kg once weekly or by subcutaneous injection, initially 750 nanograms/kg once every 2 weeks; adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given subcutaneously or intravenously once weekly or subcutaneously once every 2 weeks or subcutaneously once every month

**Note** Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. When changing route give same dose then reduce by approx. 25% and then restart at a dose approximately 25% lower than the previous dose. When changing route give same dose then reduce by approx. 25% and then restart at a dose approximately 25% lower than the previous dose.

---

**MHRA/CHM advice (December 2007) Erythropoietins—haemoglobin concentration**

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy unless symptoms of anaemia are present;
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL;
- haemoglobin concentrations higher than 12 g/100 mL should be avoided;
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range).

See also MHRA/CHM advice above.

**MHRA/CHM advice (December 2007 and July 2008) Erythropoietins—tumour progression and survival in patients with cancer**

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of symptomatic anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy;
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis.

See also MHRA/CHM advice above.

**CSM advice (pure red cell aplasia)**

There have been very rare reports of pure red cell aplasia in patients treated with epoetin alfa. The CSM has advised that in patients developing lack of efficacy with epoetin alfa, with a diagnosis of pure red cell aplasia, treatment with epoetin alfa must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

**NICE guidance**

Epoetin alfa, beta and darbepoetin alfa for cancer treatment-induced anaemia (May 2008)

Erythropoietin analogues are not recommended for routine use in the management of cancer treatment-induced anaemia, but may be considered, in combination with intravenous iron, for:

- women receiving platinum-based chemotherapy for ovarian cancer who have symptomatic anaemia with a haemoglobin concentration of 8 g/100 mL or lower (the use of erythropoietin analogues does not preclude the use of existing approaches to the management of anaemia, including blood transfusion when necessary);
- patients who cannot be given blood transfusions and who have profound cancer treatment-related anaemia that is likely to have an impact on survival.

Patients currently treated with erythropoietin analogues for the management of cancer treatment-related anaemia who do not fulfil the criteria outlined above can continue therapy until they and their specialists consider it appropriate to stop.
● Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 510), by subcutaneous injection, initially 6.75 micrograms/kg once every 3 weeks or 2.25 micrograms/kg once weekly (if response inadequate after 9 weeks further treatment may not be effective); if adequate response obtained, reduce dose by 25–50%.

**Note** Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25–50% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy.

**Aranesp** (Amgen) ▼ \[514x492] Injection, prefilled syringe, darbepoetin alfa, 25 micrograms/mL, net price 0.4 mL (10 micrograms) = £15.59; 40 micrograms/mL, 0.375 mL (15 micrograms) = £23.38; 0.5 mL (20 micrograms) = £31.17; 100 micrograms/mL, 0.3 mL (30 micrograms) = £46.76; 0.4 mL (40 micrograms) = £62.34; 0.5 mL (50 micrograms) = £77.93; 200 micrograms/mL, 0.3 mL (60 micrograms) = £93.51; 0.4 mL (80 micrograms) = £124.68; 0.5 mL (100 micrograms) = £155.85; 0.65 mL (130 micrograms) = £202.61; 500 micrograms/mL, 0.3 mL (150 micrograms) = £233.78; 0.6 mL (300 micrograms) = £467.55, 1 mL (500 micrograms) = £779.25

**Injection** (Aranesp®SureClick), prefilled disposable injection device, darbepoetin alfa, 40 micrograms/mL, net price 0.5 mL (20 micrograms) = £31.17; 100 micrograms/mL, 0.4 mL (40 micrograms) = £62.34; 200 micrograms/mL, 0.3 mL (60 micrograms) = £93.51; 0.4 mL (80 micrograms) = £124.68; 0.5 mL (100 micrograms) = £155.85; 0.65 mL (130 micrograms) = £202.61; 500 micrograms/mL, 0.3 mL (150 micrograms) = £233.78; 0.6 mL (300 micrograms) = £467.55, 1 mL (500 micrograms) = £779.25

**EPOETIN ALFA, BETA, and ZETA** (Recombinant human erythropoietins)

**Note** The prescriber must specify which epoetin is required, see also Biosimilar medicines, p. 1

**Indications** see under preparations, below

**Cautions** see notes above; also inadequately treated or poorly controlled blood pressure (monitor closely blood pressure, reticuloocyte counts, haemoglobin, and electrolytes), interrupt treatment if blood pressure uncontrolled; sudden stabling mige-like pain is warning of hypertensive crisis; sickle-cell disease (lower target haemoglobin concentration may be appropriate), exclude other causes of anaemia (e.g. folic acid or vitamin B12 deficiency) and give iron supplements if necessary (see also notes above); ischaemic vascular disease; thrombocytosis (monitor platelet count for first 8 weeks); epilepsy; malignant disease; chronic liver failure (Appendix 2); increase in hepatic dose may be needed; risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy; risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident; pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Contra-indications** pure red cell aplasia following erythropoietin therapy (see also CSM advice above); uncontrollable hypertension; patients unable to receive thrombopoephilaxis; avoid injections containing benzyl alcohol in neonates (see under preparations, below)

**Side-effects** diarrhoea, nausea, vomiting; dose-dependent increase in blood pressure or aggravation of hypertension; in isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention; headache; dose-dependent increase in platelet count (but thrombocytosis rare) regressing during treatment; influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes); cardiovascular events; shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications; very rarely sudden loss of efficacy because of pure red cell aplasia, particularly following subcaneous administration in patients with chronic renal failure (discontinue erythropoietin therapy)—see also CSM advice above; hyperkalaemia, hypersensitivity reactions (including anaphylaxis and angioedema), skin reactions, and peripheral oedema also reported

**Dose**

● See under preparations, below

**Epoetin alfa**

**Binocrit** (Sandoz) ▼ \[514x479\]

**Injection**, prefilled syringe, epoetin alfa, net price 1000 units = £5.09; 2000 units = £10.18; 3000 units = £15.27; 4000 units = £20.36; 5000 units = £25.46; 6000 units = £30.55; 8000 units = £40.73; 10 000 units = £50.91

**Note** Biosimilar medicine, p. 1

**Dose** symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 510), by intravenous injection over 1–5 minutes; for adults on haemodialysis, 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly; **Child** by intravenous injection initially as for adults; maintenance dose, body-weight < 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight > 30 kg usually 30–100 units/kg 3 times weekly Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 510), by intravenous injection over 1–5 minutes, initially; 450 units/kg once weekly, increased if appropriate rise in haemoglobin concentration (reticuloocyte count) not achieved after 4 weeks at higher dose

**Note** Avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 510), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin concentration not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose

**Note** Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL, if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then

**BNF 57**

9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias 511

**Nutrition and blood**
Intravenous route preferred; reduce dose by approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy.

Moderate anaemia (haemoglobin concentration decreases 100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable, by subcutaneous injection (max. 1 mL per injection site). Initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually a total of 75–300 units/kg weekly (as a single dose or in divided doses); CHILD by intravenous injection initially 40 units/kg 3 times weekly; maintenance dose, body-weight over 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 510), by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg twice weekly; maintenance dose 25–50 units/kg twice weekly

Severe symptomatic anaemia of renal origin in adults with renal insufficiency who cannot yet start on dialysis (see also MHRA/CHM advice, p. 510), by intravenous injection over 1–5 minutes or by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly; max. 200 units/kg 3 times weekly

Note Intravenous route preferred; reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 510), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose

Note Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery, by intravenous injection over 1–5 minutes, 600 units/kg twice weekly for 3 weeks before surgery; consult product literature for details and advice on ensuring high iron stores

Moderate anaemia (haemoglobin concentration decreases 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable, by subcutaneous injection (max. 1 mL per injection site). 600 units/kg every week for 3 weeks before surgery and on day of surgery or 300 units/kg daily for 15 days starting 10 days before surgery; consult product literature for details

Epoetin beta

Neorecormon® (Roche) (tm)

Injection, prefilled syringe, epoetin beta, net price 500 units = £3.90; 1000 units = £7.79; 2000 units = £15.59; 3000 units = £23.38; 4000 units = £31.17; 5000 units = £38.97; 6000 units = £46.76; 10 000 units = £77.93; 20 000 units = £155.87; 30 000 units = £233.81

Excipients include phenylalanine up to 300 micrograms/syringe (section 9.4)

Multidose injection, powder for reconstitution, epoetin beta, net price 50 000-unit vial = £419.01; 100 000-unit vial = £838.01 (both with solvent)

Excipients include phenylalanine up to 5 mg/vial (section 9.4.1), benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Note Avoid contact of reconstituted injection with glass; use only plastic materials

Reco-Pen, (for subcutaneous use), double-chamber cartridges (containing epoetin beta and solvent), net price 10 000-unit cartridge = £77.93; 20 000-unit cartridge = £155.87; for use with Reco-Pen injection device and needles (both available free from Roche)

Epoetin alpha, net price 50 000-unit vial = £383.01 (both with solvent)

Excipients include phenylalanine up to 5 mg/vial (section 9.4.1), benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Dose symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 510), by subcutaneous injection, ADULT and CHILD, initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses, max. 720 units/kg weekly

By intravenous injection over 2 minutes, ADULT and CHILD, initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

Note Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL, if haemoglobin concentration continues to rise despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Subcutaneous route preferred in patients not on haemodialysis

Prevention of anaemia of prematurity in neonates with birth-weight of 0.75–1.5 kg and gestational age of less than 34 weeks, by subcutaneous injection (of single-dose, unpreserved injection), 250 units/kg 3 times weekly preferably starting within 3 days of birth and continued for 6 weeks

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 510), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose

Note Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable, consult product literature

Epoetin zeta

Retacrit® ( Hospira ) ▼ (R)

Injection, prefilled syringe, epoetin zeta, net price 1000 units = £5.66; 2000 units = £11.31; 3000 units = £23.38; 4000 units = £31.17; 5000 units = £38.97; 6000 units = £46.76; 10 000 units = £77.93; 20 000 units = £155.87; 30 000 units = £233.81

Note Intravenous route preferred; reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 510), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose
Symptomatic anaemia associated with chronic kidney failure in patients on haemodialysis (see also MHRA/CHM advice, p. 510), by intravenous injection over 1–5 minutes, initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly.

CHILD

by intravenous injection initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly.

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 510), by intravenous injection over 1–5 minutes, initially 50 units/kg 3 times weekly; maintenance dose 25–50 units/kg 3 times weekly.

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 510), by intravenous injection over 1–5 minutes, initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly; max. 200 units/kg 3 times weekly.

Note

Avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 510), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (or 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose.

Note

Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration increases 12 g/100 mL if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy.

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery, by intravenous injection over 1–5 minutes, 600 units/kg 3 times weekly for 3 weeks before surgery; consult product literature for details and advice on ensuring high iron stores.

Iron overload

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate is useful. Subcutaneous infusions of desferrioxamine are given over 8–12 hours, 3–7 times a week. The dose should reflect the degree of iron overload. For children starting therapy (and who have low iron overload) the dose should not exceed 30 mg/kg. For established overload the dose is usually between 20 and 50 mg/kg daily. Desferrioxamine (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine is not added to the blood and is not given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine is enhanced by administration of ascorbic acid (vitamin C, section 9.6.3) 200 mg daily by mouth (100 mg in infants); it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

Desferrioxamine infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

Deferasirox, an oral iron chelator, is licensed for the treatment of chronic iron overload in adults and children over 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells). It is also licensed for chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with thalassaemia major who...
9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

**DEFERASIROX**

**Indications** see notes above

**Cautions** eye and ear examinations required before treatment and annually during treatment; monitor body-weight, height, and sexual development in children; test liver function before treatment, then every 2 weeks during the first month of treatment and monthly thereafter; test for proteinuria monthly; see also renal impairment (Appendix 3); measure baseline serum creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter; test for proteinuria monthly; see also renal impairment (Appendix 3); pregnancy (Appendix 4); breastfeeding (Appendix 5); interactions: Appendix 1 (deferasirox)

**Side-effects** gastro-intestinal disturbances (including ulceration and haemorrhage); headache; proteinuria; pruritus, rash; less commonly, hepatitis, cholelithiasis, oedema, fatigue, anxiety, sleep disorder, dizziness, pyrexia, pharyngitis, glucosuria, renal tubulopathy, disturbances of hearing and vision (including lens opacity and maculopathy), and skin pigmentation; hepatic failure, acute renal failure, blood disorders (including agranulocytosis, neutropenia, and thrombocytopenia), hypersensitivity reactions (including anaphylaxis and angioedema) also reported

**Dose**
- **ADULT** and **CHILD** over 2 years initially 10–30 mg/kg once daily according to serum-ferritin concentration and amount of transfused blood (consult product literature); maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration; max. 30 mg/kg daily

**Exjade** (Novartis) ▼ (Swedish Orphan)

- **Dispersible tablets**, deferasirox 125 mg, net price 28-tab pack = £117.60; 250 mg, 28-tab pack = £235.20; 500 mg, 28-tab pack = £470.40. Label: 13, 22, counselling, administration
- **Counselling** Tablets may be dispersed in water, orange juice, or apple juice; if necessary resuspend residue

**DEFERIPRONE**

**Indications** see notes above

**Cautions** monitor neutrophil count weekly and discontinue treatment if neutropenia develops; monitor plasma-zinc concentration; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

**Blood disorders** Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop

**Contra-indications** history of agranulocytosis or recurrent neutropenia; pregnancy (contraception advised in women of child-bearing potential; important teratogenic risk: see Appendix 4); breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance), increased appetite; headache; red-brown urine discoloration; neutropenia, agranulocytosis; zinc deficiency; arthropathy

**Dose**
- **ADULT** and **CHILD** over 6 years 25 mg/kg 3 times daily (max. 100 mg/kg daily)

**Ferriprox** (Swedish Orphan) ▼

- **Tablets**, f/c, scored, deferiprone 500 mg, net price 100-tab pack = £152.39. Label: 14, counselling, blood disorders
- **Oral solution**, red, deferiprone 100 mg/mL, net price 500 mL = £152.39. Label: 14, counselling, blood disorders

**DESFERRIOXAMINE MESILATE** (Deferoxamine Mesilate)

**Indications** see notes above; iron poisoning. see Emergency Treatment of Poisoning, p. 32

**Cautions** renal impairment; eye and ear examinations required before treatment and at 3-month intervals during treatment; monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses; aluminium-related encephalopathy (may exacerbate neurological dysfunction); pregnancy (Appendix 4); breastfeeding (Appendix 5); interactions: Appendix 1 (deferoxamine)

**Side-effects** hypotension (especially when given too rapidly by intravenous injection), disturbances of hearing and vision (including lens opacity and retinopathy); injection-site reactions, gastro-intestinal disturbances, asthma, fever, headache, arthralgia and myalgia; very rarely, anaphylaxis, acute respiratory distress syndrome, neurological disturbances (including dizziness, neuropathy and paraesthesia), Yersinia and mucormycosis infections, rash, renal impairment, and blood dyscrasias

**Dose**
- **See notes above; iron poisoning. see Emergency Treatment of Poisoning, p. 32**

**Note** For full details and warnings relating to administration, consult product literature

**Desferrioxamine mesilate** (Non-proprietary) ▼

- **Injection**, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.26; 2-g vial = £17.05

- **Injection**, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.44; 2-g vial = £17.77

**Paroxysmal nocturnal haemoglobinuria**

Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis. It is licensed for the
treatment of paroxysmal nocturnal haemoglobinuria, a severe and disabling form of haemolytic anaemia.

ECULIZUMAB

Indications paroxysmal nocturnal haemoglobinuria (specialist use only)

Cautions active systemic infection; intravascular haemolysis—monitor serum lactate dehydrogenase during treatment and for at least 8 weeks after discontinuation

Meningococcal infection Vaccinate against Neisseria meningitidis at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date (section 14.1)

Contra-indications unresolved Neisseria meningitidis infection; patients unvaccinated against Neisseria meningitidis (see Cautions above); known or suspected hereditary complement deficiencies; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances; nasopharyngitis, sinusitis, cough, pharyngolaryngeal pain, epistaxis; headache, fatigue, dizziness, insomnia; infection (including meningococcal infection), pyrexia, influenza-like symptoms; muscle cramp, pain in extremities; rash, pruritus

Dose

• By intravenous infusion, ADULT over 18 years, initially 600 mg once a week for 4 weeks, then 900 mg on week 5; maintenance, 900 mg once every 12–16 days

Soliris® (Alexion) ▼ Price

Concentrate for intravenous infusion, eculizumab 10 mg/mL, net price 30-mL vial = £3150.00. Counselling, meningococcal infection, patient information card

Electrolytes Na 5 mmol/vial

9.1.4 Drugs used in platelet disorders

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a corticosteroid, e.g. prednisolone 1 mg/kg daily, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

Immunoglobulin preparations (section 14.5), are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (Rh) immunoglobulin (section 14.5) is effective in raising the platelet count in about 80% of unspalenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine (section 8.2.1), cyclophosphamide (section 8.1.1), vincristine (section 8.1.4), cyclosporin (section 8.2.2), and danazol (section 6.7.2). Rituximab (section 8.2.3) may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid (section 2.11) may be given to reduce the severity of haemorrhage.

Anagrelide inhibits platelet formation. It is licensed for essential thrombocytopenia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs.

ANAGRELIDE

Indications essential thrombocythaemia in at-risk patients who have not responded adequately to other therapy or who are intolerant of it (initiated under specialist supervision)

Cautions cardiac disease; assess cardiac function before and during treatment; concomitant aspirin in patients with a history of haemorrhage or severely raised platelet count; monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established), liver function, serum creatinine and urea; hepatic impairment (Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (anagrelide)

Driving Dizziness may affect performance of skilled tasks (e.g. driving)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects gastro-intestinal disturbances; palpitation, tachycardia, fluid retention; headache, dizziness, fatigue; anaemia; rash; less commonly pancreatitis, gastro-intestinal haemorrhage, congestive heart failure, hypertension, arrhythmias, syncope, chest pain, dyspnoea, sleep disturbances, paraesthesia, hypoaesthesia, depression, nervousness, confusion, amnesia, fever, weight changes, impotence, blood disorders, myalgia, arthritis, epistaxis, dry mouth, alopecia, skin discoloration, and pruritus; rarely gastrointestinal, colitis, postural hypotension, angina, myocardial infarction, vasodilatation, pulmonary hypertension, pulmonary infiltrates, migraine, drowsiness, impaired co-ordination, dysarthria, ashenha, tinnitus, renal failure, nocturia, visual disturbances, and gingival bleeding; allergic alveolitis also reported

Dose

• Initially 500 micrograms twice daily adjusted according to response in steps of 500 micrograms daily at weekly intervals to max. 10 mg daily (max. single dose 2.5 mg); usual dose range 1–3 mg daily in divided doses

Xagrid® (Shire) ▼ Price

Capsules, anagrelide (as hydrochloride), 500 micrograms, net price 100-cap pack = £337.14. Counselling, driving, see above

9.1.5 G6PD deficiency

Glucose-6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.
Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia on taking a number of common drugs. They are also susceptible to developing acute haemolytic anaemia upon ingestion of fava beans (broad beans, *Vicia faba*); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

### Drugs with definite risk of haemolysis in most G6PD-deficient individuals

Dapsone and other sulphones (higher doses for dermatitis herpetiformis more likely to cause problems)

Methylthioninium chloride (methylene blue)

Niridazole (not on UK market)

Nitrofurantoin

Pamaquin [not on UK market]

Primaqune (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people, see section 5.4.1)

Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)

Sulphonamides (including co-trimoxazole; some sulphonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

### Drugs with possible risk of haemolysis in some G6PD-deficient individuals

Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)

Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)

Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)

Probenecid [not on UK market]

Quinidine (acceptable in acute malaria) [not on UK market]

Quinine (acceptable in acute malaria)

Rasburicase

**Note** Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency

### Recombinant human granulocyte-colony stimulating factor (rG-CSF)

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. **Filgrastim** (unglycosylated rhG-CSF) and lenograstim (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually elevates the neutrophil count with appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy. **Pegfilgrastim** is a polyethylene glycol-conjugated (‘pegylated’) derivative of filgrastim; pegylation increases the duration of filgrastim activity.

Treatment with recombinant human growth factors should only be prescribed by those experienced in their use.

### Cautions

Recombinant human growth factors should be used with caution in patients with pre-malignant or malignant myeloid conditions. Full blood counts including differential white cell and platelet counts should be monitored. Treatment should be withdrawn in patients who develop signs of pulmonary infiltration. There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a history of pulmonary infiltrates or pneumonia may be at higher risk. Splenic rupture following administration of granulocyte-colony stimulating factors has been reported—monitor spleen size. Recombinant human growth factors should be used with caution in patients with sickle-cell disease. Recombinant human growth factors are not recommended in pregnancy (Appendix 4) or breast-feeding (Appendix 5).

### Side-effects

Side-effects of granulocyte-colony stimulating factors include gastro-intestinal disturbances (including nausea, vomiting, and diarrhoea), anorexia, headache, asthenia, fever, musculoskeletal pain, bone pain, rash, alopecia, injection-site reactions, thrombocytopenia, and leucocytosis. *Less commonly* chest pain, hypersensitivity reactions (including anaphylaxis and bronchospasm) and arthralgia. *Rarely* pulmonary side-effects, particularly interstitial pneumonia, can occur (see Cautions above).

### Filgrastim

(Recombinant human granulocyte-colony stimulating factor, G-CSF)

**Indications** (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes); reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation; mobilisation of peripheral blood progenitor cells for harvesting and subsequent autologous or allogeneic infusion; severe congenital neutropenia, cyclic neutropenia, or idio-
pathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders, consult product literature); persistent neutropenia in advanced HIV infection

**Cautions** see notes above; also reduced myeloid precursors; regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia); secondary acute myeloid leukaemia, sickle-cell disease; monitor spleen size (risk of rupture); osteoporotic bone disease (monitor bone density if given for more than 6 months);

**interactions:** Appendix 1 (filgrastim)

**Contra-indications** severe congenital neutropenia (Kostmann’s syndrome) with abnormal cytogenetics

**Side-effects** see notes above; also splenic enlargement, hepatomegaly, transient hypotension, epistaxis, urinary abnormalities (including dysuria, proteinuria, and haematuria), osteoporosis, exacerbation of rheumatoid arthritis, acute febrile neutrophilic dermatosis, cutaneous vasculitis, anaemia, transient decrease in blood glucose, raised uric acid

**Dose**

- Cytotoxic-induced neutropenia, preferably by *subcutaneous injection* or *by intravenous infusion* (over 30 minutes), **ADULT** and **CHILD**, 500 000 units/kg daily started at least 24 hours after cytotoxic chemotherapy, continued until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia)

- Myeloablative therapy followed by bone-marrow transplantation, by *intravenous infusion* over 30 minutes or over 24 hours or *by subcutaneous infusion* over 24 hours, 1 million units/kg daily, started at least 24 hours following cytotoxic chemotherapy (and within 24 hours of bone-marrow infusion), then adjusted according to neutrophil count (consult product literature)

- Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone, by *subcutaneous injection* or *by subcutaneous infusion* over 24 hours, 1 million units/kg daily for 5–7 days; used following adjunctive myelosuppressive chemotherapy (to improve yield), *by subcutaneous injection*, 500 000 units/kg daily, started the day after completing chemotherapy and continued until neutrophil count in normal range; for timing of leucopheresis consult product literature

- Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion, by *subcutaneous injection*, **ADULT** under 60 years and **ADOLESCENT** over 16 years, 1 million units/kg daily for 4–5 days; for timing of leucopheresis consult product literature

- Severe chronic neutropenia, by *subcutaneous injection*, **ADULT** and **CHILD**, in severe congenital neutropenia, initially 1.2 million units/kg daily in single or divided doses (initially 500 000 units/kg daily in idiopathic or cyclic neutropenia), adjusted according to response (consult product literature)

- Persistent neutropenia in HIV infection, by *subcutaneous injection*, initially 100 000 units/kg daily, increased as necessary until neutrophil count in normal range (usual max. 400 000 units/kg daily), then adjusted to maintain neutrophil count in normal range (consult product literature)

---

**Neupogen®** (Amgen) (NH)

**Injection**, filgrastim 30 million-units (300 micro-grams)/mL, net price 1-mL vial = £68.41

**Injection** (*Singleject*®), filgrastim 60 million-units (600 micro-grams)/mL, net price 0.5-mL prefilled syringe = £68.41; 96 million-units (960 micro-grams)/mL, 0.5-mL prefilled syringe = £109.11

**Ratiogranstim®** (Ratiopharm UK) ▼ (NH)

**Injection**, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £62.25; 48 million-units (480 micrograms)/0.8 mL = £99.29

**Note** Biosimilar medicine, p. 1

---

**LENOGRASTIM** (Recombinant human granulocyte-colony stimulating factor, rHuG-CSF)

**Indications** (specialist use only) reduction in the duration of neutropenia and associated complications following peripheral stem cells or bone-marrow transplantation for non-myeloid malignancy, or following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia; mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion

**Cautions** see notes above; also pre-malignant myeloid conditions; reduced myeloid precursors; sickle cell disease; monitor spleen size (risk of rupture)

**Side-effects** see notes above; also splenic rupture, cutaneous vasculitis, acute febrile neutrophilic dermatosis, toxic epidermal necrolysis

**Dose**

- Following peripheral stem cells or bone-marrow transplantation, by *intravenous infusion* or *by subcutaneous injection*, **ADULT** and **CHILD** over 2 years 19.2 million units/m daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days)

- Cytotoxic-induced neutropenia, *by subcutaneous injection*, **ADULT** 19.2 million units/m daily started the day after completion of chemotherapy, continued until neutrophil count stable in acceptable range (max. 28 days)

- Mobilisation of peripheral blood progenitor cells, used alone, *by subcutaneous injection*, **ADULT** 1.28 million units/kg daily for 4–6 days (5–6 days in healthy donors); used following adjunctive myelosuppressive chemotherapy (to improve yield), *by subcutaneous injection*, 19.2 million units/m daily, started 1–5 days after completion of chemotherapy and continued until neutrophil count in acceptable range; for timing of leucopheresis consult product literature

**Granocyte®** (Chugai) (NH)

**Injection**, powder for reconstitution, lenograstim, net price 13.4 million-unit (105-microgram) vial = £42.00; 33.6 million-unit (263-microgram) vial = £67.09 (both with 1-mL prefilled syringe water for injections)

**Excipients** include phenylalanine (section 9.4.1)

**PEGFILGRASTIM** (Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

**Indications** (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in
corticosteroids, hormone therapy, cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

**Cautions** see notes above; also acute leukaemia and myelosuppressive chemotherapy; sickle-cell disease; monitor spleen size (risk of rupture); **interactions**: Appendix 1 (filgrastim)

**Side-effects** see notes above; also very rarely acute febrile neutrophilic dermatosis, cutaneous vasculitis, and splenic rupture

**Dose**

**Note** Dose expressed as filgrastim.

- By subcutaneous injection, **ADULT** over 18 years, 6 mg (0.6 mL) for each chemotherapy cycle, starting 24 hours after chemotherapy

Neulasta® (Amgen) Injection, pegfilgrastim (expressed as filgrastim) 10 mg/mL, net price 0.6-mL (6-mg) prefilled syringe = £714.24; SureClick® prefilled disposable injection device 0.6 mL (6 mg) = £714.24

### 9.2 Fluids and electrolytes

**9.2.1 Oral preparations for fluid and electrolyte imbalance**

Sodium and potassium salts, which may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree, are discussed in this section. Oral preparations for removing excess potassium and preparations for oral rehydration therapy are also included here. Oral bicarbonate, for metabolic acidosis, is also described in this section.

For reference to calcium, magnesium, and phosphate, see section 9.5.

**9.2.1.1 Oral potassium**

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see below for warning on renal insufficiency). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide (fruse-
Dose
If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride 2 to 4 g (approx. 25 to 50 mmol) daily (in divided doses) by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency (common in the elderly) otherwise there is danger of hyperkalaemia. Potassium salts cause nausea and vomiting therefore poor compliance is a major limitation to their effectiveness; where appropriate, potassium-sparing diuretics are preferable (see also above).

Regular monitoring of plasma-potassium concentration is essential in those receiving potassium supplements. When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Administration
Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hyperchloraemic states, section 9.2.1.3).

Salt substitutes
A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt and Ruthmol). These should not be used by patients with renal failure as potassium intoxication may result.

POLYSTYRENE SULPHONATE RESINS
Indications
hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

Cautions
children (impaction of resin with excessive dosage or inadequate dilution); monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre); pregnancy and breast-feeding; sodium-containing resin in congestive heart failure, hypertension, renal impairment, and oedema; interactions: Appendix 1 (polystyrene sulphonate resins)

Contra-indications
obstructive bowel disease; oral administration or reduced gut motility in neonates; avoid calcium-containing resin in hyperparathyroidism, multiple myeloma, sarcoidosis, or metastatic carcinoma

Side-effects
rectal ulceration following rectal administration; colonic necrosis reported following enemas containing sorbitol; sodium retention, hypercalcaemia, gastric irritation, anorexia, nausea and vomiting, constipation (discontinue treatment—avoid magnesium-containing laxatives), diarrhoea; calcium-containing resin can cause hypercalcaemia (in dialysed patients and occasionally in those with renal impairment), hypomagnesaemia

Dose
• By mouth, 15 g 3–4 times daily in water (not fruit squash which has a high potassium content) or as a paste; CHILD 0.5–1 g/kg daily in divided doses
• By rectum, as an enema, 30 g in methylcellulose solution, retained for 9 hours followed by irrigation to remove resin from colon; NEONATE and CHILD, 0.5–1 g/kg daily

Management of hyperkalaemia
Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/L or in the presence of ECG changes) calls for urgent treatment with 10–20 mL of calcium gluconate 10% by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% given over 5–15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. The correction of causal or complicating acidosis with sodium bicarbonate infusion (section 9.2.2) should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in mild hyperkalaemia or in moderate hyperkalaemia when there are no ECG changes.

Modifying-release preparations
Avoid unless effervescent tablets or liquid preparations inappropriate

Slow-K® (Alliance) Tablets, m/r, orange, s/c, potassium chloride 600 mg (8 mmol each of K⁺ and Cl⁻). Net price 20 = 54p.
Label: 25, 27, counselling, swallow whole with fluid during meals while sitting or standing.
9.2.1 Oral preparations for fluid and electrolyte imbalance  

**Calcium Resonium®** (Sanofi-Synthelabo)  
**Powder**, buff, calcium polystyrene sulphonate. Net price 300 g = £47.55. Label: 13  
**Resonium A®** (Sanofi-Synthelabo)  
**Powder**, buff, sodium polystyrene sulphonate. Net price 454 g = £70.24. Label: 13

### 9.2.1.2 Oral sodium and water

Sodium chloride is indicated in states of sodium depletion and usually needs to be given intravenously (section 9.2.2). In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate (section 9.2.1.3), according to the acid-base status of the patient, may be sufficient.

**SODIUM CHLORIDE**

**Indications** sodium depletion—see also 9.2.2.1; nebuliser diluent (section 3.1.5); eye (section 11.8.1); oral hygiene (section 12.3.4); wound irrigation (section 13.11.1)

**Slow Sodium®** (HK Pharma)  
**Tablets**, m/r, sodium chloride 600 mg (approx. 10 mmol each of Na⁺ and Cl⁻). Net price 100-tab pack = £6.05. Label: 25

**Dose** prophylaxis of sodium chloride deficiency 4–8 tablets daily with water (in severe depletion up to max. 20 tablets daily). Chronic renal salt wasting, up to 20 tablets daily with appropriate fluid intake

**CHILD** see BNF for Children

### Oral rehydration therapy (ORT)

As a worldwide problem *diarrhoea* is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

**Oral rehydration solutions should:**

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to enhance the absorption of water and electrolytes;
- prevent the possible induction of osmotic diarrhea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

**Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.**

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

For intravenous rehydration see section 9.2.2.

### ORAL REHYDRATION SALTS (ORS)

**Indications** fluid and electrolyte loss in diarrhoea, see notes above

**Dose**  
- According to fluid loss, usually 200–400 mL solution after every loose motion; **INFANT** 1–1½ times usual feed volume; **CHILD** 200 mL after every loose motion

**UK formulations**  
**Note** After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours

**Dioralyte®** (Sanofi-Aventis)  
**Oral powder**, sodium chloride 470 mg, potassium chloride 300 mg, disodium hydrogen citrate 530 mg, glucose 3.56 g/sachet, net price 6-sachet pack = £2.11. 20-sachet pack (black currant- or citrus-flavoured or natural) = £6.99

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na 60 mmol, K 20 mmol, Cl 60 mmol, citrate 10 mmol, and glucose 90 mmol

**Dioralyte® Relief** (Sanofi-Aventis)  
**Oral powder**, sodium chloride 350 mg, potassium chloride 300 mg, sodium citrate 580 mg, cooked rice powder 6 g/sachet, net price 6-sachet pack (apricot-, black currant- or raspberry-flavoured) = £2.35. 20-sachet pack (apricot-flavoured) = £7.42

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na 60 mmol, K 20 mmol, Cl 60 mmol, citrate 10 mmol, and glucose 91 mmol

**Electrolade®** (Actavis)  
**Oral powder**, sodium chloride 236 mg, potassium chloride 300 mg, sodium bicarbonate 500 mg, anhydrous glucose 4 g/sachet (banana-, black currant-, lemon and lime-, or orange-flavoured). Net price 6-sachet pack (plain or multiflavoured) pack = £1.33. 20-sachet pack (single- or multiflavoured) pack = £4.99

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na 50 mmol, K 20 mmol, Cl 40 mmol, HCO₂ 30 mmol, and glucose 111 mmol

**Rapolyte®** (KoGEN)  
**Oral powder**, sodium chloride 350 mg, potassium chloride 300 mg, sodium citrate 600 mg, anhydrous glucose 4 g, net price 20-sachet pack (black currant- or raspberry-flavoured) = £4.28

**Note** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na 60 mmol, K 20 mmol, Cl 50 mmol, citrate 10 mmol, and glucose 110 mmol
9.2.2 Parenteral preparations for fluid and electrolyte imbalance

9.2.2.1 Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% or glucose 5%) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance; for reference to the use of magnesium and phosphates, see section 9.5.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

9.2.2.2 Plasma and plasma substitutes

Intravenous sodium

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentration and is indicated in sodium depletion which may arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of from 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate. Excessive administration should be avoided; the jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe...
Nutrition and Blood

Intravenous infusion, sodium chloride 0.45% (Na⁺ and Cl⁻ each 75 mmol/litre), glucose 2.5%
In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.45% (Na⁺ and Cl⁻ each 75 mmol/litre), glucose 5%
In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.9% (Na⁺ and Cl⁻ each 150 mmol/litre), glucose 5%
In hospitals, usually 500-mL packs and sometimes other sizes are available

Note
See above for warning on hyponatraemia especially in children and elderly

Ringer’s Solution for Injection
Calcium chloride (dihydrate) 322 micrograms, potassium chloride 300 micrograms, sodium chloride 8.6 mg/mL, providing the following ions (in mmol/litre), Ca²⁺ 2.2, K⁺ 4, Na⁺ 147, Cl⁻ 156
In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Sodium Lactate Intravenous Infusion, Compound
(Hartmann’s Solution for Injection; Ringer-Lactate Solution for Injection)
Intravenous infusion, sodium chloride 0.6%, sodium lactate 0.25%, potassium chloride 0.04%, calcium chloride 0.027% (containing Na⁺ 131 mmol, K⁺ 5 mmol, Ca²⁺ 2 mmol, HCO₃⁻ (as lactate) 29 mmol, Cl⁻ 111 mmol/litre)
In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Intravenous glucose
Glucose solutions (5%) are used mainly to replace water deficit and should be given alone only when there is no significant loss of electrolytes; prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition (section 9.3).

Glucose solutions are given in regimens with calcium and insulin for the emergency management of hyperkalaemia (see p. 519). They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.
**GLUCOSE**
(Dextrose Monohydrate)

Note Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose

**Indications** fluid replacement (see notes above), provision of energy (section 9.3); hypoglycaemia (section 6.1.4)

**Side-effects** glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis

**Dose**
- Water replacement, see notes above; energy source, 1–3 litres daily of 20–50% solution

**Glucose Intravenous Infusion** (Non-proprietary) (Non-proprietary)
Intravenous infusion, glucose or anhydrous glucose (potency expressed in terms of anhydrous glucose), usual strength 5% (50 mg/mL) and 10% (100 mg/mL); 25% solution, net price 25-mL amp = £2.21; 50% solution, 25-mL amp = £3.80, 50-mL amp = £1.63
In hospitals, 500- and 1000-mL packs, and sometimes other sizes and strengths, are available, also available as Min-I-Jet Glucose, 50% in 50-mL disposable syringe

1. (NF) restriction does not apply where administration is for saving life in emergency

**Intravenous potassium**
Potassium chloride and sodium chloride intravenous infusion is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth. Ready-mixed infusion solutions should be used when possible; alternatively, potassium chloride concentrate, as ampoules containing 1.5 g (K+ 20 mmol) in 10 mL, is thoroughly mixed with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours, with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

**POTASSIUM CHLORIDE**

**Indications** electrolyte imbalance; see also oral potassium supplements, section 9.2.1.1

**Caution** for intravenous infusion the concentration of solution should not usually exceed 3 g (40 mmol)/litre; specialist advice and ECG monitoring (see notes above); renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3); interactions: Appendix 1 (potassium salts)

**Contra-indications** plasma-potassium concentration above 5 mmol/litre

**Side-effects** rapid infusion toxic to heart

**Dose**
- By slow intravenous infusion, depending on the deficit or the daily maintenance requirements, see also notes above

**Potassium Chloride and Glucose Intravenous Infusion** (Non-proprietary) (Non-proprietary)

Intravenous infusion, usual strength potassium chloride 0.3% (3 g, 40 mmol each of K+ and Cl− /litre) or 0.15% (1.5 g, 20 mmol each of K+ and Cl− /litre) with 5% of anhydrous glucose

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Potassium Chloride and Sodium Chloride Intravenous Infusion** (Non-proprietary) (Non-proprietary)

Intravenous infusion, usual strength potassium chloride 0.15% (1.5 g/litre) with sodium chloride 0.9% (9 g/litre), containing K+ 20 mmol, Na+ 150 mmol, and Cl− 170 mmol/litre or potassium chloride 0.3% (3 g/litre) with sodium chloride 0.9% (9 g/litre), containing K+ 40 mmol, Na+ 150 mmol, and Cl− 190 mmol/litre

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Potassium Chloride, Sodium Chloride, and Glucose Intravenous Infusion** (Non-proprietary) (Non-proprietary)

Intravenous infusion, sodium chloride 0.45% (4.5 g, Na+ 75 mmol/litre) with 5% of anhydrous glucose and usually sufficient potassium chloride to provide K+ 10–40 mmol/litre (to be specified by the prescriber)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Potassium Chloride Concentrate, Sterile** (Non-proprietary) (Non-proprietary)

Sterile concentrate, potassium chloride 15% (150 mg, approximately 2 mmol each of K+ and Cl− /mL). Net price 10-mL amp = 48p

Important Must be diluted with not less than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and mixed well

Solutions containing 10 and 20% of potassium chloride are also available in both 5- and 10-mL ampoules

**Bicarbonate and lactate**
Sodium bicarbonate is used to control severe metabolic acidosis (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock (section 2.7.1), for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a
small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously; plasma-pH and electrolytes should be monitored.

**Sodium lactate** intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For **chronic acidotic states**, sodium bicarbonate can be given by mouth (section 9.2.1.3).

### SODIUM BICARBONATE

**Indications** metabolic acidosis, see also notes above

- By slow intravenous injection, a strong solution (up to 8.4%), or by **continuous intravenous infusion**, a weaker solution (usually 1.26%), an amount appropriate to the body base deficit (see notes above)

**Sodium Bicarbonate Intravenous Infusion**

Usual strength sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na⁺ and HCO⁻ /litre); various other strengths available

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

**Min-I-Jet® Sodium Bicarbonate** (UCB Pharma) Intravenous injection, sodium bicarbonate in disposable syringe, net price 4.2%, 10 mL = £5.82; 8.4%, 10 mL = £6.00, 50 mL = £8.14

### SODIUM LACTATE

**Indications** see notes above

**Sodium Lactate** (Non-proprietary) Intravenous infusion, sodium lactate m/6, contains the following ions (in mmol/litre), Na⁺ 167, HCO⁻ (as lactate) 167

### Water

**Water for Injections**

Net price 1-mL amp = 18p; 2-mL amp = 18p; 5-mL amp = 33p; 10-mL amp = 33p; 20-mL amp = 92p; 50-mL amp = £1.91; 100-mL vial = 23p

### 9.2.2.2 Plasma and plasma substitutes

Plasma and plasma substitutes (‘colloids’) contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose (‘crystalloids’), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

**Albumin solutions**, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient’s blood group.

Albumin should usually be used after the acute phase of illness, to correct a plasma-volume deficit in patients with salt and water retention and oedema; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solutions in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solutions may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

### Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

**ALBUMIN SOLUTION** (Human Albumin Solution)

A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 4–5% protein) or concentrated (containing 15–25% protein).

**Indications** see under preparations, and also notes above

**Cautions** history of cardiac or circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function); increased capillary permeability; correct dehydration when administering concentrated solution

**Contra-indications** cardiac failure; severe anaemia

**Side-effects** hypersensitivity reactions (including anaphylaxis) with nausea, vomiting, increased salivation, fever, tachycardia, hypotension and chills reported

#### Isotonic solutions

**Indications**: acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery; plasma exchange

Available as: Human Albumin Solution 4.5% (50-, 100-, 250- and 400-mL bottles—Baxter); Human Albumin Solution 5% (250- and 500-mL bottles—Baxter); Octalbin® 5% (100- and 250-mL bottles—Octapharm); Zenalb® 4.5% (50-, 100-, 250-, and 500-mL bottles—BPL)

#### Concentrated solutions (20–25%)

**Indications**: severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required; adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn; paracentesis of large volume ascites associated with portal hypertension

Available as: Human Albumin Solution 20% (50- and 100-mL vials—Baxter); Flexbumin® 20% (50- and 100-mL bags—Baxter); Octalbin® 20% (50- and 100-mL bottles—Octapharm); Zenalb® 20% (50- and 100-mL bottles—BPL)
Plasma substitutes

Dextran, gelatin, and the etherified starches (heta-starch, pentastarch, and tetrastarch) are macromolecular substances which are metabolised slowly; they may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicemia. Plasma substitutes may be used as an immediate short-term measure to treat haemorrhage until blood is available. They are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also section 2.7.1 for the management of shock.

Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of some plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Dextran 70 by intravenous infusion is used for volume expansion. Dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

Cautions Plasma substitutes should be used with caution in patients with cardiac disease, liver disease, or renal impairment; urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.

Side-effects Hypersensitivity reactions may occur including, rarely, severe anaphylactoid reactions. Transient increase in bleeding time may occur.

**DEXTRAN 70**

Dextrans of weight average molecular weight about ‘70,000’

**Indications** short-term blood volume expansion

**Cautions** see notes above; can interfere with some laboratory tests (see also above); where possible, monitor central venous pressure; pregnancy (Appendix 4)

**Side-effects** see notes above

**Dose**

- See under preparation below

**Hypertonic solution**

RescueFlow® (Vitaline) [FM]

Intravenous infusion, dextran 70 intravenous infusion 6% in sodium chloride intravenous infusion 7.5%. Net price 250–mL bag = £28.50

**Cautions** see notes above; severe hyperglycaemia and hyperosmolality

**Dose** initial treatment of hypovolaemia with hypotension induced by traumatic injury. by intravenous infusion over 2–5 minutes, 250 mL, followed immediately by administration of isotonic fluids

**GELATIN**

Note The gelatin is partially degraded

**Indications** low blood volume (but see notes above)

**Cautions** see notes above; pregnancy (Appendix 4)

**Side-effects** see notes above

**Dose**

- By intravenous infusion, initially 500–1000 mL of a 3.5–4% solution (see notes above)

**Gelofusine® (Braun) [FM]**

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30,000) 40 g (4%). Na+ 154 mmol, Cl 120 mmol/litre, net price 500–mL Ecobag® = £4.70, 1-litre Ecobag® = £9.45

**Geloplasm® (Fresenius Kabi) [FM]**

Intravenous infusion, partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%). Na+ 150 mmol, K+ 5 mmol, Mg 1.5 mmol, Cl 100 mmol, lactate 30 mmol/litre, net price 500–mL bag = £5.05

**Haemaccel® (KoRa) [FM]**

Intravenous infusion, polygeline (gelatin derivative, average molecular weight 30,000) 35 g (3.5%). Na+ 145 mmol, K+ 5.1 mmol, Ca 6.25 mmol, Cl 145 mmol/litre, net price 500–mL bottle = £5.00

**Isoplex® (IS Pharmaceuticals) [FM]**

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30,000) 40 g (4%). Na+ 145 mmol, K+ 4 mmol, Mg 0.9 mmol, Cl 105 mmol, lactate 25 mmol/litre, net price 500–mL bag = £7.53, 1-litre bag = £14.54

**Volplex® (IS Pharmaceuticals) [FM]**

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30,000) 40 g (4%). Na+ 154 mmol, Cl 125 mmol/litre, net price 500–mL bag = £4.70, 1-litre bag = £9.09

**ETHERIFIED STARCH**

A starch composed of more than 90% of amylpectin that has been etherified with hydroxyethyl groups; the terms tetrastarch, pentastarch, and hetastarch reflect the degree of etherification

**Indications** low blood volume

**Cautions** see notes above; children

**Side-effects** see notes above; also pruritus, raised serum amylase

**Dose**

- See under preparations below

**Hetastarch**

Hetastarch (Non-proprietary) [FM]

Intravenous infusion, hetastarch (weight average molecular weight 450,000) 6% in sodium chloride intravenous infusion 0.9%, net price 500–mL bag = £8.00

**Dose** by intravenous infusion, 500–1000 mL, usual daily max. 1500 mL (see notes above)

**Pentastarch**

Pentastarch (Non-proprietary) [FM]

Intravenous infusion, pentastarch (weight average molecular weight 200,000), net price (in sodium chloride intravenous infusion 0.9%) 10%, 500–mL bag = £9.24

**Dose** by intravenous infusion, pentastarch 10%, 500–1000 mL; max. 1500 mL daily (see notes above)
Nutrition and blood

Volven® (Fresenius Kabi) Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 0% in sodium chloride intravenous infusion 0.9%, net price 500 mL = £16.50
Dose by intravenous infusion, up to 1500 mL daily (see notes above)

Hemohes® (Braun) Intravenous infusion, pentastarch (weight average molecular weight 200 000), net price (both in sodium chloride intravenous infusion 0.9%) 6%, 500 mL = £12.50; 10%, 500 mL = £16.50
Cautions see notes above
Dose by intravenous infusion, pentastarch 6%, up to 2500 mL daily; pentastarch 10%, up to 1500 mL daily (see notes above)

Tetraspan® (Braun) Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride 0.625%, containing Na⁺ 140 mmol, K⁺ 4 mmol, Mg 1 mmol, Cl 110 mmol, Ca 2.5 mmol, acetate 24 mmol, malate 5 mmol/litre, net price 500-mL bag = £13.50
Dose by intravenous infusion, up to 50 mL/kg daily (see notes above)

Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 10% in sodium chloride 0.625%, containing Na⁺ 140 mmol, K⁺ 4 mmol, Mg 1 mmol, Cl 110 mmol, Ca 2.5 mmol, acetate 24 mmol, malate 5 mmol/litre, net price 500-mL bag = £18.15
Dose by intravenous infusion, up to 30 mL/kg daily (see notes above)

Venofundin® (Braun) Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride intravenous infusion 0.9%, net price 500-mL bag = £12.90
Dose by intravenous infusion, up to 50 mL/kg daily (see notes above)

Volulyte® (Fresenius Kabi) Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride intravenous infusion 0.9%, net price 500-mL bag = £13.50
Dose by intravenous infusion, up to 50 mL/kg daily (see notes above)

Volven® (Fresenius Kabi) Intravenous infusion, hydroxyethyl starch (weight average molecular weight 130 000) 6% in sodium chloride intravenous infusion 0.9%, net price 500-mL bag = £12.50
Dose by intravenous infusion, up to 50 mL/kg daily (see notes above)

HyperHAES® (Fresenius Kabi) Intravenous infusion, hydroxyethyl starch (weight average molecular weight 200 000) 6% in sodium chloride intravenous infusion 7.2%, net price 250-mL bag = £28.00
Cautions see notes above; also diabetes
Dose by intravenous injection over 2–5 minutes, 4 mL/kg as a single dose, followed immediately by administration of appropriate replacement fluids

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given in the table Proprietary Infusion Fluids for Parenteral Feeding, p. 527.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B₁, as hydroxocobalamin, is given by intramuscular injection; regular vitamin B₁ injections are not usually required unless total parenteral nutrition continues for many months. Folic acid is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the patient may be able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes (see also section 9.2.2). Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes.

Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcal) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

**Glucose** is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

**Fat** emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. Additives may only be mixed with fat emulsions where compatibility is known.

### Supplementary preparations

**Compatibility with the infusion solution must be ascertained before adding supplementary preparations.**

**Addiphos** (Fresenius Kabi) [PDF]
- **Solution**, sterile, phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL. For addition to Vamin® solutions and glucose intravenous infusions. Net price 20-mL vial = £1.53

**Additrace** (Fresenius Kabi) [PDF]
- **Solution**, trace elements for addition to Vamin® solutions and glucose intravenous infusions, traces of Fe, Zn, Cu, Mn, Cr, Se, Mo, F, I. For adults and children over 40 kg. Net price 40-mL vial = £2.00

**Cernevit** (Baxter) [PDF]
- **Solution**, dl-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecalciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dextanphenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, vitamin A (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydride) 3.51 mg. Dissolve in 5 mL water for injections. Net price per vial = £3.32

**Decan** (Baxter) [PDF]
- **Solution**, trace elements for addition to infusion solutions, Fe, Zn, Cu, Mn, F, Co, I, Se, Mo, Cr. For adults and children over 40 kg. Net price 40-mL vial = £2.00

**Dipeptiven** (Fresenius Kabi) [PDF]
- **Solution**, (providing L-alanine 82 mg, l-glutamine 134.6 mg). For addition to infusion solutions containing amino acids. Net price 50 mL = £16.40, 100 mL = £30.50
- **Dose** amino acid supplement for hypercatabolic or hypermetabolic states, 300–400 mg/kg daily, max. 400 mg/kg daily, dose not to exceed 20% of total amino acid intake

**Glycophos Sterile Concentrate** (Fresenius Kabi) [PDF]
- **Solution**, sterile, phosphate 20 mmol, Na⁺ 40 mmol/20 mL. For addition to Vamin® and Vaminolact® solutions, and glucose intravenous infusions. Net price 20-mL vial = £4.60

**Peditrace** (Fresenius Kabi) [PDF]
- **Solution**, trace elements for addition to Vaminolact®, Vamin® 14 Electrolyte-Free solutions and glucose intravenous infusions, traces of Zn, Cu, Mn, Se, F, I. For use in neonates (when kidney function established, usually second day of life), infants, and children. Net price 10-mL vial = £4.18

**Solivito N** (Fresenius Kabi) [PDF]
- **Solution**, powder for reconstitution, biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg. Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or Intralipid®; dissolve in Vitlipid N® or Intralipid® for adding to Intralipid® only. Net price per vial = £2.32

**Vitlipid N** (Fresenius Kabi) [PDF]
- **Emulsion, adult**, vitamin A 330 units, ergocalciferol 20 units, dl-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL. For addition to Intralipid®. For adults and children over 11 years. Net price 10-mL amp = £2.32
- **Emulsion, infant**, vitamin A 230 units, ergocalciferol 40 units, dl-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL. For addition to Intralipid®. Net price 10-mL amp = £2.32
9.4 Oral nutrition

9.4.1 Foods for special diets

These are preparations that have been modified to eliminate a particular constituent from a food or are nutrient mixtures formulated as substitutes for the food. They are for patients who either cannot tolerate or cannot metabolise certain common constituents of food.

Phenylketonuria Phenylketonuria (phenylalaninaemia), which results from the inability to metabolise phenylalanine, is managed by restricting its dietary intake to a small amount sufficient for tissue building and repair. Aspartame (as a sweeter in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation.

Coeliac disease Coeliac disease, which results from an intolerance to gluten, is managed by completely eliminating gluten from the diet.

ACBS In certain clinical conditions some foods may have the characteristics of drugs and the Advisory Committee on Borderline Substances advises as to the circumstances in which such foods may be regarded as drugs and so can be prescribed in the NHS. Prescriptions for these foods issued in accordance with the advice of this committee and endorsed ‘ACBS’ will normally not be investigated. See Appendix 7 for details of these foods and a listing by clinical condition (consult Drug Tariff for late amendments).

Preparations For preparations on the ACBS list see Appendix 7.

9.4.2 Enteral nutrition

The body’s reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with sip or tube feeds of one of the nutritionally complete foods.

When patients cannot feed normally at all, for example, patients with severe facial injury, oesophageal obstruction, or coma, a diet composed solely of nutritionally complete foods must be given. This is planned by a dietitian who will take into account the protein and total energy requirement of the patient and decide on the form and relative contribution of carbohydrate and fat to the energy requirements.

There are a number of nutritionally complete foods available and their use reduces an otherwise heavy workload in hospital or in the home. Most contain protein derived from milk or soya. Some contain protein hydrolysates or free amino acids and are only appropriate for patients who have diminished ability to break down protein, as may be the case in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete foods are being given it may be important to monitor water and electrolyte balance. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed. Regular haematological and biochemical tests may be needed particularly in the unstable patient.

Some feeds are supplemented with vitamin K; for drug interactions of vitamin K see Appendix 1 (vitamins).

Children Infants and young children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable and should not be given. Expert advice should be sought.

Preparations See Appendix 7.

9.5 Minerals

9.5.1 Calcium and magnesium

9.5.1.1 Calcium supplements

9.5.1.2 Hypercalcaemia and hypercalciuria

9.5.1.3 Magnesium

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate, see also Osteoporosis, p. 414 and Vitamin D, p. 541.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of 10–20 mL of calcium gluconate injection 10% (providing
Calcium should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. For infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia (see also section 9.6.4). Concurrent hypomagnesaemia should be corrected with magnesium sulphate (section 9.5.1.3).

For the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia, see p. 519.

# CALCIAL SALTS

## Indications
See notes above; calcium deficiency

## Cautions
Renal impairment; sarcoidosis; history of nephrolithiasis; avoid calcium in respiratory acidosis or respiratory failure; interactions: Appendix 1 (antacids, calcium salts)

## Contra-indications
Conditions associated with hypercalcaemia and hypercalciuria (e.g. some forms of malignant disease)

## Side-effects
Gastro-intestinal disturbances; bradycardia, arrhythmias; with injection, peripheral vasodilatation, fall in blood pressure, injection-site reactions

### Dose
- By mouth, daily in divided doses, see notes above
- By slow intravenous injection, acute hypocalcaemia, calcium gluconate 1–2 g (Ca 2.25–4.5 mmol); CHILD see BNF for Children
- By continuous intravenous infusion, acute hypocalcaemia, see notes above

## Oral preparations

### Calcium Gluconate
- **(Non-proprietary)**
  - **Tablets**, calcium gluconate 600 mg (calcium 53.4 mg or Ca 1.35 mmol), net price 20-tab pack = £1.43. Label: 24
  - **Effervescent tablets**, calcium gluconate 1 g (calcium 89 mg or Ca 2.23 mmol), net price 28-tab pack = £8.83. Label: 13
  - **Note** Each tablet usually contains 4.46 mmol Na

### Calcium Lactate
- **(Non-proprietary)**
  - **Tablets**, calcium lactate 300 mg (calcium 39 mg or Ca 1 mmol), net price 84 = £3.01

### Adcal®
- **(ProStrakan)**
  - **Chewable tablets**, fruit flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca 15 mmol), net price 100-tab pack = £7.25. Label: 24

### Cacit®
- **(Procter & Gamble Pharm.)**
  - **Tablets**, effervescent, pink, calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca 12.5 mmol), net price 76-tab pack = £6.87. Label: 13

### Calcichew®
- **(Shire)**
  - **Tablets** (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca 12.5 mmol), net price 100-tab pack = £9.33. Label: 24
  - **Forte tablets** (chewable), orange flavour, scored, calcium carbonate 2.5 g (calcium 1 g or Ca 25 mmol), net price 60-tab pack = £13.16. Label: 24

### Excipients
Include aspartame (section 9.4.1)

## Parenteral preparations

### Calcium Gluconate
- **(Non-proprietary)**
  - **Injection**, calcium gluconate 10% (calcium 8.4 mg or Ca 226 micromol/mL), net price 10-mL amp = 60p

### Calcium Chloride
- **(Non-proprietary)**
  - **Injection**, calcium chloride dihydrate 10% (calcium 27.3 mg or Ca 680 micromol/mL), net price 10-mL disposable syringe = £4.64
  - **Brands** include Minject Calcium Chloride 10%

### With vitamin D
Section 9.6.4

### With disodium etidronate
Section 6.6.2

### With risedronate sodium and colecalciferol
Section 6.6.2

## Severe hypercalcaemia
Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9%. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If severe hypercalcaemia persists drugs which inhibit mobilisation of calcium from the skeleton may be required. The bisphosphonates are useful and disodium pamidronate (section 6.6.2) is probably the most effective.

### Corticosteroids
Section 6.3 are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.
Calcitonin (section 6.6.1) is relatively non-toxic but its effect can wear off after a few days despite continued use; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. Further treatment is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalciuria should be avoided; oral administration of a bisphosphate may be useful.

Hyperparathyroidism Cinacalcet is licensed for the treatment of secondary hyperparathyroidism in dialysis patients with end-stage renal disease (but see NICE guidance below), for primary hyperparathyroidism in patients where parathyroidectomy is inappropriate, and for the treatment of hypercalcaemia in parathyroid carcinoma. Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

Paricalcitol (section 9.6.4) is also licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure. Parathyroidectomy may be indicated for hyperparathyroidism.

NICE guidance
Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis (January 2007)
Cinacalcet is not recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy.
Cinacalcet is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) only in those:

- who have ‘very uncontrolled’ plasma concentration of intact parathyroid hormone (defined as greater than 85 picomol/litre) refractory to standard therapy, and a normal or high adjusted serum calcium concentration, and
- in whom surgical parathyroidectomy is contra-indicated, in that the risks of surgery outweigh the benefits.

Response to treatment should be monitored regularly and treatment should be continued only if a reduction in the plasma concentration of intact parathyroid hormone of 30% or greater is seen within 4 months of treatment.

Hypercalciuria
Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide in a dose of 2.5 mg daily (a higher dose is not usually necessary). Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

9.5.1 Calcium and magnesium
BNF 57

**CINACALCET**

**Indications** see under Dose and notes above

**Cautions** measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma; treatment should not be initiated in patients with hypocalcaemia; in secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose; then every 1–3 months; dose adjustment may be necessary if smoking started or stopped during treatment; hepatic impairment (Appendix 2); pregnancy (Appendix 4); interactions: Appendix 1 (cinacalcet)

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** nausea, vomiting, anorexia; dizziness, paraesthesia, asthenia; reduced testosterone concentrations; myalgia; rash; less commonly dyspepsia, diarrhoea, and seizures; hypotension and heart failure also reported

**Dose**

- Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis (but see notes above), ADULT over 18 years, initially 30 mg once daily, adjusted every 2–4 weeks to max. 180 mg daily
- Hypercalcaemia of primary hyperparathyroidism or parathyroid carcinoma, ADULT over 18 years, initially 30 mg twice daily, adjusted every 2–4 weeks according to response up to max. 90 mg 4 times daily

**Mimpara** (Amgen)

Tablets, green, f/c, cinacalcet (as hydrochloride) 30 mg, net price 28-tab pack = £126.28; 60 mg, 28-tab pack = £232.96; 90 mg, 28-tab pack = £349.44.
Label: 21

9.5.1.3 Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulphate (section 1.6.4) as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypomagnesaemia (causing muscle weakness and arrhythmias) is rare.

**Hypomagnesaemia** Since magnesium is secreted in large amounts in the gastro-intestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypercalcaemia, and also hypokalaemia and hypophatremia.

Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulphate; the intramuscular injection is painful. Plasma magnesium concentration should
be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in a dose of 24 mmol Mg daily in divided doses; suitable preparations are magnesium glycerophosphate tablets or liquid [unlicensed], available from ‘special-order’ manufacturers or specialist importing companies, see p. 939. For maintenance (e.g. in intravenous nutrition), parenteral doses of magnesium are of the order of 10–20 mmol Mg daily (often about 12 mmol Mg daily).

**Arrhythmias** Magnesium sulphate has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de points* (see also section 2.3.1). The usual dose of magnesium sulphate by intravenous injection is 2 g (8 mmol Mg) over 10–15 minutes (repeated once if necessary).

**Myocardial infarction** Limited evidence that magnesium sulphate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulphate for this purpose is not recommended. For the management of myocardial infarction, see section 2.10.1.

**Eclampsia and pre-eclampsia** Magnesium sulphate is the drug of choice for the prevention of recurrent seizures in *eclampsia*; see also Appendix 4. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity. Magnesium sulphate is also of benefit in women with *pre-eclampsia* in whom there is concern about developing eclampsia. The patient should be monitored carefully (see under Magnesium Sulphate).

### MAGNESIUM SULPHATE

**Indications** see notes above; constipation (section 1.6.4); severe acute asthma (section 3.1); paste for boils (section 13.10.5)

**Cautions** see notes above; hepatic impairment (Appendix 2); renal impairment (Appendix 3); in severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump); monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech); pregnancy (Appendix 4); **interactions:** Appendix 1 (magnesium, parenteral)

**Side-effects** generally associated with hypermagnesaemia, nausea, vomiting, thirst, flushing of skin, hypotension, arrhythmias, coma, respiratory depression, drowsiness, confusion, loss of tendon reflexes, muscle weakness; colic and diarrhoea following oral administration

**Dose**

- Hypomagnesaemia, see notes above
- Arrhythmias, see notes above
- Prevention of seizure recurrence in eclampsia, initially by intravenous injection over 5–15 minutes, 4 g, followed by intravenous infusion, 1 g/hour for at least 24 hours after last seizure; if seizure recurs, additional dose by intravenous injection, 2 g (4 g if body-weight over 70 kg)
- Prevention of seizures in pre-eclampsia [unlicensed indication], initially by intravenous injection over 5–15 minutes, 4 g followed by intravenous infusion, 1 g/hour for 24 hours; if seizure occurs, additional dose by intravenous injection, 2 g

**Intravenous administration** For intravenous injection concentration of magnesium sulphate should not exceed 20% (dilute 1 part of magnesium sulphate injection 50% with at least 1.5 parts of water for injections)

**Note** Magnesium sulphate 1 g equivalent to Mg approx. 4 mmol

**Magnesium Sulphate (Non-proprietary)**

**Injection**, magnesium sulphate 20% (Mg approx. 0.8 mmol/mL), net price 20-ML (4-g) amp = £2.75; 50% (Mg approx. 2 mmol/mL), 2-ML (1-g) amp = £3.80, 4-ML (2-g) prefilled syringe = £6.40, 5-ML (2.5-g) amp = £3.00, 10-ML (5-g) amp = £3.35; 10-ML (5-g) prefilled syringe = £4.95

**Brands include**

- Minijet Magnesium Sulphate 50%

### 9.5.2 Phosphorus

#### 9.5.2.1 Phosphate supplements

**Phosphate supplements**

Oral phosphate supplements may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets. Diarrhoea is a common side-effect and should prompt a reduction in dosage.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. For established hypophosphataemia, monobasic potassium phosphate may be infused at a rate of 9 mmol every 12 hours. In critically ill patients, the dose of phosphate can be increased up to 500 micro- mol/kg (approx. 30 mmol in adults, max. 50 mmol), infused over 6–12 hours, according to severity. Excessive doses of phosphates may cause hypocalcaemia and metastatic calcification; it is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes.

For phosphate requirements in total parenteral nutrition regimens, see section 9.3.

**Phosphates** (Fresenius Kabi) Intravenous infusion, phosphates (providing PO 100 mmol, K+ 19 mmol, and Na+ 162 mmol/litre), net price 500 mL (Polyfu®) = £3.75.

For the treatment of moderate to severe hypophosphatemia

**Phosphate-Sandoz** (HK Pharma) Tablets, effervescent, anhydrous sodium acid phosphate 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na+ 0.8 mmol/mL), net price 20-ML (4-g) amp = £2.75; 50% (Mg approx. 2 mmol/mL), 2-ML (1-g) amp = £3.80, 4-ML (2-g) prefilled syringe = £6.40, 5-ML (2.5-g) amp = £3.00, 10-ML (5-g) amp = £3.35; 10-ML (5-g) prefilled syringe = £4.95

**Brands include**

- Polyfusor

**9.5.2.2 Phosphate-binding agents**

- 1.5 parts of water for injections)

**9.5.2.2 Phosphate-binding agents**

**Intravenous administration**

- Prevention of seizures in pre-eclampsia [unlicensed indication], initially by intravenous injection over 5–15 minutes, 4 g followed by intravenous infusion, 1 g/hour for 24 hours; if seizure occurs, additional dose by intravenous injection, 2 g

**Note** Magnesium sulphate 1 g equivalent to Mg approx. 4 mmol

**Magnesium Sulphate (Non-proprietary)**

**Injection**, magnesium sulphate 20% (Mg approx. 0.8 mmol/mL), net price 20-ML (4-g) amp = £2.75; 50% (Mg approx. 2 mmol/mL), 2-ML (1-g) amp = £3.80, 4-ML (2-g) prefilled syringe = £6.40, 5-ML (2.5-g) amp = £3.00, 10-ML (5-g) amp = £3.35; 10-ML (5-g) prefilled syringe = £4.95

**Brands include**

- Minijet Magnesium Sulphate 50%

### 9.5.2 Phosphorus

#### 9.5.2.1 Phosphate supplements

**Phosphate supplements**

Oral phosphate supplements may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets. Diarrhoea is a common side-effect and should prompt a reduction in dosage.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. For established hypophosphataemia, monobasic potassium phosphate may be infused at a rate of 9 mmol every 12 hours. In critically ill patients, the dose of phosphate can be increased up to 500 micro-mol/kg (approx. 30 mmol in adults, max. 50 mmol), infused over 6–12 hours, according to severity. Excessive doses of phosphates may cause hypocalcaemia and metastatic calcification; it is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes.

For phosphate requirements in total parenteral nutrition regimens, see section 9.3.

**Phosphates** (Fresenius Kabi) Intravenous infusion, phosphates (providing PO 100 mmol, K+ 19 mmol, and Na+ 162 mmol/litre), net price 500 mL (Polyfu®) = £3.75.

For the treatment of moderate to severe hypophosphatemia

**Phosphate-Sandoz** (HK Pharma) Tablets, effervescent, anhydrous sodium acid phosphate 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na+ 0.8 mmol/mL), net price 20-ML (4-g) amp = £2.75; 50% (Mg approx. 2 mmol/mL), 2-ML (1-g) amp = £3.80, 4-ML (2-g) prefilled syringe = £6.40, 5-ML (2.5-g) amp = £3.00, 10-ML (5-g) amp = £3.35; 10-ML (5-g) prefilled syringe = £4.95

**Brands include**

- Polyfusor

**9.5.2.2 Phosphate-binding agents**

- 1.5 parts of water for injections)

**9.5.2.2 Phosphate-binding agents**

**Intravenous administration**
**9.5.3 Fluoride**

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

Where the fluoride content of the drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops is a suitable means of supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional prophylaxis by use of fluoride rinses or by application of

---

**Indications** hyperphosphataemia in patients on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD). **Contra-indications** pregnancy (Appendix 4)** Side-effects** gastro-intestinal disturbances; hypocalcaemia; less commonly anorexia, increased appetite, taste disturbances, dry mouth, thirst, stomatitis, chest pain, peripheral oedema, headache, dizziness, vertigo, asthenia, fatigue, malaise, hyperglycaemia, hyperparathyroidism, hypercalcaemia, hypophosphataemia, eosinophilia, arthralgia, myalgia, osteoporosis, sweating, alopecia, pruritus, and erythematous rash; accumulation of lanthanum in bone, and transient changes in QT interval also reported

**Dose**
- **ADULT** over 18 years, initially 750 mg daily in divided doses chewed with or immediately after meals, adjusted according to plasma-phosphate concentration every 2–3 weeks (usual dose range 1.5–3 g daily in divided doses)

**Fosrenol** (Shire) Tablets (chewable), lanthanum (as carbonate hydrate) 500 mg, net price 90-tab pack = £114.13; 750 mg, 90-tab pack = £152.17; 1 g, 90-tab pack = £161.33. Label: 21, counselling, to be chewed

**SEVELAMER**

**Indications** hyperphosphataemia in patients on haemodialysis or peritoneal dialysis **Cautions** gastro-intestinal disorders; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (lanthanum) **Contra-indications** bowel obstruction **Side-effects** gastro-intestinal disturbances; very rarely intestinal obstruction

**Dose**
- **ADULT** over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, then adjusted according to plasma-phosphate concentration (usual dose range 2.4–12 g daily in 3 divided doses)

**Renagel** (Genzyme) Tablets, f/c, sevelamer 800 mg, net price 180-tab pack = £122.76. Label: 25, counselling, with meals

---

<table>
<thead>
<tr>
<th>9.5.2.2 Phosphate-binding agents</th>
</tr>
</thead>
</table>
| Aluminium-containing and calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Calcium-containing phosphate-binding agents are contra-indicated in hypercalcaemia or hypercalciuria. Phosphate-binding agents which contain aluminium may increase plasma aluminium in dialysis patients. Sevelamer is licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. The Scottish Medicines Consortium (p. 3) has advised (November 2007) that sevelamer (Renagel®) is not recommended for use within NHS Scotland for the control of hyperphosphataemia in adults receiving peritoneal dialysis. Lanthanum is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD).

**ALUMINIUM HYDROXIDE**

**Indications** hyperphosphataemia; dyspepsia (section 1.1) **Cautions** hyperaluminaemia; see also notes above; renal impairment (Appendix 3); **interactions**: Appendix 1 (antacids) **Side-effects** see section 1.1.1

**Alu-Cap® (3M)**
- **Capsules**, green/red, dried aluminium hydroxide 475 mg (low Na⁺). Net price 120-cap pack = £3.75

**Dose** phosphate-binding agent in renal failure, 4–20 capsules daily in divided doses with meals

**CALCIUM SALTS**

**Indications** hyperphosphataemia **Cautions** see notes above; **interactions**: Appendix 1 (antacids, calcium salts) **Side-effects** hypercalcaemia

**Adcal®** section 9.5.1.1

**Calcichew®** section 9.5.1.1

**Calcium-500** section 9.5.1.1

**Phossex® (Vitaline)**
- **Tablets**, yellow, calcium acetate 1 g (calcium 250 mg or Ca 6.2 mmol), net price 180-tab pack = £19.79. Label: 25, counselling, with meals

**Dose** phosphate-binding agent (with meals) in renal failure, according to the requirements of the patient

**LANTHANUM**

**Indications** hyperphosphataemia in patients on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD) **Cautions** acute peptic ulcer; ulcerative colitis; Crohn’s disease; bowel obstruction; hepatic impairment; breast-feeding (Appendix 5)
fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied on a regular basis under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales; for details see preparations, below).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes. Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

## FLUORIDES

**Note** Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion

**Indications** prophylaxis of dental caries—see notes above

**Contra-indications** not for areas where drinking water is fluoridated

**Side-effects** occasional white flecks on teeth with recommended doses; rarely yellowish-brown discoloration if recommended doses are exceeded

**Dose**

**Note** Dose expressed as fluoride ion (F⁻)

- Water content less than F 300 micrograms/litre (0.3 parts per million), **CHILD** up to 6 months none; 6 months–3 years F 250 micrograms daily, 3–6 years F 500 micrograms daily, over 6 years F 1 mg daily
- Water content between F 300 and 700 micrograms/litre (0.3–0.7 parts per million), **CHILD** up to 3 years none, 3–6 years F 250 micrograms daily, over 6 years F 500 micrograms daily
- Water content above F 700 micrograms/litre (0.7 parts per million), supplements not advised

**Note** These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J 1997; 182: 6–7*)

### Tablets

**Counselling** Tablets should be sucked or dissolved in the mouth and taken preferably in the evening

**En-De-Kay®** (Manx)

- Fluotabs 3–6 years, orange-flavoured, scored, sodium fluoride 1.1 mg (F 500 micrograms). Net price 200-tab pack = £2.38
- Fluotabs 6+ years, orange-flavoured, scored, sodium fluoride 2.2 mg (F 1 mg). Net price 200-tab pack = £2.38

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

**Fluor-a-day®** (Dental Health)

- Tablets, buff, sodium fluoride 1.1 mg (F 500 micrograms), net price 200-tab pack = £2.41; 2.2 mg (F 1 mg), 200-tab pack = £2.41

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets

### Oral drops

**Note** Fluoride supplements not considered necessary below 6 months of age (see notes above)

**En-De-Kay®** (Manx)

- **Fludrops** (= paediatric drops), sugar-free, sodium fluoride 550 micrograms (F 250 micrograms)/0.15 mL. Net price 60 mL = £2.38

**Dental prescribing on NHS** Corresponds to Sodium Fluoride Oral Drops DPF 0.37% equivalent to sodium fluoride 80 micrograms (F 36 micrograms)/drop

### Mouthwashes

Rinse mouth for 1 minute and spit out

**Counselling** Avoid eating, drinking, or rinsing mouth for 15 minutes after use

**Duraphat®** (Colgate-Palmolive)

- **Weekly dental rinse** (= mouthwash), blue, sodium fluoride 0.2%. Net price 150 mL = £2.37. Counselling, see above

  - **Dose** **CHILD** 6 years and over, for **weekly use**, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.2%

**En-De-Kay®** (Manx)

- **Daily fluoride mouthrinse** (= mouthwash), blue, sodium fluoride 0.05%. Net price 250 mL = £1.51

  - **Dose** **CHILD** 6 years and over, for **daily use**, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

**Fluorinse** (= mouthwash), red, sodium fluoride 2%. Net price 100 mL = £4.97. Counselling, see above

  - **Dose** **CHILD** 8 years and over, for **daily use**, dilute 5 drops to 10 mL of water, for **weekly use**, dilute 20 drops to 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 2%

### Gels

**FluoriGard®** (Colgate-Palmolive)

- **Daily dental rinse** (= mouthwash), blue, sodium fluoride 0.05%. Net price 500 mL = £3.14. Counselling, see above

  - **Dose** **CHILD** 6 years and over, for **daily use**, rinse with 10 mL

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Mouthwash 0.05%

**Gel-Kam** (= gel), stannous fluoride 0.4% in glycerol basis. Net price 100 mL = £2.97. Counselling, see below

  - **Dose** **ADULT** and **CHILD** 3 years and over, for **daily use**, using a toothbrush, apply onto all tooth surfaces

**Counselling** Swish between teeth for 1 minute before spitting out. Avoid eating, drinking, or rinsing mouth for at least 30 minutes after use

**FluoriGard®** (Colgate-Palmolive)

- Tablets 0.5, purple, grape-flavoured, scored, sodium fluoride 1.1 mg (F 500 micrograms). Net price 200-tab pack = £1.91
- Tablets 1.0, orange, orange-flavoured, scored, sodium fluoride 2.2 mg (F 1 mg). Net price 200-tab pack = £1.91

**Dental prescribing on NHS** May be prescribed as Sodium Fluoride Tablets
9.5.4 Zinc

Zinc supplements should be given only when there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease (section 9.8.1), or in zinc-losing states.

Parenteral nutrition regimens usually include trace amounts of zinc (section 9.3). If necessary, further zinc can be added to intravenous feeding regimens. A suggested dose for intravenous nutrition is elemental zinc 6.5 mg (Zn 100 micromol) daily.

9.5.5 Selenium

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should be given only when there is good evidence of deficiency.

9.6 Vitamins

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general ‘pick-me-ups’ is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The ‘fad’ for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid and pyridoxine, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

Dental patients It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment. Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

9.6.1 Vitamin A

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption). Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation...
rate and raised serum calcium and serum alkaline phosphatase concentrations.

In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish-liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver pâté or liver sausage.

**VITAMIN A**

**Indications** see notes above

**Cautions** see notes above; interactions: Appendix 1 (vitamins)

**Side-effects** see notes above

- See notes above and under preparations

**Vitamins A and D**

**Halibut-liver Oil** (Non-proprietary)

- **Capsules**, vitamin A 4000 units [also contains vitamin D]. Net price 100-cap pack = 93p

**Vitamins A and D** (Non-proprietary)

- **Capsules**, vitamin A 4000 units, vitamin D 400 units. Net price 84-cap pack = £3.14

**Note** May be difficult to obtain

**Halycitrol** (LAB)

- **Emulsion**, vitamin A 4600 units, vitamin D 380 units/5 mL. Net price 114 mL = £1.77

**Note** May be difficult to obtain

**Vitamins A, C and D**

**Healthy Start Children’s Vitamin Drops** (Non-proprietary)

- **Oral drops**, vitamin A 5000 units, vitamin D 2000 units, ascorbic acid 150 mg/mL.

Available free of charge to children under 4 years through the Healthy Start Scheme; otherwise available direct to the public from maternity and child health clinics; community pharmacists may have difficulty obtaining supplies

**Dose** prevention of vitamin deficiency. **CHILD** 1 month–5 years, 5 drops daily (5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units, ascorbic acid approx. 20 mg)

**Note** Healthy Start Vitaminas for women (containing ascorbic acid, vitamin D, and folic acid) are also available to women during pregnancy and until their baby is one year old, through the Healthy Start Scheme

**RIBOFLAVIN**

(Riboflavine, vitamin B)

**Indications** see notes above

**Preparations**

- Injections of vitamins B and C, see under Thiamine

**Oral vitamin B complex preparations**

See p. 540

**THIAMINE**

(Vitamin B)

**Indications** see notes above

**Cautions** anaphylactic shock may occasionally follow injection (see MHRA/CHM advice above); breastfeeding (Appendix 5)

**Dose**

- Mild chronic deficiency, 10–25 mg daily; severe deficiency, 200–300 mg daily

**Thiamine** (Non-proprietary)

- **Tablets**, thiamine hydrochloride 50 mg. net price 20 = £1.31; 100 mg, 20 = £1.50

Brands include *Benerva*
Nutrition and blood

Pabrinex® (Link) (NH)

I/M High potency injection, for intramuscular use only, ascorbic acid 500 mg, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/7 mL. Net price 7 mL (in 2 amps) = £1.96

I/V High potency injection, for intravenous use only, ascorbic acid 500 mg, anhydrous glucose 1 g, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/10 mL. Net price 10 mL (in 2 amps) = £1.96

Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively or in psychiatric states), maintenance of vitamins B and C in chronic intermittent haemodialysis

Dose see MHRA/CHM advice above

Coma or delirium from alcohol, from opioids, or from barbiturates, collapse following narcosis, psychosis following narcosis or electroconvulsive therapy, toxicity from acute infections, by intravenous infusion of I/V High potency or by deep intramuscular injection into the gluteal muscle of I/M High potency, 1 pair twice daily for up to 7 days

Haemodialysis, by intravenous infusion of I/V High potency (in sodium chloride intravenous infusion 0.9%) 1 pair every 2 weeks

Oral vitamin B complex preparations

See below

PYRIDOXINE HYDROCHLORIDE

(Vitamin B )

Indications see under Dose

Cautions interactions: Appendix 1 (vitamins)

Side-effects sensory neuropathy reported with high doses given for extended periods

Dose

• Deficiency states, 20–50 mg up to 3 times daily

• Isoniazid neuropathy, prophylaxis 10 mg daily [or 20 mg daily if suitable product not available]; therapeutic, 50 mg three times daily

• Idiopathic sideroblastic anaemia, 100–400 mg daily in divided doses

• Premenstrual syndrome, 50–100 mg daily (see notes above)

Prolonged use of pyridoxine in a dose of 10 mg daily is considered safe but the long-term use of pyridoxine in a dose of 200 mg or more daily has been associated with neuropathy. The safety of long-term pyridoxine supplementation with doses above 10 mg daily has not been established.

Pyridoxine (Non-proprietary)

Tablets, pyridoxine hydrochloride 10 mg, net price 20 = 34p; 20 mg, 20 = 34p; 50 mg, 28 = 84p

Injections of vitamins B and C

See under Thiamine

NICOTINAMIDE

Indications see notes above; acne vulgaris, see section 13.8.1

Nicotinamide (Non-proprietary)

Tablets, nicotinamide 50 mg. Net price 20 = £1.37

Injections of vitamins B and C

See under Thiamine

Oral vitamin B complex preparations

Note Other multivitamin preparations are in section 9.6.7.

Vitamin B Tablets, Compound

Tablets, nicotinamide 15 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg. Net price 20 = £0.76

Dose prophylactic, 1–2 tablets daily

Vitamin B Tablets, Compound, Strong

Tablets, brown, f/c or s/c, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, riboflavin 2 mg, thiamine hydrochloride 5 mg. Net price 28-tab pack = £2.00

Dose treatment of vitamin-B deficiency, 1–2 tablets 3 times daily

Vigranon B® (Wallace Mfg)

Syrup, thiamine hydrochloride 5 mg, riboflavin 2 mg, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, panthenol 3 mg/5 mL. Net price 150 mL = £2.41

Other compounds

Potassium aminobenzoate has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma but its therapeutic value is doubtful.

Potaba® (Glenwood)

Capsules, potassium aminobenzoate 500 mg. Net price 20 = £1.59. Label: 21

Tablets, potassium aminobenzoate 500 mg. Net price 20 = £1.12. Label: 21

Envules® (= powder in sachets), potassium aminobenzoate 3 g. Net price 40 sachets = £17.21. Label: 13, 21

Dose Peyronie’s disease, scleroderma, 12 g daily in divided doses after food

Vitamin C

Vitamin C therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly. It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

ASCORBIC ACID

Indications prevention and treatment of scurvy

Cautions interactions: Appendix 1 (vitamins)

Dose

• Prophylactic, 25–75 mg daily; therapeutic, not less than 250 mg daily in divided doses

Ascorbic Acid (Non-proprietary)

Tablets, ascorbic acid 50 mg, net price 28 = £1.21; 100 mg, 28 = £1.26; 200 mg, 28 = £1.27; 500 mg (label: 24), 28 = £3.12

Brands include Redoxon
9.6.4 Vitamin D

Note: The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets. They include ergocalciferol (calciferol, vitamin D), colecalciferol (vitamin D), dihydrocholesterol, alfacalcidol (1α,25-dihydroxycholecalciferol), and calcitriol (1,25-dihydroxycholecalciferol).

Simple vitamin D deficiency can be prevented by taking an oral supplement of only 10 micrograms (400 units) of ergocalciferol (calciferol, vitamin D) or colecalciferol (vitamin D) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol in a dose of 20 micrograms (800 units) daily by mouth can prevent vitamin D deficiency. Since there is no plain tablet of this strength available, calcium and ergocalciferol tablets can be given (although the calcium is unnecessary).

Preparations containing calcium with colecalciferol are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency (see also Osteoporosis, p. 414 and Calcium Supplements, p. 532).

Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses, such as ergocalciferol tablets up to 1 mg (40 000 units) daily; the hypocalcaemia of hypoparathyroidism often requires doses of up to 2.5 mg (100 000 units) daily in order to achieve normocalcaemia.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives alfacalcidol or calcitriol should be prescribed if patients with severe renal impairment require vitamin D therapy. Calcitriol is also licensed for the management of post-menopausal osteoporosis.

Paricalcitol, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure (section 9.5.1.2).

Important. All patients receiving pharmacological doses of vitamin D and its analogues should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur. Breast milk from women taking pharmacological doses of vitamin D can cause hypercalcaemia if given to an infant.

ERGOCALCIFEROL
(Calciferol, Vitamin D)

Indications: see notes above

Caution: take care to ensure correct dose in infants; monitor plasma calcium in patients receiving high doses and in renal impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (vitamins)

Contra-indications: hypercalcaemia; metastatic calcification

Side-effects: symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine

Dose: See notes above

Daily supplements: See notes above

Note: There is no plain vitamin D tablet available for treating simple deficiency (see notes above). Alternatives include vitamins capsules (section 9.6.7), preparations of vitamins A and D (section 9.6.1), and calcium and ergocalciferol tablets (see below).

For cautions, contra-indications, and side-effects of calcium, see section 9.5.1.1

Calcium and Ergocalciferol (Non-proprietary)
(Calcium and Vitamin D)

Tablets, calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca 2 mmol), ergocalciferol 10 micrograms (400 units). Net price 28-tab pack = £2.38. Counselling, crush before administration or may be chewed.

Pharmacological strengths: See notes above

Note: The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied.

Ergocalciferol (Non-proprietary)

Tablets, ergocalciferol 250 micrograms (10 000 units), net price 20 = £4.40; 1.25 mg (50 000 units)

Note: May be difficult to obtain

Important: When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

Injection, ergocalciferol, 7.5 mg (300 000 units)/mL in oil, net price 1-mL amp = £7.44, 2-mL amp = £8.93

ALFACALCIDOL
(1α-Hydroxycholecalciferol)

Indications: see notes above

Cautions: see under Ergocalciferol; also nephrolithiasis

Contra-indications: see under Ergocalciferol

Side-effects: see under Ergocalciferol; also rarely nephrocalcinosis, pruritus, rash, urticaria

Dose: By mouth or by intravenous injection over 30 seconds, ADULT and CHILD over 20 kg, initially 1 microgram daily (elderly 500 nanograms), adjusted to avoid hypercalcaemia; maintenance, usually 0.25–1 microgram daily; NEONATE and PRETERM NEONATE initially 50–100 nanograms/kg daily, CHILD under 20 kg initially 50 nanograms/kg daily

Alfacalcidol (Non-proprietary) FR
Capsules, alfacalcidol 250 nanograms, net price 30-cap pack = £5.08; 500 nanograms 30-cap pack = £9.99; 1 microgram 30-cap pack = £13.89

One-Alpha® (LEO) FR
Capsules, alfacalcidol 250 nanograms (white), net price 30-cap pack = £3.37; 500 nanograms (red), 30-cap pack = £6.27; 1 microgram (brown), 30-cap pack = £8.75

Excipients: include sesame oil
Oral drops, sugar-free, alfacalcidol 2 micrograms/mL (1 drop contains approx. 100 nanograms), net price 10 mL = £22.49

Excipients include alcohol

Note The concentration of alfacalcidol in One-Alpha drops is 10 times greater than that of the former presentation One-Alpha solution.

Injection, alfacalcidol 2 micrograms/mL, net price 0.5-mL amp = £2.16, 1-mL amp = £4.11

Note Contains propylene glycol and should be used with caution in small preterm neonates

CALCITRIOL
(1,25-Dihydroxycholecalciferol)

Indications see notes above

Cautions see under Ergocalciferol

Contra-indications see under Ergocalciferol

Side-effects see under Ergocalciferol

Dose

\- By mouth, renal osteodystrophy, initially 250 nanograms daily, or on alternate days (in patients with normal or only slightly reduced plasma-calcium concentration), increased if necessary in steps of 250 nanograms at intervals of 2–4 weeks; usual dose 0.5–1 microgram daily; CHILD not established

Established postmenopausal osteoporosis, 250 nanograms twice daily (monitor plasma-calcium concentration and creatinine, consult product literature)

\- By intravenous injection (or injection through catheter after haemodialysis), hypocalcaemia in dialysis patients with chronic renal failure, initially 500 nanograms (approx. 10 nanograms/kg) 3 times a week, increased if necessary in steps of 250–500 nanograms at intervals of 2–4 weeks; usual dose 0.5–3 micrograms 3 times a week; CHILD see BNF for Children

Moderate to severe secondary hyperparathyroidism in dialysis patients, initially 0.5–4 micrograms 3 times a week, increased if necessary in steps of 250–500 nanograms at intervals of 2–4 weeks; max. 8 micrograms 3 times a week

Calcitriol (Non-proprietary)

Capsules, calcitriol 250 nanograms, net price 30-cap pack = £5.87, 100-cap pack = £19.15; 500 nanograms, 30-cap pack = £10.50, 100-cap pack = £34.24

Rocaltril™ (Roche)

Capsules, calcitriol 250 nanograms (red/white), net price 20 = £3.83; 500 nanograms (red), 20 = £6.85

Calcijex® (Abbott)

Injection, calcitriol 1 microgram/mL, net price 1-mL amp = £5.14; 2 micrograms/mL, 1-mL amp = £10.28

With calcium

For cautions, contra-indications, and side-effects of calcium, see section 9.5.1.1

Adcal-D™ (ProStrak)

Tablets (chewable) (lemon or tutti-frutti flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £4.06, 112-tab pack = £7.99. Label: 24

Dissolve (effervescent tablets), lemon flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £4.99. Label: 13

Cacit® D3 (Procter & Gamble Pharm.)

Granules, effervescent, lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet, net price 30-sachet pack = £43.11. Label: 13

Calceos® (Galeni)

Tablets (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.84. Label: 24

Calchew-D® (Shire)

Tablets (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca 12.5 mmol), colecalciferol 5 micrograms (200 units), net price 100-tab pack = £15.02. Label: 24

Excipients include aspartame (section 9.4.1)

Calchew-D® Forte (Shire)

Tablets (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £4.50, 100-tab pack = £7.50. Label: 24

Excipients include aspartame (section 9.4.1)

Calvotr D3® (Menarini)

Powder, lemon flavour, calcium phosphate 3.1 g (calcium 1.2 g or Ca 30 mmol), colecalciferol 20 micrograms (800 units), net price 30-sachet pack = £4.32. Label: 13, 21

Natalc D3® (Trinity-Chiesi)

Tablets, (aniseed, peppermint, and molasses flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.85. Label: 24

Excipients include aspartame (section 9.4.1)

With alendronic acid

Section 6.6.2

With risedronate sodium and calcium

Section 6.6.2

DIHYDROTACHYSTEROL

Indications see notes above

Cautions see under Ergocalciferol

Contra-indications see under Ergocalciferol

Side-effects see under Ergocalciferol

AT 10® (Intrapharm)

Oral solution, dihydrotachysterol 250 micrograms/mL. Net price 15-mL dropper bottle = £22.87

Excipients include arachis (peanut) oil

Dose acute, chronic, and latent forms of hypocalcaemic tetany due to hypoparathyroidism, consult product literature
**Vitamin E**

**Indications**  see under preparations below

**Cautions**  monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised; monitor parathyroid hormone concentration; pregnancy (Appendix 4); breastfeeding (Appendix 5); interactions: Appendix 1 (vitamins)

**Contra-indications**  see under Ergocalciferol

**Side-effects**  see under Ergocalciferol; also dyspepsia, taste disturbance, breast tenderness, acne, pruritus, and rash

**Dose**
- Consult product literature

**Zemplar®** (Abbott) ▼ 

- **Capsules**
  - paricalcitol 1 microgram (grey), net price 28-cap pack = £69.44; 2 micrograms (orange-brown), 28-cap pack = £138.88; 4 micrograms (gold), 28-cap pack = £277.76
  - For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure

- **Injection**
  - paricalcitol 5 micrograms/mL, net price 5 × 1-mL amp = £62.00, 5 × 2-mL amp = £124.00.
  - For injection via haemodialysis access

**Excipients** include propylene glycol, see Excipients, p. 2

- For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure in patients on haemodialysis

**Vitamin K**

**Indications**  see notes above

**Cautions**  G6PD deficiency (section 9.1.5) and vitamin E deficiency (risk of haemolysis); interactions: Appendix 1 (vitamins)

**Contra-indications**  neonates and infants, late pregnancy

**Dose**
- 10–40 mg daily, adjusted as necessary; **CHILD** 1–12 years, 5–10 mg daily, adjusted as necessary, 12–18 years, 10–20 mg daily, adjusted as necessary

**Menadiol Phosphate** (Cambridge)

- **Tablets**, menadiol sodium phosphate equivalent to 10 mg of menadiol phosphate. Net price 100-tab pack = £48.25

**Phytonadione** (Vitamin K)

**Indications**  see notes above

**Cautions**  intravenous injections should be given very slowly (see also below); pregnancy (Appendix 4); interactions: Appendix 1 (vitamins)

**ALPHA TOCOPHERYL ACETATE**

**Indications**  see notes above

**Cautions**  predisposition to thrombosis; increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg; interactions: Appendix 1 (vitamins)

**Side-effects**  diarrhoea and abdominal pain with doses more than 1 g daily

**Vitamin E Suspension** (Cambridge)

- **Suspension**, alpha tocopheryl acetate 500 mg/5 mL
  - Net price 100 mL = £25.08

- **Dose**
  - Malabsorption in cystic fibrosis, 100–200 mg daily; **CHILD** 1 month–1 year 50 mg daily; 1–12 years, 100 mg daily
  - Malabsorption in abetalipoproteinaemia, **ADULT** and **CHILD** 50–100 mg/kg daily
  - Malabsorption in chronic cholestasis and severe liver disease, **CHILD** see **BNF for Children**

**Note**

- Tablets containing tocopheryl acetate are available from ‘special-order’ manufacturers or specialist importing companies, see p. 939
9.6.7 Multivitamin preparations

Vitamins
Capsules, ascorbic acid 15 mg, nicotinamide 7.5 mg, riboflavin 500 micrograms, thiamine hydrochloride 1 mg, vitamin A 2500 units, vitamin D 300 units, net price 20 = 22p

Abidex (Chefaro UK)
Drops, vitamins A, B group, C, and D, net price 25 mL (with dropper) = £2.08
Excipients include arachis (peanut) oil
Note Contains 1333 units of vitamin A (as palmitate) per 0.6-mL dose

Dalivit (LPC)
Oral drops, vitamins A, B group, C, and D, net price 25 mL = £2.98, 50 mL = £4.85
Note Contains 5000 units of vitamin A (as palmitate) per 0.6-mL dose

Junior capsules, brown, vitamins (ascorbic acid 25 mg, biotin 50 micrograms, cyanocobalamin 2 micrograms, folic acid 100 micrograms, nicotinamide 7.5 mg, pantothenic acid 2 mg, pyridoxine 1 mg, riboflavin 1 mg, thiamine 1.5 mg, vitamin A 1250 units, vitamin D 200 units, vitamin E 5 mg, vitamin K 25 micrograms), minerals and trace elements (chromium 50 micrograms, copper 1 mg, iodine 75 micrograms, iron 5 mg, magnesium 1 mg, manganese 1.25 mg, molybdenum 50 micrograms, selenium 25 micrograms, zinc 5 mg), net price 30-cap pack = £3.52, 60-cap pack = £6.69
Dose vitamin and mineral deficiency and as adjunct in synthetic diets, CHILD over 5 years, 2 junior capsules daily

Ketovite (Paines & Byrne)
Tablets, yellow, ascorbic acid 16.6 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, pyridoxine hydrochloride 330 micrograms, nicotinamide 3.3 mg, calcium pantothenate 1.16 mg, alpha tocopheryl acetate 5 mg, inositol 50 mg, biotin 170 micrograms, folic acid 230 micrograms, acetonethaphone 50 micrograms, net price 100-tab pack = £4.17
Dose prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 1 tablet 3 times daily; use with Ketovite Liquid for complete vitamin supplementation

Liquid, pink, sugar-free, vitamin A 2500 units, ergocalciferol 400 units, choline chloride 150 mg, cyanocobalamin 12.5 micrograms/5 mL, net price 150-mL pack = £2.70
Dose prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 5 mL daily; use with Ketovite Tablets for complete vitamin supplementation

9.7 Bitters and tonics

Mixtures containing simple and aromatic bitters, such as alkaline gentian mixture, are traditional remedies for loss of appetite. All depend on suggestion.

Gentian Mixture, Alkaline, BP
(Alkaline Gentian Oral Solution)
Mixture, concentrated compound gentian infusion 10%, sodium bicarbonate 5% in a suitable vehicle. Extemporaneous preparations should be recently prepared according to the following formula: concentrated compound gentian infusion 1 mL, sodium bicarbonate 500 mg, double-strength chloroform water 5 mL, water to 10 mL
Dose 10 mL 3 times daily in water before meals

Effico (Forest)
Tonic, orange-red, thiamine hydrochloride 180 micrograms, nicotinamide 2.1 mg, caffeine 20.2 mg, compound gentian infusion 0.31 mL/5 mL, net price 300-mL pack = £2.53, 500-mL pack = £3.20

Metatone (Chefaro UK)
Tonic, thiamine hydrochloride 500 micrograms, calcium glycerophosphate 1250 units, vitamin A 1250 units, vitamin D 200 units, vitamin E 5 mg, vitamin K 25 micrograms, minerals and trace elements (calcium glycerophosphate 45.6 mg, manganese glyceralenate 25 micrograms, zinc 5 mg), net price 300 mL = £2.79
9.8 Metabolic disorders

9.8.1 Drugs used in metabolic disorders

This section covers drugs used in metabolic disorders and not readily classified elsewhere.

9.8.2 Acute porphyrias

Wilson’s disease

Penicillamine (see also section 10.1.3) is used in Wilson’s disease (hepatolenticular degeneration) to aid the elimination of copper ions. See below for other indications.

Trientine is used for the treatment of Wilson’s disease only in patients intolerant of penicillamine; it is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

Zinc prevents the absorption of copper in Wilson’s disease. Symptomatic patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

PENICILLAMINE

Indications see under Dose below

Cautions see section 10.1.3

Contra-indications see section 10.1.3

Side-effects see section 10.1.3

Dose

• Wilson’s disease, 1.5–2 g daily in divided doses before food; max. 2 g daily for 1 year; maintenance 0.75–1 g daily; ELDERLY 20 mg/kg daily in divided doses, adjusted according to response; CHILD up to 20 mg/kg daily in divided doses, minimum 500 mg daily

• Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids), initially 500 mg daily in divided doses increased slowly over 3 months; usual maintenance dose 1.25 g daily; ELDERLY not recommended

• Cystinuria, therapeutic, 1–3 g daily in divided doses before food, adjusted to maintain urinary cystine below 200 mg/litre; prophylactic (maintain urinary cystine below 300 mg/litre) 0.5–1 g at bedtime; maintain adequate fluid intake (at least 3 litres daily); CHILD and ELDERLY minimum dose to maintain urinary cystine below 200 mg/litre

• Severe active rheumatoid arthritis, section 10.1.3

Preparations

Section 10.1.3

TRIENTINE DIHYDROCHLORIDE

Indications Wilson’s disease in patients intolerant of penicillamine

Cautions see notes above; pregnancy (Appendix 4); interactions: Appendix 1 (trientine)

Side-effects nausea, rash; rarely anaemia

Dose

• 1.2–2.4 g daily in 2–4 divided doses before food; CHILD initially 0.6–1.5 g daily in 2–4 divided doses before food, adjusted according to response

Trientine Dihydrochloride (Univar) Capsules, trientine dihydrochloride 300 mg. Label: 6, 22

ZINC ACETATE

Indications Wilson’s disease (initiated under specialist supervision)

Cautions portal hypertension (risk of hepatic decompensation when switching from chelating agent); monitor full blood count and serum cholesterol; pregnancy (Appendix 4); interactions: Appendix 1 (zinc)

Contra-indications breast-feeding

Side-effects gastric irritation (usually transient; may be reduced if first dose taken mid-morning or with a little protein); less commonly sideroblastic anaemia and leucopenia

Dose

Note Dose expressed as elemental zinc

• Wilson’s disease, 50 mg 3 times daily (max. 50 mg 5 times daily), adjusted according to response; CHILD 1–6 years, 25 mg twice daily; 6–16 years, body-weight under 57 kg, 25 mg 3 times daily, body-weight over 57 kg, 50 mg 3 times daily; ADOLESCENT 16–18 years, 50 mg 3 times daily

Wilzin® (Orphan Europe) Capsules, zinc (as acetate) 25 mg (blue), net price 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23

Carnitine deficiency

Carnitine is available for the management of primary carnitine deficiency due to inborn errors of metabolism or of secondary deficiency in haemodialysis patients.

CARNITINE

Indications primary and secondary carnitine deficiency

Cautions diabetes mellitus; renal impairment; monitoring of free and acyl carnitine in blood and urine recommended; pregnancy (Appendix 4) and breast-feeding

Side-effects nausea, vomiting, abdominal pain, diarrhoea, body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase
**Nutrition and blood**

**Dose**
- Primary deficiency, by mouth, up to 200 mg/kg daily in 2–4 divided doses; higher doses of up to 400 mg/kg daily occasionally required; by intravenous injection over 2–3 minutes, up to 100 mg/kg daily in 3–4 divided doses
- Secondary deficiency, by intravenous injection over 2–3 minutes, 20 mg/kg after each dialysis session (dosage adjusted according to carnitine concentration); maintenance, by mouth, 1 g daily

**Carnitor®** (Sigma-Tau) (Sigma-Tau)

- Oral liquid, L-carnitine 100 mg/mL (10%), net price $10 x 10-mL (1-g) single-dose bottle = £35.00
- Paediatric solution, L-carnitine 300 mg/mL (30%), net price 20 mL = £21.00
- Excipients include sorbitol
- Injection, L-carnitine 200 mg/mL. Net price 5-mL amp = £11.90

**Fabry’s disease**

Agalsidase alfa and agalsidase beta, enzymes produced by recombinant DNA technology, are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

**AGALSIDASE ALFA AND BETA**

**Indications** Fabry’s disease (specialist use only)

**Cautions** pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (agalsidase alfa and beta)

**Side-effects** gastrointestinal disturbances, taste disturbances; tachycardia, bradycardia, palpitation, hypertension, hypotension, chest pain, oedema, flushing; dyspnoea, cough, wheezing, hoarseness, rhinorrhea; headache, fatigue, dizziness, asthenia, paraesthesia, syncope, neuropathic pain, tremor, sleep disturbances; influenza-like symptoms, nasopharyngitis; pain in extremities; eye irritation; tinnitus, vertigo; hypersensitivity reactions, pruritus, urticaria, rash, acne; less commonly bronchospasm, angioedema, cold extremities, parosmia, ear pain and swelling, skin discoloration, and injection-site reactions

**Fabrazyme®** (Genzyme)

- Intravenous infusion, powder for reconstitution, agalsidase beta, net price 5-mg vial = £325.50; 35-mg vial = £2269.20
- Dose: By intravenous infusion, ADULT and CHILD over 8 years 1 mg/kg every 2 weeks

**Replagal®** (Shire)

- Concentrate for intravenous infusion, agalsidase alfa 1 mg/mL, net price 1-mL vial = £356.85; 3.5-mL vial = £1161.57
- Dose: By intravenous infusion, ADULT and CHILD over 7 years 200 micrograms/kg every 2 weeks

**Gaucher’s disease**

Imiglucerase, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher’s disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

**Miglustat**, an inhibitor of glucosylceramide synthase, is licensed for the treatment of mild to moderate type I Gaucher’s disease in patients for whom imiglucerase is unsuitable; it is given by mouth.

**IMIGLUCERASE**

**Indications** (specialist use only) non-neurological manifestations of type I or type III Gaucher’s disease

**Cautions** pregnancy (Appendix 4); breast-feeding (Appendix 5); monitor for imiglucerase antibodies; when stabilised, monitor all parameters and response to treatment at intervals of 6–12 months

**Side-effects** hypersensitivity reactions (including urticaria, angioedema, hypotension, flushing, tachycardia); less commonly nausea, vomiting, diarrhea, abdominal cramps, headache, dizziness, paraesthesia, fatigue, fever, arthralgia, injection-site reactions

**Dose**
- By intravenous infusion, initially 60 units/kg once every 2 weeks (2.5 units/kg 3 times a week or 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly, but not bone parameters); maintenance, adjust dose according to response

**Cerezyme®** (Genzyme)

- Intravenous infusion, powder for reconstitution, imiglucerase, net price 200-unit vial = £553.35; 400-unit vial = £1106.70
- Electrolytes Na 0.62 mmol/200-unit vial, 1.24 mmol/400-unit vial

**MIGLUSTAT**

**Indications** mild to moderate type I Gaucher’s disease (specialist supervision only)

**Cautions** hepatic impairment (Appendix 2); renal impairment (Appendix 3); monitor cognitive and neurological function

**Contra-indications** pregnancy (Appendix 4); men should not father a child during or within 3 months of treatment; breast-feeding (Appendix 5)

**Side-effects** diarrhoea, flatulence, abdominal pain, dyspepsia, constipation, nausea, vomiting, anorexia, weight changes; tremor, dizziness, headache, peripheral neuropathy, impaired coordination, hypoaesthesia, paraesthesia, insomnia, fatigue, asthenia; decreased libido; thrombocytopenia; muscle spasm

**Dose**
- ADULT over 18 years, 100 mg 3 times daily; reduced if not tolerated to 100 mg 1–2 times daily

**Zavesca®** (Actelion)

- Capsules, miglustat 100 mg, net price 84-cap pack = £4015.00 (hospital only)
Mucopolysaccharidosis

Laronidase, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

Idursulfase, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

Galsulfase, a recombinant form of human N-acetylgalactosamine-4-sulfatase, is licensed for long-term replacement therapy in mucopolysaccharidosis VI (Maroteaux-Lamy syndrome).

Infusion-related reactions often occur with administration of laronidase, idursulfase, and galsulfase; they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

**GALSULFASE**

**Indications** (specialist use only) mucopolysaccharidosis VI

**Cautions** respiratory disease; acute febrile or respiratory illness (consider delaying treatment); pregnancy (Appendix 4)

**Infusion-related reactions** See notes above

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** abdominal pain, umbilical hernia, gastroenteritis; chest pain, hypertension; dyspnoea, apnoea, nasal congestion; rashes, malaise, areflexia; pharyngitis; conjunctivitis, corneal opacity; ear pain; facial oedema

**Dose**

- By intravenous infusion, ADULT and CHILD over 5 years, 1 mg/kg once weekly

**Naglazyme** (BioMarin)

Concentrate for intravenous infusion, galsulfase 1 mg/mL, net price 5-mL vial = £982.00

**LARONIDASE**

**Indications** (specialist use only) non-neurological manifestations of mucopolysaccharidosis I

**Cautions** monitor immunoglobulin G (IgG) antibody concentration; pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (laronidase)

**Infusion-related reactions** See notes above

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; cold extremities, pallor, flushing, tachycardia, blood pressure changes; dyspnoea, cough, angioedema, anaphylaxis; headache, paraesthesia, dizziness, fatigue, restlessness; influenza-like symptoms; musclekeletal pain, pain in extremities; rash, pruritus, urticaria, alopecia, infusion-site reactions; bronchospasm and respiratory arrest also reported

**Dose**

- By intravenous infusion, ADULT and CHILD over 5 years, 100 units/kg once weekly;

**Aldurazyme** (Genzyme)

Concentrate for intravenous infusion, laronidase 100 units/mL, net price 5-mL vial = £460.35

Electrolytes Na 1.29 mmol/5-mL vial

Nephropathic cystinosis

Mercaptamine (cysteamine) is available for the treatment of nephropathic cystinosis.

**MERCAPTAMINE** (Cysteamine)

**Indications** (specialist use only) nephropathic cystinosis

**Cautions** leucocyte-cystine concentration and haematological monitoring required—consult product literature; dose of phosphate supplement may need to be adjusted

**Contra-indications** pregnancy and breast-feeding; hypersensitivity to mercaptamine or penicillamine

**Side-effects** breath and body odour, nausea, vomiting, diarrhoea, anorexia, lethargy, fever, rash; also reported dehydration, hypertension, abdominal discomfort, gastroenteritis, drowsiness, encephalopathy, headache, nervousness, depression; anaemia, leuco-
penia; rarely gastro-intestinal ulceration and bleeding, seizures, hallucinations, urticaria, interstitial nephritis

**Dose**
- Initial doses should be one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks
- Maintenance, **ADULT** and **CHILD** over 50 kg body-weight, 2 g daily in 4 divided doses
  - **CHILD** up to 12 years, 1.3 g/m (approx. 50 mg/kg) daily in 4 divided doses

**Cystagon** (Orphan Europe) [\[\]]

- **Capsules**, mercaptamine (as bitartrate) 50 mg, net price 100-cap pack = £59.00; 150 mg, 100-cap pack = £162.00
- **Note** **CHILD** under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice)

**Pompe disease**

Alglucosidase alfa, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

The Scottish Medicines Consortium (p. 3) has advised (February 2007) that alglucosidase alfa (*Myozyme*) is not recommended for use within NHS Scotland for the treatment of Pompe disease.

**ALGLUCOSIDASE ALFA**

- **Indications** (specialist use only) Pompe disease
- **Cautions** cardiac and respiratory dysfunction—monitor closely; monitor immunoglobulin G (IgG) antibody concentration; pregnancy (Appendix 4)
- **Infusion-related reactions** Infusion-related reactions very common, calling for use of antihistamine, antipyretic or corticosteroid; consult product literature for details
- **Contra-indications** breast-feeding (Appendix 5)
- **Side-effects** nausea, vomiting; flushing, tachycardia, blood pressure changes, cold extremities, cyanosis, facial oedema; cough, tachypnoea, bronchospasm; headache, agitation, tremor, irritability, restlessness, paraesthesia, dizziness; pyrexia, rigors; antibody formation; sweating, rash, pruritus, and urticaria; anaphylaxis

**Dose**
- **By intravenous infusion**, 20 mg/kg every 2 weeks

*Myozyme* (Genzyme) [\[\]]

- **Intravenous infusion**, powder for reconstitution, alglucosidase alfa, net price 50-mg vial = £368.59

**Urea cycle disorders**

Sodium phenylbutyrate is used in the management of urea cycle disorders. It is indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy.

Carglumic acid is licensed for the treatment of hyperammonaemia due to N-acetylglutamate synthase deficiency.

**CARGLUMIC ACID**

- **Indications** hyperammonaemia due to *N*-acetylglutamate synthase deficiency (initiated under specialist supervision)
- **Cautions** pregnancy (Appendix 4)
- **Contra-indications** breast-feeding (Appendix 5)
- **Side-effects** sweating

**Dose**
- **ADULT** and **CHILD** initially 100 mg/kg daily in 2–4 divided doses immediately before food (max. 250 mg/kg daily), adjusted according to plasma–ammonia concentration; maintenance 10–100 mg/kg daily in 2–4 divided doses

*Carbaglu* (Orphan Europe) [\[\]]

- **Dispersible tablets**, carglumic acid 200 mg, net price 5-tab pack = £243.00, 60-tab pack = £2914.00
- **Label**: 13

**Tyrosinaemia type I**

Nitisinone is licensed for the treatment of hereditary tyrosinaemia type I in combination with dietary restriction of tyrosine and phenylalanine.
**SODIUM PHENYLButyRATE**

**Indications** adjunct in long-term treatment of urea cycle disorders (under specialist supervision)

**Cautions** congestive heart failure, hepatic and renal impairment; **interactions**: Appendix 1 (sodium phenylbutyrate)

**Contra-indications** pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** amenorrhoea and irregular menstrual cycles, decreased appetite, body odour, taste disturbances; less commonly nausea, vomiting, abdominal pain, peptic ulcer, pancreatitis, rectal bleeding, arrhythmia, oedema, syncope, depression, headache, rash, weight gain, renal tubular acidosis, aplastic anaemia, ecchymoses

**Dose**
- **ADULT** and **CHILD** over 20 kg, 9.9–13 g/m² daily in divided doses with meals (max. 20 g daily); **CHILD** less than 20 kg, 450–600 mg/kg daily in divided doses with meals

**Ammonaps®** (Swedish Orphan) pH

**Tablets**, sodium phenylbutyrate 500 mg. Contains Na⁺ 2.7 mmol/tablet. Net price 250-tab pack = £493.00

**Granules**, sodium phenylbutyrate 940 mg/g. Contains Na⁺ 5.4 mmol/g. Net price 266-g pack = £860.00

Note Granules should be mixed with food before taking

**Homocystinuria**

**Betaine** is licensed for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism. Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B, pyridoxine, and folate under specialist advice.

The **Scottish Medicines Consortium** (p. 3) has advised (September 2007) that betaine anhydrous oral powder (**Cystadane®**) is not recommended for use within NHS Scotland as adjunctive treatment of homocystinuria.

**BETAINe**

**Indications** (specialist use only) adjunctive treatment of homocystinuria

**Cautions** monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** less commonly gastro-intestinal disorders, anorexia, reversible cerebral oedema (see Cautions), agitation, depression, personality disorder, sleep disturbances, urinary incontinence, alopecia, and urticaria

**Dose**
- **ADULT** and **CHILD** over 10 years, 3 g twice daily, adjusted according to response; max. 20 g/day; **CHILD** under 10 years 50 mg/kg twice daily, dose and frequency adjusted according to response; max. 75 mg/kg twice daily

**Cystadane®** (Orphan Europe) pH

**Powder**, betaine (anhydrous), net price 180 g = £314.00

Note Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of powder

**9.8.2 Acute porphyrias**

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyrin crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute porphyrin attack occurs during pregnancy, contact an expert porphyria service for further advice.

**Haem arginate** is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyrin crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Supplies of haem arginate may be obtained outside office hours from the on-call pharmacist at: St Thomas’ Hospital, London (020) 7188 7188

**HAEM ARGINATE**

(Human hemin)

**Indications** acute porphyrias (acute intermittent porphyria, porphyria variegata, hereditary coproporphyria)

**Cautions** pregnancy (Appendix 4); breast feeding (Appendix 5)

**Side-effects** rarely hypersensitivity reactions and fever; pain and thrombophlebitis at injection site

**Dose**
- **ADULT** and **CHILD** 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

**Normosang®** (Orphan Europe) pH

Concentrate for intravenous infusion, haem arginate 25 mg/mL, net price 10-mL amp = £338.50

---

**BNF 57**

9 Nutrition and blood
Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyria is available at www.wmmic.wales.nhs.uk/porphyria_info.php

Further information may be obtained from: www.porphyria-europe.org

and also from:
Welsh Medicines Information Centre
University Hospital of Wales
Cardiff, CF14 4XW
Tel: (029) 2074 2979/3877

Note Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

<table>
<thead>
<tr>
<th>Amphetamines</th>
<th>Anabolic steroids</th>
<th>Antidepressants</th>
<th>Antihistamines</th>
<th>Barbiturates</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calcium channel blockers</td>
<td>Contraceptives, hormonal</td>
<td>Ergot derivatives</td>
<td>Gold salts</td>
<td>Hormone Replacement Therapy</td>
</tr>
</tbody>
</table>

Unsafe Drugs (check groups above first)

1. Includes tricyclic (and related) antidepressants and MAOIs; fluoxetine and mianserin thought to be safe.
2. Alimemazine (trimeprazine), chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe.
3. Includes primidone and thiopental.
4. Diltiazem may be used with caution if safer alternative not available.
5. Progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting contraceptives, hormonal and also from:
6. Includes co-trimoxazole and sulfasalazine.
7. Rosuvastatin is thought to be safe.
8. Contact Welsh Medicines Information Centre for further advice.
9. Although evidence of hazard is uncertain, manufacturer advises avoid.
10. Small amounts in medicines probably safe.
11. Ergometrine (oxytocin probably safe) and pergolide.
12. Progestogen preparations should never be used in those at risk of acute porphyria.
13. Status epilepticus has been treated successfully with intravenous diazepam.
14. When used for local anaesthesia, bupivacaine, lidocaine (lignocaine), procaine, prilocaine, and tetracaine are thought to be safe.
15. Buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, and pethidine are thought to be safe.
16. Rifamycins have been used in a few patients without evidence of harm—use with caution if safer alternative not available.
17. Includes aminophylline.
Rheumatoid arthritis and other inflammatory disorders

A non-steroidal anti-inflammatory drug (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease. Drugs are also used to influence the disease process itself (section 10.1.3). For rheumatoid arthritis these disease-modifying antirheumatic drugs (DMARDs) include penicillamine, gold salts, antimalarials (chloroquine and hydroxychloroquine), drugs that affect the immune response, and sulfasalazine; corticosteroids may also be of value (section 10.1.2.1). Drugs which may affect the disease process in psoriatic arthritis include sulfasalazine, gold salts, azathioprine, methotrexate (section 10.1.3), and etanercept. For long-term control of gout uricosuric drugs and allopurinol (section 10.1.4) can be used.

Osteoarthritis and soft-tissue disorders

In osteoarthritis (sometimes called degenerative joint disease or osteoarthrosis) non-drug measures, such as weight reduction and exercise, should be encouraged. For pain relief in osteoarthritis and soft-tissue disorders, paracetamol (section 4.7.1) should be used first and may need to be taken regularly. A topical NSAID (section 10.3.2) should also be considered, particularly in knee or hand osteoarthritis. If further pain relief is required, then an oral NSAID (section 10.1.1), selective inhibitor of cyclo-oxygenase-2, or opioid (section 4.7.2) should be considered; a proton pump inhibitor (section 1.3.5) should be taken with a NSAID or selective inhibitor of cyclo-oxygenase-2. An opioid should be considered before a NSAID or selective inhibitor of cyclo-oxygenase-2 in patients taking low-dose aspirin.
Topical capsaicin 0.025% (section 10.3.2) should be considered as an adjunct in hand or knee osteoarthritis.

Intra-articular corticosteroid injections (section 10.1.2.2) may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Glucosamine (section 10.1.5) is licensed for symptomatic relief of mild to moderate osteoarthritis of the knee.

10.1.1 Non-steroidal anti-inflammatory drugs

In single doses non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol (section 4.7.1), but paracetamol is preferred, particularly in the elderly (see also Prescribing for the Elderly, p. 20).

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the inflammatory arthritides (e.g. rheumatoid arthritis) and in some cases of advanced osteoarthritis. NSAIDs can also be of benefit in the less well defined conditions of back pain and soft-tissue disorders.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individuals’ tolerance to these drugs and their response to them. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 reduces gastro-intestinal intolerance. Several other factors also influence susceptibility to gastro-intestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. Doses of 1.6 to 2.4 g daily are needed for rheumatoid arthritis and it is unsuitable for conditions where inflammation is prominent, such as acute gout. Dextibuprofen is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

- Naproxen is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen, see CSM comment below).
- Fenbufen is claimed to be associated with less gastrointestinal bleeding, but there is a high risk of rash (see p. 557).
- Feno profen is as effective as naproxen, and flurbiprofen may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.
- Ketoprofen has anti-inflammatory properties similar to ibuprofen and has more side-effects (see also CSM advice below). Dextketoprofen, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.
- Tiaprofenic acid is as effective as naproxen; it has more side-effects than ibuprofen (important: reports of severe cystitis, see CSM advice on p. 561).

Drugs with properties similar to those of propionic acid derivatives:

- Azapropazone is similar in effect to naproxen; it has a tendency to cause rashes and is associated with an increased risk of severe gastro-intestinal toxicity (important: see CSM restrictions on p. 554).
- Diclofenac and aceclofenac have actions and side-effects similar to those of naproxen.
- Etodolac is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.
- Indometacin (indomethacin) has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastrointestinal disturbances (see also CSM advice below).
- Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.
- Meloxicam is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.
- Nabumetone is comparable in effect to naproxen.
- Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions (important: see CHMP advice, p. 560).
Sulindac is similar in tolerance to naproxen.

Tenoxicam is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Toltenamic acid is licensed for the treatment of migraine (section 4.7.4.1).

Ketorolac and the selective inhibitor of cyclo-oxygenase-2, parecoxib, are licensed for the short-term management of postoperative pain (section 15.1.4.2).

The selective inhibitors of cyclo-oxygenase-2, etoricoxib and celecoxib, are as effective as non-selective NSAIDs such as diclofenac and naproxen. Short-term data indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin. There are concerns about the cardiovascular safety of cyclo-oxygenase-2 selective inhibitors (see below).

Celecoxib and etoricoxib are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Dental and orofacial pain Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include ibuprofen and diclofenac.

In an appraisal of the relative safety of 7 non-selective NSAIDs, the CSM assessed ibuprofen to have the lowest risk of serious gastro-intestinal side-effects (see p. 554).

For further information on the management of dental and orofacial pain, see p. 229.

Cautions and contra-indications NSAIDs should be used with caution in the elderly (risk of serious side-effects and fatalities, see also Prescribing for the Elderly p. 20), in allergic disorders (they are contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID), during pregnancy and breast-feeding (see Appendix 4 and Appendix 5), and in coagulation defects. Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

In patients with renal, cardiac, or hepatic impairment caution is required since NSAIDs may impair renal function (see also Under-side-effects, below and Appendix 2 and Appendix 3); the dose should be kept as low as possible and renal function should be monitored.

All NSAIDs are contra-indicated in severe heart failure. The selective inhibitors of cyclo-oxygenase-2 (celecoxib, etoricoxib, and parecoxib) are contra-indicated in ischaemic heart disease, cerebrovascular disease, peripheral arterial disease, and moderate or severe heart failure. The selective inhibitors of cyclo-oxygenase-2 should be used with caution in patients with a history of cardiac failure, left ventricular dysfunction, hyper-tension, in patients with oedema for any other reason, and in patients with risk factors for heart disease.

NSAIDs and cardiovascular events Cyclo-oxygenase-2 selective inhibitors are associated with an increased risk of thrombotic events (e.g. myocardial infarction and stroke) and should not be used in preference to non-selective NSAIDs except when specifically indicated (i.e. for patients at a particularly high risk of developing gastroduodenal ulceration or bleeding) and after assessing their cardiovascular risk.

Non-selective NSAIDs may also be associated with a small increased risk of thrombotic events particularly when used at high doses and for long-term treatment. Diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of licensed doses of etoricoxib. Naproxen (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction. A small increased thrombotic risk cannot be excluded for other NSAIDs.

The CHM has advised (October 2006) that the lowest effective dose of NSAID or cyclo-oxygenase-2 selective inhibitor should be prescribed for the shortest period to control symptoms and that the need for long-term treatment should be reviewed periodically.

The CSM has advised that non-selective NSAIDs are contra-indicated in patients with previous or active peptic ulceration and that selective inhibitors of cyclo-oxygenase-2 are contra-indicated in active peptic ulceration (see also CSM advice below). While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness. For advice on the prophylaxis and treatment of NSAID-associated peptic ulcers, see section 1.3.

For interactions of NSAIDs, see Appendix 1 (NSAIDs).

Side-effects Gastro-intestinal discomfort, nausea, diarrhoea, and occasionally bleeding and ulceration occur (see also CSM advice below). Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia. Those at risk of duodenal or gastric ulceration (including the elderly) who need to continue NSAID treatment should receive either a selective inhibitor of cyclo-oxygenase-2 alone, or a non-selective NSAID with gastroprotective treatment (section 1.3).

Other side-effects include hypersensitivity reactions (particularly rashes, angioedema, and bronchospasm—see CSM advice below), headache, dizziness, nervousness, depression, drowsiness, insomnia, vertigo, hearing disturbances such as tinnitus, photosensitivitv, and haematuria. Blood disorders have also occurred. Fluid retention may occur (rarely precipitating congestive heart failure); blood pressure may be raised.
Renal failure may be provoked by NSAIDs, especially in patients with renal impairment (important, see also under Cautions above). Rarely, papillary necrosis or interstitial fibrosis associated with NSAIDs can lead to renal failure.

Hepatic damage, alveolitis, pulmonary eosinophilia, pancreatitis, eye changes, Stevens-Johnson syndrome and toxic epidermal necrolysis are other rare side-effects. Induction of or exacerbation of colitis has been reported. Aseptic meningitis has been reported rarely with NSAIDs; patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible.

Overdosage: see Emergency Treatment of Poisoning, p. 29.

**CSM advice (gastro-intestinal side-effects)**

All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of 7 non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects. Azapropazone is associated with the highest risk (important: see also CSM restrictions, below) and ibuprofen with the lowest; piroxicam, ketoprofen, indometacin, naproxen and diclofenac are associated with intermediate risks (possibly higher in the case of piroxicam, see also CHMP advice, p. 560). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are generally preferred, to start at the lowest recommended dose, not to use more than one oral NSAID at a time, and to remember that all NSAIDs (including selective inhibitors of cyclo-oxygenase-2) are contra-indicated in patients with active peptic ulceration. The CSM also contra-indicates non-selective NSAIDs in patients with a history of peptic ulceration.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

**CSM warning (asthma)**

Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

**ACECLOFENAC**

**Indications** pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2); breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- 100 mg twice daily; CHILD not recommended

**Preservex®** (UCB Pharma) [TH]

Tablets, f/c, aceclofenac 100 mg, net price 60-tab pack = £9.45. Label: 21

**ACEMETACIN**

(Glycolic acid ester of indometacin)

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; postoperative analgesia

**Cautions** see under Indometacin and notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above

**Side-effects** see under Indometacin and notes above

**Dose**

- 120 mg daily in divided doses with food, increased if necessary to 180 mg daily; CHILD not recommended

**Emflex®** (Merck) [TH]

Capsules, yellow/orange, acemetacin 60 mg, net price 90-cap pack = £28.20. Label: 21, counselling, driving

**AZAPROPAZONE**

**Indications** see under CSM restrictions

**CSM restrictions** CSM has restricted azapropazone to use in rheumatoid arthritis, ankylosing spondylitis, and acute gout only when other NSAIDs have been tried and failed, has contra-indicated it in patients with a history of peptic ulceration, and has reduced the maximum daily dose to 600 mg for rheumatoid arthritis and ankylosing spondylitis in patients over 60 years, and those with impaired renal function

**Cautions** see notes above; interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above; also acute porphyria (section 9.8.2); history of inflammatory bowel disease or blood disorder

**Side-effects** see notes above; also photosensitivity; see CSM advice below

**Photosensitivity** CSM has reminded of the need to advise patients taking azapropazone to avoid direct exposure to sunlight (or to use sunscreen preparations)

**Dose**

- Rheumatoid arthritis and ankylosing spondylitis, 1.2 g daily in 2 or 4 divided doses; ELDERLY over 60 years, 300 mg twice daily; CHILD not recommended

- Acute gout, 1.8 g daily in divided doses until acute symptoms subside (usually by day 4) then 1.2 g daily in divided doses until symptoms resolve—consider alternative therapy if symptoms persist; ELDERLY over 60 years, 1.8 g daily in divided doses for the first 24 hours then 1.2 g daily in divided doses, reduced to 600 mg daily in divided doses as soon as possible (preferably by day 4) until acute symptoms resolve—consider alternative therapy if symptoms persist; CHILD not recommended

**Rheumox®** (Goldshield) [TH]

Capsules, orange, azapropazone 300 mg, net price 100-cap pack = £15.50. Label: 11, 21, counselling, photosensitivity (see above)
CELECOXIB

Indications  pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis

Cautions  see notes above; monitor blood pressure before treatment and during treatment; interactions: Appendix 1 (NSAI ds)

Contra-indications  see notes above; sulphonamide sensitivity; inflammatory bowel disease

Side-effects  see notes above; flatulence, insomnia; less commonly stomatitis, constipation, palpitation, fatigue, paraesthesia, muscle cramps; rarely taste disturbance, alopecia; very rarely aggravation of epilepsy

Dose  
- Osteoarthritis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 200 mg twice daily; CHILD not recommended
- Rheumatoid arthritis, 100 mg twice daily, increased if necessary to 200 mg twice daily; CHILD not recommended
- Ankylosing spondylitis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 400 mg daily in 1–2 divided doses; CHILD not recommended

Note  Discontinue if no improvement after 2 weeks on max. dose

Celebrex® (Pharmacia)  Capsules, celecoxib 100 mg (white/blue), net price 60-cap pack = £21.55; 200 mg (white/gold), 30-cap pack = £21.55

DEXIBuprofen

Indications  pain and inflammation associated with osteoarthritis and other musculoskeletal disorders; mild to moderate pain and inflammation including dysmenorrhoea and dental pain

Cautions  see notes above; systemic lupus erythematosus and other connective tissue disorders; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAI ds)

Contra-indications  see notes above

Side-effects  see notes above

Dose  
- 600–900 mg daily in up to 3 divided doses; increased if necessary to max. 1.2 g daily (900 mg daily for dysmenorrhoea); max. single dose 400 mg (300 mg for dysmenorrhoea); CHILD not recommended

Seractil® (Genus)  Tablets, f/c, dexibuprofen 300 mg, net price 60–tab pack = £9.47; 400 mg (scored) 60–tab pack = £9.47. Label: 21

DESKETOPROFEN

Indications  short-term treatment of mild to moderate pain including dysmenorrhoea

Cautions  see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAI ds)

Contra-indications  see notes above

Side-effects  see notes above

Dose  
- 12.5 mg every 4–6 hours or 25 mg every 8 hours; max. 75 mg daily; ELDERLY initially max. 50 mg daily; CHILD not recommended

Keral® (Menarini)  Tablets, f/c, scored, dexketoprofen (as trometamol) 25 mg, net price 20-tab pack = £3.67, 50-tab pack = £9.18. Label: 22

DICLOFENAC SODIUM

Indications  pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; acute gout; postoperative pain

Cautions  see notes above; interactions: Appendix 1 (NSAI ds)

Contra-indications  see notes above; acute porphyria (section 9.8.2); avoid injections containing benzyl alcohol in neonates (see preparations below)

Intravenous use  Additional contra-indications include concomitant NSAID or anticoagulant use (including low-dose heparin), history of haemorrhagic diathesis, history of confirmed or suspected cerebrovascular bleeding, operations with high risk of haemorrhage, history of asthma, moderate or severe renal impairment, hypovolaemia, dehydration

Side-effects  see notes above; suppositories may cause rectal irritation; injection site reactions

Dose  
- By mouth, 75–150 mg daily in 2–3 divided doses
- By rectum in suppositories, 75–150 mg daily in divided doses
- CHILD 1–12 years, juvenile arthritis, by mouth or by rectum, 1–3 mg/kg (max. 150 mg) daily in divided doses (25 mg e/c tablets, 12.5 mg and 25 mg suppositories only)
- CHILD 6–12 years, postoperative pain, by rectum, 1–2 mg/kg (max. 150 mg) daily in divided doses (12.5 mg and 25 mg suppositories only) for max. 4 days

Diclofenac Sodium (Non-proprietary)  Tablets, e/c, diclofenac sodium 25 mg, net price 84–tab pack = £1.19; 50 mg, 84-tab pack = £1.36. Label: 5, 25

Brands include Defenc®, Dicloflex®, Diclozap®, Fenacot®, Flamrase

Dental prescribing on NHS Diclofenac Sodium Tablets may be prescribed

Suppositories, diclofenac sodium 100 mg, net price 10 = £3.06

Brands include Econac

Dyloject® (Javelin)  Injection, diclofenac sodium 37.5 mg/mL, net price 2-mL vial = £4.80

Dose  by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days

Urteretic colic, 75 mg then a further 75 mg after 30 minutes if necessary

By intravenous injection (in supervised settings), acute postoperative pain, 75 mg repeated after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days

Prevention of postoperative pain, 25–50 mg after surgery; further doses given after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days

Note  The Scottish Medicines Consortium (p. 3) has advised (Feb 2008) that Dyloject® is accepted for restricted use within NHS Scotland for the treatment or prevention of postoperative pain by intravenous injection in supervised healthcare settings

Voltarol® (Novartis)  Tablets, e/c, diclofenac sodium 25 mg (yellow), net price 84-tab pack = £3.67; 50 mg (brown), 84-tab pack = £5.71. Label: 5, 25
Dispersible tablets, sugar-free, pink, diclofenac, equivalent to diclofenac sodium 50 mg, net price 21-tab pack = £6.19. Label: 13, 21

Note Voltarol Dispersible tablets are more suitable for short-term use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months)

Injection, diclofenac sodium 25 mg/mL, net price 3-mL amp = £8.3p

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2), propylene glycol

Dose by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days

Ureteric colic, 75 mg then a further 75 mg after 30 minutes if necessary

By intravenous infusion (in hospital setting), acute postoperative pain, 75 mg repeated if necessary after 4–6 hours, max. 150 mg in 24 hours for 2 days

Prevention of postoperative pain, initially after surgery 25–50 mg over 15–60 minutes then 5 mg/hour, max. 150 mg in 24 hours for 2 days

Suppositories, diclofenac sodium 12.5 mg, net price 10 = £1.71; 25 mg, 10 = £1.26; 50 mg, 10 = £2.07; 100 mg, 10 = £3.70

Diclofenac potassium

Voltarol® Rapid (Novartis) (PHV)

Tablets, s/c, diclofenac potassium 25 mg (red), net price 30-tab pack = £4.33; 50 mg (brown), 30-tab pack = £8.28

Dose rheumatic disease, musculoskeletal disorders, acute gout, postoperative pain, 75–150 mg daily in 2–3 divided doses; CHILD over 14 years, 75–100 mg daily in 2–3 divided doses

Migraine, 50 mg at onset, repeated after 2 hours if necessary then over 15–60 minutes then 5 mg/hour; max. 150 mg in 24 hours for 2 days

Contra-indications see notes above; also dehydration; monitor blood pressure before treatment, 2 weeks after

Topical preparations

Section 10.3.2

ETODOLAC

Indications pain and inflammation in rheumatoid arthritis and osteoarthritis

Cautions see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

Contra-indications see above

Side-effects see notes above; also flatulence, constipation, vomiting, ulcerative stomatitis, gastritis, vasculitis, palpitation, dyspnoea, confusion, fatigue, paraesthesia, tremor, urinary frequency, dysuria, pyrexia, and pruritus

Dose

ADULT over 18 years, 600 mg daily in 1–2 divided doses

Etodolac (Non-proprietary) (PHV)

Capsules, etodolac 300 mg, net price 60-cap pack = £8.14

Brands include Eccoxolac

Modified release

Etopan XL® (Taro) (PHV)

Tablets, m/r, f/c, grey, etodolac 600 mg, net price 30-tab pack = £15.50. Label: 25

Dose 1 tablet daily; CHILD not recommended

Lodine SR® (Shire) (PHV)

Tablets, m/r, f/c, light-grey, etodolac 600 mg, net price 30-tab pack = £15.50. Label: 25

Dose 1 tablet daily; CHILD not recommended

ETORICOXIB

Indications pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; acute gout

Cautions see notes above; also dehydration; monitor blood pressure before treatment, 2 weeks after
initiation and periodically during treatment; hepatic impairment (avoid if severe; Appendix 2); renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above; inflammatory bowel disease; uncontrolled hypertension (persistently above 140/90 mmHg); breast-feeding (Appendix 5)

**Side-effects** see notes above; also flatulence, palpitation, fatigue, influenza-like symptoms, eczema, less commonly dry mouth, taste disturbance, mouth ulcer, constipation, appetite and weight change, atrial fibrillation, transient ischaemic attack, chest pain, flushing, cough, dyspnoea, epistaxis, anxiety, mental acuity impaired, paraesthesia, electrolyte disturbance, myalgia and arthralgia; very rarely confusion and hallucinations

**Dose**
- Osteoarthritis, ADULT and CHILD over 16 years, 30 mg once daily, increased if necessary to 60 mg once daily
- Rheumatoid arthritis and ankylosing spondylitis, ADULT and CHILD over 16 years, 90 mg once daily
- Acute gout, ADULT and CHILD over 16 years, 120 mg once daily for max. 8 days

**Fenoprofen**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions** see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above

**Side-effects** see notes above; upper respiratory-tract infection, nasopharyngitis, and cystitis also reported

**Dose**
- 300–600 mg 3–4 times daily with food; max. 3 g daily
- CHILD not recommended

**Fenopron** (Typharm) Tablets, both orange, fenoprofen (as calcium salt) 300 mg (Fenopron 300), net price 100-tab pack = £9.45; 600 mg (Fenopron 600, scored), 100-tab pack = £18.29. Label: 21

**FLURBIPROFEN**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; migraine; postoperative analgesia; sore throat (section 12.3.1)

**Cautions** see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above

**Side-effects** see notes above; also vomiting, ulcerative stomatitis; less commonly gastritis, paraesthesia, confusion, hallucinations, and fatigue

**Dose**
- ADULT and CHILD over 12 years, 150–200 mg daily in 2–4 divided doses, increased in acute conditions to 300 mg daily
- Dysmenorrhoea, ADULT and CHILD over 12 years, initially 100 mg, then 50–100 mg every 4–6 hours; max. 300 mg daily

**Flurbiprofen** (Non-proprietary) Tablets, flurbiprofen 50 mg, net price 20 = £2.54; 100 mg, 20 = £5.16. Label: 21

**Froben** (Abbott) Tablets, yellow, s/c, flurbiprofen 50 mg, net price 20 = £2.18; 100 mg, 20 = £4.13. Label: 21

**Modified release**

**Froben SR** (Abbott) Capsules, m/r, yellow, flurbiprofen 200 mg, net price 30-cap pack = £7.84. Label: 21, 25

**Dose**
- ADULT and CHILD over 12 years, 1 capsule daily, preferably in the evening

**IBUPROFEN**

**Indications** pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; postoperative analgesia; migraine; dental pain; fever and pain in children; post-immunisation pyrexia (section 14.1)

**Cautions** see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above

**Side-effects** see notes above; overdosage: see Emergency Treatment of Poisoning, p. 29

**Dose**
- ADULT and CHILD over 12 years, initially 300–400 mg 3–4 times daily; increased if necessary to max. 2.4 g daily; maintenance dose of 0.6–1.2 g daily may be adequate
Musculoskeletal and joint diseases

Suspension Sugar-free may be prescribed

10.1.1 Non-steroidal anti-inflammatory drugs

BNF 57

- Pain and fever in children, CHILD 1–3 months, see BNF for Children, CHILD 3–6 months (body-weight over 5 kg), 50 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); CHILD 6 months–1 year, 50 mg 3–4 times daily (max. 30 mg/kg daily in 3–4 divided doses); CHILD 1–4 years, 100 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); CHILD 4–7 years, 150 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); CHILD 7–10 years, 200 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses); CHILD 10–12 years, 300 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses)

- Rheumatic disease in children (including juvenile idiopathic arthritis), CHILD 3 months–18 years (body-weight over 5 kg), 30–40 mg/kg (max. 2.4 g) daily in 3–4 divided doses; in systemic juvenile idiopathic arthritis up to 60 mg/kg (max. 2.4 g) daily (unlicensed) in 4–6 divided doses

1 Ibuprofen (Non-proprietary) PbM

- Tablets, coated, ibuprofen 200 mg, net price 84-tab pack = £2.07; 400 mg, 84-tab pack = £2.31; 600 mg, 84-tab pack = £3.96. Brand: Label: 21
- Brands include Arthritis , Eufaft , Rimafen

- Oral suspension, ibuprofen 100 mg/5 mL, net price 100 mL = £1.44, 150 mL = £2.71, 500 mL = £8.88. Label: 21
- Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription
- Brands include Culprofen , Fenpaed , Feverfen , Nurofen for Children , Orfifen for Children

- Dental prescribing on NHS Ibuprofen Tablets and Ibuprofen Oral Suspension Sugar-free may be prescribed

Brufen® (Abbott) PbM

- Tablets, f/c, ibuprofen 200 mg, net price 100-tab pack = £4.08; 400 mg, 100-tab pack = £8.16; 600 mg, 100-tab pack = £12.24. Label: 21
- Syrup, orange, ibuprofen 100 mg/5 mL, net price 500 mL (orange-flavoured) = £8.88. Label: 21
- Granules, effervescent, ibuprofen 600 mg/sachet, net price 20-sachet pack = £6.80. Label: 13, 21
- Electrolytes Na approx. 9 mmol/sachet

- Modified release
- Brufen Retard® (Abbott) PbM
- Tablets, m/r, ibuprofen 800 mg, net price 56-tab pack = £6.74. Label: 25, 27
- Dose ADULT and CHILD over 12 years, 2 tablets daily as a single dose, preferably in the early evening, increased in severe cases to 3 tablets daily in 2 divided doses

- Fenbid® (Goldshield) PbM
- Spansule® (= capsule m/r), maroon/pink, enclosing off-white pellets, ibuprofen 300 mg, net price 120-cap pack = £9.64. Label: 25
- Dose ADULT and CHILD over 12 years, initially 2 capsules twice daily, increased in severe cases to 3 capsules twice daily; then 1–2 capsules twice daily

- Topical preparations
- Section 10.3.2

1. Can be sold to the public in certain circumstances; for exemptions see Medicines, Ethics and Practice, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available)

INDOMETACIN (Indomethacin)

Indications pain and moderate to severe inflammation in rheumatic disease and other acute musculoskeletal disorders; acute gout; dysmenorrhoea; closure of ductus arteriosus (section 7.1.1.1); premature labour (section 7.1.3)

Cautions see notes above; also epilepsy, parkinsonism, psychiatric disturbances; during prolonged therapy ophthalmic and blood examinations particularly advisable; avoid rectal administration in proctitis and haemorrhoids; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

Driving Dizziness may affect performance of skilled tasks (e.g. driving)

Contra-indications see notes above

Side-effects see notes above; frequently gastro-intestinal disturbances (including diarrhoea), headache, dizziness, and light-headedness; also gastro-intestinal ulceration and bleeding; rarely, drowsiness, confusion, insomnia, convulsions, psychiatric disturbances, depression, syncope, blood disorders (particularly thrombocytopenia), hypertension, hyperglycaemia, blurred vision, corneal deposits, peripheral neuropathy, and intestinal strictures; suppositories may cause rectal irritation and occasional bleeding

Dose
- By mouth, rheumatic disease, 50–200 mg daily in divided doses; CHILD not recommended
- Acute gout, 150–200 mg daily in divided doses
- Dysmenorrhoea, up to 75 mg daily
- By rectum in suppositories, 100 mg at night and in the morning if required; CHILD not recommended
- Combined oral and rectal treatment, max. total daily dose 150–200 mg

Indometacin (Non-proprietary) PbM

- Capsules, indometacin 25 mg, net price 28-cap pack = £1.59; 50 mg, 28-cap pack = £1.93. Label: 21, counselling, driving, see above
- Suppositories, indometacin 100 mg, net price 10 = £14.46. Counselling, driving, see above

- Modified release
- Indometacin m/r preparations PbM
- Capsules, m/r, indometacin 75 mg. Label: 21, 25, counselling, driving, see above
- Brands include Indolar SR , Pareldrin , Solo-Indo
- Dose 1 capsule 1–2 times daily, CHILD not recommended

KETOPROFEN

Indications pain and mild inflammation in rheumatic disease and other musculoskeletal disorders, and after orthopaedic surgery; acute gout; dysmenorrhoea

Cautions see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

Contra-indications see notes above

Side-effects see notes above; pain may occur at injection site (occasionally tissue damage); suppositories may cause rectal irritation

Dose
- By mouth, rheumatic disease, 100–200 mg daily in 2–4 divided doses; CHILD not recommended
- Pain and dysmenorrhoea, 50 mg up to 3 times daily; CHILD not recommended
**MEFENAMIC ACID**

**Indications** pain and inflammation in rheumatoid arthritis and osteoarthritis; postoperative pain, mild to moderate pain; dysmenorrhoea and menorrhagia

**Cautions** see notes above; epilepsy; breast-feeding (Appendix 5); acute porphyria (section 9.8.2); in proctitis or haemorrhoids; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above; renal failure (unless receiving dialysis); severe heart failure

**Side-effects** see notes above

**Dose**
- **Adult** over 18 years, 500 mg 3 times daily
- **Child** 12–18 years, acute pain including dysmenorrhoea, menorrhagia, 500 mg 3 times daily
- **Child** under 12 years not recommended

**Mefenamic Acid**

**Capsules**
- Mefenamic acid 250 mg, net price 100-cap pack = £3.97. Label: 21
- Tablets, mefenamic acid 500 mg, net price 28-tab pack = £1.97. Label: 21
- Suspension, mefenamic acid 50 mg/5 mL, net price 125 mL = £79.99. Label: 21

**Excipients** include ethanol

**MELOXICAM**

**Indications** pain and inflammation in rheumatic disease; exacerbation of osteoarthritis (short-term); ankylosing spondylitis

**Cautions** see notes above; avoid rectal administration in proctitis or haemorrhoids; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above; renal failure (unless receiving dialysis); severe heart failure

**Side-effects** see notes above

**Dose**
- **By mouth**, osteoarthritis, 7.5 mg daily, increased if necessary to max. 15 mg once daily
- **Rheumatoid arthritis, ankylosing spondylitis, 15 mg once daily, may be reduced to 7.5 mg daily; Elderly 7.5 mg daily**
- **By rectum**, in suppositories, osteoarthritis, 7.5 mg daily, increased if necessary to max. 15 mg once daily
- **Rheumatoid arthritis, ankylosing spondylitis, 15 mg once daily, may be reduced to 7.5 mg daily; Elderly 7.5 mg daily**
- **Child** under 15 years not recommended

**Meloxicam**

**Tablets**
- Meloxicam 7.5 mg, net price 30-tab pack = £2.85; 15 mg, 30-tab pack = £3.52. Label: 21

**Mobic**

**Tablets**
- yellow, scored, meloxicam 7.5 mg, net price 30-tab pack = £9.30; 15 mg, 30-tab pack = £12.93. Label: 21

**Note** Tablets may be dispersed in water

**Suppositories**
- meloxicam 7.5 mg, net price 12 = £3.72; 15 mg, 12 = £5.58

**NABUMETONE**

**Indications** pain and inflammation in osteoarthritis and rheumatoid arthritis

**Cautions** see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- **1 g at night; severe or persistent symptoms 0.5–1 g in morning and 1 g at night; Elderly 0.5–1 g daily; Child not recommended**

**Nabumetone**

**Tablets**
- Nabumetone 500 mg, net price 56-tab pack = £7.29. Label: 21

**Relifex**

**Tablets**
- red, f/c, nabumetone 500 mg. Net price 56-tab pack = £6.18. Label: 21

**Suspension**
- sugar-free, nabumetone 500 mg/5 mL. Net price 300-mL pack = £24.08. Label: 21
NAPROXEN

Indications
pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; dysmenorrhoea; acute gout

Cautions
see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

Contra-indications
see notes above

Side-effects
see notes above

Dose

- Rheumatic disease, 0.5–1 g daily in 1–2 divided doses; CHILD 2–18 years, juvenile idiopathic arthritis, 5 mg/kg twice daily [max. 1 g daily] [unlicensed]

- Acute musculoskeletal disorders and dysmenorrhoea, 500 mg initially, then 250 mg every 6–8 hours as required; max. dose after first day 1.25 g daily; CHILD under 18 years, see BNF for Children

- Acute gout, 750 mg initially, then 250 mg every 8 hours until attack has passed; CHILD under 16 years not recommended

PIROXICAM

Indications
pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; acute gout

Cautions
see notes above and CHMP advice below; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

Contra-indications
see notes above

Side-effects
see notes above; pain at injection site (occasionally tissue damage)

Dose

- By mouth, rheumatic disease, initially 20 mg daily, increased if necessary to 30 mg daily in single or divided doses; CHILD (over 6 years), juvenile idiopathic arthritis, under 15 kg, 5 mg daily; 16–25 kg, 10 mg; 26–45 kg, 15 mg; over 46 kg, 20 mg (but see CHMP advice below)

Acute musculoskeletal disorders, 40 mg daily in single or divided doses for 2 days, then 20 mg daily for 7–14 days (but see CHMP advice below); CHILD not recommended

Acute gout, 40 mg initially, then 40 mg daily in single or divided doses for 4–6 days (but see CHMP advice below); CHILD not recommended

- By deep intramuscular injection into gluteal muscle, for initial treatment of acute conditions (but see CHMP advice below), as dose by mouth (on short-term basis); CHILD not recommended

CHMP advice

Piroxicam (June 2007)

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of osteoarthritis, rheumatic disease, initially 20 mg daily, increased if necessary to 30 mg daily in single or divided doses; CHILD (over 6 years), juvenile idiopathic arthritis, under 15 kg, 5 mg daily; 16–25 kg, 10 mg; 26–45 kg, 15 mg; over 46 kg, 20 mg (but see CHMP advice below)

Acute musculoskeletal disorders, 40 mg daily in single or divided doses for 2 days, then 20 mg daily for 7–14 days (but see CHMP advice below); CHILD not recommended

Acute gout, 40 mg initially, then 40 mg daily in single or divided doses for 4–6 days (but see CHMP advice below); CHILD not recommended

- By deep intramuscular injection into gluteal muscle, for initial treatment of acute conditions (but see CHMP advice below), as dose by mouth (on short-term basis); CHILD not recommended

Note
Topical preparations containing piroxicam are not affected by these restrictions

Piroxicam (Non-proprietary)

| Capsules, piroxicam 10 mg, net price 56-cap pack = £2.07; 20 mg, 28-cap pack = £1.99. Label: 21 |

| Tablets, yellow, scored, piroxicam (as betadex) 20 mg, net price 30-tab pack = £14.66. Label: 21 |
| Dose osteoarthritis, rheumatic disease and acute musculoskeletal disorders, 1 tablet daily (may be halved in elderly); CHILD not recommended |
| Feldene® (Pfizer) |
| Capsules, piroxicam 10 mg (red/blue), net price 56-cap pack = £7.20; 20 mg (white), 28-cap pack = £7.20. Label: 21 |
**Corticosteroids**

The general actions, uses, and cautions of corticosteroids are described in section 6.3. Treatment with corticosteroids in rheumatic diseases should be reserved for specific indications, e.g. when other anti-inflammatory drugs are unsuccessful. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment (section 6.6).

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone 7.5 mg daily may reduce the rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years' duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

---

**Aspirin**

Aspirin (section 4.7.1) has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

---

**SULINDAC**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout

**Cautions** see notes above; also renal stones

**Contra-indications** see notes above; breast-feeding (Appendix 1); jaundice with fever

**Side-effects** see notes above; jaundice with fever, cholestasis, hepatitis, hepatic failure; also urine discoloration occasionally reported

**Dose**

- 200 mg twice daily (may be reduced according to response); max. 400 mg daily; acute gout should respond within 7 days; limit treatment of peri-articular disorders to 7–10 days; CHILD not recommended

**Sulindac** (Non-proprietary)

**Tablets**, sulindac 100 mg, net price 56-tab pack = £17.51; 200 mg, 56-tab pack = £35.48. Label: 21

---

**TENOXICAM**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions** see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- By mouth, rheumatic disease, 20 mg daily; CHILD not recommended
- Acute musculoskeletal disorders, 20 mg daily for 7 days; max. duration of treatment 14 days (including treatment by intravenous or intramuscular injection); CHILD not recommended
- By intravenous or intramuscular injection, initial treatment for 1–2 days if oral administration not possible, 20 mg once daily; CHILD not recommended

**Tenoxicam** (Non-proprietary)

**Injection**, powder for reconstitution, tenoxicam, net price 20-mg vial = £3.98

**Mobiflex** (Roche)

**Tablets**, yellow, f/c, tenoxicam 20 mg, net price 30-tab pack = £12.92. Label: 21

---

**TIAPROFENIC ACID**

**Indications** pain and inflammation in rheumatic disease and other musculoskeletal disorders

**Cautions** see notes above; breast-feeding (Appendix 5); interactions: Appendix 1 (NSAIDs)

**Contra-indications** see notes above; also active bladder or prostate disease (or symptoms) and history of recurrent urinary-tract disorders—i.e. urinary symptoms develop discontinue immediately and perform urine tests and culture; see also CSM advice below

**CSM advice**

Following reports of severe cystitis the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop. Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine)

**Side-effects** see notes above

**Dose**

- 300 mg twice daily; CHILD not recommended

**Surgam** (Sanofi-Aventis)

**Tablets**, tiaprofenic acid 300 mg, net price 56-tab pack = £15.56. Label: 21

---

**Aspirin**

Aspirin (section 4.7.1) has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

---

**10.1.2.1 Systemic corticosteroids**

The general actions, uses, and cautions of corticosteroids are described in section 6.3. Treatment with corticosteroids in rheumatic diseases should be reserved for specific indications, e.g. when other anti-inflammatory drugs are unsuccessful. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment (section 6.6).

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone 7.5 mg daily may reduce the rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years’ duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.
Polymyalgia rheumatica and giant cell (temporal) arteritis are always treated with corticosteroids. The usual initial dose of prednisolone in polymyalgia rheumatica is 10–15 mg daily and in giant cell arteritis 40–60 mg daily (the higher dose being used if visual symptoms occur). Treatment should be continued until remission of disease activity and doses are then reduced gradually to about 7.5–10 mg daily for maintenance. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

Polyparasitis nodosa and polymyositis are usually treated with corticosteroids. An initial dose of 60 mg of prednisolone daily is often used and reduced to a maintenance dose of 10–15 mg daily.

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyparasitis nodosa and polymyositis (above). Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine or hydroxychloroquine, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

### 10.1.2 Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by intra-articular injection to relieve pain, increase mobility, and reduce deformity in one or a few joints. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neuropathies. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath, the Achilles tendon should not be injected). A soluble preparation (e.g. containing betamethasone or dexamethasone sodium phosphate) is preferred for injection into the carpal tunnel.

Hydrocortisone acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should usually be treated no more than 3 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions (see section 13.4).

### LOCAL CORTICOSTEROID INJECTIONS

**Indications**  local inflammation of joints and soft tissues (for details, consult product literature)

**Cautions** see notes above and consult product literature; see also section 6.3.2

**Contra-indications** see notes above and consult product literature; avoid injections containing benzyl alcohol in neonates (see preparations below)

**Side-effects** see notes above and consult product literature

**Dose**

- See under preparations

#### Betamethasone

**Betnesol** (UCB Pharma) [\(\text{\textregistered}\)]

*Injection*, betamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.22.

#### Dose calculated as dexamethasone

**Dexamethasone** (Organon) [\(\text{\textregistered}\)]

*Injection*, dexamethasone 4 mg/mL (as sodium phosphate) (\(=\) dexamethasone sodium phosphate 5.2 mg/mL \(=\) dexamethasone phosphate 4.8 mg/mL), net price 1-mL amp = £0.83; 2-mL vial = £1.27

**Dose** by intra-articular or intrasynovial injection (for details consult product literature), 0.4–4 mg (calculated as dexamethasone) according to size; where appropriate may be repeated at intervals of 3–21 days according to response

#### Dose calculated as dexamethasone phosphate

**Dexamethasone** (Hospira) [\(\text{\textregistered}\)]

*Injection*, dexamethasone phosphate 4 mg/mL (as sodium phosphate) (\(=\) dexamethasone 3.3 mg/mL \(=\) dexamethasone sodium phosphate 4.4 mg/mL), net price 1-mL amp = £1.00; 2-mL vial = £1.98

**Dose** by intra-articular or intrasynovial injection (for details consult product literature), 0.4–4 mg (calculated as dexamethasone phosphate) according to size (by soft-tissue infiltration 2–4 mg), where appropriate may be repeated at intervals of 3–21 days

#### Hydrocortisone acetate

**Hydrocortistab** (Sovereign) [\(\text{\textregistered}\)]

*Injection* (aqueous suspension), hydrocortisone acetate 25 mg/mL, net price 1-mL amp = £5.72

**Dose** by intra-articular or intrasynovial injection (for details consult product literature), 5–50 mg according to size, where appropriate may be repeated at intervals of 21 days; not more than 3 joints should be treated on any one day; CHILD 5–30 mg (divided)

#### Methylprednisolone acetate

**Depo-Medrone** (Pharmacia) [\(\text{\textregistered}\)]

*Injection* (aqueous suspension), methylprednisolone acetate 40 mg/mL, net price 1-mL vial = £2.87; 2-mL vial = £5.15; 3-mL vial = £7.47

**Dose** by intra-articular or intrasynovial injection (for details consult product literature), 4–80 mg, according to size, where appropriate may be repeated at intervals of 7–35 days; also for intralesional injection

**Depo-Medrone** with **Lidocaine** (Pharmacia) [\(\text{\textregistered}\)]

*Injection* (aqueous suspension), methylprednisolone acetate 40 mg, lidocaine hydrochloride 10 mg/mL, net price 1-mL vial = £3.28; 2-mL vial = £5.88

**Dose** by intra-articular or intrasynovial injection (for details consult product literature), 4–80 mg, according to size, where appropriate may be repeated at intervals of 7–35 days
10.1.3 Drugs that suppress the rheumatic disease process

Certain drugs such as those affecting the immune response can suppress the disease process in rheumatoid arthritis and psoriatic arthritis; gold, penicillamine, hydroxychloroquine, chloroquine, and sulfasalazine can also suppress the disease process in rheumatoid arthritis while sulfasalazine and possibly gold can suppress the disease process in psoriatic arthritis. Unlike NSAIDs, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Since in the first few months of treatment, the course of rheumatoid arthritis is unpredictable and the diagnosis uncertain, it is usual to start treatment with an NSAID alone. However, disease-modifying anti-rheumatic drugs should be initiated by specialists as soon as diagnosis, progression, and severity of the disease have been confirmed. Response to a disease-modifying anti-rheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying antirheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations such as vasculitis. They reduce the erythrocyte sedimentation rate, C-reactive protein, and sometimes the titre of rheumatoid factor; some also retard erosive damage as judged radiologically.

### Prednisolone acetate

**Deltastab® (Sovereign)**

**Injection** (aqueous suspension), prednisolone acetate 25 mg/mL, net price 1-mL amp = £5.73

**Dose** by intra-articular or intrasynovial injection (for details consult product literature), 5–25 mg according to size; not more than 3 joints should be treated on any one day, where appropriate may be repeated when relapse occurs

For **intramuscular injection**, see section 6.3.2

### Triamcinolone acetonide

**Adcortyl® Intra-articular/Intradermal** (Squibb)

**Injection** (aqueous suspension), triamcinolone acetonide 10 mg/mL, net price 1-mL vial = £1.02; 5-mL vial = £4.14

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Dose** by intra-articular injection or intrasynovial injection (for details consult product literature), 2.5–15 mg according to size (for larger doses use Kenalog®); where appropriate may be repeated when relapse occurs

By **intradermal injection**, (for details consult product literature): 2–3 mg; max. 5 mg at any one site (total max. 30 mg); where appropriate may be repeated at intervals of 1–2 weeks

**CHILD under 6 years not recommended**

**Kenalog® Intra-articular/Intramuscular** (Squibb)

**Injection** (aqueous suspension), triamcinolone acetonide 40 mg/mL, net price 1-mL vial = £1.70; 1-mL prefilled syringe = £2.11; 2-mL prefilled syringe = £3.66

**Note** Intramuscular needle with prefilled syringe should be replaced for intra-articular injection

**Dose** by intra-articular or intrasynovial injection (for details consult product literature), 5–40 mg according to size; total max. 80 mg (for doses below 5 mg use Adcortyl Intra-articular/Intradermal), where appropriate may be repeated when relapse occurs. **CHILD under 6 years not recommended**

For **intramuscular injection**, see section 6.3.2

### Choice

The choice of a disease-modifying anti-rheumatic drug should take into account co-morbidity and patient preference. Sulfasalazine, methotrexate, intramuscular gold and penicillamine are similar in efficacy. However, sulfasalazine or methotrexate are often used first because they may be better tolerated.

Penicillamine and drugs that affect the immune response (‘immunomodulators’) are also sometimes used in rheumatoid arthritis where there are troublesome extra-articular features such as vasculitis, and in patients who are taking high doses of corticosteroids. Response to the drugs often produces a striking reduction in requirements of both corticosteroids and other drugs. Gold and penicillamine are effective in polidromic rheumatism. Systemic and discoid lupus erythematosus are sometimes treated with chloroquine or hydroxychloroquine.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months (or within 3 months for inhibitors of tumour necrosis factor), it should be replaced by a different one.

In some circumstances, and under specialist supervision, combining two or more disease-modifying anti-rheumatic drugs can be considered.

### Juvenile idiopathic arthritis

Many children with juvenile idiopathic arthritis (juvenile chronic arthritis) do not require disease-modifying antirheumatic drugs. Methotrexate is effective [unlicensed indication]; sulfasalazine is an alternative [unlicensed indication] but it should be avoided in systemic-onset juvenile idiopathic arthritis. Gold and penicillamine are no longer used. For the role of adalimumab and etanercept in polyarticular juvenile idiopathic arthritis, see p. 569

### Gold

Gold can be given by intramuscular injection as sodium aurothiomalate or by mouth as auranofin.

**Sodium aurothiomalate** must be given by deep intramuscular injection and the area gently massaged. A test dose of 10 mg must be given followed by doses of 50 mg at weekly intervals until there is definite evidence of remission. Benefit is not to be expected until about 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased to 50 mg weekly and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective. Children can be given 1 mg/kg weekly to a maximum of 50 mg weekly, the intervals being gradually increased to 4 weeks according to response; an initial test dose is given corresponding to one-tenth to one-fifth of the calculated dose.

**Auranofin** is given by mouth. If there is no response after 6 months treatment should be discontinued. Auranofin is less effective than parenteral gold.

Gold therapy should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is
AURANOFIN
Indications active progressive rheumatoid arthritis
Cautions see under Sodium Aurothiomalate; inflammatory bowel disease; pregnancy (Appendix 4); breast-feeding (Appendix 5)
Blood counts Withdraw if platelet count falls below 100 000/mm³ or if signs and symptoms suggestive of thrombocytopenia occur, see also notes above
Counselling Patients should be advised to seek prompt medical attention if diarrhoea, rectal bleeding, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop
Contra-indications see under Sodium Aurothiomalate
Side-effects see under Sodium Aurothiomalate; headache and dizziness
Dose • Administered on expert advice, 6 mg daily (initially in 2 divided doses then if tolerated as single dose), if response inadequate after 6 months, increase to 9 mg daily (in 3 divided doses), discontinue if no response after a further 3 months; CHILD not recommended

RIDURA® (Astellas) *(NM)
Tablets, yellow, f/c, auranofin 3 mg, net price 60-tab pack = £25.20. Label: 11, 21, counselling, blood disorder symptoms (see above)

SODIUM AUROTHIOMALATE
Indications active progressive rheumatoid arthritis, juvenile idiopathic arthritis
Cautions see notes above; elderly, history of urticaria, eczema, colitis; monitor for pulmonary fibrosis with annual chest X-ray; hepatic impairment (avoid if severe); renal impairment (avoid if severe); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (gold)
Counselling Patients should be advised to seek prompt medical attention if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop
Contra-indications history of blood disorders or bone marrow aplasia, exfoliative dermatitis, systemic lupus erythematosus, necrotising enterocolitis, pulmonary fibrosis; acute porphyria (section 9.8.2)
Side-effects see notes above; also severe anaphylactic reactions; stomatitis, taste disturbances, colitis, hepatotoxicity with cholestatic jaundice, pulmonary fibrosis, peripheral neuropathy, mouth ulcers, proteinuria, blood disorders (sometimes sudden and fatal), nephrotic syndrome, gold deposits in eye, alopecia, and skin reactions (including, on prolonged parenteral treatment, irreversible pigmentation in sun-exposed areas)

Dose • By deep intramuscular injection, administered on expert advice, see notes above

Myocrisin® (Sanofi-Aventis) *(NM)
Injection, sodium aurothiomalate 20 mg/mL, net price 0.5-mL (10-mg) amp = £3.80; 100 mg/mL, 0.5-mL (50-mg) amp = £11.23. Label: 11, counselling, blood disorder symptoms

Penicillamine
Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase). A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase. Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued provided that renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.

Nausea may occur but is not usually a problem provided that penicillamine is taken before food or on retiring and that low initial doses are used and only gradually increased. Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued; mineral supplements are not recommended. Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased. Late rashes are more resistant and often necessitate discontinuation of treatment.

Patients who are hypersensitive to penicillin may react rarely to penicillamine.

PENICILLAMINE
Indications see notes above and under Dose
Cautions see notes above; concomitant nephrotoxic drugs (increased risk of toxicity); gold treatment (avoid concomitant use if adverse reactions to gold); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (penicillamine)
Blood counts and urine tests See notes above. Longer intervals may be adequate in cystinuria and Wilson’s disease. Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 2500/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia)
Counselling Warn patient to tell doctor promptly if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop
Contra-indications lupus erythematosus
Side-effects (see also notes above) initially nausea, anorexia, fever, and skin reactions; taste loss (mineral supplements not recommended); blood disorders including thrombocytopenia, leucopenia, agranulocytosis and aplastic anaemia; proteinuria, rarely haematuria (withdraw immediately); haemolytic anaemia, nephrotic syndrome, lupus erythematosus-like syndrome, myasthenia gravis-like syndrome, polymyositis (rarely with cardiac involvement), dermatomyositis, mouth ulcers, stomatitis, alopecia, bronchiolitis and pneumonitis, pempigus, Goodpasture's syndrome, and Stevens-Johnson syndrome also reported; male and female breast enlargement reported in non-rheumatoid conditions rheumatoid arthritis-like syndrome also reported; late rashes (consider withdrawing treatment)

Dose
- Severe active rheumatoid arthritis, administered on expert advice, ADULT initially 125–250 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks to usual maintenance of 500–750 mg daily in divided doses; max. 1.5 g daily; if remission sustained for 6 months, reduction of daily dose by 125–250 mg every 12 weeks may be attempted; ELDERLY initially up to 125 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks; max. 1 g daily; CHILD maintenance of 15–20 mg/kg daily (initial dose lower and increased at intervals of 4 weeks over a period of 3–6 months)
- Wilson's disease, autoimmune hepatitis, and cystinuria, section 9.8.1

Penicillamine (Non-proprietary) (CA)
Tablets, penicillamine 125 mg, net price 56-tab pack = £13.19; 250 mg, 56-tab pack = £16.96. Label: 6, 22, counselling, blood disorder symptoms (see above)

Distamine® (Alliance) (CA)
Tablets, f/c, penicillamine 125 mg, net price 100-tab pack = £6.82; 250 mg, 100-tab pack = £14.82. Label: 6, 22, counselling, blood disorder symptoms (see above)

Antimalariais
The antimalarial hydroxychloroquine is used to treat rheumatoid arthritis of moderate inflammatory activity; chloroquine is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed. Chloroquine and hydroxychloroquine are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis.

Chloroquine and hydroxychloroquine are better tolerated than gold or penicillamine. Retinopathy (see below) rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing. Mepacrine (section 5.4.4) is sometimes used in discoid lupus erythematosus [unlicensed].

Cautions Chloroquine and hydroxychloroquine should be used with caution in hepatic impairment (Appendix 2) and in renal impairment (Appendix 3). Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists, below). It is not necessary to withdraw an antimalarial drug during pregnancy (Appendix 4) if the rheumatic disease is well controlled. Chloroquine and hydroxychloroquine are present in breast milk and breast-feeding (Appendix 5) should be avoided when they are used to treat rheumatoid disease; chloroquine can, however, be used for malaria during pregnancy and breast-feeding (section 5.4.1). Both should be used with caution in neurological disorders (especially in those with a history of epilepsy), in severe gastro-intestinal disorders, in G6PD deficiency (section 9.1.3), in acute porphyria, and in the elderly (see also above). Chloroquine and hydroxychloroquine may exacerbate psoriasis and aggravate myasthenia gravis. Concurrent use of hepatotoxic drugs should be avoided; other interactions: Appendix 1 (chloroquine and hydroxychloroquine).

Screening for ocular toxicity
A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine, hydroxychloroquine, and mepacrine (Ocular toxicity with hydroxychloroquine: guidelines for screening 2004). Chloroquine should be considered (for treating chronic inflammatory conditions) only if other drugs have failed. All patients taking chloroquine should receive ocular examination according to a protocol arranged locally between the prescriber and the ophthalmologist. Mepacrine has negligible ocular toxicity. The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

Before treatment:
- Assess renal and liver function (adjust dose if impaired)
- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist
- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart
- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulphate 6.5 mg/kg daily)

During treatment:
- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart
- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to stop treatment and seek prescribing doctor’s advice
- A child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis
- If long-term treatment is required (more than 5 years), individual arrangement should be agreed with the local ophthalmologist

Note To avoid excessive dosage in obese patients, the doses of hydroxychloroquine and chloroquine should be calculated on the basis of lean body weight. Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily)
Side-effects  The side-effects of chloroquine and hydroxychloroquine include gastro-intestinal disturbances, headache and skin reactions (rashes, pruritus); those occurring less frequently include ECG changes, convulsions, visual changes, retinal damage (see above), keratopathy, otoxicity, hair depigmentation, hair loss, and discoloration of skin, nails, and mucous membranes. Side-effects that occur rarely include blood disorders (including thrombocytopenia, agranulocytosis, and aplastic anaemia), mental changes (including emotional disturbances and psychosis), myopathy (including cardiomyopathy and neuromyopathy), acute generalised exanthematous pustulosis, exfoliative dermatitis, Stevens-Johnson syndrome, photosensitivity and hepatic damage. Important: very toxic in overdosage—immediate advice from poisons centres essential (see also p. 32).

CHLOROQUINE

Indications  active rheumatoid arthritis (including juvenile idiopathic arthritis), systemic and discoid lupus erythematosus; malaria (section 5.4.1)

Cautions  see notes above

Side-effects  see notes above

Dose  

- Administered on expert advice, by mouth, chloroquine (base) 150 mg daily; max. 2.5 mg/kg daily, see recommendations above; CHILD up to 3 mg/kg daily

Note  Chloroquine base 150 mg ≡ chloroquine sulphate 200 mg ≡ chloroquine phosphate 250 mg (approx.).

Preparations  

Section 5.4.1

HYDROXYCHLOROQUINE SULPHATE

Indications  active rheumatoid arthritis (including juvenile idiopathic arthritis), systemic and discoid lupus erythematosus; dermatological conditions caused or aggravated by sunlight

Cautions  see notes above

Side-effects  see notes above

Dose  

- Administered on expert advice, initially 400 mg daily in divided doses; maintenance 200–400 mg daily; max. 6.5 mg/kg daily (but not exceeding 400 mg daily), see recommendations above; CHILD up to 6.5 mg/kg daily (max. 400 mg daily)

Plaquenil® (Sanofi-Synthelabo) (pW)

Tablets, f/c. hydroxychloroquine sulphate 200 mg, net price 60-tab pack = £5.46. Label: 5, 21

Drugs affecting the immune response

Methotrexate is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. Azathioprine, ciclosporin, cyclophosphamide, leflunomide, and the cytokine modulators (adalimumab, anakinra, etanercept, and infliximab) are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

Methotrexate is usually given in an initial dose of 7.5 mg by mouth once a week, adjusted according to response to a maximum of 15 mg once a week (occasionally 20 mg once a week). Regular full blood counts (including differential white cell count and platelet count), renal and liver function tests are required. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid 5 mg every week may help to reduce the frequency of such side-effects.

Azathioprine is usually given in a dose of 1.5 to 2.5 mg/kg daily in divided doses. Blood counts are needed to detect possible neutropenia or thrombocytopenia (usually resolved by reducing the dose). Nausea, vomiting, and diarrhoea may occur, usually starting early during the course of treatment, and may necessitate withdrawal of the drug; herpes zoster infection may also occur.

Leflunomide acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar in efficacy to sulfasalazine and methotrexate, may be chosen when these drugs cannot be used. The active metabolite of leflunomide persists for a long period; active procedures to wash the drug out are required in case of serious adverse effects, or before starting treatment with another disease-modifying antirheumatic drug, or, in men or women, before conception. Side-effects of leflunomide include bone-marrow toxicity; its immunosuppressive effects increase the risk of infection and malignancy.

Ciclosporin (cyclosporin) is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide (section 8.1.1) may be used at a dose of 1 to 1.5 mg/kg daily by mouth for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given intravenously in a dose of 0.5 to 1 g (with prophylactic mesna) for severe systemic rheumatoid arthritis and for other connective tissue diseases (especially with active vasculitis), repeated initially at fortnightly then at monthly intervals (according to clinical response and haematological monitoring).

Drugs that affect the immune response are also used in the management of severe cases of systemic lupus erythematosus and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of polymyositis that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. Azathioprine is usually used.

Azathioprine and methotrexate are used in the treatment of psoriatic arthropathy [unlicensed indication] for severe or progressive cases that are not controlled with anti-inflammatory drugs.
AZATHIOPRINE

Indications  see notes above: inflammatory bowel disease [unlicensed indication] (section 1.5.3); transplantation rejection, see section 8.2.1
Cautions  see section 8.2.1
Contra-indications  see section 8.2.1
Side-effects  see section 8.2.1

Dose
- By mouth, initially, rarely more than 3 mg/kg daily, reduced according to response; maintenance 1–3 mg/kg daily; consider withdrawal if no improvement within 3 months

Preparations
Section 8.2.1

CICLOSPORIN
(Cyclosporin)

Indications  severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective; severe active ulcerative colitis [unlicensed indication] (section 1.5.3); graft-versus-host disease (section 8.2.2); atopic dermatitis and psoriasis (section 13.5.3).
Cautions  see section 8.2.2
Additional cautions in rheumatoid arthritis  Contra-indicated in abnormal renal function, uncontrolled hypertension (see also below), uncontrolled infections, and malignancy. Measure serum creatinine at least twice before treatment and monitor every 2 weeks for first 3 months; then every 4 weeks (or more frequently if dose increased or concomitant NSAIDs introduced or increased (see also interactions: Appendix 1 (cyclosporin)), reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement; if above 90%, reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month; monitor blood pressure (discontinue if hypertension develops that cannot be controlled by antihypertensive therapy); monitor hepatic function if concomitant NSAIDs given.
Side-effects  see section 8.2.2

Dose
- By mouth, administered in accordance with expert advice, initially 2.5 mg/kg daily in 2 divided doses, if necessary increased gradually after 6 weeks; max. 4 mg/kg daily (discontinue if response insufficient after 3 months); dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks); CHILD and under 18 years, not recommended Important For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

Preparations
Section 8.2.2

LEFLUNOMIDE

Indications  (specialist use only) moderate to severe active rheumatoid arthritis; active psoriatic arthritis
Caution renal impairment (avoid if moderate or severe; Appendix 3); impaired bone-marrow function including anaemia, leucopenia or thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis); recent treatment with other hepatotoxic or myelotoxic disease-modifying anti-rheumatic drugs; washout procedures recommended for serious adverse effects or before switching to other disease-modifying antirheumatic drugs (consult product literature and see Washout Procedure, below); history of tuberculosis; exclude pregnancy before treatment; effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature and see Washout Procedure, below); monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks; monitor liver function—see Hepatotoxicity, below; monitor blood pressure; interactions: Appendix 1 (leflunomide)

Hepatotoxicity  Potentially life-threatening hepatotoxicity reported usually in the first 6 months; monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks. Discontinue treatment (and institute washout procedure—consult product literature and see Washout Procedure below) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure
Washout procedure  To aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception (see also Appendix 4), stop treatment and give either colchicine 1 mg 3 times daily for 11 days or activated charcoal 50 g 4 times daily for 11 days; the concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature

Contra-indications  severe immunodeficiency; severe hypoproteinaemia; serious infection; hepatic impairment (Appendix 2); pregnancy (important teratogenic risk: see Cautions and Appendix 4); breastfeeding (Appendix 5)

Side-effects  diarrhoea, nausea, vomiting, anorexia, oral mucosal disorders, abdominal pain; increased blood pressure; headache, dizziness, asthenia, paraesthesia, leucopenia; tenosynovitis; alopecia, rash, dry skin, pruritus; less commonly taste disturbance, anxiety, hypokalaemia, hypophosphataemia, anaemia, thrombocytopenia, and tendon rupture; rarely hepatitis, jaundice (see Hepatotoxicity, above), interstitial lung disease, severe infection, eosinophilia, and pancreatitis; very rarely pancreatitis, hepatic failure (see Hepatotoxicity, above), peripheral neuropathy, vasculitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis; hyperlipidaemia and renal failure also reported; important: discontinue treatment and institute washout procedure (see Washout Procedure under Caution) in case of serious side-effects

Dose
- Rheumatoid arthritis, ADULT over 18 years, initially 100 mg once daily for 3 days, then 10–20 mg once daily
- Psoriatic arthritis, ADULT over 18 years, initially 100 mg once daily for 3 days, then 20 mg once daily

Arava® (Sanofi-Aventis) Tablets, 5/c, leflunomide 10 mg (white), net price 30-tab pack = £51.13; 20 mg (yellow), 30-tab pack = £51.13; 100 mg (white), 3-tab pack = £25.56. Label: 4
METHOTREXATE

Indications moderate to severe active rheumatoid arthritis; Crohn’s disease [unlicensed indication] (section 1.5.3); malignant disease (section 8.1.3); psoriasis (section 13.5.3)

Cautions section 8.1; see CSM advice below (blood count, liver and pulmonary toxicity); extra caution in blood disorders (avoid if severe); peptic ulceration, ulcerative colitis, diarrhoea and ulcerative stomatitis (withdraw if stomatitis develops—may be first sign of gastro-intestinal toxicity); risk of accumulation in pleural effusion or ascites—drain before treatment; acute porphyria (section 9.8.2); renal impairment (avoid if creatinine clearance less than 20 mL/minute; Appendix 3); Interactions: see below and Appendix 1 (methotrexate)

CSM advice
In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate, the CSM has advised:

- full blood count and renal and liver function tests before starting treatment and repeated weekly until therapy stabilised, thereafter patients should be monitored every 2-3 months
- that patients should be advised to report all symptoms and signs suggestive of infection, especially sore throat

Treatment with folic acid (as calcium folinate, section 8.1) may be required in acute toxicity

Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-foolate drug. A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.

Liver toxicity Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate.

Pulmonary toxicity Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.

Aspirin and other NSAIDs If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored. Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

Contra-indications see Cautions above, hepatic impairment (Appendix 2), pregnancy (following administration to a woman or a man, avoid conception for at least 3 months after stopping—Appendix 4), breast-feeding (Appendix 5), active infection and immunodeficiency syndromes.

Side-effects section 8.1; also anorexia, abdominal discomfort, dyspepsia, gastro-intestinal ulceration and bleeding, diarrhoea, toxic megacolon, hepatotoxicity (see Cautions above); hypotension, pericarditis, pericardial tamponade; pulmonary oedema, pleuritic pain, pulmonary fibrosis, interstitial pneumonitis (see also Pulmonary Toxicity above); ana phylactic reactions, urticaria; dizziness, fatigue, chills, fever, drowsiness, malaise, headache, mood changes, neurotoxicity, confusion, paraesthesia; precipitation of diabetes; menstrual disturbances, vaginitis, cystitis, reduced libido, impotence; blood disorders; haemat uria, dysuria, renal failure; osteoporosis, arthralgia, myalgia, vasculitis; conjunctivitis, visual disturbance; rash, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity, changes in nail and skin pigmentation, telangiectasia, acne, furunculosis, ecchymosis; injection-site reactions.

Dose
- Moderate to severe active rheumatoid arthritis, by mouth, 7.5 mg once weekly, adjusted according to response; max. weekly dose 20 mg
- Severe active rheumatoid arthritis, by subcutaneous or by intramuscular or by intravenous injection, 7.5 mg once weekly, increased according to response by 2.5 mg weekly; max. weekly dose 25 mg

Important
Note that the above dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath)

Methotrexate (Non-proprietary) Tablets, yellow, methotrexate 2.5 mg, net price 28-tab pack = £3.27. Counselling, dose, NSAIDs

Brands include Mtxrex Tablets, yellow, methotrexate 10 mg, net price 20 (Hospira) = £11.44; (Pharmacia, Mtxrex*) = £9.03. Counselling, dose, NSAIDs

Parenteral preparations
See also section 8.1.3

Metobject* (Medac) Injection, prefilled syringe, methotrexate (as disodium salt) 10 mg/mL, net price 0.75 mL (7.5 mg) = £14.85, 1 mL (10 mg) = £15.29, 1.5 mL (15 mg) = £16.57, 2 mL (20 mg) = £17.84, 2.5 mL (25 mg) = £18.48

Cytokine modulators
Cytokine modulators should be used under specialist supervision.

Adalimumab, etanercept, and infliximab inhibit the activity of tumour necrosis factor alpha (TNF-α).

NICE guidance
Adalimumab for the treatment of psoriatic arthritis (August 2007)

Adalimumab is an option for the treatment of active and progressive psoriatic arthritis in adults with at least 3 tender joints and at least 3 swollen joints, who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination). Adalimumab should be used under specialist supervision and should be discontinued if there is an inadequate response after 12 weeks.
BNF 57

10.1.3 Drugs that suppress the rheumatic disease process

NICE guidance
Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007)
The tumour necrosis factor alpha (TNF-\(\alpha\)) inhibitors adalimumab, etanercept, and infliximab are options for the treatment of adults with active rheumatoid arthritis who have failed to respond to at least 2 disease-modifying antirheumatic drugs (DMARDs), including methotrexate (unless contra-indicated). TNF-\(\alpha\) inhibitors should be given in combination with methotrexate; however, when methotrexate cannot be used because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy.

Adalimumab, etanercept, and infliximab should be withdrawn if response is not adequate within 6 months. Response to treatment should be monitored at least every 6 months in patients who respond initially; treatment should be withdrawn if response is not maintained. An alternative TNF-\(\alpha\) inhibitor may be considered for patients in whom treatment is withdrawn because of intolerance before the initial 6-month assessment of efficacy.

Use of TNF-\(\alpha\) inhibitors for the treatment of severe, active, and progressive rheumatoid arthritis in adults not previously treated with methotrexate or other DMARDs is not recommended.

NICE guidance
Adalimumab, etanercept and infliximab for the treatment of ankylosing spondylitis (May 2008)
Adalimumab or etanercept are recommended as treatment options for adults with severe active ankylosing spondylitis whose disease satisfies specific criteria for diagnosis where there is confirmation of sustained active spinal disease, and where treatment with two or more NSAIDs taken sequentially at maximum tolerated or recommended doses for 4 weeks has failed to control symptoms. Response to adalimumab or etanercept treatment should be assessed at 12-week intervals and continued only if response is adequate. If response to treatment is not maintained, a repeat assessment should be made after a further 6 weeks and treatment discontinued if there is an inadequate response. Patients who are intolerant of adalimumab or etanercept during the initial 12 weeks may receive the alternative TNF-\(\alpha\) inhibitor (adalimumab or etanercept). However an alternative TNF-\(\alpha\) inhibitor is not recommended in patients who fail to respond initially or fail to maintain an adequate response. Infliximab is not recommended for the treatment of ankylosing spondylitis. Patients receiving infliximab for the treatment of ankylosing spondylitis can continue treatment until they and their specialist consider it appropriate to stop.

See full NICE guidance for specific criteria to diagnose severe active ankylosing spondylitis, confirm sustained active spinal disease, and assess response to treatment.

NICE guidance
Etanercept and infliximab for the treatment of adults with psoriatic arthritis (July 2006)
Etanercept is recommended for severe active psoriatic arthritis in adults with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to 2 other disease-modifying antirheumatic drugs (used alone or in combination), infliximab [in combination with methotrexate, unless contra-indicated or not tolerated] is recommended for those intolerant of etanercept.

Etanercept or infliximab should be used under specialist supervision and should be withdrawn if inadequate response after 12 weeks.

NICE guidance
Adalimumab for the treatment of ankylosing spondylitis (October 2007)
Adalimumab is licensed for moderate to severe active rheumatoid arthritis when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, above); it can also be used for severe, active, and progressive disease in adults not previously treated with methotrexate. It is also licensed for active polyarticular juvenile idiopathic arthritis in adolescents who have not responded adequately to one or more disease-modifying antirheumatic drugs. In the treatment of rheumatoid arthritis and polyarticular juvenile idiopathic arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive psoriatic arthritis (see also NICE guidance, above) and severe active ankylosing spondylitis that have not responded adequately to other disease-modifying antirheumatic drugs. For the role of adalimumab in Crohn’s disease, see section 13.5.3. For the role of adalimumab in plaque psoriasis, see section 13.5.3.

Etanercept is licensed for the treatment of moderate to severe active rheumatoid arthritis either alone or in combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate (see also NICE guidance). It is also licensed for the treatment of active polyarticular juvenile idiopathic arth-
ritis in children who have not responded adequately to or are intolerant of methotrexate (see also NICE guidance), active and progressive psoriatic arthritis inadequately responsive to other disease-modifying antirheumatic drugs, and for severe ankylosing spondylitis inadequately responsive to conventional therapy. For the role of etanercept in plaque psoriasis, see section 13.5.3.

Infliximab is licensed for the treatment of active rheumatoid arthritis in combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate (see also NICE guidance). It is also licensed for the treatment of ankylosing spondylitis, in patients with severe axial symptoms who have not responded adequately to conventional therapy, and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive psoriatic arthritis which has not responded adequately to disease-modifying antirheumatic drugs. For the role of infliximab in plaque psoriasis, see section 13.5.3.

Rituximab is licensed in combination with methotrexate for the treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (see also NICE guidance, below). For the role of rituximab in malignant disease, see section 8.2.3.

NICE guidance

Rituximab for the treatment of rheumatoid arthritis (August 2007)

Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have not had an adequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including treatment with at least 1 tumour necrosis factor alpha (TNF-α) inhibitor. Treatment with rituximab plus methotrexate should be continued only if there is an adequate response to therapy; repeat courses should be given no more frequently than every 6 months.

Side-effects

Adalimumab, etanercept, infliximab, and rituximab have been associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation. Other side-effects include nausea, abdominal pain, worsening heart failure, hypersensitivity reactions, fever, headache, depression, antibody formation (including lupus erythematosus-like syndrome), pruritus, injection-site reactions, and blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia, and aplastic anaemia).

Anakinra inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of rheumatoid arthritis which has not responded to methotrexate alone; it is not, however, recommended for routine management of rheumatoid arthritis, see NICE guidance below.

The Scottish Medicines Consortium has advised (October 2003) that anakinra is not recommended for rheumatoid arthritis.

Abatacept prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active rheumatoid arthritis in combination with methotrexate, in patients unresponsive or intolerant to other disease-modifying antirheumatic drugs (including at least one tumour necrosis factor (TNF) inhibitor). Abatacept is not recommended for use in combination with TNF inhibitors.

The Scottish Medicines Consortium has advised (August 2007) that abatacept is not recommended for the treatment of moderate to severe active rheumatoid arthritis.

**ABATACEPT**

**Indications** see under Cytokine Modulators, above

**Cautions** predisposition to infection (screen for latent tuberculosis and viral hepatitis); do not initiate until active infections are controlled; elderly (increased risk of side-effects); interactions: Appendix 1 (abatacept)

**Contra-indications** severe infection (see also Cautions); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** abdominal pain, diarrhoea, dyspepsia, nausea; flushing, hypertension; cough; dizziness, fatigue, headache; infection, rhinitis; rash; less commonly gastritis, stomatitis, tachycardia, bradycardia, palpitation, hypotension, dyspnoea, paraesthesia, weight gain, depression, anxiety, amenorrhoea, basal cell carcinoma, thrombocytopenia, leucopenia, arthralgia, pain in extremities, conjunctivitis, visual disturbance, vertigo, bruising, alopecia, and dry skin

**Dose**

- By intravenous infusion, ADULT over 18 years, body-weight less than 60 kg, 500 mg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight 60–100 kg, 750 mg repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight over 100 kg, 1 g repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks

**Note** Discontinue if no response within 6 months

**Orencia®** (Bristol-Myers Squibb) ▼ Intravenous infusion, powder for reconstitution, abatacept, net price 250-mg vial = £252.00

**Electrolytes** Na <0.5 mmol/vial
**ADALIMUMAB**

**Indications** see under Cytokine Modulators above; Crohn’s disease (section 1.5.3); psoriasis (section 13.5.3).

**Cautions** predisposition to infection; monitor for infections before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; hepatitis B virus—monitor for active infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate or severe heart failure); demyelinating CNS disorders (risk of exacerbation); history of malignancy; monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy; **interactions:** Appendix 1 (adalimumab)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemotherapy should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Contra-indications** pregnancy (Appendix 4); breast-feeding (Appendix 5); severe infection (see also Cautions)

**Side-effects** see under Cytokine Modulators above; infections, neutropenia (see also Cautions), and antibody formation; also reported pregnancy (Appendix 4); breast-feeding (Appendix 5); neutropenia

**Dose** 
- By subcutaneous injection, ADULT over 18 years, 40 mg on alternate weeks; if necessary increased to 40 mg weekly in patients receiving adalimumab alone; review treatment if no response within 12 weeks
- Polyarticular juvenile idiopathic arthritis, CHILD 13–17 years, 40 mg on alternate weeks; review treatment if no response within 12 weeks
- Psoriatic arthritis, ankylosing spondylitis, ADULT over 18 years, 40 mg on alternate weeks; discontinue treatment if no response within 12 weeks

**ADALIMUMAB Injection**
- adalimumab, net price 40-mg prefilled pen or prefilled syringe = £357.50. Counselling, tuberculosis

**ANAKINRA**

**Indications** see under Cytokine Modulators above

**Cautions** predisposition to infections; history of asthma (risk of serious infection); renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); **interactions:** Appendix 1 (anakinra)

**Blood disorders** Neutropenia reported commonly. Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months—discontinue if neutropenia develops. Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, infection) develop

**Contra-indications** pregnancy (Appendix 4); breast-feeding (Appendix 5); neutropenia

**Side-effects** injection-site reactions; headache; infections, neutropenia (see also Cautions), and antibody formation; also reported malignancy

**Dose** 
- By subcutaneous injection, ADULT over 18 years, 100 mg once daily

**Kinerei**

**Injection**
- anakinra, net price 100-mg prefilled syringe = £19.03. Counselling, blood disorder symptoms

**ETANERCEPT**

**Indications** see under Cytokine Modulators above; severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate; psoriasis (section 13.5.3)

**Cautions** predisposition to infection (avoid if predisposition to septicaemia); significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin; hepatitis B virus—monitor for active infection; heart failure (risk of exacerbation); demyelinating CNS disorders (risk of exacerbation); history of blood disorders; **interactions:** Appendix 1 (etanercept)

**Tuberculosis** Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

**Contra-indications** active infection; avoid injections containing benzyl alcohol in neonates (see preparations below); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see under Cytokine Modulators (p. 570); also interstitial lung disease, rash; rarely demyelinating disorders, seizures, Stevens-Johnson syndrome, and cutaneous vasculitis; very rarely toxic epidermal necrolysis; also reported appendicitis, cholecystitis, gastritis, gastro-intestinal haemorrhage, intestinal...
obstruction, liver damage, oesophagitis, pancreatitis, ulcerative colitis, vomiting, cerebral ischaemia, hypertension, hypotension, myocardial infarction, thrombophlebitis, thromboembolism, asthma, dyspnoea, asptic meningitis, confusion, paresis, paranoia, vertigo, lymphadenopathy, diabetes mellitus, haematuria, malignancy, renal calculi, renal impairment, bone fracture, bursitis, polyomyositis, scieritis, and cutaneous ulcer

### Dose
- **By subcutaneous injection**, rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, **INFELIXIMAB** over 18 years, 25 mg twice weekly or 50 mg once weekly Polyarticular-course juvenile idiopathic arthritis, CHILD 4–17 years, 400 micrograms/kg (max. 25 mg) twice weekly, with an interval of 3–4 days between doses.

### Enbrel® (Wyeth) ▼ [link]
**Injection**, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £98.39. Label: 10, alert card, counselling, tuberculosis and blood disorders.

**Paediatric injection**, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £98.39. Label: 10, alert card, counselling, tuberculosis and blood disorders.

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2).

**Injection**, etanercept, net price 25-mg prefilled syringe = £98.39, 50-mg prefilled syringe = £178.75. Label: 10, alert card, counselling, tuberculosis and blood disorders.

### INFELIXIMAB

#### Indications
- see under Cytokine Modulators above; severe, active and progressive rheumatoid arthritis in patients not previously treated with methotrexate; inflammatory bowel disease (section 1.5.3); psoriasis (section 13.5.3).

#### Cautions
- predisposition to infection; monitor for infections before, during, and for 2 months after treatment (see also Tuberculosis below); hepatitis B virus—monitor for active infection; heart failure (discontinue if symptoms develop or worsen; avoid in moderate or severe heart failure); demyelinating CNS disorders (risk of exacerbation); history of malignancy (consider discontinuing treatment if malignancy develops); history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis; inter- actions: Appendix 1 (infliximab).

#### Tuberculosis
- Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemotherapy should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemotherapy can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

#### Hypersensitivity reactions
- Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immuno- suppressants. All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use. Prophylactic antipyretics, anti- histamines, or hydrocortisone may be administered. Monitor for symptoms of delayed hypersensitivity if readministered after a prolonged period. Patients should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

#### Contra-indications
- severe infections (see also under Cautions); pregnancy (Appendix 4); breast-feeding (Appendix 5).

#### Side-effects
- see under Cytokine Modulators (p. 570) and under Cautions above; also diarrhoea, dyspepsia; flushing, chest pain; dyspnoea; dizziness, fatigue; sinusitis; rash, sweating, dry skin; less commonly con- stipation, gastro-oesophageal reflux, diverticulitis, cholecystitis, palpitation, arrhythmia, hypertension, hypotension, vasospasm, cyanosis, bradycardia, syn- copa, oedema, flushing, thrombophlebitis, epistaxis, bronchospasm, pleurisy, confusion, agitation, ner- vousness, amnesia, sleep disturbances, vaginitis, demyelinating disorders, antibody formation, pyelo- nephritis, myalgia, arthralgia, eye disorders, abnormal skin pigmentation, ecchymosis, cheilitis, and alopecia; rarely hepatitis, intestinal stenosis, intestinal perfora- tion, gastro-intestinal haemorrhage, pancreatitis, cir- culatory failure, meningitis, seizure, neuropathy, paraesthesia, lymphoma, and transverse myelitis; very rarely pericardial effusion, and skin reactions (includ- ing Stevens-Johnson syndrome, and toxic epidermal necrolysis); interstitial lung disease also reported.

#### Dose
- **By intravenous infusion**, rheumatoid arthritis (in combination with methotrexate), **ADULT** over 18 years, 3 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; if response inadequate after 12 weeks, dose may be increased in steps of 1.5 mg/kg every 8 weeks, up to max. 7.5 mg/kg every 8 weeks; alternatively, 3 mg/kg may be given every 4 weeks; discontinue if no response by 12 weeks or no response by 12 weeks of initial infusion or after dose adjustment.

- Ankylosing spondylitis, **ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 6–8 weeks; discontinue if no response by 6 weeks of initial infusion.

- Psoriatic arthritis (in combination with methotrexate), **ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks.

- **Remicade®** (Schering-Plough) ▼ [link]
**Intravenous infusion**, powder for reconstitution, infliximab, net price 100-mg vial = £419.62. Label: 10, alert card, counselling, tuberculosis and hypersensi- tivity reactions.

#### RITUXIMAB

#### Indications
- see under Cytokine Modulators above; malignant disease (section 8.2.3).

#### Cautions
- section 8.2.3; predisposition to infection; hepatitis B virus—monitor for active infection.

#### Contra-indications
- section 8.2.3; severe infection.

#### Side-effects
- section 8.2.3 and under Cytokine Mod- ulators (p. 570); also dyspepsia; hypertension, hypo- tension; rhinitis, sore throat; asthma, paraesthesia, migraine; arthralgia, muscle spasm; urticaria
Acute attacks of gout

Acute attacks of gout are usually treated with high doses of NSAIDs such as diclofenac, etoricoxib, indometacin, ketoprofen, naproxen, or sulindac (section 10.1.1). Colchicine is an alternative in patients in whom NSAIDs are contra-indicated. Aspirin is not indicated in gout. Allopurinol and uricosurics are not effective in treating an acute attack and may prolong it indefinitely if started during the acute episode.

The use of colchicine is limited by the development of toxicity at higher doses, but it is of value in patients with heart failure since, unlike NSAIDs, it does not induce fluid retention; moreover, it can be given to patients receiving anticoagulants. Oral or parenteral corticosteroids are an effective alternative in those who cannot tolerate NSAIDs or who are resistant to other treatments. Intra-articular injection of a corticosteroid can be used in acute mono-articular gout [unlicensed indication]. A corticosteroid by intramuscular injection can be effective in podagra.

COLCHICINE

Indications acute gout, short-term prophylaxis during initial therapy with allopurinol and uricosuric drugs; prophylaxis of familial Mediterranean fever (recurrent polyserositis) [unlicensed]

Cautions elderly, gastro-intestinal disease, cardiac disease, hepatic impairment, renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3); breast-feeding (Appendix 5); interactions: Appendix 1 (colchicine)

Contra-indications pregnancy (Appendix 4)

Side-effects most common are nausea, vomiting, and abdominal pain; excessive doses may also cause profuse diarrhoea, gastro-intestinal haemorrhage, rashes, renal and hepatic damage. Rarely peripheral neuritis, myopathy, alopecia, inhibition of spermato-genesis, and with prolonged treatment blood disorders

Dose

• Acute gout, 500 micrograms 2–4 times daily until symptoms relieved, max. 6 mg per course; course not to be repeated within 3 days
• Prevention of gout attacks during initial treatment with allopurinol or uricosuric drugs, 500 micrograms twice daily
• Prophylaxis of familial Mediterranean fever [unlicensed], 0.5–2 mg daily

Note BNF doses may differ from those in the product literature

Colchicine (Non-proprietary) (Pharmacia) Tablets, colchicine 500 micrograms, net price 20 = £5.06

10.1.4 Gout and cytotoxic-induced hyperuricaemia

It is important to distinguish drugs used for the treatment of acute attacks of gout from those used in the long-term control of the disease. The latter exacerbate and prolong the acute manifestations if started during an attack.

Sulfasalazine

Sulfasalazine (sulphasalazine) has a beneficial effect in suppressing the inflammatory activity of rheumatoid arthritis. Side-effects include rashes, gastro-intestinal intolerance and, especially in patients with rheumatoid arthritis, occasional leucopenia, neutropenia, and thrombocytopenia. These haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment. Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months (liver function tests also being performed at monthly intervals for the first 3 months). Although the manufacturer recommends renal function tests, evidence of practical value is unsatisfactory.

SULFASALAZINE (Sulphasalazine)

Indications active rheumatoid arthritis; inflammatory bowel disease, see section 15.1 and notes above

Cautions see section 15.1 and notes above

The CSM has recommended that patients should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

Contra-indications see section 15.1 and notes above

Side-effects see section 15.1 and notes above

Dose

• By mouth, administered on expert advice, as enteric-coated tablets, initially 500 mg daily, increased by 500 mg at intervals of 1 week to a max. of 2–3 g daily in divided doses

Sulfasalazine (Non-proprietary) (Pharmacia) Tablets, e/c, sulfasalazine 500 mg. Net price 112-tab pack = £21.52. Label: 5, 14, 25, counselling, blood disorder symptoms (see CSM recommendation above), contact lenses may be stained

Brands include Sulazine EC

Salazopyrin EN-Tabs® (Pharmacia) Tablets, e/c, yellow, t/c, sulfasalazine 500 mg. Net price 112-tab pack = £8.43. Label: 5, 14, 25, counselling, blood disorder symptoms (see CSM recommendation above), contact lenses may be stained

Note BNF 57 10.1.4 Gout and cytotoxic-induced hyperuricaemia 573
hyperuricaemia. These drugs should never be started during an acute attack; they are usually started 1–2 weeks after the attack has settled. The initiation of treatment may precipitate an acute attack, and therefore colchicine or an anti-inflammatory analgesic should be used as a prophylactic and continued for at least one month after the hyperuricaemia has been corrected. However, if an acute attack develops during treatment, then the treatment should continue at the same dosage and the acute attack treated in its own right.

Allopurinol is widely used and is especially useful in patients with renal impairment or urate stones when uricosuric drugs cannot be used; it is not indicated for the treatment of asymptomatic hyperuricaemia. It can cause rashes.

Sulfinpyrazone (sulfinpyrazone) can be used instead of allopurinol, or in conjunction with it in cases that are resistant to treatment.

Probenecid (available from ‘special-order’ manufacturers or specialist importing companies, see p. 939) is a uricosuric drug used to prevent nephrotoxicity associated with cidofovir (section 5.3.2.2).

Benzbromarone (available from ‘special-order’ manufacturers or specialist importing companies, see p. 939) is a uricosuric drug that can be used in patients with mild renal impairment.

Crystallisation of urate in the urine can occur with the uricosuric drugs and it is important to ensure an adequate urine output especially in the first few weeks of treatment. As an additional precaution the urine may be rendered alkaline. Aspirin and other salicylates antagonise the uricosuric drugs; they do not antagonise allopurinol but are nevertheless not indicated in gout.

**ALLOPURINOL**

**Indications** prophylaxis of gout and of uric acid and calcium oxalate renal stones; prophylaxis of hyperuricaemia associated with cancer chemotherapy

**Cautions** administer prophylactic colchicine (usually for first 3 months) or NSAID (not aspirin or salicylates) until at least 1 month after hyperuricaemia corrected; ensure adequate fluid intake (2–3 litres/day); for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (allopurinol)

**Contra-indications** not a treatment for acute gout but continue if attack develops when already receiving allopurinol, and treat attack separately (see notes above)

**Side-effects** rashes (withdraw therapy; if rash mild re-introduce cautiously but discontinue promptly if recurrence—hypersensitivity reactions occur rarely and include exfoliation, fever, lymphadenopathy, arthralgia, and eosinophilia resembling Stevens-Johnson or Lyell’s syndrome, vasculitis, hepatitis, renal impairment, and very rarely seizures); gastrointestinal disorders; rarely malaise, headache, vertigo, drowsiness, visual and taste disturbances, hypertension, alopecia, hepatotoxicity, paraesthesia and neuropathy, gynaecomastia, blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia and aplastic anaemia)

**Dose**
- Initially 100 mg daily, preferably after food, then adjusted according to plasma or urinary uric acid concentration; usual maintenance dose in mild conditions 100–200 mg daily, in moderately severe conditions 300–600 mg daily, in severe conditions 700–900 mg daily; doses over 300 mg daily given in divided doses; CHILD under 15 years, (in neoplastic conditions, enzyme disorders) 10–20 mg/kg daily (max. 400 mg daily)

**Probenecid (Non-proprietary)**

**Tablets**, allopurinol 100 mg, net price 28-tab pack = £9.7p; 300 mg, 28-tab pack = £1.10. Label: 8, 21, 27

Brands include Caplenal, Cosuric, Rimapurinol

**Zyloric** (GSK)

**Tablets**, allopurinol 100 mg, net price 100-tab pack = £10.19; 300 mg, 28-tab pack = £7.31. Label: 8, 21, 27

**SULFINPYRAZONE** (Sulfinpyrazone)

**Indications** gout prophylaxis, hyperuricaemia

**Cautions** see under Probenecid; regular blood counts advisable; cardiac disease (may cause salt and water retention); renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3)

**Side-effects** gastro-intestinal disturbances, urinary frequency, headache, flushing, dizziness, alopecia, anaemia, haemolytic anaemia, sore gums; hypersensitivity reactions including anaphylaxis, dermatitis, pruritus, urticaria, fever and Stevens-Johnson syndrome; rarely nephrotic syndrome, hepatic necrosis, leucopenia, aplastic anaemia; toxic epidermal necrolysis reported with concurrent colchicine

**Dose**
- Used with cidofovir, see section 5.3.2.2

**Probenecid (Non-proprietary)**

**Tablets**, probenecid 500 mg. Label: 12, 21, 27

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 939
Dose
- Initially 100–200 mg daily with food (or milk) increasing over 2–3 weeks to 600 mg daily (rarely 800 mg daily), continued until serum uric acid concentration normal then reduced for maintenance (maintenance dose may be as low as 200 mg daily)

Anturan® (Amdipharm)
Tablets, both yellow, s/c, sulfinpyrazone 100 mg, net price 84-tab pack = £5.66; 200 mg, 84-tab pack = £11.25. Label: 12, 21

Hyperuricaemia associated with cytotoxic drugs
Allopurinol is used to prevent hyperuricaemia associated with cytotoxic drugs—see section 8.1 (Hyperuricaemia) and Allopurinol above.

Rasburicase is licensed for the prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and a high tumour burden at risk of rapid lysis.

**RASBURICASE**

**Indications** prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

**Cautions** monitor closely for hypersensitivity; atopic allergies; may interfere with test for uric acid—consult product literature

**Contra-indications** G6PD deficiency (section 9.1.5); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** fever; less commonly nausea, vomiting, diarrhoea, constipation, rash, bronchospasm and anaphylaxis; haemolytic anaemia, methaemoglobinaemia

**Dose**
- **ADULT** over 18 years, 1.25 g once daily; review treatment if no benefit after 2–3 months

Alateris® (Pharmexx UK)
Tablets, glucosamine (as hydrochloride) 625 mg, net price 60-tab pack = £18.40

10.2 Drugs used in neuromuscular disorders

10.2.1 Drugs that enhance neuromuscular transmission

**Anticholinesterases** are used as first-line treatment in ocular myasthenia gravis and as an adjunct to immunosuppressant therapy for generalised myasthenia gravis.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thyromectomy.

**Anticholinesterases**

Glucosamine is a natural substance found in mucopolysaccharides, mucoproteins, and chitin. It is licensed for symptomatic relief of mild to moderate osteoarthritis of the knee, but the mechanism of action is not understood.

The Scottish Medicines Consortium (p. 3) has advised (May 2008) that glucosamine (Alateris®) is not recommended for use within NHS Scotland for the symptomatic relief of mild to moderate osteoarthritis of the knee.

**Anticholinesterases**

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secre-
tions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine.

**Edrophonium** has a very brief action and it is therefore used mainly for the diagnosis of myasthenia gravis. However, such testing should be performed only by those experienced in its use; other means of establishing the diagnosis are available. A single test-dose usually causes substantial improvement in muscle power (lasting about 5 minutes) in patients with the disease (if respiration already impaired, *only* in conjunction with someone skilled at intubation).

Edrophonium can also be used to determine whether a patient with myasthenia is receiving inadequate or excessive treatment with cholinergic drugs. If treatment is excessive an injection of edrophonium will either have no effect or will intensify symptoms (if respiration already impaired, *only* in conjunction with someone skilled at intubation). Conversely, transient improvement may be seen if the patient is being inadequately treated. The test is best performed just before the next dose of anticholinesterase.

**Neostigmine** produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an anti-cholinergic drug such as atropine or propantheline may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. The maximum that most patients can tolerate is 180 mg daily.

**Pyridostigmine** is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastro-intestinal effect but an antimuscarinic drug may still be necessary (particularly with age). Pyridostigmine is preferable to neostigmine because of its smoother action and the need for less frequent dosage. Pyridostigmine is less powerful and slower in action than neostigmine but it has a longer duration of action.

**Distigmine** has the longest action but the danger of a cholinergic crisis caused by accumulation of the drug is greater than with shorter-acting drugs; it is rarely used in the management of myasthenia gravis.

Neostigmine and edrophonium are also used to reverse the actions of the non-depolarising neuromuscular blocking drugs (see section 15.1.6).

### Side-effects

- Nausea, vomiting, increased salivation, diarrhoea, abdominal cramps (more marked with higher doses); signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation and micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

### Dose

- **By mouth**, neostigmine bromide 15–30 mg at suitable intervals throughout day, total daily dose 75–300 mg (but see also notes above); **NEOSTIGMINE** 1–5 mg every 4 hours, half an hour before feeds; **CHILD** up to 6 years initially 7.5 mg, 6–12 years initially 15 mg, usual total daily dose 15–90 mg

- **By subcutaneous or intramuscular injection**, ADULT and **CHILD** over 12 years, neostigmine metilsulfate 1–2.5 mg at suitable intervals throughout day (usual total daily dose 5–20 mg); **NEOSTIGMINE** 150 micrograms/kg every 6–8 hours 30 minutes before feeds, increased to max. 300 micrograms/kg every 4 hours, if necessary [unlicensed]; **CHILD** 1 month–12 years 200–500 micrograms as required

**Neostigmine** (Non-proprietary) (PFI)

- Tablets, scored, neostigmine bromide 15 mg, net price 20 = £7.29

- **Injection**, neostigmine metilsulfate 2.5 mg/mL, net price 1 mL amp = 57p

### Distigmine Bromide

**Indications** myasthenia gravis (but rarely used); urinary retention and other indications (section 7.4.1)

**Cautions** see section 7.4.1

**Contra-indications** see section 7.4.1

**Side-effects** see section 7.4.1

**Dose**

- Initially 5 mg daily half an hour before breakfast, increased at intervals of 3–4 days if necessary to a max. of 20 mg daily; **CHILD** up to 10 mg daily according to age

**Preparations**

Section 7.4.1

### Edrophonium Chloride

**Indications** see under Dose and notes above; reversal of non-depolarising neuromuscular blockade and diagnosis of dual block (section 15.1.6)

**Cautions** see under Neostigmine; have resuscitation facilities; *extreme* caution in respiratory distress (see notes above) and in asthma

**Note** Severe cholinergic reactions can be counteracted by injection of atropine sulphate (which should always be available)

**Contra-indications** see under Neostigmine

**Side-effects** see under Neostigmine

**Dose**

- Diagnosis of myasthenia gravis, *by intravenous injection*, 2 mg followed after 30 seconds (if no adverse reaction has occurred) by 8 mg; in adults without suitable veins, *by intramuscular injection*, 10 mg

- Detection of overdosage or underdosage of cholinergic drugs, *by intravenous injection*, 2 mg (prefer-
ably just before next dose of anticholinesterase, see notes above)

- **CHILD** by intravenous injection, 20 micrograms/kg followed after 30 seconds (if no adverse reaction has occurred) by 80 micrograms/kg

**Edrophonium** (Cambridge) NW
Injection, edrophonium chloride 10 mg/mL, net price 1-mL amp = £7.86

### PYRIDOSTIGMINE BROMIDE

**Indications** myasthenia gravis

**Cautions** see under Neostigmine; weaker muscarinic action

**Contra-indications** see under Neostigmine

**Side-effects** see under Neostigmine

**Dose**

- **By mouth**, 30–120 mg at suitable intervals throughout day, total daily dose 0.3–1.2 g (but see also notes above); **NEONATE** 5–10 mg every 4 hours, 30–60 minutes before feeds; **CHILD** up to 6 years initially 30 mg, 6–12 years initially 60 mg, usual total daily dose 30–360 mg

**Mestinon®** (Valeant) SW
Tablets, scored, pyridostigmine (as bromide) 60 mg, net price 20 = £4.81

---

### Immunosuppressant therapy

**Corticosteroids** (section 6.3) are established as treatment for myasthenia gravis; although they are commonly given on alternate days there is little evidence of benefit over daily administration. Corticosteroid treatment is usually initiated under in-patient supervision and all patients should receive osteoporosis prophylaxis (section 6.6).

In **generalised myasthenia gravis** small initial doses of prednisolone (10 mg on alternate days) are increased in steps of 10 mg on alternate days to 1–1.5 mg/kg (max. 100 mg) on alternate days. When given daily, prednisolone is started at 5 mg daily and then increased in steps of 5 mg daily to 60 mg daily or occasionally up to 80 mg daily (0.75–1 mg/kg daily). About 10% of patients experience a transient but very serious worsening of symptoms in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. However, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days. Smaller doses of corticosteroid are usually required in **ocular myasthenia**. Once clinical remission has occurred (usually after 2–6 months), the dose of prednisolone should be reduced slowly to the minimum effective dose (usually 10–40 mg on alternate days).

In **generalised myasthenia gravis** azathioprine (section 8.2.1) is usually started at the same time as the corticosteroid and it allows a lower maintenance dose of the corticosteroid to be used; azathioprine is initiated at a low dose, which is increased over 3–4 weeks to 2–2.5 mg/kg daily. Ciclosporin (section 8.2.2), methotrexate (section 8.1.3), or mycophenolate mofetil (section 8.2.1) can be used in patients unresponsive or intolerant to other treatments (unlicensed indications).

---

### BACLOFEN

**Indications** chronic severe spasticity resulting from disorders such as multiple sclerosis or traumatic partial section of spinal cord

**Cautions** psychiatric illness, Parkinson's disease, cerebrovascular disease, elderly; respiratory impairment, epilepsy; history of peptic ulcer (avoid oral route in active peptic ulceration); diabetes; hypertonic bladder sphincter; renal impairment (Appendix 3); pregnancy (Appendix 4); avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions, see also under Withdrawal below); **interactions**: Appendix 1 (muscle relaxants)

**Withdrawal** CSM has advised that serious side-effects can occur on abrupt withdrawal; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms worsen)

**Side-effects** gastro-intestinal disturbances, dry mouth; hypotension, respiratory or cardiovascular depression; sedation, drowsiness, confusion, dizziness, ataxia, hallucinations, nightmares, headache, euphoria, insomnia, depression, anxiety, agitation, tremor; seizure; urinary disturbances; myalgia; nys-\n
---

### 10.2.2 Skeletal muscle relaxants

The drugs described below are used for the relief of chronic muscle spasm or spasticity associated with multiple sclerosis or other neurological damage; they are not indicated for spasm associated with minor injuries. They act principally on the central nervous system with the exception of dantrolene, which has a peripheral site of action. They differ in action from the muscle relaxants used in anaesthesia (section 15.1.5), which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splitting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

**Dantrolene** acts directly on skeletal muscle and produces fewer central adverse effects making it a drug of choice. The dose should be increased slowly.

**Baclofen** inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

**Diazepam** can also be used. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties. Muscle-relaxant doses of benzodiazepines are similar to anxiolytic doses (section 4.1.2).

**Tizanidine** is an alpha -adrenoceptor agonist indicated for spasticity associated with multiple sclerosis or spinal cord injury.
tagmus; visual disorders; rash, hyperhidrosis; rarely taste disturbances, abdominal pain, paraesthesia, erectile dysfunction, dysarthria; very rarely hypothermia

**Dose**

- **By mouth**, 5 mg 3 times daily, preferably with or after food, gradually increased; max. 100 mg daily (discontinue if no benefit within 6 weeks); **CHILD** 0.75–2 mg/kg daily (over 10 years, max. 2.5 mg/kg daily) or 2.5 mg 4 times daily increased gradually according to age to maintenance: 1–2 years 10–20 mg daily, 2–6 years 20–30 mg daily, 6–10 years 30–60 mg daily

- **By intrathecal injection**, see preparation below

**Baclofen** (Non-proprietary) Tablets, baclofen 10 mg, net price 84-tab pack = £1.65. Label: 2, 8 Oral solution, baclofen 5 mg/5 mL, net price 300 mL = £8.95. Label: 2, 8 Brands include Lylex (sugar-free)

**Lioresal** (Novartis) Tablets, scored, baclofen 10 mg, net price 84-tab pack = £10.84. Label: 2, 8 Excipients include gluten Liquid, sugar-free, raspberry-flavoured, baclofen 5 mg/5 mL, net price 300 mL = £8.95. Label: 2, 8

**By intrathecal injection**

**Lioresal** (Novartis) Intrathecal injection, baclofen, 50 micrograms/mL, net price 1-mL amp (for test dose) = £2.74; 50 micrograms/mL, 20-mL amp (for use with implantable pump) = £60.77; 2 mg/mL, 5-mL amp (for use with implantable pump) = £60.77 Important Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use

Dose by intrathecal injection, specialist use only, severe chronic spasticity unresponsive to oral antispastic drugs (or where side-effects of oral therapy unacceptable) or as alternative to ablative neurosurgical procedures, initial test dose 25–50 micrograms over at least 1 minute via catheter or lumbar puncture, increased in 25-microgram steps (not more often than every 24 hours) to max. 100 micrograms to determine appropriate dose then dose-adjustment phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose (ranging from 12 micrograms to 2 mg daily for spasticity of spinal origin or 22 micrograms to 1 mg daily for spasticity of cerebral origin) retaining some spasticity to avoid sensation of paralysis; **CHILD** 4–18 years (spasticity of cerebral origin only), initial test dose 25 micrograms then titrated as for **ADULT** to maintenance dose (ranging from 24 micrograms to 1.2 mg daily in children under 12 years)

**DANTROLENE SODIUM**

**Indications** chronic severe spasticity of voluntary muscle; malignant hyperthermia (section 15.1.8)

**Caution** impaired cardiac and pulmonary function; therapeutic effect may take a few weeks to develop—discontinue if no response within 45 days; **Interactions**: Appendix 1 (muscle relaxants). **Hepatotoxicity** Potentially life-threatening hepatotoxicity reported, usually if doses greater than 400 mg daily used, in females, patients over 30 years, if history of liver disorders, or concomitant use of hepatotoxic drugs; test liver function before and at intervals during therapy—discontinue if abnormal liver function tests or symptoms of liver disorder (counselling, see below); re-introduce only if complete reversal of hepatotoxicity

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop. **Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-Indications** hepatic impairment (may cause severe liver damage); acute muscle spasm; avoid when spasticity is useful, for example, locomotion; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-Effects** diarrhoea (withdraw if severe, discontinue treatment if recurs on re-introduction), nausea, vomiting, anorexia, hepatotoxicity (see above), abdominal pain; pericarditis; pleural effusion, respiratory depression; headache, drowsiness, dizziness, asthenia, fatigue, seizures, fever, chills; speech and visual disturbances; rash; less commonly dysphagia, constipation, exacerbation of cardiac insufficiency, tachycardia, erratic blood pressure, dysphonia, depression, confusion, nervousness, insomnia, increased urinary frequency, urinary incontinence or retention, haematuria, crystalluria, and increased sweating

**Dose**

- Initially 25 mg daily, may be increased at weekly intervals to max. 100 mg 4 times daily; usual dose 75 mg 3 times daily; **CHILD** 5–18 years see **BNF** for Children

Dant瑞m® (Procter & Gamble Pharm.) Capsules, orange/brown, dantrolene sodium 25 mg, net price 20 = £2.46; 100 mg, 20 = £8.61. Label: 2, counselling, driving, hepatotoxicity

**DIAZEPAM**

**Indications** muscle spasm of varied aetiology, including tetanus; other indications (section 4.1.2, section 4.8, section 15.1.4.1)

**Cautions** see section 4.1.2; special precautions for intravenous injection (section 4.8.2)

**Contra-Indications** see section 4.1.2

**Side-Effects** see section 4.1.2; also hypotonia

**Dose**

- Muscle spasm, by mouth, 2–15 mg daily in divided doses, increased if necessary in spastic conditions to 60 mg daily according to response

Cerebral spasticity in selected cases, **CHILD** 2–40 mg daily in divided doses

By intramuscular or by slow intravenous injection (into a large vein at a rate of not more than 5 mg/minute), in acute muscle spasm, 10 mg repeated if necessary after 4 hours

**Note** Only use intramuscular route when oral and intravenous routes not possible; special precautions for intravenous injection see section 4.8.2

- **Tetanus**, **ADULT** and **CHILD**, by intravenous injection, 100–300 micrograms/kg repeated every 1–4 hours; by intravenous infusion (or by nasoduodenal tube), 3–10 mg/kg, over 24 hours, adjusted according to response

**Preparations** Section 4.1.2

**TIZANIDINE**

**Indications** spasticity associated with multiple sclerosis or spinal cord injury or disease

**Caution** elderly; monitor liver function monthly for first 4 months and in those who develop unexplained nausea, anorexia or fatigue; concomitant administra-
Cautions hepatic impairment (Appendix 2); renal short-term symptomatic relief of muscle Carisoma.

Dose see under Meprobamate (section 4.1.2); Side-effects see under Meprobamate (section Contra-indications see under Meprobamate (section 4.1.2); Cautions see under Meprobamate (section Indications short-term symptomatic relief of muscle spasms but see notes above)

Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feathering (Appendix 5); Interactions Appendix 1 (muscle relaxants)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications severe hepatic impairment Side-effects drowsiness, fatigue, dizziness, dry mouth, nausea, gastro-intestinal disturbances, hypotension; also reported, bradycardia, insomnìa, hallucinations and altered liver enzymes (discontinue if persistently raised—consult product literature); rarely acute hepatitis

Dose Adults over 18 years, initially 2 mg daily as a single dose increased according to response at intervals of at least 3–4 days in steps of 2 mg daily (and given in divided doses) usually up to 24 mg daily in 3–4 divided doses; max. 36 mg daily

Tizanidine (Non-proprietary) Tablets, tizanidine (as hydrochloride) 2 mg net price 120-tab pack = £14.97; 4 mg, 120-tab pack = £21.76. Label: 2

Zanaflex® (Cephalon) Tablets, scored, tizanidine (as hydrochloride) 2 mg, net price 120-tab pack = £63.00; 4 mg, 120-tab pack = £80.00. Label: 2

Other muscle relaxants

The clinical efficacy of carisoprodol, meprobamate (section 4.1.2), and methocarbamol as muscle relaxants is not well established, although they have been included in compound analgesic preparations.

Carisoprodol is to be withdrawn from the market and the MHRA/CHM have advised that treatment with carisoprodol should no longer be started; patients who are already receiving it should have their treatment reviewed. However, carisoprodol should not be stopped abruptly because a withdrawal syndrome may occur.

CARISOPRODOL

Indications short-term symptomatic relief of muscle spasm (but see notes above)

Cautions see under Meprobamate (section 4.1.2); breast-feeding (Appendix 5); Interactions Appendix 1 (muscle relaxants)

Contra-indications see under Meprobamate (section 4.1.2)

Side-effects seen under Meprobamate (section 4.1.2); drowsiness is common

Dose see notes above; 350 mg 3 times daily; Elderly half adult dose or less

Carisoma® (Forest) Tablets, carisoprodol 125 mg, net price 100 = £6.65; 350 mg, 100 = £7.45. Label: 2

METHOCARBAMOL

Indications short-term symptomatic relief of muscle spasm (but see notes above)

Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); severe hepatic impairment

Side-effects nausea, vomiting, dyspepsia; hyper-sensitivity reactions (including urticaria, angioedema, anaphylaxis); fever, headache, drowsiness, dizziness, confusion, amnesia, restlessness, anxiety, tremor, seizures; blurred vision, nasal congestion; rash, pru- ritus; leucopenia, cholestatic jaundice

Dose 1.5 g 4 times daily; may be reduced to 750 mg 3 times daily; Elderly up to 750 mg 4 times daily may be sufficient; Child not recommended

Robaxin® (Shire) Tablets 750 Tablets, f/c, scored, methocarbamol 750 mg, net price 20 = £2.53. Label: 2

Nocturnal leg cramps

Quinine salts (section 5.4.1) 200–300 mg at bedtime are effective in reducing the frequency of nocturnal leg cramps by about 25% in ambulatory patients. It may take up to 4 weeks for improvement to become apparent; if there is benefit, quinine treatment can be continued. Patients should be monitored closely during the early stages for adverse effects as well as for benefit. Treatment should be interrupted at intervals of approximately 3 months to assess the need for further quinine treatment. Quinine is toxic in overdosage and accidental fatalities have occurred in children (see also below).

QUININE

Indications see notes above; malaria (section 5.4.1)

Cautions see section 5.4.1 and notes above

Contra-indications see section 5.4.1

Side-effects see section 5.4.1; important: very toxic in overdosage—immediate advice from poison centres essential (see also p. 32)

Dose see notes above

Preparations Section 5.4.1

10.3 Drugs for the relief of soft-tissue inflammation

10.3.1 Enzymes Rubefacients and other topical antirheumatics

Extravasation

Local guidelines for the management of extravasa- tion should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intra- venous fluids from the veins or inadvertent administra-
tation into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis. Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. In addition, certain patients such as the very young and the elderly are at increased risk. Those receiving anti-coagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

**Prevention of extravasation** Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and patients receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration. Placing a glyceryl trinitrate patch (section 2.6.1) distal to the cannula may improve the patency of the vessel in patients with small veins or in those whose veins are prone to collapse. Patients should be asked to report any pain or burning at the site of injection immediately.

**Management of extravasation** If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy. **Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone or dexamethasone (section 6.3.2) can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. **Antihistamines** (section 3.4.1) and **analgesics** (section 4.7) may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. **Rubefacients** (e.g. capsaicin, ibuprofen, ketoprofen, and piroxicam) may provide some relief of pain in musculoskeletal conditions; they act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method which itself produces irritation of the skin. Counter-irritation is comforting in painful lesions of the muscles, tendons, and joints, and in non-articular rheumatism. Rubefacients probably all act through the same essential mechanism and differ mainly in intensity and duration of action.

**Hyaluronidase**

**Indications** enhance permeation of subcutaneous or intramuscular injections, local anaesthetics and subcutaneous infusions; promote resorption of excess fluids and blood

**Cautions** infants or elderly (control speed and total volume and avoid overhydration especially in renal impairment)

**Contra-indications** do not apply direct to cornea; avoid sites where infection or malignancy; not for anaesthesia in unexplained premature labour; not to be used to reduce swelling of bites or stings; not for intravenous administration

**Side-effects** oedema; rarely local irritation, infection, bleeding, bruising; occasional severe allergy (including anaphylaxis)

**Dose**
- With subcutaneous or intramuscular injection, 1500 units dissolved directly in solution to be injected (ensure compatibility)
- With local anaesthetics, 1500 units mixed with local anaesthetic solution (ophthalmology, 15 units/mL)
- Hypodermoclysis, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, administered before start of 500–1000 mL infusion fluid
- Extravasation (see notes above) or haematoma, 1500 units dissolved in 1 mL water for injections or 0.9% sodium chloride injection, infiltrated into affected area (as soon as possible after extravasation)

**Hyalase** (CP) (HAI)

**Injection**, powder for reconstitution, hyaluronidase (ovine). Net price 1500-unit amp = £7.60

**Rubefacients and other topical antirheumatics**

Rubefacients act by counter-irritation. Pain, whether superficial or deep-seated, is relieved by any method which itself produces irritation of the skin. Counter-irritation is comforting in painful lesions of the muscles, tendons, and joints, and in non-articular rheumatism. Rubefacients probably all act through the same essential mechanism and differ mainly in intensity and duration of action.

The use of a NSAID by mouth is effective for relieving musculoskeletal pain. **Topical NSAIDs** (e.g. felbinac, ibuprofen, ketoprofen, and piroxicam) may provide some relief of pain in musculoskeletal conditions; they can be considered as an adjunctive treatment in knee or hand osteoarthritis (see section 10.1).

A preparation containing capsaicin 0.025% is licensed for the symptomatic relief of osteoarthritis. It may need to be used for 1–2 weeks before pain is relieved. A
higher strength of capsaicin 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia (section 4.7.3) after lesions have healed, and for the relief of painful diabetic neuropathy (section 6.1.5).

**Topical NSAIDs and counter-irritants**

**Cautions** Apply with gentle massage only. Avoid contact with eyes, mucous membranes, and inflamed or broken skin; discontinue if rash develops. Hands should be washed immediately after use. Not for use with occlusive dressings. Topical application of large amounts can result in systemic effects, including hypersensitivity and asthma (renal disease has also been reported). Not generally suitable for children. Patient packs carry a warning to avoid during pregnancy or breast-feeding.

**Hypersensitivity** For NSAID hypersensitivity and asthma warning, see p. 553 and p. 554

**Photosensitivity** Patients should be advised against excessive exposure to sunlight of area treated in order to avoid possibility of photosensitivity

**Ketoprofen** (Non-proprietary) (£W)

- **Gel**, ketoprofen 2.5%, net price 30 g = £2.42, 50 g = £3.06, 100 g = £2.60.
- **Dose** apply 2–4 times daily for up to 7 days (usual max. 15 g daily).

**Piroxicam** (Non-proprietary) (£W)

- **Gel**, piroxicam 0.5%, net price 60 g = £1.65; 112 g = £2.65.
- **Dose** apply 3–4 times daily.

**Proprietary preparations**

**Feldene** (Pfizer) (£W)

- **Gel**, piroxicam 0.5%. Net price 60 g = £6.00; 112 g = £9.41 (also 7.5 g starter pack, hosp. only).
- **Excipients** include benzyl alcohol, propylene glycol.
- **Dose** apply 3–4 times daily; therapy should be reviewed after 4 weeks.

**Fenbid** (Forté) (£W)

- **Foam**, ibuprofen 10%, net price 100 g = £6.50.
- **Excipients** include benzyl alcohol.
- **Dose** apply up to 4 times daily; therapy should be reviewed after 14 days.

1. **Smaller pack sizes available on sale to the public.

**Ibugel** (Dermal) (£W)

- **Gel**, ibuprofen 10%, net price 100 g = £6.05.
- **Excipients** none as listed in section 13.1.3
- **Dose** apply up to 3 times daily.

2. **Orravil** (Rhône-Poulenc Rorer) (£W)

- **Gel**, ketoprofen 2.5%, net price 100 g = £5.87.
- **Excipients** include fragrance.
- **Dose** apply 2–4 times daily for up to 7 days (usual recommended dose 15 g daily).

1. **Smaller pack sizes available on sale to the public.

**Tralam** (Goldshield) (£W)

- **Foam**, felbinac 3.17%. Net price 100 g = £7.30.
- **Label** 15.
- **Excipients** include cetostearyl alcohol.
- **Gel**, felbinac 3%. Net price 100 g = £7.00.
- **Excipients** none as listed in section 13.1.3
- **Dose** apply 2–4 times daily, max. 25 g daily; therapy should be reviewed after 14 days.
- **Note** Felbinac is an active metabolite of the NSAID fenbufen.

\*\*Votarol Emulgel\*\* (Novartis) (£W)

- **Gel**, diclofenac diethylammonium salt 1.16% (equivalent to diclofenac sodium 1%), net price 20 g (hosp. only) = £1.55; 100 g = £7.00.
- **Excipients** include propylene glycol, fragrance.
- **Dose** apply 3–4 times daily; therapy should be reviewed after 14 days (or after 28 days for osteoarthritis).

1. **Smaller pack sizes available on sale to the public.

**Votarol Gel Patch** (Novartis) (£W)

- **Gel patch**, diclofenac epolamine (equivalent to 140 mg diclofenac sodium per patch), net price 10-patch pack = £14.09.
- **Excipients** include hydroxybenzoates (parabens), propylene glycol.
- **Dose** **ADULT** and **CHILD** over 15 years, ankle sprain, apply 1 patch daily for up to 3 days, epicondylitis, apply 1 patch twice daily for up to 14 days.
- **Note** The Scottish Medicines Consortium has advised (September 2005) that Votarol Gel Patch is not recommended for the treatment of pain in epicondylitis and ankle sprain.

**Capsaicin**

**Cautions** Avoid contact with eyes, and inflamed or broken skin. Hands should be washed immediately after use. Not for use under tight bandages. Avoid taking a hot shower or bath just before or after applying capsaicin—burning sensation enhanced.

**Side-effects** Transient burning sensation can occur during initial treatment, particularly if too much cream is used, or if the frequency of administration is less than 3–4 times daily.

**Zacin** (Cephalon) (£W)

- **Cream**, capsaicin 0.025%. Net price 45 g = £15.04.
- **Excipients** include benzyl alcohol, cetyl alcohol.
- **Dose** symptomatic relief in osteoarthritis, apply a small amount 4 times daily.

**Axsaín** (Cephalon) (£W)

- **Cream**, capsaicin 0.075%. Net price 45 g = £12.15.
- **Excipients** include benzyl alcohol, cetyl alcohol.
- **Dose** post-herpetic neuralgia (important: after lesions have healed), apply a small amount up to 3–4 times daily; for painful diabetic neuropathy, under supervision of hospital consultant, apply 3–4 times daily for 8 weeks then review.

**Poultices**

**Kaolin Poultice** (£)

- **Poultice**, heavy kaolin 52.7%, thymol 0.05%, boric acid 4.5%, peppermint oil 0.05%, methyl salicylate 0.2%, glycerol 42.5%. Net price 200 g = £2.44.
- **Dose** warm and apply directly or between layers of muslin; avoid application of overheated poultice.

**Kaolin Poultice K/L Pack** (£/l) (£)

- **Kaolin poultice** Net price 4 × 100-g pouches = £6.40.
11 Eye

11.1 Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. Where a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles; they are particularly useful for the elderly, visually impaired, arthritic, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; one drop is all that is needed. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow may occur when one immediately follows the other. The patient should therefore leave an interval of at least 5 minutes between the two.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

For warnings relating to eye drops and contact lenses, see section 11.9.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% solution (section 11.8.1) is usually used. Clean water will suffice in an emergency.

Other preparations

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy. The drug diffuses through the cornea and sclera to the anterior and posterior chambers and vitreous humour. However, because the dose-volume is limited (usually not more than 1 mL), this route is suitable only for drugs which are readily soluble.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.
11.2 Control of microbial contamination

Preparations for the eye should be sterile when issued. Eye drops in multiple-application containers include a preservative but care should nevertheless be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated).

Eye drops for use in hospital wards are normally discarded 1 week after first opening. Individual containers should be provided for each patient. A separate bottle should be supplied for each eye only if there are special concerns about contamination. Containers used before an operation should be discarded at the time of the operation and fresh containers supplied. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue eye-drop bottles that have been dispensed to the patient on the day of discharge.

In out-patient departments single-application packs should preferably be used; if multiple-application packs are used, they should be discarded at the end of each day. In clinics for eye diseases and in accident and emergency departments, where the dangers of infection are high, single-application packs should be used; if a multiple-application pack is used, it should be discarded after single use.

Diagnostic dyes (e.g., fluorescein) should be used only from single-application packs.

In eye surgery single-application containers should be used if possible; if a multiple-application pack is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not suitable for this purpose. For all surgical procedures, a previously unopened container is used for each patient.

11.3 Anti-infective eye preparations

11.3.1 Antibacterials

Bacterial infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol has a broad spectrum of activity and is the drug of choice for superficial eye infections. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin, levofloxacin, and ofloxacin; the aminoglycosides, gentamicin and neomycin [unlicensed] are also active against a wide variety of bacteria. Gentamicin, quinolones, and polymyxin B are effective for infections caused by Pseudomonas aeruginosa.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Trachoma which results from chronic infection with Chlamydia trachomatis can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamidine isetionate is of little value in bacterial infections but is specific for the rare but potentially devastating condition of acanthamoeba keratitis (see also section 11.9).

With corticosteroids Many antibacterial preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose (section 11.4).

Administration Frequency of application depends on the severity of the infection and the potential for irre-
versible ocular damage; antibacterial eye preparations are usually administered as follows:

**Eye drops** Apply 1 drop at least every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing.

**Eye ointment** Apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

### CHLORAMPHENICOL

**Indications** see notes above

**Side-effects** transient stinging; see also notes above

**Dose**

1. **Chloramphenicol** (Non-proprietary) 
   - **Eye drops**, chloramphenicol 0.5%. Net price 10 mL = £1.39
   - **Eye ointment**, chloramphenicol 1%. Net price 4 g = £1.63

1. Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days

**Chloromycetin** (Goldshield) 
- **Redidrops** (= eye drops), chloramphenicol 0.5%. Net price 5 mL = £1.65; 10 mL = £1.85
- **Ophthalmic ointment** (= eye ointment), chloramphenicol 1%. Net price 4 g = £1.85

### CIPROFLOXACIN

**Indications** superficial bacterial infections, see notes above; corneal ulcers

**Cautions** not recommended for children under 1 year; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** transient ocular irritation, visual disturbances, lid margin crusting, lid or conjunctival oedema, hyperaemia, conjunctival follicles, pho-

**Dose**

1. **Ciprofloxacin** (Non-proprietary) 
   - **Ophthalmic solution** (= eye drops), ciprofloxacin (as hydrochloride) 0.3%. Net price 5 mL = £4.94
   - **Eye ointment**, ciprofloxacin (as hydrochloride) 0.3%. Net price 3.5 g = £5.49

### FUSIDIC ACID

**Indications** see notes above

**Dose**

- See under preparation below

**Fucithalmic** (LEO) 
- **Eye drops**, m/r, fusidic acid 1% in gel basis (liquifies on contact with eye). Net price 5 g = £2.09
- **Excipients** include benzalkonium chloride, disodium edetate

**Dose** apply twice daily

### GENTAMICIN

**Indications** see notes above

**Dose**

- See Administration in notes above

**Genticin** (Roche) 
- **Drops** (for ear or eye), gentamicin 0.3% (as sulphate). Net price 10 mL = £1.78
- **Excipients** include benzalkonium chloride

### LEVOFLOXACIN

**Indications** see notes above

**Cautions** not recommended for children under 1 year; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** transient ocular irritation, visual disturbances, lid margin crusting, lid or conjunctival oedema, hyperaemia, conjunctival follicles, photo-

**Dose**

1. **Ofaquix** (Kestrel Ophthalmics) 
   - **Eye drops**, levofloxacin 0.5%, net price 5 mL = £6.95
   - **Excipients** include benzalkonium chloride

1. Levofloxacin 0.5% eye drops (in max. pack size 20 mL) and 0.5% single use units = £17.95

### NEOMYCIN SULPHATE

**Indications** see notes above

**Dose**

- See Administration in notes above

**Neomycin** (Non-proprietary) 
- **Eye drops**, neomycin sulphate 0.5% (3500 units/mL). Net price 10 mL = £2.31
- **Available from specialist importing companies, p. 939**
- **Eye ointment**, neomycin sulphate 0.5% (3500 units/g). Net price 3 g = £2.44
- **Available from specialist importing companies, p. 939**

1. **With other antibacterials**
   - **Neosporin** (PL/VA) 
     - **Eye drops**, gramicidin 25 units, neomycin sulphate 1700 units, polymyxin B sulphate 5000 units/mL. Net price 5 mL = £4.86
     - **Excipients** include thiomersal
     - **Dose** apply 2–4 times daily or more frequently if required

1. **With hydrocortisone**
   - Section 12.1.1
OFLOXACIN

Indications see notes above
Cautions pregnancy (Appendix 4); breastfeeding (Appendix 5)
Side-effects local irritation including photophobia; dizziness, numbness, nausea and headache reported
Dose
- Apply every 2–4 hours for the first 2 days then reduce frequency to 4 times daily (max. 10 days treatment)
Exocop® (Allergan)  
Ophthalmic solution (= eye drops), ofloxacin 0.3%. Net price 5 mL = £2.17
Excipients include benzalkonium chloride

POLYMIXIN B SULPHATE

Indications see notes above
Side-effects local irritation and dermatitis
Dose
- See Administration in notes above
With other antibacterials Polyfax® (PLIVA)  
Eye ointment, polymyxin B sulphate 10 000 units, bacitracin zinc 500 units/g. Net price 4 g = £3.26

PROPAMIDINE ISETIONATE

Indications local treatment of infections (but see notes above)
Dose
- See preparations
Brolene® (Aventis Pharma)  
Eye drops, propamidine isetionate 0.1%. Net price 10 mL = £2.80
Excipients include benzalkonium chloride
Dose apply 4 times daily
Note Eye drops containing propamidine isetionate 0.1% also available from Typharm (Golden Eye Drops)
Eye ointment, dibromopropamidine isetionate 0.15%. Net price 5 g = £2.92
Dose apply 1–2 times daily
Note Eye ointment containing dibromopropamidine isetionate 0.15% also available from Typharm (Golden Eye Ointment)

11.4 Corticosteroids and other anti-inflammatory preparations

11.4.1 Corticosteroids

11.4.2 Other anti-inflammatory preparations

11.3.2 Antifungals

Fungal infections of the cornea are rare but can occur after agricultural injuries, especially in hot and humid climates. Orbital mycosis is rarer, and when it occurs it is usually because of a direct spread of infection from the paranasal sinuses. Increasing age, debility, or immunosuppression may encourage fungal proliferation. The spread of infection through blood occasionally produces a metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they may be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, City Road, London EC1V 2PD (tel. (020) 7253 3411).

11.3.3 Antvirals

Hepatitis infections producing, for example, dendritic corneal ulcer can be treated with aciclovir. Slow-release ocular implants containing ganciclovir (available on a named-patient basis from specialist importing companies, see p. 924) may be inserted surgically to treat immediate sight-threatening CMV retinitis. Local treatments do not protect against systemic infection or infection in the other eye. For systemic treatment of CMV retinitis, see section 5.3.2.2.

ACICLOVIR  
(Acyclovir)

Indications local treatment of herpes simplex infections
Side-effects local irritation and inflammation, superficial punctate keratopathy; rarely blepharitis; very rarely hypersensitivity reactions including angioedema
Dose
- Apply 5 times daily (continue for at least 3 days after complete healing)
Zovirax® (GSK)  
Eye ointment, aciclovir 3%. Net price 4.5 g = £9.92
Tablets, section 5.3.2.1
Injection, section 5.3.2.1
Cream, section 13.10.3
surgery to reduce inflammation and prevent infection; use of combination products is otherwise rarely justified. Systemic corticosteroids (section 6.3.2) may be useful for ocular conditions. The risk of producing a ‘steroid cataract’ increases with the dose and duration of corticosteroid use.

The Scottish Medicines Consortium (p. 3) has advised (May 2008) that loteprednol etabonate 0.5% eye drops (Lotemax®) are not recommended for use within NHS Scotland.

### BETAMETHASONE

**Indications**  local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- Apply eye drops every 1–2 hours until controlled then reduce frequency; apply eye ointment 2–4 times daily or at night when used with eye drops

**Betnesol®** (UCB Pharma) (**BN**)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.32

**Exipients** include benzalkonium chloride, disodium edetate

**Eye ointment**, betamethasone sodium phosphate 0.1%. Net price 3 g = £1.41

**Vistamethasone®** (Martindale) (**BN**)

**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

**Exipients** include benzalkonium chloride

With neomycin

**Betnesol-N®** (UCB Pharma) (**BN**)

**Drops** (for ear, eye, or nose), see section 12.1.1

**Eye ointment**, betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 3 g = £1.28

**Vistamethasone N®** (Martindale) (**BN**)

**Drops** (for ear, eye, or nose), see section 12.1.1

### DEXAMETHASONE

**Indications**  local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- Apply eye drops every 30–60 minutes until controlled then reduce frequency to 4–6 times daily

**Maxidex®** (Alcon) (**BN**)

**Eye drops**, dexamethasone 0.1%, hypromellose 0.5%. Net price 5 mL = £1.49; 10 mL = £2.95

**Exipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Single use**

**Minims® Dexamethasone** (Chauvin) (**BN**)

**Eye drops**, dexamethasone sodium phosphate 0.1%. Net price 20 × 0.5 mL = £6.95

**Exipients** include disodium edetate

With antibacterials

**Maxitrol®** (Alcon) (**BN**)

**Eye drops**, dexamethasone 0.1%, neomycin 0.35% (as sulphate), polymyxin B sulphate 6000 units/mL. Net price 5 mL = £1.77

**Exipients** include benzalkonium chloride, polysorbate 20

**Eye ointment**, dexamethasone 0.1%, neomycin 0.35% (as sulphate), polymyxin B sulphate 6000 units/g. Net price 3.5 g = £1.52

**Exipients** include hydrocortisone (pamabrom), wool fat

**Dose** apply 3–4 times daily or at night when used with eye drops

**Sofradex®** (Sanofi-Aventis) (**BN**)

**Eye drops**, dexamethasone 0.1%, tobramycin 0.3%. Net price 5 mL = £5.65

**Exipients** include benzalkonium chloride, disodium edetate

### FLUOROMETHOLONE

**Indications**  local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- Apply every hour for 24–48 hours then reduce frequency to 2–4 times daily

**FML®** (Allergan) (**BN**)

**Ophthalmic suspension** (= eye drops), fluorometholone 0.1%, polyvinyl alcohol (Liquifilm®) 1.4%. Net price 5 mL = £1.71; 10 mL = £2.95

**Exipients** include benzalkonium chloride, disodium edetate, polysorbate 80

### HYDROCORTISONE ACETATE

**Indications**  local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- Apply eye drops every 30–60 minutes until controlled then reduce frequency to every 4 hours

**Hydrocortisone** (Non-proprietary) (**BN**)

**Eye drops**, hydrocortisone acetate 1%. Net price 10 mL = £8.61

**Eye ointment**, hydrocortisone acetate 0.5%, net price 3 g = £2.40; 1%, 3 g = £2.42; 2.5%, 3 g = £6.55

With neomycin

**Neo-Cortef®** (PLIVA) (**BN**)

**Ointment** (for ear or eye), see section 12.1.1

**Note** May be difficult to obtain

**Dose** apply 2–3 times daily

### LOTEPREDNOL ETABONATE

**Indications**  treatment of post-operative inflammation following ocular surgery

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- Apply 4 times daily starting 24 hours after surgery; max. duration of treatment 14 days
PREDNISOLONE

**Indications** local treatment of inflammation (short-term)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**
- Apply every 1–2 hours until controlled then reduce frequency

**Predsol®** (UCB Pharma) (£)
- **Drops** (for ear or eye), prednisolone sodium phosphate 0.5%. Net price 10 mL = £2.00
  - Excipients include benzalkonium chloride, disodium edetate

**Pred Forte®** (Allergan) (£)
- **Eye drops**, prednisolone acetate 1%. Net price 5 mL = £1.52; 10 mL = £3.05
  - Excipients include benzalkonium chloride, disodium edetate, polysorbate 80

**Predsol-N®** (UCB Pharma) (£)
- **Drops** (for ear or eye), see section 12.1.1
  - Excipients include benzalkonium chloride, disodium edetate, polyvinylpyrrolidone

**Single use**

**Minims® Prednisolone Sodium Phosphate** (Chauvin) (£)
- **Eye drops**, prednisolone sodium phosphate 0.5%. Net price 20 × 0.5 mL = £5.75
  - Excipients include disodium edetate

**With neomycin**

**Predsol-N Emadine®** (Alcon) (£)
- **Opthalmic suspension** include benzalkonium chloride, disodium edetate

**AZELASTINE HYDROCHLORIDE**

**Indications** allergic conjunctivitis

**Side-effects** mild transient irritation; bitter taste reported

**Dose**
- Seasonal allergic conjunctivitis, **ADULT** and **CHILD** over 4 years, apply twice daily, increased if necessary to 4 times daily
- Perennial conjunctivitis, **ADULT** and **ADOLESCENT** over 12 years, apply twice daily, increased if necessary to 4 times daily; max. duration of treatment 6 weeks

**Optilast®** (Viatris) (£)
- **Eye drops**, azelastine hydrochloride 0.05%. Net price 8 mL = £6.40
  - Excipients include benzalkonium chloride, disodium edetate

**Note** Azelastine 0.05% eye drops can be sold to the public (in max. pack size of 6 mL) for treatment of seasonal and perennial allergic conjunctivitis in adults and children over 12 years

**EMEDASTINE**

**Indications** seasonal allergic conjunctivitis

**Side-effects** transient burning or stinging; blurred vision, local oedema, keratitis, irritation, dry eye, lacrimation, corneal infiltrates (discontinue) and staining; photophobia; headache, and rhinitis occasionally reported

**Dose**
- **ADULT** and **CHILD** over 3 years, apply twice daily

**Emedine®** (Alcon) (£)
- **Eye drops**, emedastine 0.05% (as difumarate), net price 5 mL = £7.69
  - Excipients include benzalkonium chloride

**EPINASTINE HYDROCHLORIDE**

**Indications** seasonal allergic conjunctivitis

**Side-effects** burning; less commonly dry mouth, taste disturbance; nasal irritation, rhinitis; headache, blepharoconjunctivitis, conjunctival oedema and hyperaemia.

Other preparations used for the topical treatment of inflammation and allergic conjunctivitis include antihistamines, lodoxamide, and sodium cromoglicate.

Eye drops of antihistamines such antazoline (with xylometazoline as Otrivine-Antistin®), azelastine, epinastine, ketotifen and olopatadine may be used for allergic conjunctivitis.

**Sodium cromoglicate** (sodium cromoglycate) and nedocromil sodium eye drops can be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Diclofenac eye drops (section 11.8.2) and emedastine eye drops are also licensed for seasonal allergic conjunctivitis.
dry eye, local irritation, photophobia, visual disturbance; pruritus

**Dose**
- **ADULT** and **preadolescent** over 12 years, apply twice daily; max. duration of treatment 8 weeks

**Relestat** (Allergan) **(F)***

*Eye drops*, epinastine hydrochloride 500 micrograms/mL, net price 5 mL = £9.90

**Excipients** include benzalkonium chloride, disodium edetate

**KETOTIFEN**

**Indications** seasonal allergic conjunctivitis

**Side-effects** burning or stinging, punctate corneal epithelial erosions; less commonly dry eye, subconjunctival haemorrhage, photophobia; headache, drowsiness, skin reactions, and dry mouth also reported

**Dose**
- **ADULT** and **CHILD** over 3 years, apply twice daily

**Zaditen** (Novartis) **(F)***

*Eye drops*, ketotifen (as fumarate) 250 micrograms/mL, net price 5 mL = £9.75

**Excipients** include benzalkonium chloride

**LODOXAMIDE**

**Indications** allergic conjunctivitis

**Side-effects** burning, stinging, itching, and lacrimation; flushing and dizziness reported

**Dose**
- **ADULT** and **CHILD** over 4 years, apply 4 times daily

**Alomide** (Alcon) **(F)***

*Ophthalmic solution* (= eye drops), lodoxamide 0.1% (as trometamol). Net price 10 mL = £5.48

**Excipients** include benzalkonium chloride, disodium edetate

**Note** Lodoxamide 0.1% eye drops can be sold to the public for the treatment of allergic conjunctivitis in adults and children over 4 years

**NEDOCROMIL SODIUM**

**Indications** allergic conjunctivitis; seasonal keratoconjunctivitis

**Side-effects** burning and stinging; distinctive taste reported

**Dose**
- Seasonal and perennial conjunctivitis, **ADULT** and **CHILD** over 6 years, apply twice daily increased if necessary to 4 times daily; max. 12 weeks treatment for seasonal allergic conjunctivitis
- Seasonal keratoconjunctivitis, **ADULT** and **CHILD** over 6 years, apply 4 times daily

**Rapitil** (Aventis Pharma) **(F)***

*Eye drops*, nedocromil sodium 2%. Net price 5 mL = £5.12

**Excipients** include benzalkonium chloride, disodium edetate

**OLOPATADINE**

**Indications** seasonal allergic conjunctivitis

**Side-effects** local irritation; less commonly keratitis, dry eye, local oedema, photophobia; headache, asthenia, dizziness; dry nose also reported

**Dose**
- **ADULT** and **CHILD** over 3 years, apply twice daily; max. duration of treatment 4 months

**Opatanol** (Alcon) **(F)***

*Eye drops*, olopatadine (as hydrochloride) 1 mg/mL, net price 5 mL = £4.11

**Excipients** include benzalkonium chloride

**SODIUM CROMOGLYCATE**

*(Sodium cromoglycate)*

**Indications** allergic conjunctivitis; seasonal keratoconjunctivitis

**Side-effects** burning and stinging

**Dose**
- **ADULT** and **CHILD** apply eye drops 4 times daily

**Sodium Cromoglicate** *(Non-proprietary)***

*Eye drops*, sodium cromoglicate 2%. Net price 13.5 mL = £2.01

**Brands** include Hay-Crom Aqueous, Opticrom Aqueous, Vioform

1. Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis

**11.5 Mydriatics and cycloplegics**

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide 0.5%, facilitate the examination of the fundus of the eye. Cyclopentolate 1% or atropine are preferable for producing cycloplegia for refraction in young children. Atropine ointment 1% is sometimes preferred for children aged under 5 years because the ointment formulation reduces systemic absorption. Atropine, which has a longer duration of action, is also used for the treatment of anterior uveitis mainly to prevent posterior synechiae, often with phenylephrine 10% eye drops (2.5% in children, the elderly, and those with cardiac disease). Homatropine 1% is also used in the treatment of anterior segment inflammation, and may be preferred for its shorter duration of action.

**Cautions** Darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. Mydriasis can precipitate acute angle-closure glaucoma in a few patients, usually aged over 60 years and hypermetropic (long-sighted), who are predisposed to the condition because of a shallow anterior chamber. Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors; other interactions: Appendix 1 (sympathomimetics).

**Driving** Patients should be warned not to drive for 1–2 hours after mydriasis.

**Side-effects** Ocular side-effects of mydriatics and cycloplegics include transient stinging and raised intra-ocular pressure; on prolonged administration, local irritation, hyperaemia, oedema and conjunctivitis can occur. Contact dermatitis can occur with the antimuscarinic mydriatic drugs, especially atropine.
Systemic side-effects of atropine and cyclopentolate can occur, particularly in children and the elderly; see section 1.2 for systemic side-effects of antimuscarinic drugs.

**Antimuscarinics**

**ATROPINE SULPHATE**

**Indications** refraction procedures in young children; anterior uveitis—see also notes above

**Cautions** risk of systemic effects with eye drops in infants under 3 months—eye ointment preferred; see also notes above

**Side-effects** see notes above

*Atropine* (Non-proprietary)

Eye drops, atropine sulphate 0.5%, net price 10 mL = £2.32; 1%, 10 mL = 98p

Eye ointment, atropine sulphate 1%. Net price 3 g = £2.97

**Single use**

Minims® Atropine Sulphate (Chauvin)

Eye drops, atropine sulphate 1%. Net price 20 x 0.5 mL = £4.92

**CYCLOPENTOLATE HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

*Mydriolate* (Intrapharm)

Eye drops, cyclopentolate hydrochloride 0.5%, net price 5 mL = 97p; 1%, 5 mL = £1.19

Excipients include benzalkonium chloride

**Single use**

Minims® Cyclopentolate Hydrochloride (Chauvin)

Eye drops, cyclopentolate hydrochloride 0.5% and 1%. Net price 20 x 0.5 mL (both) = £4.92

**HOMATROPINE HYDROBROMIDE**

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

*Homatropine* (Non-proprietary)

Eye drops, homatropine hydrobromide 1%, net price 10 mL = £2.14; 2%, 10 mL = £2.26

**TROPICAMIDE**

**Indications** see notes above

**Cautions** see notes above

**Side-effects** see notes above

*Mydriacyl* (Alcon)

Eye drops, tropicamide 0.5%, net price 5 mL = £1.36; 1%, 5 mL = £1.68

Excipients include benzalkonium chloride, disodium edetate

**Sympathomimetics**

**PHENYLEPHRINE HYDROCHLORIDE**

**Indications** mydriasis; see also notes above

**Cautions** children and elderly (avoid 10% strength); cardiovascular disease (avoid or use 2.5% strength only); tachycardia; hyperthyroidism; diabetes; see also notes above

**Side-effects** eye pain and stinging; blurred vision, photophobia; systemic effects include palpitations, arrhythmias, hypertension, coronary artery spasm; very rarely angle-closure glaucoma

*Phenylephrine* (Non-proprietary)

Eye drops, phenylephrine hydrochloride 10%. Net price 10 mL = £3.38

**Single use**

Minims® Phenylephrine Hydrochloride (Chauvin)

Eye drops, phenylephrine hydrochloride 2.5%, net price 20 x 0.5 mL (both) = £5.75

Excipients include disodium edetate, sodium metabisulphite

**11.6 Treatment of glaucoma**

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage. While glaucoma is generally associated with raised intra-ocular pressure, it can occur when the intra-ocular pressure is within the normal range.

The commonest form of glaucoma is primary open-angle glaucoma (chronic simple glaucoma; wide-angle glaucoma), where the obstruction is in the trabecular meshwork. The condition is often asymptomatic and the patient may present with significant loss of visual-field. Primary angle closure glaucoma (acute closed-angle glaucoma, narrow-angle glaucoma) results from blockage of aqueous humour flow into the anterior chamber and is a medical emergency.

Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue is usually the drug of first choice. It may be necessary to combine these drugs or add others, such as miotics, sympathomimetics, or carbonic anhydrase inhibitors, to control intra-ocular pressure.

For urgent reduction of intra-ocular pressure and before surgery, mannitol 20% (up to 500 mL) is given by slow intravenous infusion until the intra-ocular pressure has been satisfactorily reduced. Acetazolamide by intravenous injection can also be used for the emergency management of raised intra-ocular pressure.

Standard antiglaucoma therapy is used if supplementary treatment is required after iridotomy, iridectomy, or a drainage operation in either primary open-angle or acute closed-angle glaucoma.
Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary open-angle glaucoma, probably by reducing the rate of production of aqueous humour. Administration by mouth also reduces intra-ocular pressure but this route is not used since side-effects may be troublesome.

Beta-blockers used as eye drops include betaxolol, carteolol, levobunolol, metipranolol, and timolol.

Cautions, contraindications and side-effects

Systemic absorption may follow topical application to the eyes; therefore, eye drops containing a beta-blocker are contra-indicated in patients with bradycardia, heart block, or uncontrolled heart failure. Important: for a warning to avoid in asthma see CSM advice below. Consider also other cautions, contra-indications and side-effects of beta-blockers (p. 85). Local side-effects of eye drops include ocular stinging, burning, pain, itching, erythema, dry eyes and allergic reactions including anaphylaxis and blepharoconjunctivitis; occasionally corneal disorders have been reported.

CSM advice The CSM has advised that beta-blockers, even those with apparent cardioselectivity, should not be used in patients with asthma or a history of obstructive airways disease, unless no alternative treatment is available. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

Interactions Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind. See also Appendix 1 (beta-blockers).

Betaxolol hydrochloride

Indications see notes above
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above
Dose
- Apply twice daily

Betoptic® (Alcon) (£)
Ophthalmic solution (= eye drops), betaxolol (as hydrochloride) 0.5%, net price 5 mL = £2.00
Excipients include benzalkonium chloride, disodium edetate
Ophthalmic suspension (= eye drops), betaxolol (as hydrochloride) 0.25%, net price 5 mL = £2.80
Excipients include benzalkonium chloride, disodium edetate

Unit dose eye drop suspension, m/t, betaxolol (as hydrochloride) 0.25%, net price 50 × 0.25 mL = £14.49

Carbotrol hydrochloride

Indications see notes above
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above
Dose
- Apply twice daily

Teoptic® (Novartis) (£)
Eye drops, carteolol hydrochloride 1%, net price 5 mL = £4.60; 2%, 5 mL = £5.40
Excipients include benzalkonium chloride

LEVOBUNOLOL HYDROCHLORIDE

Indications see notes above
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above; anterior uveitis occasionally reported
Dose
- Apply once or twice daily

Levobunolol (Non-proprietary) (£)
Eye drops, levobunolol hydrochloride 0.5%. Net price 5 mL = £2.68
Betagan® (Allergan) (£)
Eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (Liquifilm®) 1.4%. Net price 5-mL = £1.85
Excipients include benzalkonium chloride, disodium edetate, sodium metabisulphite

Unit dose eye drops, levobunolol hydrochloride 0.5%, polyvinyl alcohol (Liquifilm®) 1.4%. Net price 30 × 0.4 mL = £9.98
Excipients include disodium edetate

Metipranolol

Indications see notes above but in chronic open-angle glaucoma restricted to patients allergic to preservatives or to those wearing soft contact lenses (in whom benzalkonium chloride should be avoided)
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above; granulomatous anterior uveitis reported (discontinue treatment)
Dose
- Apply twice daily

Minims® Metipranolol (Chauvin) (£)
Eye drops, metipranolol 0.1%, net price 20 × 0.5 mL = £10.19

Timolol maleate

Indications see notes above
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above
Dose
- Apply twice daily; long-acting preparations, see under preparations below

Timolol (Non-proprietary) (£)
Eye drops, timolol (as maleate) 0.25%, net price 5 mL = £2.30; 0.5%, 5 mL = £1.95

Timoptol® (MSD) (£)
Eye drops, in Ocumeter® metered-dose unit, timolol (as maleate) 0.25%, net price 5 mL = £3.12, 0.5%, 5 mL = £3.12
Excipients include benzalkonium chloride

Unit dose eye drops, timolol (as maleate) 0.25%, net price 30 × 0.2 mL = £8.45; 0.5%, 30 × 0.2 mL = £9.65

Once-daily preparations

Nygocil® (Novartis) (£)
Eye gel (= eye drops), timolol (as maleate) 0.1%, net price 5 g = £2.85
Excipients include benzalkonium chloride
Dose apply once daily
Timoptic®-LA (MSD) (INN) Ophthalmic gel-forming solution (= eye drops), timolol (as maleate) 0.25%, net price 2.5 mL = £3.12; 0.5%, 2.5 mL = £3.12
Excipients include benzododecinium bromide
Dose apply once daily

With bimatoprost
See under Rimatoprost

With brimonidine
See under Brimonidine

With dorzolamide
See under Dorzolamide

With latanoprost
See under Latanoprost

With travoprost
See under Travoprost

Prostaglandin analogues

Latanoprost and travoprost are prostaglandin analogues which increase uveoscleral outflow; bimatoprost is a related drug. They are used to reduce intra-ocular pressure in ocular hypertension or in open-angle glaucoma. Patients receiving prostaglandin analogues should be monitored for any changes to eye coloration since an increase in the brown pigment in the iris may occur; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only.

BIMATOPROST

Indications raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

Cautions see under Latanoprost and notes above

Side-effects see under Latanoprost

Dose

• Apply once daily, preferably in the evening; CHILD and ADOLESCENT under 18 years, not recommended

Lumigan® (Allergan) (INN) Eye drops, bimatoprost 300 micrograms/mL, net price 3 mL = £11.46, triple pack (3 x 3 mL) = £32.66
Excipients include benzaalkonium chloride

With timolol

See under Timolol, contra-indications, and side-effects of timolol, see section 11.6, Beta-blockers

Ganfort® (Allergan) (INN) Eye drops, bimatoprost 300 micrograms/mL, timolol (as maleate) 5 mg/mL, net price 3 mL = £14.58
Excipients include benzaalkonium chloride

Dose for raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate; apply once daily, preferably in the morning

LATANOPROST

Indications raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

Cautions before initiating treatment, advise patients of possible change in eye colour; monitor for eye colour change (see also notes above); aphakia, or pseudophakia with torn posterior lens capsule or anterior chamber lenses; risk factors for iritis, uveitis, and cystoid macular oedema; brittle or severe asthma; not to be used within 5 minutes of use of thiomersal-containing preparations; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects brown pigmentation particularly in those with mixed-colour irides; blepharitis, ocular irritation and pain; darkening, thickening and lengthening of eye lashes; conjunctival hyperaemia; transient punctate epithelial erosion; skin rash; less commonly eyelid oedema and rash; rarely dyspnœa, exacerbation of asthma, iritis, uveitis, local oedema, darkening of palpebral skin; very rarely chest pain, exacerbation of angina

Dose

• Apply once daily, preferably in the evening; CHILD not recommended

Xalatan® (Pharmacia) (INN) Eye drops, latanoprost 50 micrograms/mL, net price 2.5 mL = £13.14
Excipients include benzaalkonium chloride

With timolol

For cautions, contra-indications, and side-effects of timolol, see section 11.6, Beta-blockers

Xalacom® (Pharmacia) (INN) Eye drops, latanoprost 50 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £15.07
Excipients include benzaalkonium chloride

Dose for raised intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension when beta-blocker alone not adequate; apply once daily

TRAVOPROST

Indications raised intra-ocular pressure in open-angle glaucoma; ocular hypertension

Cautions see under Latanoprost and notes above

Side-effects see under Latanoprost

Dose

• Apply once daily, preferably in the evening; CHILD and ADOLESCENT under 18 years, not recommended

Travatan® (Alcon) (INN) Eye drops, travoprost 40 micrograms/mL, net price 2.5 mL = £10.50
Excipients include benzaalkonium chloride

With timolol

For cautions, contra-indications, and side-effects of timolol, see section 11.6, Beta-blockers

DuoTrav® (Alcon) (INN) Eye drops, travoprost 40 micrograms, timolol (as maleate) 5 mg/mL, net price 2.5 mL = £13.20
Excipients include benzaalkonium chloride, disodium edetate

Dose for raised intra-ocular pressure in patients with open-angle glaucoma or ocular hypertension when beta-blocker or prostaglandin analogue alone not adequate; apply once daily, CHILD and ADOLESCENT under 18 years, not recommended
**Sympathomimetics**

Dipivefrine is a pro-drug of adrenaline (epinephrine). It is claimed to pass more rapidly than adrenaline through the cornea and is then converted to the active form. Adrenaline probably acts both by reducing the rate of production of aqueous humour and by increasing the outflow through the trabecular meshwork. Because it is a mydriatic, adrenaline should be used with caution in patients susceptible to angle-closure glaucoma, unless an iridectomy has been carried out. Side-effects include severe smarting and redness of the eye; adrenaline should be used with caution in patients with hypertension and heart disease.

**Brimonidine**, a selective alpha -adrenoceptor agonist, is licensed for the reduction of intra-ocular pressure in open-angle glaucoma or ocular hypertension in patients for whom beta-blockers are inappropriate; it may also be used as adjunctive therapy when intra-ocular pressure is inadequately controlled by other antiglaucoma therapy.

Apraclonidine (section 11.8.2) is another alpha -adrenoceptor agonist. Eye drops containing apraclonidine 0.5% are used for a short term to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

**BRIMONIDINE TARTRATE**

**Indications** raised intra-ocular pressure, see notes above

**Cautions** severe cardiovascular disease; cerebral or coronary insufficiency, Raynaud's syndrome, postural hypotension, depression, hepatic or renal impairment; pregnancy, breast-feeding; interactions: Appendix 1 (brimonidine)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Side-effects** ocular reactions including conjunctival hyperaemia, stinging, photophobia, corneal erosion, superficial punctuate keratitis, eye pain, discharge, dryness, and irritation, eyelid inflammation, oedema, pruritus conjunctivitis, photophobia; also, hypertension, headache, depression, dry mouth, fatigue, drowsiness; less commonly, taste disturbances, palpitation, dizziness, syncope, rhinitis, nasal dryness

**Dose**

- Apply twice daily

**Alphagan®** (Allergan) [Prescriber information]

**Eye drops**, brimonidine tartrate 0.2%, net price 5 mL = £26.85

**Excipients** include benzalkonium chloride

**With timolol**

For cautions, contra-indications, and side-effects of timolol, see section 11.6, Beta-blockers

**Combigan®** (Allergan) [Prescriber information]

**Eye drops**, brimonidine tartrate 0.2%, timolol (as maleate) 0.5%, net price 5-mL = £10.00

**Excipients** include benzalkonium chloride

**Dose** for raised intra-ocular pressure in open-angle glaucoma and for ocular hypertension when beta-blocker alone not adequate, apply twice daily

**Carbonic anhydrase inhibitors and systemic drugs**

The **carbonic anhydrase inhibitors**, acetazolamide, brinzolamide, and dorzolamide, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use also produces weak diuresis.

Acetazolamide is given by mouth or by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is a sulphonamide; blood disorders, rashes, and other sulphonamide-related side-effects occur occasionally. It is not generally recommended for long-term use; electrolyte disturbances and metabolic acidosis that occur may be corrected by administering potassium bicarbonate (as effervescent potassium tablets, section 9.2.1.3).

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are licensed for use in patients resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Systemic absorption may rarely give rise to sulphonamide-like side-effects and may require discontinuation if severe.

The **osmotic diuretics**, intravenous hypertonic mannitol (section 2.2.5), or glycerol by mouth, are useful short-term ocular hypotensive drugs.

**ACETAZOLAMIDE**

**Indications** reduction of intra-ocular pressure in open-angle glaucoma, secondary glaucoma, and peri-operatively in angle-closure glaucoma; diuresis (section 2.2.7); epilepsy

**Cautions** not generally recommended for prolonged use but if given monitor blood count and plasma electrolyte concentration; pulmonary obstruction (risk of acidosis); elderly; pregnancy (Appendix 4); avoid extravasation at injection site (risk of necrosis); interactions: Appendix 1 (diuretics)

**Contra-indications** hypokalaemia, hyponatraemia, hyperchloaraemic acidosis; severe hepatic impairment; renal impairment (Appendix 3); sulphonamide hypersensitivity

**Side-effects** nausea, vomiting, diarrhoea, taste disturbance; loss of appetite, paraesthesia, flushing, headache, dizziness, fatigue, irritability, depression; thirst, polyuria; reduced libido; metabolic acidosis and electrolyte disturbances on long-term therapy; occasionally, drowsiness, confusion, hearing disturbances, urticaria, melaena, glycosuria, haematuria, abnormal liver function, renal calculi, blood disorders including agranulocytosis and thrombocytopenia, rashes
including Stevens-Johnson syndrome and toxic epidermal necrolysis; rarely, photosensitivity, liver damage, flaccid paralysis, convulsions; transient myopia reported

**Dose**

- Glaucoma, by mouth or by intravenous injection, 0.25–1 g daily in divided doses
- Epilepsy, by mouth or by intravenous injection, 0.25–1 g daily in divided doses; CHILD 8–30 mg/kg daily, max. 750 mg daily

**Note** Dose by intramuscular injection, as for intravenous injection but preferably avoided because of alkalinity

**Diamox** (Goldshield) Tablets, acetazolamide 250 mg. Net price 112-tab pack = £12.68. Label: 3

**Sodium Parenteral** (= injection), powder for reconstitution, acetazolamide (as sodium salt). Net price 500-mg vial = £14.76

**BRINZOLAMIDE**

**Indications** adjunct to beta-blockers or used alone in raised intra-ocular pressure in ocular hypertension and in open-angle glaucoma if beta-blocker alone inadequate or inappropriate

**Cautions** hepatic impairment; pregnancy (Appendix 4); interactions: Appendix 1 (brinzolamide)

**Contra-indications** renal impairment (creatinine clearance less than 30 mL/minute), hyperchloremic acidosis; breast-feeding

**Side-effects** local irritation, taste disturbance; less commonly nausea, dyspepsia, dry mouth, chest pain, epistaxis, haemoptysis, rhinitis, pharyngitis, bronchitis, paraesthesia, depression, dizziness, headache, dermatitis, alopecia, corneal erosion

**Dose**

- Apply twice daily increased to 3 times daily if necessary
- Azopt (Alcon) Eye drops, brinzolamide 10 mg/mL, net price 5 mL = £6.90

**Contra-indications** renal impairment (Appendix 3); hyperchloremic acidosis; pregnancy and breast-feeding

**Side-effects** nausea, bitter taste, dry mouth; headache, asthenia; ocular irritation, blurred vision, lacrimation, conjunctivitis, superficial punctate keratitis, eyelid inflammation; less commonly iridocyclitis; rarely hypersensitivity reactions (including urticaria, angioedema, bronchospasms), dizziness, paraesthesia, urolithiasis, eyelid crusting, transient myopia, corneal oedema, epistaxis, throat irritation

**Dose**

- Used alone, apply 3 times daily
- With topical beta-blocker, apply twice daily

**Trusopt** (MSD) **Ophthalmic solution** (= eye drops), in Ocumeter Plus metered-dose unit, dorzolamide (as hydrochloride) 2%, net price 5 mL = £6.33

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, dorzolamide (as hydrochloride) 2%, net price 60 × 0.2 mL = £24.18

**With timolol**

For cautions, contra-indications, and side-effects of timolol, see section 11.6, Beta-blockers

**Cosopt** (MSD) **Ophthalmic solution** (= eye drops), dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 5 mL = £10.05

**Excipients** include benzalkonium chloride

**Unit dose eye drops**, dorzolamide (as hydrochloride) 2%, timolol (as maleate) 0.5%, net price 60 × 0.2 mL = £28.59

**Miotics**

The small pupil is an unfortunate side-effect of these drugs (except when pilocarpine is used temporarily before an operation for angle-closure glaucoma). They act by opening up the inefficient drainage channels in the trabecular meshwork resulting from contraction or spasm of the ciliary muscle.

Miotics used in the management of raised intra-ocular pressure include pilocarpine.

**Cautions** A darkly pigmented iris may require higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage. Retinal detachment has occurred in susceptible individuals and those with retinal disease; therefore fundus examination is advised before starting treatment with a miotic. Care is also required in conjunctival or corneal damage. Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.

Miotics should be used with caution in cardiac disease, hypertension, asthma, peptic ulceration, urinary-tract obstruction, and Parkinson’s disease.

**Counselling** Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting conditions.

**Contra-indications** Miotics are contra-indicated in conditions where pupillary constriction is undesirable such as acute iritis, anterior uveitis and some forms of secondary glaucoma. They should be avoided in acute inflammatory disease of the anterior segment.

**Side-effects** Ciliary spasm leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment (a particular disadvantage in patients under 40 years of age). Ocular side-effects include burning, itching, smarting, blurred vision, conjunctival vascular congestion, myopia, lens changes
with chronic use, vitreous haemorrhage, and pupillary block. Systemic side-effects (see under Parasympathomimetics, section 7.4.1) are rare following application to the eye.

### PILOCARPINE

#### Indications
see notes above; dry mouth (section 12.3.5)

#### Cautions
see notes above

#### Contra-indications
see notes above

#### Side-effects
see notes above

#### Dose
- Apply up to 4 times daily; long-acting preparations, see under preparations below

### Pilocarpine Hydrochloride

#### (Non-proprietary)

#### Eye drops
- pilocarpine hydrochloride 0.5%, net price 10 mL = £1.39; 1%, 10 mL = £2.71; 2%, 10 mL = £2.59; 3%, 10 mL = £1.77; 4%, 10 mL = £3.46

#### Single use

- **Minims® Pilocarpine Nitrate (Chauvin)**
  - **Eye drops**, pilocarpine nitrate 2%, net price 20 × 0.5 mL = £4.92

#### Long acting

- **Pilogel® (Alcon)**
  - Ophthalmic gel, pilocarpine hydrochloride 4%, net price 5 g = £6.86
  - **Excipients** include benzalkonium chloride, disodium edetate
  - **Dose** apply 1–1.5 cm gel once daily at bedtime

### 11.7 Local anaesthetics

Oxybuprocaine and tetracaine (amethocaine) are probably the most widely used topical local anaesthetics. Proxymetacaine causes less initial stinging and is useful for children. Oxybuprocaine or a combined preparation of lidocaine (lignocaine) and fluorescein is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine, with or without adrenaline (epinephrine), is injected into the eyelids for minor surgery, while retrobulbar or peribulbar injections are used for surgery of the globe itself. Local anaesthetics should never be used for the management of ocular symptoms.

Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

### LIDOCAINE HYDROCHLORIDE

#### (Lignocaine hydrochloride)

#### Indications
local anaesthetic

- **Minims® Lignocaine and Fluorescein (Chauvin)**
  - **Eye drops**, lidocaine hydrochloride 4%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £6.93

### OXYBUPROCAINE HYDROCHLORIDE

#### (Benoxinate hydrochloride)

#### Indications
local anaesthetic

- **Minims® Oxybuprocaine Hydrochloride (Chauvin)**
  - **Eye drops**, oxybuprocaine hydrochloride 0.4%. Net price 20 × 0.5 mL = £4.92

### PROXYMETACAINE HYDROCHLORIDE

#### Indications
local anaesthetic

- **Minims® Proxymetacaine (Chauvin)**
  - **Eye drops**, proxymetacaine hydrochloride 0.5%. Net price 20 × 0.5 mL = £6.95

- **With fluorescein**
  - **Minims® Proxymetacaine and Fluorescein (Chauvin)**
    - **Eye drops**, proxymetacaine hydrochloride 0.5%, fluorescein sodium 0.25%. Net price 20 × 0.5 mL = £7.95

### TETRACAINE HYDROCHLORIDE

#### (Amethocaine hydrochloride)

#### Indications
local anaesthetic

- **Minims® Amethocaine Hydrochloride (Chauvin)**
  - **Eye drops**, tetracaine hydrochloride 0.5% and 1%. Net price 20 × 0.5 mL (both) = £5.75

### 11.8 Miscellaneous ophthalmic preparations

#### 11.8.1 Tear deficiency, ocular lubricants, and astringents

- Chronic soreness of the eyes associated with reduced or abnormal tear secretion (e.g. in Sjögren’s syndrome) often responds to tear replacement therapy or pilocarpine given by mouth (section 12.3.5). The severity of the condition and patient preference will often guide the choice of preparation.

- **Hypromellose** is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination
of hypromellose with a mucolytic such as acetylcysteine can be helpful.

The ability of carbomers to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Povidone and sodium hyaluronate eye drops are also used in the management of tear deficiency.

Sodium chloride 0.9% drops are sometimes useful in tear deficiency, and can be used as ‘comfort drops’ by contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intraocular surgery.

Eye ointments containing a paraffin may be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

Zinc sulphate is a traditional astringent that is now little used.

### ACETYLICYSTEINE

**Indications** tear deficiency, impaired or abnormal mucus production

**Dose**
- Apply 3–4 times daily

**Ilube®** (Alcon)
- **Eye drops**, acetylcysteine 5%, hypromellose 0.35%. Net price 10 mL = £4.63
  - **Excipients** include benzalkonium chloride, disodium edetate

### CARBOMERS

**(Polyacrylic acid)**

**Note** Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol

**Indications** dry eyes including keratoconjunctivitis sicca, unstable tear film

**Dose**
- Apply 3–4 times daily or as required

**GelTears®** (Chauvin)
- **Gel** (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.80
  - **Excipients** include benzalkonium chloride

**Liposic®** (Bausch & Lomb)
- **Gel** (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £2.96
  - **Excipients** include cetrimide

**Liquivisc®** (Allergan)
- **Gel** (= eye drops), carbomer 974P (polyacrylic acid) 0.25%, net price 10 g = £1.99
  - **Excipients** include benzalkonium chloride
  - **Note** May be difficult to obtain

**Viscotears®** (Novartis)
- **Liquid gel** (= eye drops), carbomer 980 (polyacrylic acid) 0.2%, net price 10 g = £3.12
  - **Excipients** include cetrimide

### CARMELLOSE SODIUM

**Indications** dry eye conditions

**Dose**
- Apply as required

**Optive®** (Allergan)
- **Eye drops**, carmellose sodium 0.5%, glycerol, net price 10 mL = £7.49

**Single use**

**Celluvics®** (Allergan)
- **Eye drops**, carmellose sodium 0.5%, net price 30 x 0.4 mL = £7.59, 90 x 0.4 mL = £15.53; 1%, 30 x 0.4 mL = £7.59, 60 x 0.4 mL = £10.99

### HYDROXYETHYLCELLULOSE

**Indications** tear deficiency

**Minims® Artificial Tears** (Chauvin)
- **Eye drops**, hydroxyethylcellulose 0.44%, sodium chloride 0.35%. Net price 20 x 0.5 mL = £5.75

### HYPROMELLOSE

**Indications** tear deficiency

**Note** The Royal Pharmaceutical Society of Great Britain has stated that where it is not possible to ascertain the strength of hypromellose prescribed, the prescriber should be contacted to clarify the strength intended.

**Hypromellose** (Non-proprietary)
- **Eye drops**, hypromellose 0.3%, net price 10 mL = £1.63
  - **Brands** include Artelac

**Isopto Alkaline®** (Alcon)
- **Eye drops**, hypromellose 1%, net price 10 mL = 99p
  - **Excipients** include benzalkonium chloride

**Isopto Plain®** (Alcon)
- **Eye drops**, hypromellose 0.5%, net price 10 mL = 85p
  - **Excipients** include benzalkonium chloride

**Tears Naturale®** (Alcon)
- **Eye drops**, dextran '70' 0.1%, hypromellose 0.3%, net price 15 mL = £1.68
  - **Excipients** include benzalkonium chloride, disodium edetate

**Hypromellose** (Non-proprietary)
- **Eye drops**, hypromellose 0.3%, net price 30 x 0.4 mL = £5.75

**Artelac® SDU** (Pharma-Global)
- **Eye drops**, hypromellose 0.32%, net price 30 x 0.5 mL = £13.95

### LIQUID PARAFFIN

**Indications** dry eye conditions

**Lacri-Lube®** (Allergan)
- **Eye ointment**, white soft paraffin 57.3%, liquid paraffin 42.5%, wool alcohols 0.2%. Net price 3.5 g = £2.28, 5 g = £2.96
Lubri-Tears® (Alcon)

Eye ointment, white soft paraffin 60%, liquid paraffin 30%, wool fat 10%. Net price 5 g = £2.29

PARAFFIN, YELLOW, SOFT

Indications  see notes above

Simple Eye Ointment

Ointment, liquid paraffin 10%, wool fat 10%, in yellow soft paraffin. Net price 4 g = £3.03

POLYVINYL ALCOHOL

Indications  tear deficiency

Liquifilm Tears® (Allergan)

Ophthalmic solution (= eye drops), polyvinyl alcohol 1.4%. Net price 15 mL = £1.93

Excipients include benzalkonium chloride, disodium edetate

Ophthalmic solution (= eye drops), polyvinyl alcohol 1.4%, povidone 0.6%. Net price 30 x 0.4 mL = £5.35

Sno Tears® (Chauvin)

Eye drops, polyvinyl alcohol 1.4%. Net price 10 mL = £1.06

Excipients include benzalkonium chloride, disodium edetate

POVIDONE

Indications  dry eye conditions

Dose

• Apply 4 times daily or as required

Oculotect® (Novartis)

Eye drops, povidone 5%. Net price 20 x 0.4 mL = £3.40

SODIUM CHLORIDE

Indications  irrigation, including first-aid removal of harmful substances

Sodium Chloride 0.9% Solutions

See section 13.11.1

Balanced Salt Solution

Solution (sterile), sodium chloride 0.64%, sodium acetate 0.39%, sodium citrate 0.17%, calcium chloride 0.048%, magnesium chloride 0.03%, potassium chloride 0.075%

For intra-ocular or topical irrigation during surgical procedures

Brands include Iocare

□ Single use

Minims® Saline (Chauvin)

Eye drops, sodium chloride 0.9%. Net price 20 x 0.5 mL = £4.92

□ With local anaesthetic

Section 11.7

SODIUM HYALURONATE

Indications  dry eye conditions

Dose

• Apply as required

□ With local anaesthetic

Section 11.7

Hycosan® (Bausch & Lomb)

Eye drops, sodium hyaluronate 0.1%, net price 10 mL = 7.19

Oxyal® (Kestrel Ophthalmics)

Eye drops, sodium hyaluronate 0.15%, net price 10 mL = £4.15

Vismed® Multi (TRB Chemedica)

Eye drops, sodium hyaluronate 0.18%, net price 10 mL = £6.81

□ Single use

Clinitas® (Altacor)

Eye drops, sodium hyaluronate 0.4%, net price 30 x 0.5 mL = £5.70

Dose

Ocusan® (Agepha)

Eye drops, sodium hyaluronate 0.2%, net price 20 x 0.5 mL = £5.25

Vismed® (TRB Chemedica)

Eye drops, sodium hyaluronate 0.18%, net price 20 x 0.3 mL = £5.10

ZINC SULPHATE

Indications  see notes above

Cautions  see notes above

Zinc Sulphate (Non-proprietary)

Eye drops, zinc sulphate 0.25%. Net price 10 mL = £3.15

11.8.2 Ocular diagnostic and peri-operative preparations and photodynamic treatment

Ocular diagnostic preparations

Fluorescein sodium is used in diagnostic procedures and for locating damaged areas of the cornea due to injury or disease.

□ FLUORESCIN SODIUM

Indications  detection of lesions and foreign bodies

Minims® Fluorescein Sodium (Chauvin)

Eye drops, fluorescein sodium 1% or 2%. Net price 20 x 0.5 mL (both) = £4.92

11 Eye
Ocular peri-operative drugs

Drugs used to prepare the eye for surgery, drugs that are injected into the anterior chamber at the time of surgery, and those used after eye surgery, are included here.

Non-steroidal anti-inflammatory eye drops such as diclofenac, flurbiprofen, and ketorolac, are used for the prophylaxis and treatment of inflammation, pain, and other symptoms associated with ocular surgery or laser treatment of the eye. Diclofenac and flurbiprofen are also used to prevent miosis during ocular surgery.

Apraclonidine, an alpha-adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used to control increases in intra-ocular pressure associated with ocular surgery and as short-term treatment to reduce intra-ocular pressure prior to surgery.

Acetylcholine, instilled into the anterior chamber of the eye during surgery, rapidly produces miosis which lasts approximately 20 minutes. If prolonged miosis is required, it can be applied again.

Intra-ocular sodium hyaluronate and balanced salt solution (section 11.8.1) are used during surgical procedures on the eye.

ACETYLCHOLINE CHLORIDE

Indications cataract surgery, penetrating keratoplasty, iridectomy, and other anterior segment surgery requiring rapid complete miosis

Contra-indications pregnancy; breast-feeding

Side-effects rarely bradycardia, hypotension, breathing difficulty, sweating, flushing

Miochol-E® (Novartis) Intra-ocular irrigation, powder for reconstitution, acetylcholine chloride 10 mg/mL (1%) when reconstituted, net price 20-mg vial (with solvent) = £9.10

APRACLONIDINE

Note Apraclonidine is a derivative of clonidine

Indications control of intra-ocular pressure

Cautions history of angina, severe coronary insufficiency, recent myocardial infarction, heart failure, cerebrovascular disease, vasovagal attack, chronic renal failure; depression; pregnancy and breast-feeding; monitor intra-ocular pressure and visual fields; loss of effect may occur over time; suspend treatment if reduction in vision occurs in end-stage glaucoma; monitor for excessive reduction in intra-ocular pressure following peri-operative use; interactions: Appendix 1 (apraclonidine)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving)

Contra-indications history of severe or unstable and uncontrolled cardiovascular disease

Side-effects dry mouth, taste disturbance; hyperaemia, ocular pruritus, discomfort and lacrimation (withdraw if ocular intolerance including oedema of lids and conjunctiva); headache, asthenia, dry nose; lid retraction, conjunctival blanching and mydriasis reported after peri-operative use; since absorption may follow topical application systemic effects (see Clonidine Hydrochloride, section 2.5.2) may occur

Dose • See under preparations below

Iopidine® (Alcon) Ophthalmic solution (= eye drops), apraclonidine 1% (as hydrochloride), net price 12 × 2 single use 0.25-mL units = £81.90

Dose control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery; apply 1 drop 1 hour before laser procedure then 1 drop immediately after completion of procedure; CHILD not recommended

Iopidine 0.5% ophthalmic solution (= eye drops), apraclonidine 0.5% (as hydrochloride), net price 5 mL = £11.45

Excipients include benzalkonium chloride

Dose short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug (see note below); apply 1 drop 3 times daily usually for max. 1 month; CHILD not recommended

Note May not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

DICLOFENAC SODIUM

Indications inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties); postoperative inflammation in cataract surgery, strabismus surgery or argon laser trabeculoplasty; pain in corneal epithelial defects after photorefractive keratectomy, radial keratotomy or accidental trauma; seasonal allergic conjunctivitis (section 11.4.2)

Voltarol® Ophtha Multidose (Novartis) Eye drops, diclofenac sodium 0.1%, net price 5 mL = £6.68

Excipients include benzalkonium chloride, disodium edetate, propylene glycol

Single use Voltarol® Ophtha (Novartis) Eye drops, diclofenac sodium 0.1%, net price pack of 5 single-dose units = £4.00, 40 single-dose units = £32.00

FLURBIPROFEN SODIUM

Indications inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties); anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

Ocufen® (Allergan) Ophthalmic solution (= eye drops), flurbiprofen sodium 0.03%, polyvinyl alcohol (Liquifilm®) 1.4%, net price 40 × 0.4 mL = £37.15

KETOROLAC TROMETAMOL

Indications prophylaxis and reduction of inflammation and associated symptoms following ocular surgery

Acular® (Allergan) Eye drops, ketorolac trometamol 0.5%, net price 5 mL = £5.00

Excipients include benzalkonium chloride, disodium edetate

Subfoveal choroidal neovascularisation

Pegaptanib and ranibizumab are vascular endothelial growth factor inhibitors licensed for the treatment of neovascular (wet) age-related macular degeneration;
they are given by intravitreal injection by specialists experienced in the management of this condition.

### NICE guidance

#### Ranibizumab and pegaptanib for the treatment of wet age-related macular degeneration (August 2008)

Ranibizumab is recommended for the treatment of wet age-related macular degeneration if all of the following apply:

- the best corrected visual acuity is between 6/12 and 6/96;
- there is no permanent structural damage to the central fovea;
- the lesion size is less than or equal to 12 disc areas in greatest linear dimension;
- there is evidence of recent disease progression;
- the cost of ranibizumab beyond 14 injections is met by the manufacturer.

Ranibizumab should only be continued in patients who maintain adequate response to therapy. Pegaptanib is not recommended for the treatment of wet age-related macular degeneration; patients currently receiving pegaptanib for any lesion type can continue therapy until they and their specialist consider it appropriate to stop.

Verteporfin is licensed for use in the photodynamic treatment of age-related macular degeneration associated with predominantly classic subfoveal choroidal neovascularisation or with pathological myopia (see NICE guidance below). Following intravenous infusion, verteporfin is activated by local irradiation using non-thermal red light to produce cytotoxic derivatives. Only specialists experienced in the management of these conditions should use it.

### NICE guidance

#### Photodynamic therapy for wet age-related macular degeneration (September 2003)

Photodynamic therapy is recommended for wet age-related macular degeneration with a confirmed diagnosis of classic (no occult) subfoveal choroidal neovascularisation and best-corrected visual acuity of 6/60 or better.

Photodynamic therapy is not recommended for wet age-related macular degeneration with predominantly classic but partly occult subfoveal choroidal neovascularisation except in clinical studies.

#### PEGAPTANIB SODIUM

**Indications**
- see notes above—specialist use only

**Cautions**
- monitor intra-ocular pressure following injection; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Contra-indications**
- ocular or pericocular infection

**Side-effects**
- rhinorrhoea; headache; eye pain, anterior chamber inflammation, raised intra-ocular pressure, punctate keratitis, vitreous floaters, cataract, conjunctival and retinal haemorrhage, local oedema, conjunctivitis, corneal dystrophy, dry eye, endophthalmitis, eye discharge, eye irritation, macular degeneration, mydriasis, peribulbar haematoma, photophobia, flashing lights, vitreous disorders; less commonly vomiting, dyspepsia, palpitation, chest pain, hypertension, aortic aneurysm, influenza-like symp-
toms, nightmares, depression, back pain, asthenopia, blepharitis, corneal deposits, vitreous haemorrhage, chalazion, retinal exudates, eyelid ptosis, decreased intra-ocular pressure, injection-site reactions, retinal detachment, occlusion of retinal blood vessels, ectropion, eye movement disorder, pupillary disorder, iritis, optic nerve cupping, nasopharyngitis, deafness, vertigo, eczema, changes in hair colour, rash, pruritus, night sweats

**Dose**
- By intravitreal injection, 300 micrograms once every 6 weeks into the affected eye

**Note**
- For further information on administration, consult product literature

**Macugen**® (Pfizer) [RW]

Solution for intravitreal injection, pegaptanib (as sodium salt), net price 300-microgram vial = £514.00

### RANIBIZUMAB

**Indications**
- see notes above—specialist use only

**Cautions**
- monitor intra-ocular pressure and for signs of ocular infection following injection; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Contra-indications**
- ocular or pericocular infection; severe intra-ocular inflammation

**Side-effects**
- nausea; headache; nasopharyngitis, cough; anxiety; anaemia; arthralgia; raised intra-ocular pressure, visual disturbance, conjunctival and vitreous disorders, eye inflammation and irritation, eye haemorrhage; allergic skin reactions; less commonly atrial fibrillation, blindness, corneal disorders, iris adhesion, injection site reactions

**Dose**
- By intravitreal injection, initially 500 micrograms once a month for 3 months into the affected eye, thereafter monitor visual acuity once a month; if necessary subsequent doses may be given at least 1 month apart

**Note**
- For further information on administration, consult product literature

**Antimicrobial eye drops should be administered into the affected eye for 3 days before and 3 days after each injection**

**Lucentis®** (Novartis) [RW]

Solution for intravitreal injection, ranibizumab 10 mg/mL, net price 0.23-mL vial = £761.20

### VERTEPORFIN

**Indications**
- see notes above—specialist use only

**Cautions**
- photosensitivity—avoid exposure of unprotected skin and eyes to bright light during infusion and for 48 hours afterwards; hepatic impairment (avoid if severe), biliary obstruction; avoid extravasation; pregnancy (Appendix 4)

**Contra-indications**
- acute porphyria; breast-feeding (Appendix 5)

**Side-effects**
- visual disturbances (including blurred vision, flashing lights, visual-field defects), nausea, back pain, asthenia, pruritus, hypercholesterolaemia, fever; rarely lacrimation disorder, subretinal or vitreous haemorrhage, hypersensitivity reactions (including chest pain, syncope, headache, dizziness, dyspnoea, urticaria, sweating, changes in blood pressure and in heart rate); injection-site reactions including pain, oedema, inflammation, haemorrhage, discoloration and blistering
**Dose**

*By intravenous infusion* over 10 minutes, 6 mg/m²

**Note** For information on administration and light activation, consult product literature

**Visudyne®** (Novartis)

**Injection**, powder for reconstitution, verteporfin, net price 15-mg vial = £850.00

---

**11.9 Contact lenses**

**Note** Some recommendations in this section involve non-licensed indications.

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel) lenses; soft lenses are the most popular type, because they are the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day. Continuous (extended) wear involves much greater risks to eye health and is not recommended except where medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis and conjunctival problems (such as purulent or papillary conjunctivitis). One-day disposable lenses, which are worn only once and therefore require no maintenance or storage, are becoming increasingly popular.

**Acanthamoeba keratitis**, a sight-threatening condition, is associated with ineffective lens cleaning and disinfection or the use of contaminated lens cases. The condition is especially associated with the use of soft lenses (including frequently replaced lenses). **Acanthamoeba keratitis** is treated, by specialists, with intensive use of polihexanide (polyhexamethylene biguanide), propamidine isetionate (section 11.3.1), chlorhexidine, and neomycin (section 11.3.1) drops, sometimes used in combination.

**Contact lenses and drug treatment** Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic reactions. Therefore, unless medically indicated, the lenses should be removed before instillation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled over rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including epinephrine and hydralazine). Other drugs that may affect contact lens wear are isotretinoin (can cause conjunctival inflammation), aspirin (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin and sulfasalazine (can discolor lenses).
12 Ear, nose, and oropharynx

12.1 Drugs acting on the ear 600
12.1.1 Otitis externa 600
12.1.2 Otitis media 603
12.1.3 Removal of ear wax 603
12.2 Drugs acting on the nose 604
12.2.1 Drugs used in nasal allergy 604
12.2.2 Topical nasal decongestants 606
12.2.3 Nasal preparations for infection 607
12.3 Drugs acting on the oropharynx 608
12.3.1 Drugs for oral ulceration and inflammation 608
12.3.2 Oropharyngeal anti-infective drugs 610
12.3.3 Lozenges and sprays 612
12.3.4 Mouthwashes, gargles, and dentifrices 612
12.3.5 Treatment of dry mouth 613

This chapter also includes advice on the drug management of the following:
- allergic rhinitis, p. 604
- nasal polyps, p. 604
- oropharyngeal infections, p. 610
- periodontitis, p. 609

12.1.1 Otitis externa

Otitis externa is an inflammatory reaction of the meatal skin. It is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping. A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

If infection is present, a topical anti-infective which is not used systemically (such as neomycin or clioquinol) may be used, but for only about a week as excessive use may result in fungal infections; these may be difficult to treat and require expert advice. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol may be used but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid (such as Locorten-Vioform®) are used for treating cases where infection is present with inflammation and eczema.

In view of reports of ototoxicity in patients with a perforated tympanic membrane (eardrum), the CSM has stated that treatment with a topical aminoglycoside antibiotic is contra-indicated in those with a tympanic perforation. However, many specialists do use these drops cautiously in the presence of a perforation in patients with otitis media (section 12.1.2) and where other measures have failed for otitis externa.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EarCalm® spray) is on sale to the public.
For severe pain associated with otitis externa, a simple analgesic, such as paracetamol (section 4.7.1) or ibuprofen (section 10.1.1), can be used. A systemic antibacterial (Table 1, section 5.1) can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, fluocinolone acetonide (or an aminoglycoside) may be needed in pseudomonal infections which may occur if the patient has diabetes or is immunocompromised.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments (section 13.4) are then required, but prolonged use should be avoided.

### Astringent preparations

#### ALUMINIUM ACETATE

**Indications** inflammation in otitis externa (see notes above)

**Dose**

- Insert into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

**Aluminium Acetate** (Non-proprietary)

- **Ear drops 13%**, aluminium sulphate 2.25 g, calcium carbonate 1 g, tartaric acid 450 mg, acetic acid (33%) 2.5 mL, purified water 7.5 mL

  - Available from manufacturers of ‘special order’ products

- **Ear drops 8%**, dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared

### Anti-inflammatory preparations

#### Corticosteroids

Topical corticosteroids are used to treat inflammation and eczema in otitis externa.

**Cautions** Prolonged use of topical corticosteroid ear preparations should be avoided.

**Contra-indications** Corticosteroid ear preparations should be avoided in the presence of an untreated ear infection. If infection is present, the corticosteroid should be used in combination with a suitable anti-infective (see notes above).

**Side-effects** Local sensitivity reactions may occur.

### BETAMETHASONE SODIUM PHOSPHATE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### Betnesol® (UCB Pharma) **[Link]**

- **Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 10 mL = £2.32

  - **Excipients** include benzalkonium chloride, disodium edetate

  - **Dose** ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained; eye, section 11.4.1; nose, section 12.2.1

#### Vistamethasone® (Martindale) **[Link]**

- **Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%. Net price 5 mL = £1.02; 10 mL = £1.16

  - **Excipients** include benzalkonium chloride, disodium edetate

  - **Dose** ear, apply 2–3 drops every 3–4 hours; reduce frequency when relief obtained; eye, section 11.4.1; nose, section 12.2.1

#### With antibacterial

**Betnesol-N®** (UCB Pharma)

- **Drops** (for eye, ear, or nose), betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 10 mL = £2.39

  - **Excipients** include benzalkonium chloride, disodium edetate

  - **Dose** ear, apply 2–3 drops 3–4 times daily; eye, section 11.4.1; nose, section 12.2.3

### DEXAMETHASONE

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### With antibacterial

**Otomize®** (GSK Consumer Healthcare) **[Link]**

- **Ear spray**, dexamethasone 0.1%, neomycin sulphate 3250 units/mL, glacial acetic acid 2%. Net price 5-mL pump-action aerosol unit = £4.24

  - **Excipients** include hydrocortisone (parabens)

  - **Dose** ear, apply 1 metered spray 3 times daily

**Sofradex®** (Sanofi-Aventis) **[Link]**

- **Drops** (for ear or eye), dexamethasone (as sodium metasulphobenzoate) 0.05%, framycetin sulphate 0.5%, framycetin sulphate 0.5%, gramicidin 0.005%. Net price 5 mL = £1.09; 10 mL = £1.20

  - **Excipients** include thiomersal

  - **Dose** ear, apply 2–3 drops every 3–4 hours; reduce frequency when relief obtained; eye, section 11.4.1; nose, section 12.2.3

### FLUMETASONE PIVALATE

(flumethasone pivalate)

**Indications** eczematous inflammation in otitis externa (see notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

#### With antibacterial

**Locoten-Vioform®** (Amdipharm) **[Link]**

- **Ear drops**, flumetason pivalate 0.02%, ciprofloxacin 1%. Net price 7.5 mL = £1.47

  - **Dose** ADULT and CHILD over 2 years apply 2–3 drops into the ear twice daily for 7–10 days

  - **Note** Clioquinol stains skin and clothing
HYDROCORTISONE

Indications  eczematous inflammation in otitis externa (see notes above)

Cautions  see notes above

Contra-indications  see notes above

Side-effects  see notes above

With antibacterial

Gentisone® HC  (Amidipharm)  

Ear drops, hydrocortisone acetate 1%, gentamicin 0.3% (as sulphate). Net price 10 mL = £3.69

Excipients  include benzalkonium chloride, disodium edetate

Dose  ear, apply 2–4 drops 3–4 times daily and at night

Neo-Cortef®  (PLIVA)  

Ointment  (for ear or eye), hydrocortisone acetate 1.5%, neomycin sulphate 0.5%. Net price 3.9 g = £1.53

Excipients  include wool fat

Dose  ear, apply 1–2 times daily; eye, see section 11.4.1

Note  May be difficult to obtain

Otosporin®  (GSK)  

Ear drops, hydrocortisone 1%, neomycin sulphate 3400 units, polymyxin B sulphate 10 000 units/mL. Net price 5 mL = £2.00; 10 mL = £4.00

Excipients  include cetostearyl alcohol, hydroxybenzoates (parabens), polysorbate 20

Dose  ADULT and CHILD over 3 years, ear, apply 3 drops 3–4 times daily

PREDNISOLONE SODIUM PHOSPHATE

Indications  eczematous inflammation in otitis externa (see notes above)

Cautions  see notes above

Contra-indications  see notes above

Side-effects  see notes above

Predsol®  (UCB Pharma)  

Ear drops, hydrocortisone acetate 0.5%, neomycin sulphate 0.5%. Net price 10 mL = £2.00

Excipients  include benzalkonium chloride, disodium edetate

Dose  ear, apply 2–3 drops every 2–3 hours; reduce frequency when relief obtained, eye, section 11.4.1

With antibacterial

Predsol-N®  (UCB Pharma)  

Ear drops, hydrocortisone acetate 0.5%, neomycin sulphate 0.5%. Net price 10 mL = £2.36

Excipients  include benzalkonium chloride, disodium edetate

Dose  ear, apply 2–3 drops 3–4 times daily; eye, section 11.4.1

TRIAMCINOLONE ACETONIDE

Indications  eczematous inflammation in otitis externa (see notes above)

Cautions  see notes above

Contra-indications  see notes above

Side-effects  see notes above

With antibacterial

Tri-Adcortyl Otic®  (Squibb)  

Ear ointment, triamcinolone acetonide 0.1%, gramicidin 0.025%, neomycin 0.25% (as sulphate), nystatin 100 000 units/g in Plastibase®. Net price 10 g = £1.58

Dose  ear, ADULT and CHILD over 1 year, apply 2–3 times daily

Anti-infective preparations

CHLORAMPHENICOL

Indications  bacterial infection in otitis externa (but see notes above)

Cautions  avoid prolonged use (see notes above)

Side-effects  high incidence of sensitivity reactions to vehicle

Chloramphenicol  (Non-proprietary)  

Ear drops, chloramphenicol in propylene glycol, net price 5%, 10 mL = £1.83; 10%, 10 mL = £5.62

Dose  ear, apply 2–3 drops 2–3 times daily

CLOTRIMAZOLE

Indications  fungal infection in otitis externa (see notes above)

Side-effects  occasional local irritation or sensitivity

Canesten®  (Bayer Consumer Care)  

Solution, clotrimazole 1% in polyethylene glycol 400 (macrogol 400). Net price 20 mL = £2.43

Dose  ear, apply 2–3 times daily continuing for at least 14 days after disappearance of infection; skin, section 13.10.2

FRAMYCETIN SULPHATE

Indications  bacterial infection in otitis externa (see notes above)

Cautions  avoid prolonged use (see notes above)

Contra-indications  perforated tympanic membrane (see p. 600)

Side-effects  local sensitivity

With corticosteroid

Locorten-Vioform®  see Flumetasone, p. 601

GENTAMICIN

Indications  bacterial infection in otitis externa (see notes above)

Cautions  avoid prolonged use (see notes above)

Contra-indications  perforated tympanic membrane (but see also p. 600 and section 12.1.2)

Side-effects  local sensitivity

With corticosteroid

Gentisone® HC  see Hydrocortisone, above
12.1.2 Otitis media

Acute otitis media  Acute otitis media is the commonest cause of severe pain in small children. Many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a simple analgesic, such as paracetamol, may be sufficient. In children without systemic features, a systemic antibacterial may be started after 72 hours if there is no improvement, or earlier in immunocompromised patients, in children under 2 years, or if there is deterioration (Table 1, section 5.1). Topical treatment of acute otitis media is ineffective and there is no place for drops containing a local anaesthetic. Perforation of the tympanic membrane in patients with acute otitis media usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial (Table 1, section 5.1) can be given.

Otitis media with effusion  Otitis media with effusion (‘glue ear’) occurs in about 10% of children and in 90% of children with cleft palate. Systemic antibiotics are not usually required. If ‘glue ear’ persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

Chronic otitis media  Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in patients with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction which may completely resolve long-standing infection. Local cleansing of the meatal skin is usually performed by treatment with a sponge wick or ribbon gauze dressing soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution; this is particularly beneficial for discharging ears or infections of the mastoid cavity. An antibacterial ear ointment may also be used. Acute exacerbations of chronic infection may also require systemic treatment with amoxicillin (or erythro-

mycin if penicillin-allergic); treatment is adjusted according to the results of sensitivity testing. Parenteral antibacterials are required if *Pseudomonas aeruginosa* and *Proteus* spp. are present.

The CSM has stated that topical treatment with ototoxic antibacterials is contra-indicated in the presence of a perforation (section 12.1.1). However, many specialists use ear drops containing aminoglycosides (e.g. neomycin) or polymyxins if the otitis media has failed to settle with systemic antibacterials; it is considered that the pus in the middle ear associated with otitis media carries a higher risk of ototoxicity than the drops themselves. Ciprofloxacin or ofloxacin ear drops [both unlicensed; available on named-patient basis from a specialist importing company] or eye drops used in the ear [unlicensed indication] are an effective alternative to aminoglycoside ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

Wax may be removed by syringing with water (warmed to body temperature). If necessary, wax can be softened using simple remedies such as *olive oil* ear drops or *almond oil* ear drops; *sodium bicarbonate* ear drops are also effective but may cause dryness of the ear canal. If the wax is hard and impacted the drops may be used twice daily for a few days before syringing; otherwise the wax may be softened on the day of syringing. The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Some proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium or urea–hydrogen peroxide are ingredients in a number of proprietary preparations for softening ear wax.

**Almond Oil** (Non-proprietary)  
*Ear drops,* almond oil in a suitable container  
Allow to warm to room temperature before use

**Olive Oil** (Non-proprietary)  
*Ear drops,* olive oil in a suitable container  
Allow to warm to room temperature before use

**Sodium Bicarbonate** (Non-proprietary)  
*Ear drops,* sodium bicarbonate 5%, net price 10 mL = £1.25

**Cerumol** (LAB)  
*Ear drops,* chlorobutanol 5%, arachis (peanut) oil 57.3%. Net price 11 mL = £1.76

**Exterol** (Dermal)  
*Ear drops,* urea–hydrogen peroxide complex 5% in glycerol. Net price 8 mL = £1.83
Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide (section 12.2.2) can reduce watery rhinorrhea.

Very disabling symptoms occasionally justify the use of systemic corticosteroids for short periods (section 6.3), for example, in students taking important examinations. They may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal cavity.

Pregnancy If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone, budesonide, fluticasone, or sodium cromoglicate may be considered.

### Antihistamines

#### AZELASTINE HYDROCHLORIDE

**Indications** allergic rhinitis

**Side-effects** irritation of nasal mucosa; bitter taste (if applied incorrectly)

**Rhinolast** (Viatris) £1.26

Nasal spray, azelastine hydrochloride 140 micrograms (0.14 mL)/metered spray. Net price 22 mL (with metered pump) = £11.09

**Excipients** include sodium edetate

**Dose** ADULT and CHILD over 5 years, 140 micrograms (1 spray) into each nostril twice daily

**Note** Preparations of azelastine hydrochloride can be sold to the public for nasal administration in aqueous form (other than by aerosol) if supplied for the treatment of seasonal allergic rhinitis or perennial allergic rhinitis in adults and children over 5 years, subject to max. single dose of 140 micrograms per nostril, max. daily dose of 280 micrograms per nostril, and a pack size limit of 36 doses

### Corticosteroids

Nasal preparations containing corticosteroids (beclometasone, betamethasone, budesonide, flunisolide, fluticasone, mometason, and triamcinolone) have a useful role in the prophylaxis and treatment of allergic rhinitis (see notes above).

**Cautions** Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, and also after nasal surgery (until healing has occurred); they should also be avoided in pulmonary tuberculosis. Patients transferred from systemic corticosteroids may experience exacerbation of some symptoms. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids, see section 6.3.2. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The CSM recommends that the height of children receiving prolonged treatment with nasal corticosteroids is monitored; if growth is slowed, referral to a paediatrician should be considered.

**Side-effects** Local side-effects include dryness, irritation of nose and throat, epistaxis and rarely ulceration; nasal septal perforation (usually following nasal surgery)
and raised intra-ocular pressure or glaucoma may also occur rarely. Headache, smell and taste disturbances may also occur. Hypersensitivity reactions, including bronchospasm, have been reported.

### BECLOMETASONE DIPROPIONATE

**Indications**
- prophylaxis and treatment of allergic and vasomotor rhinitis

**Cautions**
- see notes above

**Side-effects**
- see notes above

**Dose**
- **ADULT** and **CHILD** over 6 years, 100 micrograms (2 sprays) into each nostril twice daily; max. total 400 micrograms (8 sprays) daily; when symptoms controlled, dose reduced to 50 micrograms (1 spray) into each nostril twice daily

**Beclometasone (Non-proprietary)**
- Nasal spray, beclometasone dipropionate 50 micrograms/metered spray. Net price 200-spray unit = £2.89

**Brands** include Nasonex, AstraZeneca, and Syntaris.

1. Can be sold to the public for nasal administration (other than by aerosol) if supplied for the prevention and treatment of seasonal allergic rhinitis in adults over 18 years subject to max. single dose of 200 micrograms per nostril, max. daily dose of 200 micrograms per nostril for max. period of 3 months, and a pack size of 10 mg

### RHINOCORT AQUA®

**Indications**
- prophylaxis and treatment of allergic rhinitis

**Cautions**
- see notes above

**Side-effects**
- see notes above

**Dose**
- **ADULT** over 12 years, 128 micrograms (2 sprays) into each nostril once daily in the morning or 64 micrograms (1 spray) into each nostril twice daily; when control achieved reduce to 64 micrograms (1 spray) into each nostril once daily, max. duration of treatment 3 months

**Brands** include Flixonase Nasule, AstraZeneca, and Budesonide.

### FLUNISOLIDE

**Indications**
- prophylaxis and treatment of allergic rhinitis

**Cautions**
- see notes above

**Side-effects**
- see notes above

**Dose**
- **ADULT** and **CHILD** over 12 years, 64 micrograms (1 spray) into each nostril twice daily for up to 3 months

### FLUTICASONE PROPIONATE

**Indications**
- prophylaxis and treatment of allergic rhinitis and perennial rhinitis; nasal polyps

**Cautions**
- see notes above; interactions: Appendix 1 (corticosteroids)

**Side-effects**
- see notes above

**Dose**
- **Rhinitis**, 100 micrograms (2 sprays) into each nostril once daily, preferably in the morning, increased to max. twice daily if required; when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily; **CHILD** 4–11 years, 50 micrograms (1 spray) into each nostril once daily, preferably in the morning, increased to max. twice daily if required

- **Nasal polyps**, see Flixonase Nasule® below

### BUDESONIDE

**Indications**
- prophylaxis and treatment of allergic and vasomotor rhinitis; nasal polyps

**Cautions**
- see notes above; interactions: Appendix 1 (corticosteroids)

**Side-effects**
- see notes above

**Dose**
- See preparations
**12.2.2 Topical nasal decongestants**

The nasal mucosa is sensitive to changes in atmospheric temperature and humidity and these alone may cause slight nasal congestion. The nose and nasal sinuses produce a litre of mucus in 24 hours and much of this finds its way silently into the stomach via the nasopharynx. Slight changes in the nasal airway, accompanied by an awareness of mucus passing along the nasopharynx, may cause some patients to be inaccurately diagnosed as suffering from chronic sinusitis. These symptoms are particularly noticeable in the later stages of the common cold. **Sodium chloride** 0.9% given as nasal drops may relieve nasal congestion by helping to liquefy mucous secretions.

**Inhalation of warm moist air** is useful in the treatment of symptoms of acute infective conditions. The addition of volatile substances such as menthol and eucalyptus may encourage the use of warm moist air (section 3.8).

Symptoms of nasal congestion associated with vasomotor rhinitis and the common cold can be relieved by the short-term use (usually not longer than 7 days) of decongestant nasal drops and sprays. These all contain sympathomimetic drugs which exert their effect by vasoconstriction of the mucosal blood vessels which in turn reduces oedema of the nasal mucosa. They are of limited value because they can give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.

**Epinephrine nasal drops** is the safest sympathomimetic preparation and can give relief for several hours. The more potent sympathomimetic drugs oxymetazoline, and xylometazoline are more likely to cause a rebound effect. All of these preparations may cause a hypertensive crisis if used during treatment with a monoamine-oxidase inhibitor including moclobemide. The CHM/MHRA has stated that non-prescription cough and cold medicines containing epinephrine, oxymetazoline, or xylometazoline should not be used in children under 2 years of age (section 3.9.1). However, in special circumstances, some specialists prescribe nasal drops containing epinephrine or xylometazoline in children under 2 years of age for the short-term treatment of severe nasal obstruction that has not responded to sodium chloride 0.9% nose drops and inhalation of warm moist air.

Non-allergic wet cough rhinorrhea often responds well to treatment with the antimuscarinic **iropatripium bromide**.

Systemic nasal decongestants—see section 3.10.

---

**Nasal drops**, **trituration** 400 micrograms/unit dose, net price 28 x 0.4 mL units = £13.76. **Excipients** include polysorbate 20

**Nasal spray**, mometasone furoate 50 micrograms/metered spray. Net price 150-spray unit = £10.52. **Excipients** include benzalkonium chloride, polysorbate 80

**Aqueous nasal spray**, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit = £10.52. **Excipients** include benzalkonium chloride, polysorbate 80

**Nasal drops**, **trituration** 400 micrograms/unit dose, net price 28 x 0.4 mL units = £13.76. **Excipients** include polysorbate 20

**Nasal spray**, mometasone furoate 50 micrograms/metered spray. Net price 150-spray unit = £7.83. **Excipients** include benzalkonium chloride, polysorbate 80

**Aqueous nasal spray**, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit = £10.52. **Excipients** include benzalkonium chloride, polysorbate 80

**Nasal drops**, **trituration** 400 micrograms/unit dose, net price 28 x 0.4 mL units = £13.76. **Excipients** include polysorbate 20

**Nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 120-spray unit = £7.39. **Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Nasal drops**, **trituration** 400 micrograms/unit dose, net price 28 x 0.4 mL units = £13.76. **Excipients** include polysorbate 20

**Aqueous nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 150-spray unit = £7.39. **Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Nasal drops**, **trituration** 400 micrograms/unit dose, net price 28 x 0.4 mL units = £13.76. **Excipients** include polysorbate 20

**Aqueous nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 150-spray unit = £7.83. **Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Aqueous nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 150-spray unit = £7.83. **Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Aqueous nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 150-spray unit = £7.83. **Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

---

**Mometasone furoate**

**Indications** see preparations

**Cautions** see notes above

**Side-effects** see notes above

---

**Nasonex** (Schering-Plough) **(A)W**

**Nasal spray**, mometasone furoate 50 micrograms/metered spray. Net price 140-spray unit = £7.83. **Excipients** include benzalkonium chloride, polysorbate 80

**Dose** nasal polyps, **ADULT** and **ADOLESCENT** over 12 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary to max. 200 micrograms (4 sprays) into each nostril once daily, when control achieved reduce to 50 micrograms (1 spray) into each nostril once daily. **CHILD** 6–11 years, 50 micrograms (1 spray) into each nostril once daily.

**Nasal polyps, ADULT** over 18 years, 100 micrograms (2 sprays) into each nostril once daily, increased if necessary after 5–6 weeks to 100 micrograms (2 sprays) into each nostril twice daily (consider alternative treatment if no improvement after further 5–6 weeks); reduce to the lowest effective dose when control achieved

---

**Triamcinolone acetonide**

**Indications** prophylaxis and treatment of allergic rhinitis

**Cautions** see notes above

**Side-effects** see notes above

---

**Nasacort** (Aventis Pharma) **(A)W**

**Aqueous nasal spray**, triamcinolone acetonide 55 micrograms/metered spray. Net price 120-spray unit = £7.39. **Excipients** include benzalkonium chloride, disodium edetate, polysorbate 80

**Dose** **ADULT** and **CHILD** over 12 years 110 micrograms (2 sprays) into each nostril once daily, when control achieved, reduce to 55 micrograms (1 spray) into each nostril once daily. **CHILD** 6–12 years, 55 micrograms (1 spray) into each nostril once daily

**Note** Preparations of triamcinolone acetonide can be sold to the public for nasal administration as a non-presurised nasal spray if supplied for the symptomatic treatment of seasonal allergic rhinitis in adults over 18 years, subject to max. daily dose of 110 micrograms per nostril for max. 3 months, and a pack size of 3.575 mg

---

**Cromoglicate**

**Sodium Cromoglicate** (Sodium Cromoglicate)

**Indications** prophylaxis of allergic rhinitis

**Side-effects** local irritation; rarely transient bronchospasm

---

**Rynacrom** (Sanoﬁ-Aventis)

4% aqueous nasal spray, sodium cromoglicate 4% (5.2 mg/spray). Net price 22 mL with pump = £17.76. **Excipients** include benzalkonium chloride, disodium edetate

**Dose** **ADULT** and **CHILD**, 1 spray into each nostril 2–4 times daily

**Vividrin** (Pharma-Global)

**Nasal spray**, sodium cromoglicate 2%. Net price 15 mL = £10.35. **Excipients** include benzalkonium chloride, edetic acid, polysorbate 80

**Dose** **ADULT** and **CHILD**, 1 spray into each nostril 4–6 times daily

---

**Fixonase Nasule** (A&H)**(A)W**

**Nasal drops**, fluticasone propionate 400 micrograms/unit dose, net price 28 x 0.4 mL units = £13.76. **Excipients** include polysorbate 20

**Dose** nasal polyps, **ADULT** and **ADOLESCENT** over 16 years, 200 micrograms (approx. 6 drops) into each nostril once or twice daily; consider alternative treatment if no improvement after 4–6 weeks

---

**Nasofan** (IVAX) **(A)W**

**Aqueous nasal spray**, fluticasone propionate 50 micrograms/metered spray. Net price 150-spray unit = £10.52. **Excipients** include benzalkonium chloride, polysorbate 80

---

12 Ear, nose, and oropharynx

---
**Sinusitis and oral pain**  Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air (section 3.8) or with **epinephrine nasal drops** (see above). For antibacterial treatment of sinusitis, see Table 1, section 5.1.

### Sympathomimetics

#### Ephedrine Hydrochloride

**Indications** nasal congestion  
**Cautions** see notes above; also avoid excessive or prolonged use; caution in infants under 3 months (no good evidence of value—if irritation occurs might narrow nasal passage); **interactions:** Appendix 1  
**Side-effects** local irritation, nausea, headache; after excessive use tolerance with diminished effect, rebound congestion; cardiovascular effects also reported  
**Dose**  
- **Ephedrine** (Non-proprietary)  
  - **Nasal drops**, ephedrine hydrochloride 0.5%, net price 10 mL = £1.25; 1%, 10 mL = £1.31  
  - **Note** The BP directs that if no strength is specified 0.5% drops should be supplied  
  - **Dose** 1–2 drops into each nostril up to 4 times daily when required, **CHILD** 3 months–12 years (on a specialist’s advice only for **CHILD** 3 months–2 years), 1–2 drops of 0.5% solution into each nostril 3–4 times daily, max. duration 7 days  
  - **Dental prescribing on NHS** Ephedrine nasal drops may be prescribed  
  - **1. Can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for more details see Medicines, Ethics and Practice, No. 32, London Pharmaceutical Press, 2008 (and subsequent editions as available)**

#### Xylometazoline Hydrochloride

**Indications** nasal congestion  
**Cautions** see under Ephedrine Hydrochloride and notes above  
**Side-effects** see under Ephedrine Hydrochloride and notes above  
**Dose**  
- **Xylometazoline** (Non-proprietary)  
  - **Nasal drops**, xylometazoline hydrochloride 0.1%, net price 10 mL = £1.91  
  - **Dose** 2–3 drops into each nostril 2–3 times daily when required; max. duration 7 days; not recommended for children under 12 years  
  - **Brands include** Otradrone, Otrivine, Otraspray  
  - **Paediatric nasal drops**, xylometazoline hydrochloride 0.05%, net price 10 mL = £1.59  
  - **Dose** **CHILD** 2–12 years 1–2 drops into each nostril 1–2 times daily when required (on a specialist’s advice only for **CHILD** 3 months–2 years), max. duration 7 days  
  - **Brands include** Otradrone, Otrivine, Tinycolds

### Antimuscarinic

#### IPATROPIUM BROMIDE

**Indications** rhinorrhoea associated with allergic and non-allergic rhinitis  
**Cautions** see section 3.1.2; avoid spraying near eyes  
**Side-effects** epistaxis, nasal dryness, and irritation; less frequently nausea, headache, and pharyngitis; **very rarely** antimuscarinic effects such as gastrointestinal motility disturbances, palpitations, and urinary retention  
**Dose**  
- **ADULT** and **CHILD** over 12 years, 42 micrograms (2 sprays) into each nostril 2–3 times daily  
- **Rinatec** (Boehringer Ingelheim)  
  - **Nasal spray 0.03%**, ipratropium bromide 21 micrograms/metered spray. Net price 180-dose unit = £4.55  
  - **Excipients** include benzalkonium chloride, disodium edetate

### 12.2.3 Nasal preparations for infection

There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; for elimination of nasal staphylococci, see below.  
Systemic treatment of sinusitis—see Table 1 section 5.1

#### Betnesol-N® (UCB Pharma)  
**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 10 mL = £2.39  
**Excipients** include benzalkonium chloride, disodium edetate  
**Dose** **nose**, 2–3 drops into each nostril 2–3 times daily; **eye**, section 11.4.1; **ear**, section 12.1.1

#### Vistarinasone N® (Martenstian)  
**Drops** (for ear, eye, or nose), betamethasone sodium phosphate 0.1%, neomycin sulphate 0.5%. Net price 5 mL = £1.09, 10 mL = £1.20  
**Excipients** include thiomersal  
**Dose** **nose**, 2–3 drops into each nostril twice daily; **eye**, section 11.4.1; **ear**, section 12.1.1

### Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Naseptin®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.  
A nasal ointment containing mupirocin is also available; it should probably be held in reserve for resistant cases. In hospital or in care establishments, mupirocin nasal ointment should be reserved for the eradication

---

**Nasal spray**, xylometazoline hydrochloride 0.1%, net price 10 mL = £1.91  
**Dose** 1 spray into each nostril 2–3 times daily when required; max. duration 7 days; not recommended for children under 12 years  
**Brands include** Otrasprr , Otrivine , Otraspray
Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy (see also Chemotherapy-induced mucositis and myelosuppression, section 8.1). It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Patients with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer.

**Simple mouthwashes** A saline mouthwash (section 12.3.4) may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

**Antiseptic mouthwashes** Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of chlorhexidine mouthwash (section 12.3.4) is often beneficial and may accelerate healing of recurrent aphthae.

**Mechanical protection** Carmellose gelatin paste may relieve some discomfort arising from ulceration by protecting the ulcer site. As the paste adheres to dry mucosa, it is difficult to apply it effectively to the tongue and oropharynx.

**Corticosteroids** Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

**Hydrocortisone oromucosal tablets** are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

**Triamcinolone dental paste** is designed to keep the corticosteroid in contact with the mucosa for long enough to permit penetration of the lesion. As the paste adheres to dry mucosa, it is difficult to apply it effectively to the tongue and oropharynx.

**Beclometasone** inhaler 50–100 micrograms sprayed twice daily on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

**Systemic corticosteroid therapy** (section 6.3.2) is reserved for severe conditions such as pemphigus vulgaris.

**Local anaesthetics** Local anaesthetics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that anaesthesia cannot be maintained continuously throughout the day. The main indication for a topical local anaesthetic is to relieve the pain of otherwise intractable oral ulceration particularly when it is due to major aphthae. For this purpose lidocaine (lignocaine) 5% ointment or lozenges containing a local anaesthetic are applied to the ulcer. Lidocaine 10% solution as spray (section 15.2) can be applied thinly to the ulcer [unlicensed indication] using a cotton bud. When local anaesthetics are used in the mouth care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

**Benzydamine** mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water.

**Flurbiprofen** lozenges are licensed for the relief of sore throat.

**Choline salicylate** gel has some analgesic action and may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration. Benefit in teething may merely be due to pressure of application (comparable with biting a teething ring); excessive use can lead to salicylate poisoning.
Other preparations Doxycycline rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis Low-dose doxycycline (Periostar®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis. For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see section 12.3.2 and Table 1, section 5.1. For mouthwashes used for oral hygiene and plaque inhibition, see section 12.3.4.

BENZYMADINE HYDROCHLORIDE
Indications painful inflammatory conditions of oropharynx
Side-effects occasional numbness or stinging; rarely hypersensitivity reactions

Difflam® (3M)
Oral rinse, green, benzydamine hydrochloride 0.15%, net price 200 mL (Difflam® Sore Throat Rinse) £2.63; 300 mL £4.01

Dose ADULT and ADOLESCENT over 12 years, rinse or gargle, using 15 mL (dilute with an equal volume of water if stinging occurs) every 1½–3 hours as required, usually for not more than 7 days

Dental prescribing on NHS May be prescribed as Benzydamine Mouthwash 0.15%

Spray, benzydamine hydrochloride 0.15%. Net price 30–mL unit = £3.17

Dose ADULT 4–8 sprays onto affected area every 1½–3 hours; CHILD under 6 years 1 spray per 4 kg body-weight to max. 4 sprays every 1½–3 hours; 6–12 years 4 sprays every 1½–3 hours

Dental prescribing on NHS May be prescribed as Benzydamine Oromucosal Spray 0.15%

CARMELLOSE SODIUM
Indications mechanical protection of oral and perioral lesions

Orabase® (Convatec)
Protective paste (= oral paste), carmellose sodium 16.7%, pectin 16.7%, gelatin 16.7%, in Plastibase®. Net price 30 g = £2.02; 100 g = £4.88

Dose apply a thin layer when necessary after meals

Dental prescribing on NHS May be prescribed as Carmellose Gelatin Paste

Orabhesive® (Convatec)
Powder, carmellose sodium, pectin, gelatin, equal parts. Net price 25 g = £2.33

Dose sprinkle on the affected area

CORTICOSTEROIDS
Indications oral and perioral lesions
Contra-indications untreated oral infection; manufacturer of triamcinolone contra-indicates use on tuberculous and viral lesions
Side-effects occasional exacerbation of local infection; thrush or other candidal infections

Adcortyl in Orabase® (Squibb) (SFH)
Oral paste, triamcinolone acetonide 0.1% in adhesive basis. Net price 10 g = £1.18

Dose ADULT and CHILD, apply a thin layer 2–4 times daily; do not rub in; use limited to 5 days for children and short-term use also advised for elderly

Dental prescribing on NHS May be prescribed as Triamcinolone Dental Paste

Note A 5-g tube is on sale to the public for the treatment of common mouth ulcers for max. 5 days

Betnesol® (Geltech) (SFH)
Soluble tablets, pink, scored, betamethasone 500 micrograms (as sodium phosphate). net price 100-pack = £5.17. Label: 10, steroid card, 13, 21

Dose oral ulceration, (unlicensed indication) ADULT and CHILD over 12 years, 500 micrograms dissolved in 20 mL water and rinsed around the mouth 4 times daily, not to be swallowed

Dental prescribing on the NHS May be prescribed as Betamethasone Soluble Tablets 500 micrograms

Coraln® (UCB Pharma)
Pellets (= oromucosal tablets), hydrocortisone 2.5 mg (as sodium succinate). Net price 20 = £2.54

Dose ADULT and CHILD over 12 years, 1 lozenge 4 times daily, allowed to dissolve slowly in the mouth in contact with the ulcer; CHILD under 12 years, only on medical advice

Dental prescribing on NHS May be prescribed as Hydrocortisone Oromucosal Tablets

DOXYCYCLINE
Indications see preparations; oral herpes (section 12.3.2); other indications (section 5.1.3)
Cautions section 5.1.3; monitor for superficial fungal infection, particularly, if predisposition to oral candidiasis
Contra-indications section 5.1.3
Side-effects section 5.1.3; fungal superinfection
Dose

Note Doxycycline stains teeth; avoid in children under 12 years of age

Periodostat® (Alliance) (SFH)
Tablets, H.c, doxycycline (as hyclate) 20 mg, net price 56-tab pack = £16.50. Label: 6, 11, 27, counselling, posture

Dose periodontitis (as an adjunct to gingival scaling and root planing), 20 mg twice daily for 3 months; CHILD under 12 years not recommended

Counselling Tablets should be swallowed whole with plenty of fluid (at least 100 mL), while sitting or standing

Dental prescribing on NHS May be prescribed as Doxycycline Tablets 20 mg

Local application

For recurrent aphthous ulceration, the contents of a 100 mg doxycycline capsule can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes 4 times daily usually for 3 days; it should preferably not be swallowed (unlicensed indication).

FLURBIPROFEN
Indications relief of sore throat
Cautions see section 10.1.1
Contra-indications see section 10.1.1
Side-effects taste disturbance, mouth ulcers (move lozenge around mouth); see also section 10.1.1

Strelen® (Crookes)
Lozenges, flurbiprofen 8.75 mg, net price 16 = £2.24

Dose ADULT and CHILD over 12 years, allow 1 lozenge to dissolve slowly in the mouth every 3–4 hours, max. 5 lozenges in 24 hours, for max. 3 days

LOCAL ANAESTHETICS
Indications relief of pain in oral lesions
Cautions avoid prolonged use; hypersensitivity; pregnancy (Appendix 4); avoid anaesthesia of the pharynx before meals—risk of choking
12.3.2 Oropharyngeal anti-infective drugs

**Lidocaine** (Non-proprietary)

**Ointment**, lidocaine 5% in a water-miscible basis, net price 15 g = 80p

**Dose** rub sparingly and gently on affected areas

*Dental prescribing on NHS* Lidocaine 5% Ointment may be prescribed

**Xylocaine** (AstraZeneca)

**Spray** (= pump spray), lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/spray; 500 spray doses per container. Net price 50-mL bottle = £3.13

**Dose** apply thinly to the ulcer [unlicensed indication] using a cotton bud

*Dental prescribing on NHS* May be prescribed as Lidocaine Spray 10%

### Preparations on sale to the public

Many mouth ulcer preparations, throat lozenges, and throat sprays on sale to the public contain a **local anaesthetic**. To identify the active ingredients in such preparations, consult the product literature of the manufacturer.

**Note** The correct proprietary name should be ascertained—many products have very similar names but different active ingredients

#### SALICYLATES

**Indications** mild oral and perioral lesions

**Cautions** not to be applied to dentures—leave at least 30 minutes before re-insertion of dentures; frequent application, especially in children, may give rise to salicylate poisoning

**Note** CSM warning on aspirin and Reye's syndrome does not apply to salicylates in topical preparations such as teething gels and oral paints

**Choline salicylate**

**Choline Salicylate Dental Gel, BP**

**Oral gel**, choline salicylate 8.7% in a flavoured gel basis, net price 15 g = £1.89

**Brands** include Bonpepa (sugar-free)

**Dose** apply ½-inch of gel with gentle massage not more often than every 3 hours; **CHILD** over 4 months ¼-inch of gel not more often than every 3 hours; max. 6 applications daily

*Dental prescribing on NHS* Choline Salicylate Dental Gel may be prescribed

**Salicylic acid**

**Pyralvex** (Norgine)

**Oral paint**, brown, rhubarb extract (anthraquinone glycosides 0.5%), salicylic acid 1%. Net price 10 mL with brush = £3.38

**Dose** **ADULT** and **CHILD** over 12 years, apply 3–4 times daily

### 12.3.2 Oropharyngeal anti-infective drugs

The most common cause of a sore throat is a viral infection which does not benefit from anti-infective treatment. Streptococcal sore throats require systemic *penicillin* therapy (Table 1, section 5.1). Acute ulcerative gingivitis (Vincent's infection) responds to systemic *metronidazole* (section 5.1.11).

Preparations administered in the dental surgery for the local treatment of periodontal disease include gels of *metronidazole* (**Elyzol***, Colgate-Palmolive) and of minocycline (**Dentomycin***, Blackwell).

#### Oropharyngeal fungal infections

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

**Thrush** Acute pseudomembranous candidiasis (thrust), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. **Treatment with** **nystatin**, **amphotericin**, or **miconazole** may be needed. Fluconazole (section 5.2) is effective for unresponsive infections or if a topical antifungal drug cannot be used or if the patient has dry mouth. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred (section 5.2).

**Acute erythematous candidiasis** Acute erythematous (atrophic candidiasis) is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole (section 5.2).

**Denture stomatitis** Patients with denture stomatitis (chronic atrophic candidiasis), should cleanse their dentures thoroughly and leave them out as often as possible during the treatment period. To prevent recurrence of the problem, dentures should not normally be worn at night. New dentures may be required if these measures fail despite good compliance.

**Miconazole** oral gel can be applied to the fitting surface of the denture before insertion (for short periods only). Alternatively, **amphotericin** lozenges can be allowed to dissolve slowly in the mouth but they are less effective at resolving the stomatitis. Denture stomatitis is not always associated with candidiasis and other factors such as mechanical or chemical irritation, bacterial infection, or rarely allergy to the dental base material, may be the cause.

**Chronic hyperplastic candidiasis** Chronic hyperplastic candidiasis (candidal leucoplaclia) carries an increased risk of malignancy; biopsy is essential—this type of candidiasis may be associated with varying degrees of dysplasia, with oral cancer present in a high proportion of cases. Chronic hyperplastic candidiasis is treated with a systemic antifungal such as fluconazole (section 5.2) to eliminate candidal overgrowth. Patients should avoid the use of tobacco.

**Angular cheilitis** Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It is commonly associated with denture stomatitis but may represent a nutritional deficiency or it may be related to orofacial granulomatosis. While the underlying cause is being identified and
treated, it is often helpful to apply miconazole and hydrocortisone cream or ointment (see p. 622), miconazole cream (see p. 650), or sodium fusidate ointment (see p. 649).

**Immunocompromised patients** For advice on prevention of fungal infections in immunocompromised patients see p. 328.

**Drugs used in oropharyngeal candidiasis**

**Amphotericin** and nystatin are not absorbed from the gastro-intestinal tract and are applied locally (as lozenges or suspension) to the mouth for treating local fungal infections. Miconazole is applied locally (as an oral gel) in the mouth but it is absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci.

**Fluconazole** (section 5.2) is given by mouth for infections that do not respond to topical therapy. It is reliably absorbed and effective. Itraconazole (section 5.2) can be used for fluconazole-resistant infections.

If candidal infection fails to respond to 1 to 2 weeks of treatment with antifungal drugs the patient should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by reinfection from the genito-urinary or gastro-intestinal tract. Infection can be eliminated from these sources by appropriate anticandidal therapy; the patient’s partner may also require treatment to prevent reinfection.

For the role of antiseptic mouthwashes in the prevention of oral candidiasis in immunocompromised patients and treatment of denture stomatitis, see section 12.3.4.

### AMPHOTERICIN

**Indications** oral and peroral fungal infections

**Side-effects** mild gastro-intestinal disturbances reported

**Fungilin** (Squibb)

**Dose** allow 1 lozenge to dissolve slowly in the mouth 4 times daily for 10–15 days (continued for 48 hours after lesions have resolved); increase to 8 daily if infection severe

**Dental prescribing on NHS** May be prescribed as Amphotericin Lozenges

### MICONAZOLE

**Indications** see preparations

**Cautions** pregnancy (Appendix 4); breast-feeding; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (antifungals, imidazole)

**Contra-indications** hepatic impairment; with oral gel, impaired swallowing reflex in infants, first 5–6 months of life of an infant born preterm

**Side-effects** nausea, vomiting, rash; with **buccal tablets**, abdominal pain, taste disturbance, burning sensation at application site, pruritus, and oedema; with **oral gel**, very rarely diarrhoea (usually on long-term treatment), hepatitis, toxic epidermal necrolysis, and Stevens-Johnson syndrome

**Dose** see preparations

### Nystatin

**Indications** oral and peroral fungal infections

**Side-effects** oral irritation and sensitisation, nausea reported; see also p. 332

**Dose**

- Treatment, ADULT and CHILD, 100 000 units 4 times daily after food, usually for 7 days (continued for 48 hours after lesions have resolved);
- **Note** Unlicensed for treating candidiasis in NEONATE

**Nystan** (Squibb)

**Oral suspension**, yellow, nystatin 100 000 units/mL. Net price 30 mL with pipette = £1.91. Label: 9, counselling, use of pipette, hold in mouth, after food

**Dental prescribing on NHS** Nystatin Oral Suspension may be prescribed

### Oropharyngeal viral infections

The management of primary herpetic gingivostomatitis is a soft diet, adequate fluid intake, and analgesics as required, including local use of **benzydamine** (section 12.3.1). The use of chlorhexidine mouthwash (section 12.3.4) will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In the case of severe herpetic stomatitis, a systemic antiviral such as aciclovir is required (section 5.3.2.1). Valaciclovir and famciclovir are suitable alternatives for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used for the prevention of frequently recurring herpes simplex lesions of the mouth, particularly when implicated in the initiation of erythema multiforme. See section 13.10.3 for the treatment of labial herpes simplex infections.

Herpes infections of the mouth may also respond to rinsing the mouth with **doxycycline** (see p. 609).
12.3.3 Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

12.3.4 Mouthwashes, gargles, and dentifrices

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash with an equal volume of warm water. Mouthwash solution-tablets are used to remove unpleasant tastes.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris.

Chlorhexidine is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine mouthwash is used in the treatment of denture stomatitis. It is also used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in patients undergoing dental procedures. Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis.

There is no convincing evidence that gargles are effective.

CHLORHEXIDINE GLUCONATE

Indications  see under preparations below

Side-effects  mucosal irritation (if desquamation occurs, discontinue treatment or dilute mouthwash with an equal volume of water); taste disturbance; reversible brown staining of teeth, and of silicate or composite restorations; tongue discoloration; parotid gland swelling reported

Note  Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; leave an interval of at least 30 minutes between using mouthwash and toothpaste

Chlorhexidine (Non-proprietary)

Mouthwash, chlorhexidine gluconate 0.2%, net price 300 mL = £1.97
Dose  oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily
Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily
Dental prescribing on NHS  Chlorhexidine Mouthwash may be prescribed

Chlorohex® (Colgate-Palmoive)

Chlorohex 1200® mouthwash, chlorhexidine gluconate 0.12% (mint-flavoured). Net price 300 mL = £2.00
Dose  oral hygiene and plaque inhibition, rinse mouth with 15 mL for about 30 seconds twice daily

Cordyol® (GSK Consumer Healthcare)

Dental gel, chlorhexidine gluconate 1%. Net price 50 g = £1.21
Dose  oral hygiene and plaque inhibition and gingivitis, brush on the teeth once or twice daily
Dental prescribing on NHS  May be prescribed as Chlorhexidine Gluconate Gel 1%

Mouthwash, chlorhexidine gluconate 0.2%. Net price 300 mL (original or mint) = £1.93, 600 mL (mint) = £3.85
Dose  oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, rinse mouth with 10 mL for about 1 minute twice daily
Denture stomatitis, cleanse and soak dentures in mouthwash solution for 15 minutes twice daily

Oral spray, chlorhexidine gluconate 0.2% (mint-flavoured). Net price 60 mL = £4.10
Dose  oral hygiene and plaque inhibition, oral candidiasis, gingivitis, and management of aphthous ulcers, apply as required to tooth, gingival, or ulcer surfaces using up to 12 actuations (approx. 0.14 mL/actuation) twice daily
Dental prescribing on NHS  May be prescribed as Chlorhexidine Oral Spray

With chlorobutanol

Eludril® (Fabre)

Mouthwash or gargle, chlorhexidine gluconate 0.1%, chlorobutanol 0.5% (mint-flavoured), net price 90 mL = £1.36, 250 mL = £2.83, 500 mL = £5.06
Dose  oral hygiene and plaque inhibition, use 10–15 mL (diluted with warm water in measuring cup provided) 2–3 times daily
Denture disinfection, soak previously cleansed dentures in mouthwash (diluted with 2 volumes of water) for 60 minutes

HEXETIDINE

Indications  oral hygiene

Side-effects  local irritation; very rarely taste disturbance and transient anaesthesia

Oraldene® (McNeil)

Mouthwash or gargle, red or blue-green (mint-flavoured), hexetidine 0.1%. Net price 100 mL = £1.31; 200 mL = £2.02
Dose  ADULT and CHILD over 6 years, use 15 mL undiluted 2–3 times daily

HYDROGEN PEROXIDE

Indications  oral hygiene, see notes above

Side-effects  hypertrophy of papillae of tongue on prolonged use
Hydrogen Peroxide Mouthwash, BP

Mouthwash, consists of Hydrogen Peroxide Solution 6% (= approx. 20 volume) BP

Dose  
- rinse the mouth for 2–3 minutes with 15 mL diluted in half a tumblerful of warm water 2–3 times daily

Dental prescribing on NHS  
Hydrogen Peroxide Mouthwash may be prescribed

Peroxyl® (Colgate-Palmolive)

Mouthwash, hydrogen peroxide 1.5%, net price 300 mL = £2.95

Dose  
- rinse the mouth with 10 mL for about 1 minute up to 4 times daily (after meals and at bedtime)

SOODIUM CHLORIDE

Indications  
oral hygiene, see notes above

Sodium Chloride Mouthwash, Compound, BP

Mouthwash, sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with a peppermint flavour.

Dose  
- extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL.

To be diluted with an equal volume of warm water

Dental prescribing on NHS  
Compound Sodium Chloride Mouthwash may be prescribed

THYMOL

Indications  
oral hygiene, see notes above

Mouthwash Solution-tablets

Consist of tablets which may contain antimicrobial, colouring, and flavouring agents in a suitable soluble effervescent basis to make a mouthwash suitable for dental purposes.

Dose  
- dissolve 1 tablet in a tumblerful of warm water

Note  
Mouthwash solution tablets may contain ingredients such as thymol.

Dental prescribing on NHS  
Mouthwash Solution-tablets may be prescribed

12.3.5 Treatment of dry mouth

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics, tricyclic antidepressants, and some antipsychotics), by diuretics, by irradiation of the head and neck region or by damage to or disease of the salivary glands. Patients with a persistently dry mouth may develop increased dental caries, periodontal disease, intolerance of dentures, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates saliva in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate. Of the proprietary preparations, Luboran® is licensed for any condition giving rise to a dry mouth; Biotène Oralbalance®, BioXtra®, Glondosane®, Saliva Orthana®, and Saliveze®, have ACBS approval for dry mouth associated only with radiotherapy or sicca syndrome. Salivix® pastilles, which act locally as salivary stimulants, are also available and have similar ACBS approval. SST tablets may be prescribed for dry mouth in patients with salivary gland impairment (and patent salivary ducts). Salinum® may also be prescribed for relief of symptoms of dry mouth.

Pilocarpine tablets are licensed for the treatment of xerostomia following irradiation for head and neck cancer and for dry mouth and dry eyes (xerophthalmia) in Sjögren's syndrome. They are effective only in patients who have some residual salivary gland function, and therefore should be withdrawn if there is no response.

Local treatment

AS Saliva Orthana®  
(AS Pharma)

Oral spray, gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral. Net price 50-mL bottle = £4.92; 450-mL refill = £29.69

Dose  
- ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray 2–3 times onto oral and pharyngeal mucosa, when required

Lozenges, mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral. Net price 30-lozenge pack = £3.50

Dose  
- ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome

Note  
Avoid use with toothpastes containing detergents (including foaming agents)

Dental prescribing on NHS  
AS Saliva Orthana Oral Spray and Lozenges may be prescribed

Biotène Oralbalance®  
(Anglian)

Saliva replacement gel, lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis, net price 50-g tube = £4.10, 24 × 12.4-mL tube = £30.40 (for hospital use)

Dose  
- ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, apply to gums and tongue as required

Note  
Avoid use with toothpastes containing detergents (including foaming agents)

Dental prescribing on NHS  
Biotène Oralbalance Saliva Replacement Gel may be prescribed

BioXtra®  
(RIS Products)

Gel, lactoperoxidase, lactoferrin, lysozyme, whey collostrum, xylitol and other ingredients, net price 40-mL tube = £3.94, 50-mL spray = £3.94

Dose  
- ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, apply to oral mucosa as required

Dental prescribing on NHS  
BioXtra Gel may be prescribed

Glandosane®  
(Fresenius Kabi)

Aerosol spray, carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50-g, pH 5.75. Net price 50-mL unit (neutral, lemon or peppermint flavoured) = £4.48

Dose  
- ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, spray onto oral and pharyngeal mucosa as required

Dental prescribing on NHS  
Glandosane Aerosol Spray may be prescribed

Luboran®  
(Goldshield)

Oral spray, pink, sorbitol 1.8 g, carmellose sodium (sodium carboxymethylcellulose) 390 mg, dibasic acid.
potassium phosphate 48.23 mg, potassium chloride 37.5 mg, monobasic potassium phosphate 21.97 mg, calcium chloride 9.972 mg, magnesium chloride 3.528 mg, sodium fluoride 258 micrograms/60 mL, with preservatives and colouring agents. Net price 60-mL unit = £3.96

Dose  saliva deficiency, 2–3 sprays onto oral mucosa up to 4 times daily; or as directed

Note  May be difficult to obtain

Dental prescribing on NHS  Luborant Oral Spray may be prescribed as Artificial Saliva

Salimun®  (Crawford)
Liquid, sugar-free, lined extract (containing polysaccharides) with dipotassium phosphate buffer and preservatives, pH 6–7, net price 300-mL bottle = £13.50

Dose  symptomatic treatment of dry mouth, approx. 2 mL rinsed around the mouth and then swallowed, when required

Saliveze®  (Wyvern)
Oral spray, carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral. Net price 50-mL bottle (mint-flavoured) = £3.50

Dose  ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, 1 spray onto oral mucosa as required

Dental prescribing on NHS  Saliveze Oral Spray may be prescribed

Salivix®  (KoGEN)
Pastilles, sugar-free, reddish-amber, acacia, malic acid and other ingredients. Net price 50-pastille pack = £3.50

Dose  ACBS: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome, suck 1 pastille when required

Dental prescribing on NHS  Salivix Pastilles may be prescribed

SST  (Medac)
Tablets, sugar-free, citric acid, malic acid and other ingredients in a sorbitol base, net price 100-tab pack = £4.86

Dose  symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts, allow 1 tablet to dissolve slowly in the mouth when required

Dental prescribing on NHS  May be prescribed as Saliva Stimulating Tablets

Systemic treatment

PILOCARPINE HYDROCHLORIDE

Indications  xerostomia following irradiation for head and neck cancer (see also notes above); dry mouth and dry eyes in Sjögren’s syndrome

Cautions  asthma and chronic obstructive pulmonary disease (avoid if uncontrolled, see Contra-indications), cardiovascular disease (avoid if uncontrolled); cholelithiasis or biliary-tract disease, peptic ulcer, hepatic impairment (Appendix 2), renal impairment; risk of increased urethral smooth muscle tone and renal colic; maintain adequate fluid intake to avoid dehydration associated with excessive sweating; cognitive or psychiatric disturbances; susceptibility to angle-closure glaucoma; interactions: Appendix 1 (parasympathomimetics)

Counselling  Blurred vision or dizziness may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting

Contra-indications  uncontrolled asthma and chronic obstructive pulmonary disease (increased bronchial secretions and increased airways resistance); uncontrolled cardiorenal disease; acute iritis; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects  dyspepsia, diarrhoea, abdominal pain, nausea, vomiting, constipation; flushing, hypertension, palpitation, headache, dizziness, asthma, influenza-like symptoms, sweating; increased urinary frequency; visual disturbances, lacrimation, ocular pain, conjunctivitis; rhinitis, rash, pruritus; less commonly flatulence, urinary urgency

Dose  • Xerostomia following irradiation for head and neck cancer, 5 mg 3 times daily with or immediately after meals (last dose always with evening meal); if tolerated but response insufficient after 4 weeks, may be increased to max. 30 mg daily in divided doses; max. therapeutic effect normally within 4–8 weeks; discontinue if no improvement after 2–3 months; CHILD not recommended

• Dry mouth and dry eyes in Sjögren’s syndrome, 5 mg 4 times daily (with meals and at bedtime); if tolerated but response insufficient, may be increased to max. 30 mg daily in divided doses; discontinue if no improvement after 2–3 months; CHILD not recommended

Salagen®  (Novartis)  Tablets, f/c, pilocarpine hydrochloride 5 mg. Net price 84-tab pack = £51.43. Label: 21, 27, counselling, driving

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at http://88.208.244.6/BAD/site/495/default.aspx

13.1 Management of skin conditions

13.11 Vehicles

Both vehicle and active ingredients are important in the treatment of skin conditions; the vehicle alone may have more than a mere placebo effect. The vehicle affects the degree of hydration of the skin, has a mild anti-inflammatory effect, and aids the penetration of active drug.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.
Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. Shake lotions (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

13.1.2 Suitable quantities for prescribing

</table>

These amounts are usually suitable for an adult for twice daily application for 1 week. The recommendations do not apply to corticosteroid preparations—for suitable quantities of corticosteroid preparations see section 13.4.

13.1.3 Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis, p. 173). The following excipients in topical preparations are rarely associated with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients under General Guidance, p. 2.

13.2 Emollient and barrier preparations

13.2.1 Emollients

Emollients soothe, smooth and hydrate the skin and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis (section 13.5.2). Light emollients such as aqueous cream are suitable for many patients with dry skin but a wide range of more greasy preparations, including white soft paraffin, emulsifying ointment, and liquid and white soft paraffin ointment, are available; the severity of the condition, patient preference

1. Purified versions of wool fat have reduced the problem
Flammable

Preparations such as aqueous cream and emulsifying ointment can be used as soap substitutes for hand washing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil (section 13.2.1) may also be helpful.

Preparations containing an antibacterial (section 13.10) should be avoided unless infection is present or is a frequent complication.

Urea is a hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients. It is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Non-proprietary emollient preparations

Aqueous Cream, BP
Cream, emulsifying ointment 30%, 1 phenoxyethanol 1% in freshly boiled and cooled purified water, net price 500 g = £1.68
Excipients include cetostearyl alcohol
1. The BP permits use of alternative antimicrobials provided their identity and concentration are stated on the label

Emulsifying Ointment, BP
Ointment, emulsifying wax 30%, white soft paraffin 50%, liquid paraffin 20%, net price 500 g = £2.10
Excipients include cetostearyl alcohol

Hydrous Ointment, BP
Ointment, (oily cream), dried magnesium sulphate 0.5%, phenoxyethanol 1%, wool alcohols ointment 50%, in freshly boiled and cooled purified water, net price 500 g = £2.12

Liquid and White Soft Paraffin Ointment, NPF
Ointment, liquid paraffin 50%, white soft paraffin 50%, net price 500 g = £3.94

Paraffin, White Soft, BP
White petroleum jelly, net price 100 g = 48p

Paraffin, Yellow Soft, BP
Yellow petroleum jelly, net price 100 g = 34p

Proprietary emollient preparations

Avene® (RJL)
Cream, colloidal oatmeal in emollient basis, net price 100 mL = £3.78; 300-mL pump pack = £6.80
Excipients include benzy! alcohol, cetyl alcohol, isopropyl palmitate
ACBS: For endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin

Cetabren® (Genus)
Emollient cream, white soft paraffin 13.2%, light liquid paraffin 10.5%, net price 50-g pump pack = £1.17; 150-g pump pack = £2.88; 500-g pump pack = £5.61, 1.05-kg pump pack = £11.11
Excipients include benzy! alcohol, cetyl alcohol, isopropyl palmitate
ACBS: as for Avene Cream

Dermamist® (Alliance)
Spray application, white soft paraffin 10% in a basis containing liquid paraffin, fractionated coconut oil, net price 250-mL pressurised aerosol unit = £9.22
Excipients none as listed in section 13.1.3
For dry skin conditions including eczema, ichthyosis, pruritus of the elderly
Note Flammable

Diprobase® (Schering-Plough)
Cream, cetomacrogol 2.25%, cetostearyl alcohol 7.2%, liquid paraffin 6%, white soft paraffin 15%, water-miscible basis used for Diprosone® cream, net price 50 g = £1.34; 500-g pump pack = £6.76
Excipients include cetostearyl alcohol, chlorocresol
For dry skin conditions

Ointment, liquid paraffin 5%, white soft paraffin 95%, basis used for Diprosone® ointment, net price 50 g = £1.34
Excipients none as listed in section 13.1.3
For dry skin conditions

Doublebase® (Dermal)
Gel, isopropyl myristate 15%, liquid paraffin 15%, net price 100 g = £2.77, 500 g = £6.09
Excipients none as listed in section 13.1.3
For dry chapped or itchy skin conditions

Emollient shower gel, isopropyl myristate 15%, liquid paraffin 15%, net price 200 g = £5.45
Excipients none as listed in section 13.1.3
For dry and chapped skin conditions

E45® (Crookes)
Cream, light liquid paraffin 12.6%, white soft paraffin 14.5%, hypoallergenic anhydrous wool fat (hypoallergenic lanolin) 1% in self-emulsifying monostearin, net price 50 g = £1.40, 125 g = £2.55, 350 g = £4.46, 500-g pump pack = £6.20
Excipients include cetyl alcohol, hydroxybenzenes (parabens)
For dry skin conditions

Emollient Wash Cream, soap substitute, zinc oxide 5% in an emollient basis, net price 250-mL pump pack = £3.19
Excipients none as listed in section 13.1.3
ACBS: For endogenous and exogenous eczema, xeroderma, ichthyosis and senile pruritus (pruritus of the elderly) associated with dry skin

Lotion, light liquid paraffin 4%, cetomacrogol, white soft paraffin 10%, hypoallergenic anhydrous wool fat
Emollients

Spray:
- QV Oilatum
- Linola
- Hydromol
- Hewletts
- Epaderm

For dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus, use as an emollient or soap substitute.

Epaderm® (Medlock): Ointment, emulsifying wax 30%, yellow soft paraffin 30%, liquid paraffin 40%, net price 125 g = £3.62, 500 g = £6.14, 1 kg = £11.44

For use as an emollient or soap substitute.

Hewletts® (Kestrel):
- Cream, hydrous wool fat 4%, zinc oxide 8%, arachis (peanut) oil, oleic acid, white soft paraffin, net price 35 g = £1.43, 400 g = £6.69

For use as an emollient or soap substitute.

Hydromol® (Alliance):
- Cream, sodium pidolate 2.5%, liquid paraffin 13.8%, net price 50 g = £2.04, 100 g = £3.80, 500 g = £12.60

For dry skin conditions.

Linola® Gamma (Lindera)
- Cream, evening primrose oil 20%, net price 50 g = £2.83, 250 g = £8.20

Cautions: epilepsy (but hazard unlikely with topical preparations).

For dry skin conditions.

Lipobase® (Astellas)
- Cream, fatty cream basis used for Locoid Lipocream®, net price 50 g = £2.08

Excipients include cetostearyl alcohol, alcohol, hydroxybenzoates (parabens).

For dry skin conditions, also for use during treatment with topical corticosteroids as a diluent for Locoid Lipocream.

Oilatum® (Stiefel)
- Cream, liquid paraffin 6%, white soft paraffin 15%, net price 40 g = £1.79, 150 g = £3.38, 500 mL pump pack = £6.35, 1.05-litre pump pack = £14.67

Excipients include cetostearyl alcohol, alcohol, hydroxybenzoates (parabens).

For dry skin conditions, for use during treatment with topical corticosteroids as a diluent for Locoid Lipocream.

QV® (Crawford)
- Cream, glycerol 10%, light liquid paraffin 10%, white soft paraffin 5%, net price 100 g = £1.95, 500 g = £5.60

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens).

For dry skin conditions including eczema, psoriasis, ichthyosis, pruritus.

Wash, glycerol 10%, net price 200 mL = £2.50

Excipients include hydroxybenzoates (parabens).

For dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus, use as a soap substitute.

Ultrabase® (Valeant)
- Cream, water-miscible, containing liquid paraffin and white soft paraffin, net price 50 g = £8.90, 500-g pump pack = £6.44

Excipients include fragrance, alcohol, hydroxybenzoates (parabens), disodium edetate, alcohol.

For dry skin conditions.

Unguentum M® (Almirall)
- Cream, containing saturated neutral oil, liquid paraffin, white soft paraffin, net price 50 g = £1.41, 100 g = £2.78, 200-mL pump pack = £5.50, 500-g pump pack = £8.48

Excipients include cetostearyl alcohol, alcohol, propylene glycol, paraffin wax.

For dry skin conditions and nappy rash.

Zerobase® (Zeroderm)
- Cream, liquid paraffin 11%, net price 500-g pump pack = £5.89

Excipients include cetostearyl alcohol, cholesterol.

For dry skin conditions.

Preparations containing urea

Aquadrate® (Alliance)
- Cream, urea 10%, net price 30 g = £1.37, 100 g = £3.64

Excipients none as listed in section 13.1.3

Dose for dry, scaling and itching skin, apply thinly and rub into area when required.

Balneum® Plus (Almirall)
- Cream, urea 5%, laurmacrogols 3%, net price 100 g = £3.29, 175-g pump pack = £8.33, 500-g pump pack = £17.09

Excipients include benzy alcohol, polyols and polysorbates.

Dose for dry, scaling and itching skin, apply twice daily.

Calmurd® (Galderma)
- Cream, urea 10%, lactic acid 5%, net price 100 g = £7.36, 500-g pump pack = £28.37

Excipients none as listed in section 13.1.3

Dose for dry, scaling and itching skin, apply a thick layer for 3–5 minutes, massage into area, and remove excess, usually twice daily. Use half-strength cream for 1 week if stinging occurs.

Note: Can be diluted with aqueous cream (life of diluted cream 14 days).

E45® Itch Relief Cream (Crookes)
- Cream, urea 5%, macrogol lauryl ether 3%, net price 50 g = £2.55, 100 g = £3.47, 500-g pump pack = £17.09

Excipients include benzy alcohol, polyols and polysorbates.

Dose for dry, scaling and itching skin, apply twice a day.

Eucerin® Intensive (Beiersdorf)
- Cream, urea 10%, net price 100 mL = £7.59

Excipients include benzy alcohol, propyl palmitate, wool fat.

Dose for dry skin conditions including eczema, ichthyosis, xeroderma, hyperkeratosis, apply thinly and rub into area twice daily.

Lotion, urea 10%, net price 250 mL = £7.93

Excipients include benzy alcohol, propyl palmitate.

Dose for dry skin conditions including eczema, ichthyosis, xeroderma, hyperkeratosis, apply sparingly and rub into area twice daily.

Nutraplus® (Galderma)
- Cream, urea 10%, net price 100 g = £4.37

Excipients include hydroxybenzoates (parabens), alcohol.

Dose for dry, scaling and itching skin, apply 2–3 times daily.

With antimicrobials

Dermol® (Dermal)
- Cream, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, isopropyl myristate 10%, liquid.
paraffin 10%, net price 100-g tube = £3.22, 500-g pump pack = £7.45
Exipients include ceteareth alcohol
Dose for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

Dermol® 500 Lotion, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 500-mL pump pack = £6.31
Exipients include ceteareth alcohol
Dose for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

Dermol® 200 Shower Emollient, benzalkonium chloride 0.1%, chlorhexidine hydrochloride 0.1%, liquid paraffin 2.5%, isopropyl myristate 2.5%, net price 200 mL = £3.71
Exipients include ceteareth alcohol
Dose for dry and pruritic skin conditions including eczema and dermatitis, apply to skin or use as soap substitute

13.2.1 Emollient bath additives

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to the skin or used as a soap substitute. The quantities of bath additives recommended for adults are suitable for an adult-size bath. Proportionately less should be used for a child-size bath (INFANT 10 mL), do not use undiluted

These preparations make skin and surfaces slippery—particular care is needed when bathing

Alpha Keri Bath® (Novartis Consumer Health)
Bath oil, liquid paraffin 91.7%, oil-soluble fraction of wool fat 3%, net price 240 mL = £3.45, 480 mL = £6.43
Exipients include fragrance
Dose for dry skin conditions including ichthyosis and pruritus of the elderly, add 10–20 mL/bath (INFANT 5 mL) or apply to wet skin and rinse

Aveeno® (J&J)
Aveeno® Bath oil, colloidal oatmeal, white oat fraction in emollient basis, net price 250 mL = £4.28
Exipients include beeswax, fragrance
Dose for dry skin conditions including ichthyosis and pruritus of the elderly, add 20–30 mL/bath or apply to wet skin and rinse

Aveeno Colloidal® Bath additive, oatmeal, white oat fraction in emollient basis, net price 10 × 50-g sachets = £7.33, Baby Bath Additive, 10 × 15-g sachets = £4.39
Exipients none as listed in section 13.1.3
Dose ACBS: as for Aveeno Bath oil, add 50 g/bath (INFANT and CHILD under 12 years, 15 g)

Balneum® (Almirall)
Balneum® bath oil, soya oil 84.75%, net price 200 mL = £2.48, 500 mL = £5.38, 1 litre = £10.39
Exipients include butylated hydroxytoluene, propylene glycol, fragrance
Dose for dry skin conditions including those associated with dermatitis and eczema, add 20–60 mL/bath (INFANT 5–15 mL), do not use undiluted

Balneum Plus® bath oil, soya oil 82.95%, mixed lauramidocrocols 15%, net price 500 mL = £6.66
Exipients include butylated hydroxytoluene, propylene glycol, fragrance
Dose for dry skin conditions including those associated with dermatitis and eczema where pruritus also experienced, add 20 mL/bath (INFANT 5 mL) or apply to wet skin and rinse

Cetran® (Genus)
Emollient bath additive, light liquid paraffin 82.8%, net price 500 mL = £5.25
Dose for dry skin conditions, including eczema, add 1–2 capfuls/bath (CHILD ½–1 capful) or apply to wet skin and rinse

Dermal® (Dermal)
Bath emollient, acetylated wool alcohols 5%, liquid paraffin 65%, net price 500 mL = £3.60
Exipients none as listed in section 13.1.3
Dose for dermatitis, dry skin conditions including ichthyosis and pruritus of the elderly, add 15–20 mL/bath (INFANT and CHILD 5–10 mL) or apply to wet skin and rinse

Diprobase® (Schering-Plough)
Bath additive, isopropyl myristate 39%, light liquid paraffin 46%, net price 500 mL = £6.97
Exipients none as listed in section 13.1.3
Dose for dry skin conditions including dermatitis and eczema; add 25–50 mL/bath (INFANT 10 mL), do not use undiluted

Doublebase® (Dermal)
Emollient bath additive, liquid paraffin 65%, net price 500 mL = £5.70
Exipients include ceteareth alcohol
Dose for dry skin conditions including dermatitis, ichthyosis, and pruritus of the elderly; add 15–20 mL/bath (INFANT and CHILD 5–10 mL)

E45® (Crookes)
Emollient bath oil, cetyl dimethicone 5%, light liquid paraffin 91%, net price 250 mL = £3.19, 500 mL = £5.11
Exipients none as listed in section 13.1.3
Dose ACBS: for endogenous and exogenous eczema, xeroderma, ichthyosis, and senile pruritus (pruritus of the elderly) associated with dry skin; add 15 mL/bath (CHILD 5–10 mL) or apply to wet skin and rinse

Hydromol® (Alliance)
Bath and Shower Emollient, isopropyl myristate 13%, light liquid paraffin 37.8%, net price 350 mL = £3.80, 500 mL = £5.14, 1 litre = £9.00
Exipients none as listed in section 13.1.3
Dose for dry skin conditions including eczema, ichthyosis and pruritus of the elderly; add 1–3 capfuls/bath (INFANT ½–2 capfuls) or apply to wet skin and rinse

Imuderm® (Goldshield)
Bath oil, almond oil 30%, light liquid paraffin 69.6%, net price 250 mL = £3.75
Exipients include butylated hydroxyanisole
Dose for dry skin conditions including dermatitis, eczema, pruritus of the elderly, and ichthyosis, add 15–30 mL/bath (INFANT and CHILD 7.5–15 mL) or rub into dry skin until absorbed

Oilatum® (Stiefel)
Emollient bath additive (emulsion), acetylated wool alcohols 5%, liquid paraffin 63.4%, net price 250 mL = £2.75, 500 mL = £4.57
Exipients include isopropyl palmitate, fragrance
Dose for dry skin conditions including dermatitis, pruritus of the elderly and ichthyosis; add 1–3 capfuls/bath (INFANT 0.5–2 capfuls) or apply to wet skin and rinse

Junior Emollient bath additive, light liquid paraffin 63.4%, net price 150 mL = £2.82, 250 mL = £3.25, 300 mL = £5.10, 500 mL = £5.75
Exipients include wool fat, isopropyl palmitate
Dose for dry skin conditions including dermatitis, pruritus of the elderly and ichthyosis; add 1–3 capfuls/bath (INFANT 0.5–2 capfuls) or apply to wet skin and rinse

QV® (Crawford)
Bath oil, light liquid paraffin 85.09%, net price 200 mL = £2.20, 500 mL = £4.50
Exipients include hydroxybenzenes (parabens)
Dose for dry skin conditions including eczema, ichthyosis, and pruritus of the elderly, add 10 mL/bath (CHILD 7 mL, INFANT 4 mL) or apply to wet skin and rinse
13.2.2 Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone (dimethicone) or other silicones. They are used on the skin around stomas, bedsores, and pressure areas in the elderly where the skin is intact. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. They are not a substitute for adequate nursing care and it is doubtful if they are any more effective than barrier preparations, which are usually a topical treatment of eczema and ichthyosis.

Nappy rash
Barrier creams and ointments are used for protection against nappy rash which is usually a local dermatitis. The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting nappies and waterproof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation can be applied. If the rash is associated with a fungal infection, an antifungal cream such as clotrimazole (section 13.10) is useful. A mild corticosteroid such as hydrocortisone 1% is useful in moderate to severe inflammation.

Proprietary barrier preparations

**Conotrane** (Astellas)
Cream, benzalkonium chloride 0.1%, dimeticone ‘350’ 22%, net price 100 g = 74p, 200 g = £3.51 Excipients include cetostearyl alcohol, fragrance. For nappy and urinary rash and pressure sores

**Drapolene** (Chefarco UK)
Cream, benzalkonium chloride 0.01%, cetrimide 0.2% in a basis containing white soft paraffin, cetyl alcohol and wool fat, net price 100 g = £1.54, 200 g = £2.50, 350 g = £3.75 Excipients include cetyl alcohol, chlororessol, wool fat. For nappy and urinary rash; minor wounds

**Metanium** (Ransom)
Ointment, titanium dioxide 20%, titanium peroxide 5%, titanium salicylate 3% in a basis containing dimeticone, light liquid paraffin, white soft paraffin, and benzoin tincture, net price 30 g = £2.01 Excipients none as listed in section 13.1.3 For nappy rash

**Morhulin** (Actavis)
Ointment, cod-liver oil 11.4%, zinc oxide 38%, in a basis containing liquid paraffin and yellow soft paraffin, net price 50 g = £1.72 Excipients include wool fat derivative. For minor wounds, varicose ulcers, pressure sores, eczema and nappy rash

**Siope1** (Centrapharm)
Barrier cream, dimeticone ‘1000’ 10%, cetrimide 0.3%, arachis (peanut) oil, net price 50 g = £2.15 Excipients include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens). For protection against water-soluble irritants

**Sprilon** (Ayrton Saunders)
Spray application, dimeticone 1.04%, zinc oxide 12.5%, in a basis containing wool alcohols, cetostearyl alcohol, dextran, white soft paraffin, liquid paraffin, propellants, net price 115-g pressurised aerosol unit = £3.54 Excipients include cetostearyl alcohol, hydroxybenzoates (parabens), wool fat. For urinary rash, pressure sores, leg ulcers, moist eczema, fissures, fistulae and ileostomy care.

Note: Flammable
13.3 Topical local anaesthetics and antipruritics

Pruritus may be caused by systemic disease (such as drug hypersensitivity, obstructive jaundice, endocrine disease, and certain malignant diseases), skin disease (e.g. psoriasis, eczema, urticaria, and scabies) or as a side-effect of opioid analgesics. Where possible the underlying causes should be treated. An emollient (section 13.2.1) may be of value where the pruritus is associated with dry skin. Pruritus that occurs in otherwise healthy elderly people can also be treated with an emollient. For advice on the treatment of pruritus in palliative care, see p. 17.

Preparations containing crotamiton are sometimes used but are of uncertain value. Preparations containing calamine are often ineffective.

A topical preparation containing doxepin 5% is licensed for the relief of pruritus in eczema; it can cause drowsiness and there may be a risk of sensitisation.

Pruritus is common in biliary obstruction, especially in primary biliary cirrhosis and drug-induced cholestasis. Oral administration of colestyramine (cholestyramine) is the treatment of choice (section 1.9.2).

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause sensitisation. For insect stings and insect bites, a short course of a topical corticosteroid is appropriate. Short-term treatment with a sedating antihistamine (section 3.4.1) may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

For preparations used in pruritus ani, see section 1.7.1.

**CALAMINE**

**Indications** pruritus

Calamine (Non-proprietary)

Aqueous cream, calamine 4%, zinc oxide 3%, liquid paraffin 20%, self-emulsifying glyceryl monostearate 5%, cetomacrogol emulsifying wax 5%, phenoxethanol 0.5%, freshly boiled and cooled purified water 62.5%, net price 100 mL = 59p

Lotion (= cutaneous suspension), calamine 15%, zinc oxide 5%, glycerol 5%, bentonite 3%, sodium citrate 0.5%, liquefied petrolatum 0.5%, in freshly boiled and cooled purified water, net price 200 mL = 63p

**DOXEPIN HYDROCHLORIDE**

**Indications** pruritus in eczema; depressive illness (section 4.3.1)

**Cautions** susceptibility to angle-closure glaucoma, urinary retention, severe liver impairment, mania; avoid application to large areas; pregnancy and breast-feeding; **interactions**: Appendix 1 (antidepressants, tricyclic)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Side-effects** drowsiness; local burning, stinging, irritation, tingling and rash; systemic side-effects such as antimuscarinic effects, headache, fever, dizziness, gastro-intestinal disturbances also reported

**Dose**

- ADULT and CHILD over 12 years, apply thinly 3–4 times daily; usual max. 3 g per application; usual total max. 12 g daily; coverage should be less than 10% of body surface area

Xepin® (CHS) (FR)

**Cream**, doxepin hydrochloride 5%, net price 30 g = £11.70. Label: 2, 10, patient information leaflet

**Excipients** include benzyl alcohol

**TOPICAL LOCAL ANAESTHETICS**

**Indications** relief of local pain, see notes above. See section 15.2 for use in surface anaesthesia

**Cautions** occasionally cause hypersensitivity

**Note** Topical local anaesthetic preparations may be absorbed, especially through mucosal surfaces; therefore excessive application should be avoided and they should preferably not be used for more than about 3 days; not generally suitable for young children

**TOPICAL ANTIHISTAMINES**

**Indications** see notes above

**Cautions** may cause hypersensitivity; avoid in eczema; photosensitivity (diphenhydramine); not recommended for longer than 3 days
13.4 Topical corticosteroids

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), in particular eczema (section 13.5.1), contact dermatitis, insect stings (p. 36), and eczema of scabies (section 13.10.4). Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Topical corticosteroids are of no value in the treatment of urticaria and they are contra-indicated in rosacea; they may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). Topical use of potent corticosteroids on widespread psoriasis can lead to systemic as well as to local side-effects. It is reasonable, however, to prescribe a mild to moderate topical corticosteroid for a short period (2–4 weeks) for flexural and facial psoriasis and to use a more potent corticosteroid such as betamethasone or fluorocinonide for psoriasis of the scalp, palms, or soles (see below for cautions in psoriasis).

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use in these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections (section 10.1.2.2) may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

Perioral lesions Hydrocortisone cream 1% can be used for up to 7 days to treat uninfected inflammatory lesions on the lips and on the skin surrounding the mouth. Hydrocortisone and miconazole cream or ointment is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis (see also p. 610). Organisms susceptible to miconazole include Candida spp. and many Gram-positive bacteria including streptococci and staphylococci.

Children Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. A mild corticosteroid such as hydrocortisone 1% ointment or cream is useful for treating nappy rash (section 13.2.2) and for atopic eczema in childhood (section 13.5.1). A moderately potent or potent corticosteroid may be appropriate for severe atopic eczema on the limbs, for 1–2 weeks only, switching to a less potent preparation as the condition improves. In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition. A very potent corticosteroid should be initiated under the supervision of a specialist. Continuous daily application of a mild corticosteroid such as hydrocortisone 1% is equivalent to a potent corticosteroid such as betamethasone 0.1% applied intermittently. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the patient’s condition.

Choice of formulation Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polyethylene or hydrocolloid dressings increase absorption, but also increase the risk of side-effects: they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the BNF topical corticosteroids for the skin are categorised as ‘mild’, ‘moderately potent’, ‘potent’ or ‘very potent’ (see p. 623); the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

Cautions Avoid prolonged use of a topical corticosteroid on the face (and keep away from eyes). In children avoid prolonged use and use potent or very potent corticosteroids under specialist supervision; extreme caution is required in dermatoses of infancy including nappy rash—treatment should be limited to 5–7 days.

Psoriasis The use of potent or very potent corticosteroids in psoriasis can result in rebound relapse, development of generalised pustular psoriasis, and local and systemic toxicity.

Contra-indications Topical corticosteroids are contra-indicated in untreated bacterial, fungal, or viral skin lesions, in rosacea, and in perioral dermatitis; potent corticosteroids are contra-indicated in widespread plaque psoriasis (see notes above).

Side-effects Mild and moderately potent topical corticosteroids are associated with few side-effects but care is required in the use of potent and very potent corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome (section 6.3.2), depending on the area of the body being treated and the duration of treatment. Absorption is greatest where the skin is thin or raw, and from inter-
triginous areas; it is increased by occlusion. Local side-effects include:

- spread and worsening of untreated infection;
- thinning of the skin which may be restored over a period after stopping treatment but the original structure may never return;
- irreversible striae atrophicae and telangiectasia;
- contact dermatitis;
- acne, or worsening of acne or rosacea;
- mild depigmentation which may be reversible;
- hypertrichosis also reported.

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.

Application Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids are spread thinly on the skin; the length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a fingertip unit (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg) is sufficient to cover an area that is twice that of the flat adult palm.

Suitable quantities of corticosteroid preparations to be prescribed for specific areas of the body

<table>
<thead>
<tr>
<th>Creams and Ointments</th>
<th>Face and neck</th>
<th>15 to 30 g</th>
<th>Both hands</th>
<th>15 to 30 g</th>

<th>Both legs</th>
<th>100 g</th>
<th>Trunk</th>
<th>100 g</th>
<th>Groins and genitalia</th>
<th>15 to 30 g</th>
</tr>
</thead>
</table>

These amounts are usually suitable for an adult for a single daily application for 2 weeks

If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. The potency of each topical corticosteroid (see Topical Corticosteroid Preparation Potencies, below) should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations. The practice of using an emollient immediately before a topical corticosteroid is inappropriate.

Compound preparations The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

13.4 Topical corticosteroids

Topical corticosteroid preparation potencies

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown below.

Mild

- Hydrocortisone 0.1–2.5%, Dioderm, Mildison, Synalar 1 in 10 dilution
- Mild with antimicrobials: Canesten HC, Daktacort, Econacort, Econase, Nystaform-HC, Timodine, Vioform-Hydrocortisone
- Mild with crotamiton: Eurax-Hydrocortisone

Moderate

- Betnovate-RD, Eumovate, Haelan, Modrasone, Synalar 1 in 4 Dilution, Ultralanum Plain
- Moderate with antimicrobials: Trimovate
- Moderate with urea: Alphaderm, Calmurid HC

Potent

- Betamethasone valerate 0.1%, Betacap, Bettamousse, Betnovate, Cutivate, Diprosone, Elocon, Hydrocortisone butyrate, Locoid, Locoid Crelo, Metosyn, Nerison, Synalar
- Potent with antimicrobials: Aureocort, Betnovate-C, Betnovate-N, Fucibet, Lotriderm, Synalar C, Synalar N
- Potent with salicylic acid: Diproasalic

Very potent

- Clarelux, Dermovate, Etrivex, Nerison Forte

HYDROCORTISONE

Indications mild inflammatory skin disorders such as eczemas (but for over-the-counter preparations, see below); nappy rash, see notes above and section 13.2.2

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- Apply thinly 1–2 times daily

Hydrocortisone (Non-proprietary) 22

Cream, hydrocortisone 0.5%, net price, 15 g = £3.04, 30 g = £5.19, 1%, 15 g = £2.70, 30 g = £3.65, 50 g = £16.96, 2.5%, 15 g = £24.03. Label: 28, counselling, application, see above. Potency: mild

Dental prescribing on NHS Hydrocortisone Cream 1% 15 g may be prescribed

Ointment, hydrocortisone 0.5%, net price 15 g = £3.57, 30 g = £5.23; 1%, 15 g = £2.55, 30 g = £3.55, 50 g = £25.22; 2.5%, 15 g = £32.53. Label: 28, counselling, application, see above. Potency: mild

When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied.
Over-the-counter hydrocortisone preparations
Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritant dermatitis, insect bite reactions and mild to moderate eczema, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot).

Proprietary hydrocortisone preparations
Dioderm® (Dermal) 
Cream, hydrocortisone 0.1%, net price 30 g = £2.50. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include cetostearyl alcohol, propylene glycol
Note Although this contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP

Midison® (Astellas)
Lipocream, hydrocortisone 1%, price 30 g = 87p. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Compound preparations
Compound preparations with coal tar see section 13.5.2

Alphaderm® (Alliance)
Cream, hydrocortisone 1%, urea 10%, net price 30 g = £1.98; 100 g = £5.86. Label: 28, counselling, application, see p. 623. Potency: moderate
Excipients none as listed in section 13.1.3

Calmurid HC® (Galderma)
Cream, hydrocortisone 1%, urea 10%, lactic acid 5%, net price 30 g = £2.80, 50 g = £4.67. Label: 28, counselling, application, see p. 623. Potency: moderate
Excipients none as listed in section 13.1.3
Note Manufacturer advises dilute to half-strength with aqueous cream for 1 week if stinging occurs then transfer to undiluted preparation (but see section 13.1.1 for advice to avoid dilution where possible)

Eurax-Hydrocortisone® (Novartis Consumer Health)
Cream, hydrocortisone 0.25%, crotamiton 10%, net price 30 g = £8.7p. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include fragrance, hydroxybenzoates (parabens), propylene glycol, stearyl alcohol
1. A 15-g tube is on sale to the public for the treatment of contact dermatitis and insect bites

With antimicrobials
See notes above for comment on compound preparations

Canesten HC® (Bayer Consumer Care)
Cream, hydrocortisone 1%, clotrimazole 1%, net price 30 g = £2.42. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include benzyl alcohol, cetostearyl alcohol
1. A 15-g tube is on sale to the public for the treatment of athlete’s foot and fungal infection of skin folds with associated inflammation

Daktacort® (Janssen-Cilag)
Cream, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.08. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include butylated hydroxyanisole, disodium edetate
Note A 15-g tube is on sale to the public for the treatment of athlete’s foot and candidal intertrigo

Ointment, hydrocortisone 1%, miconazole nitrate 2%, net price 30 g = £2.09. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients none as listed in section 13.1.3

Econacort® (Squibb)
Cream, hydrocortisone 1%, econazole nitrate 1%, net price 30 g = £2.25. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include butylated hydroxyanisole

Fucidin H® (LEO)
Cream, hydrocortisone acetate 1%, fusidic acid 2%, net price 30 g = £5.30, 60 g = £10.60. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include butylated hydroxyanisole, hydrocortisone, cetyl alcohol, polysorbate 60, potassium sorbate

Ointment, hydrocortisone acetate 1%, sodium fusidate 2%, net price 30 g = £3.26, 60 g = £6.53. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include cetyl alcohol, wool fat

Nystaform-HC® (Typharm)
Cream, hydrocortisone 0.5%, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include benzyl alcohol, cetostearyl alcohol, polyoxyalkyle 60

Ointment, hydrocortisone 1%, nystatin 100 000 units/g, chlorhexidine acetate 1%, net price 30 g = £2.66. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients none as listed in section 13.1.3

Timodine® (R&C)
Cream, hydrocortisone 0.5%, nystatin 100 000 units/g, benzalkonium chloride solution 0.2%, dimeticone ‘350’ 10%, net price 30 g = £2.38. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include butylated hydroxyanisole, hydrocortisone aluminium, hydroxybenzoates (parabens), sodium metabisulphate, sorbic acid

Vioform-Hydrocortisone® (Novartis Consumer Health)
Cream, hydrocortisone 1%, clioquinol 3%, net price 30 g = £1.46. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients include cetostearyl alcohol

Ointment, hydrocortisone 1%, clioquinol 3%, net price 30 g = £1.46. Label: 28, counselling, application, see p. 623. Potency: mild
Excipients none as listed in section 13.1.3
Note Stains clothing

HYDROCORTISONE BUTYRATE
Indications severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above

HYDROCORTISONE BUTYRATE
Indications severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above
Cautions see notes above
Contra-indications see notes above
Side-effects see notes above
Dose

- Apply thinly 1–2 times daily

Locoid® (Astellas) (Non-proprietary)

Cream, hydrocortisone butyrate 0.1%, net price 30 g = £2.29, 100 g = £7.05. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Lipocream, hydrocortisone butyrate 0.1%, net price 30 g = £2.41, 100 g = £7.38. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include benzyl alcohol, cetostearyl alcohol, hydroxybenzoates (parabens)

Note For bland cream basis see Lipocide , section 13.2.1

Ointment, hydrocortisone butyrate 0.1%, net price 30 g = £2.29, 100 g = £7.05. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients none as listed in section 13.1.3

Scalp lotion, hydrocortisone butyrate 0.1%, in an aqueous isopropyl alcohol basis, net price 100 mL = £9.76. Label: 15, 28, counselling, application, see p. 623. Potency: potent

Excipients none as listed in section 13.1.3

Locoid Crelo® (Astellas) (Non-proprietary)

Lotion (topical emulsion), hydrocortisone butyrate 0.1% in a water-miscible basis, net price 100 g (with applicator nozzle) = £8.44. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens), propylene glycol

ALCLOMETASONE DIPROPIONATE

Indications inflammatory skin disorders such as eczemas

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose

- Apply thinly 1–2 times daily

Modrasone® (PLIVA) (Non-proprietary)

Cream, alclometasone dipropionate 0.05%, net price 50 g = £2.68. Label: 28, counselling, application, see p. 623. Potency: moderate

Excipients include cetostearyl alcohol, chlorocresol, propylene glycol

Ointment, alclometasone dipropionate 0.05%, net price 50 g = £2.68. Label: 28, counselling, application, see p. 623. Potency: moderate

Excipients include beeswax, propylene glycol

BETAMETHASONE ESTERS

Indications severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

Cautions see notes above; use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

Contra-indications see notes above

Side-effects see notes above

Dose

- Apply thinly 1–2 times daily

Betamethasone Valerate (Non-proprietary)

Cream, betamethasone (as valerate) 0.1%, net price 30 g = £1.63, 100 g = £4.36. Label: 28, counselling, application, see p. 623. Potency: potent

Ointment, betamethasone (as valerate) 0.1%, net price 30 g = £1.70, 100 g = £4.15. Label: 28, counselling, application, see p. 623. Potency: potent

Betacap® (Dermal) (Non-proprietary)

Scalp application, betamethasone (as valerate) 0.1% in a water-miscible basis containing coconut oil derivative, net price 100 mL = £3.92. Label: 15, 28, counselling, application, see p. 623. Potency: potent

Excipients none as listed in section 13.1.3

Betnovate® (GSK) (Non-proprietary)

Cream, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as valerate) 0.1% in an anhydrous paraffin basis, net price 30 g = £1.43, 100 g = £4.05. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include cetostearyl alcohol, hydroxybenzoates (parabens)

Scalp application, betamethasone (as valerate) 0.1% in a water-miscible basis, net price 100 mL = £5.30. Label: 15, 28, counselling, application, see p. 623. Potency: potent

Excipients none as listed in section 13.1.3

Betnovate-RO® (GSK) (Non-proprietary)

Cream, betamethasone (as valerate) 0.025% in a water-miscible basis (1 in 4 dilution of Betnovate® cream), net price 100 g = £3.34. Label: 28, counselling, application, see p. 623. Potency: moderate

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as valerate) 0.025% in an anhydrous paraffin basis (1 in 4 dilution of Betnovate® ointment), net price 100 g = £3.34. Label: 28, counselling, application, see p. 623. Potency: moderate

Excipients none as listed in section 13.1.3

Bettamousse® (UCB Pharma) (Non-proprietary)

Foam (= scalp application), betamethasone valerate 0.12% (= betamethasone 0.1%), net price 100 g = £9.75. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include cetyl alcohol, polysorbate 60, propylene glycol, stearyl alcohol

Note Flammable

Diprosone® (Scherling-Plough) (Non-proprietary)

Cream, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.24, 100 g = £6.36. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include cetostearyl alcohol, chlorocresol

Ointment, betamethasone (as dipropionate) 0.05%, net price 30 g = £2.24, 100 g = £6.36. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients none as listed in section 13.1.3

Lotion, betamethasone (as dipropionate) 0.05%, net price 30 mL = £2.83, 100 mL = £8.10. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients none as listed in section 13.1.3
### With salicylic acid

See notes above for comment on compound preparations

**Diprosalic®** *(Scherling-Plough) (SM)*

**Ointment**, betamethasone (as dipropionate) 0.05%, salicylic acid 3%, net price 30 g = £3.30, 100 g = £9.50. Label: 28, counselling, application, see p. 623.

Potency: potent

**Excipients** none as listed in section 13.1.3

**Dose** apply thinly 1–2 times daily; max. 60 g per week

**Scalp application**, betamethasone (as dipropionate) 0.05%, salicylic acid 2%, in an alcoholic basis, net price 100 mL = £10.50. Label: 28, counselling, application, see p. 623.

Potency: potent

**Excipients** include disodium edetate

**Dose** apply a few drops 1–2 times daily

### With antimicrobials

See notes above for comment on compound preparations

**Betnovate-C®** *(Chemidex) (SM)*

**Cream**, betamethasone (as valerate) 0.1%, clioquinol 3%, net price 30 g = £1.76. Label: 28, counselling, application, see p. 623. Potency: potent

**Excipients** include cetoesteryl alcohol, chlororessol

**Note** Stains clothing

**Ointment**, betamethasone (as valerate) 0.1%, clioquinol 3%, net price 30 g = £1.76. Label: 28, counselling, application, see p. 623. Potency: potent

**Excipients** none as listed in section 13.1.3

**Note** Stains clothing

**Betnovate-N®** *(Chemidex) (SM)*

**Cream**, betamethasone (as valerate) 0.1%, neomycin sulphate 0.5%, net price 30 g = £1.76, 100 g = £4.88. Label: 28, counselling, application, see p. 623.

Potency: potent

**Excipients** include cetoesteryl alcohol, chlororessol

**Ointment**, betamethasone (as valerate) 0.1%, neomycin sulphate 0.5%, net price 30 g = £1.76, 100 g = £4.88. Label: 28, counselling, application, see p. 623. Potency: potent

**Excipients** none as listed in section 13.1.3

### CLOBETASONE BUTYRATE

**Indications** eczemas and dermatitis of all types; maintenance between courses of more potent corticosteroids

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily

**Eumovate®** *(GSK) (SM)*

**Cream**, clobetasone butyrate 0.05%, net price 30 g = £1.97, 100 g = £5.77. Label: 28, counselling, application, see p. 623. Potency: moderate

**Excipients** include beeswax substitute, cetoesteryl alcohol, chlororessol

**Ointment**, clobetasone butyrate 0.05%, net price 30 g = £1.97, 100 g = £5.77. Label: 28, counselling, application, see p. 623. Potency: moderate

**Excipients** none as listed in section 13.1.3

1. Cream can be sold to the public for short-term symptomatic treatment and control of patches of eczema and dermatitis (but not seborrhoeic dermatitis) in adults and children over 12 years provided pack does not contain more than 15 g

### CLOBETASOL PROPIONATE

**Indications** short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily for up to 4 weeks; max. 50 g of 0.05% preparation per week

**Clarelux®** *(Fabre) (SM)*

**Foam** (= scalp application), clobetasol propionate 0.05%, net price 100 g = £11.06. Label: 15, 28, counselling, application, see p. 623. Potency: very potent

**Excipients** include cetly alcohol, polyisobutylate 60, propylene glycol, stearyl alcohol

**Caution** flammable

**Note** Apply directly to scalp lesions (foam begins to subside immediately on contact with skin)

**Dermovate®** *(GSK) (SM)*

**Cream**, clobetasol propionate 0.05%, net price 30 g = £2.86, 100 g = £8.39. Label: 28, counselling, application, see p. 623. Potency: very potent

**Excipients** include beeswax (or beeswax substitute), cetoesteryl alcohol, chlororessol, propylene glycol

**Ointment**, clobetasol propionate 0.05%, net price 30 g = £2.86, 100 g = £8.39. Label: 28, counselling, application, see p. 623. Potency: very potent

**Excipients** include propylene glycol

**Scalp application**, clobetasol propionate 0.05%, in a thickened alcoholic basis, net price 30 mL = £3.26, 100 mL = £11.06. Label: 15, 28, counselling, application, see p. 623. Potency: very potent

**Excipients** none as listed in section 13.1.3

**Etrivex®** *(Galdema) (SM)*

**Shampoo**, clobetasol propionate 0.05%, net price 125 mL = £11.94. Label: 28, counselling, application, see p. 623. Potency: very potent

**Excipients** none as listed in section 13.1.3

**Dose** moderate scalp psoriasis, ADULT over 18 years, apply thinly once daily, rinse off after 15 minutes; reduce frequency of application after clinical improvement; max. duration of treatment 4 weeks

**Clarex®** *(Schering-Plough) (SM)*

**Cream**, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.62, 60 g = £11.23. Label: 28, counselling, application, see p. 623.

Potency: potent

**Excipients** include cetoesteryl alcohol, chlororessol

**Lipid cream**, betamethasone (as valerate) 0.1%, fusidic acid 2%, net price 30 g = £5.62. Label: 28, counselling, application, see p. 623.

Potency: potent

**Excipients** include cetoesteryl alcohol, chlororessol

**Lotiderm®** *(Pilva) (SM)*

**Cream**, betamethasone dipropionate 0.064% (= betamethasone 0.05%), clotrimazole 1%, net price 30 g = £6.34. Label: 28, counselling, application, see p. 623. Potency: potent

**Excipients** include benzyl alcohol, cetoesteryl alcohol, propylene glycol

**Trimovate®** *(GSK) (SM)*

**Cream**, clobetasone butyrate 0.05%, oxytetracycline 3% (as calcium salt), nystatin 100 000 units/g, net price 30 g = £3.49. Label: 28, counselling, application, see p. 623. Potency: moderate

**Excipients** include cetoesteryl alcohol, chlororessol, sodium metabisulphite

**Note** Stains clothing
**DIFLUCORTOLONE VALERATE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; high strength (0.3%), short-term treatment of severe exacerbations; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily for up to 4 weeks (0.1% preparations) or 2 weeks (0.3% preparations), reducing strength as condition responds; max. 60 g of 0.3% per week

**Nerisone** (Meadow) (Pf)

**Cream**
- fludrocortizone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 623. Potency: potent
- Excipients include disodium edetate, hydroxybenzoates (parabens), stearyl alcohol

**Oily cream**
- fludrocortizone valerate 0.1%, net price 30 g = £2.56. Label: 28, counselling, application, see p. 623. Potency: potent
- Excipients include beeswax

**Ointment**
- fludrocortizone valerate 0.1%, net price 30 g = £1.59. Label: 28, counselling, application, see p. 623. Potency: potent
- Excipients none as listed in section 13.1.3

**Nerisone Forte** (Meadow) (Pf)

**Oily cream**
- fludrocortizone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 623. Potency: very potent
- Excipients include beeswax

**Ointment**
- fludrocortizone valerate 0.3%, net price 15 g = £2.09. Label: 28, counselling, application, see p. 623. Potency: very potent
- Excipients none as listed in section 13.1.3

**FLUDROXYCORTIDE** (Flurandrenolone)

**Indications** inflammatory skin disorders such as eczemas

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily

**Haelan** (Typpharm) (Pf)

**Cream**
- fludrocortizone 0.0125%, net price 60 g = £3.26. Label: 28, counselling, application, see p. 623. Potency: moderate
- Excipients include cetyl alcohol, propylene glycol

**Ointment**
- fludrocortizone 0.0125%, net price 60 g = £3.26. Label: 28, counselling, application, see p. 623. Potency: moderate
- Excipients include beeswax, cetyl alcohol, polysorbate

**Tape**
- polythene adhesive film impregnated with fludrocortizone 4 micrograms/cm², net price 7.5 cm × 50 cm = £9.27. 7.5 cm × 200 cm = £24.95

**Dose** for chronic localised recalcitrant dermatoses (but not acute or weeping), cut tape to fit lesion, apply to clean, dry skin abom of hair, usually for 12 hours daily

---

**FLUCINOLONE ACETONIDE**

**Indications** inflammatory skin disorders such as eczemas; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily, reducing strength as condition responds

**Synalar** (GP Pharma) (Pf)

**Cream**
- fluocinolone acetonide 0.025%, net price 30 g = £3.76, 100 g = £10.68. Label: 28, counselling, application, see p. 623. Potency: potent
- Excipients include benzyl alcohol, cetylstearyl alcohol, polysorbates, propylene glycol

**Gel**
- fluocinolone acetonide 0.025%, net price 30 g = £5.56, 60 g = £10.02. For use on scalp and other hairy areas. Label: 28, counselling, application, see p. 623. Potency: potent
- Excipients include hydroxybenzoates (parabens), propylene glycol

**Ointment**
- fluocinolone acetonide 0.025%, net price 30 g = £3.76, 100 g = £10.68. Label: 28, counselling, application, see p. 623. Potency: potent
- Excipients include propylene glycol, wool fat

**Synalar 1 in 4 Dilution** (GP Pharma) (Pf)

**Cream**
- fluocinolone acetonide 0.00625%, net price 50 g = £4.40. Label: 28, counselling, application, see p. 623. Potency: moderate
- Excipients include benzyl alcohol, cetylstearyl alcohol, polysorbates, propylene glycol

**Synalar 1 in 10 Dilution** (GP Pharma) (Pf)

**Cream**
- fluocinolone acetonide 0.0025%, net price 50 g = £4.16. Label: 28, counselling, application, see p. 623. Potency: mild
- Excipients include benzyl alcohol, cetylstearyl alcohol, polysorbates, propylene glycol

---

**With antibacterials**

See notes above for comment on compound preparations

**Synalar C** (GP Pharma) (Pf)

**Cream**
- fluocinolone acetonide 0.025%, clioquinol 3%, net price 15 g = £2.42. Label: 28, counselling, application, see p. 623. Potency: potent
- Excipients include cetylstearyl alcohol, disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

**Synalar N** (GP Pharma) (Pf)

**Cream**
- fluocinolone acetonide 0.025%, neomycin sulphate 0.5%, net price 30 g = £3.96. Label: 28, counselling, application, see p. 623. Potency: potent
- Excipients include propylene glycol, wool fat
FLUOCINONIDE

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily

**Metosyn** (GP Pharma)

FAPG cream, fluocinonide 0.05%, net price 25 g = £3.30, 100 g = £11.12. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include propylene glycol

Ointment, fluocinonide 0.05%, net price 25 g = £2.92, 100 g = £10.96. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include propylene glycol, wool fat

**FLUOCORTOLONE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily, reducing strength as condition responds

**Ultralanum Plain** (Meadow)

Cream, fluocortolone caproate 0.25%, fluocortolone pivalate 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 623. Potency: moderate

Excipients include disodium edetate, fragrance, hydroxybenzoates (parabens), stearyl alcohol

Ointment, fluocortolone 0.25%, net price 50 g = £2.95. Label: 28, counselling, application, see p. 623. Potency: moderate

Excipients include wool fat, fragrance

**FLUTICASONE PROPIONATE**

**Indications** inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily

**Cutivate** (GSK)

Cream, fluticasone propionate 0.05%, net price 15 g = £2.41, 50 g = £7.11. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include cetostearyl alcohol, imidurea, propylene glycol

Ointment, fluticasone propionate 0.005%, net price 15 g = £2.41, 50 g = £7.11. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include propylene glycol

**MOMETASONE FUROATE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly once daily (to scalp in case of lotion)

**Elocon** (Schering-Plough)

Cream, mometasone furoate 0.1%, net price 30 g = £4.54, 100 g = £13.07. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include propylene glycol, stearyl alcohol

Ointment, mometasone furoate 0.1%, net price 30 g = £4.54, 100 g = £13.07. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include propylene glycol

Scalp lotion, mometasone furoate 0.1% in an aqueous isopropyl alcohol basis, net price 30 mL = £4.54. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include propylene glycol

**TRIAMCINOLONE ACETONIDE**

**Indications** severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids; psoriasis, see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly 1–2 times daily

**Aureocort** (Goldshield)

Ointment, triamcinolone acetonide 0.1%, chlortetracycline hydrochloride 3%, in an anhydrous greasy basis containing wool fat and white soft paraffin, net price 15 g = £2.70. Label: 28, counselling, application, see p. 623. Potency: potent

Excipients include wool fat

Note: Stains clothing

---

13.5 Preparations for eczema and psoriasis

### 13.5.1 Preparations for eczema

Eczema (dermatitis) has several causes, which may influence treatment. The main types of eczema are irritant, allergic contact, atopic, venous and discoid; different types may co-exist. Lichenification, due to scratching and rubbing, may complicate any chronic
eczema. **Atopic eczema** is the most common type and it usually involves dry skin as well as infection and lichenification.

Management of eczema involves the removal or treatment of contributory factors including occupational and domestic irritants. Known or suspected contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; the BNF lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** (section 13.2.1) applied regularly and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

**Topical corticosteroids** (section 13.4) are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition. Mild corticosteroids are generally used on the face and on flexures; potent corticosteroids are generally required for use on adults with discoid or lichenified eczema or with eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. Bandages (including those containing zinc and ichthammol) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs.

For the role of topical pimecrolimus and tacrolimus in atopic eczema see section 13.5.3.

**Infection** Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema and requires treatment with topical or systemic **antibacterial drugs** (section 13.10.1 and section 5.1). Antibacterial drugs, particularly fusidic acid, should be used in short courses (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid usually of moderate or high potency.

Eczema involving widespread or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Products that combine an antiseptic with an emollient application (section 13.2.1) and with a bath emollient (section 13.2.1.1) can also be used; antiseptic shampoos (section 13.9) and combinations of mild corticosteroids with suitable antimicrobials (section 13.4) are used.

**Severe refractory eczema** Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system (section 13.5.3). **Alitretinoin** (see below) is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

**Seborrhoeic dermatitis** Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast *Malassezia* and affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole and coal tar, section 13.9) and combinations of mild corticosteroids with suitable antimicrobials (section 13.4) are used.

### Topical preparations for eczema

#### ICHTHAMMOL

- **Indications** chronic lichenified eczema
- **Side-effects** skin irritation
- **Dose**
  - Apply 1–3 times daily

**Ichthammol Ointment, BP 1980**

Ointment, ichthammol 10%, yellow soft paraffin 45%, wool fat 45%

**Zinc and Ichthammol Cream, BP**

Cream, ichthammol 3%, cetostearyl alcohol 3%, wool fat 10%, in zinc cream

**Zinc Paste and Ichthammol Bandage, BP 1993**

See Appendix 8 (section A8.2.9)

### Oral retinoid for eczema

The retinoid, alitretinoin, is licensed for the treatment of severe chronic hand eczema refractory to potent topical corticosteroids; patients with hyperkeratotic features are more likely to respond to alitretinoin than those with pompholyx.

Alitretinoin should be prescribed only by, or under the supervision of, a consultant dermatologist. Alitretinoin is *teratogenic* and must not be given to women of child-bearing potential unless they practise effective contraception and then only after detailed assessment and explanation by the physician. See also Pregnancy Prevention under Cautions, below.

#### ALITRETINOIN

- **Indications** severe chronic hand eczema refractory to potent topical corticosteroids
- **Cautions** avoid blood donation during treatment and for at least 1 month after stopping treatment; monitor
13.5.2 Preparations for psoriasis

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp. For mild psoriasis, reassurance and treatment with an emollient may be all that is necessary.

Occasionally psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not be seen until the drug has been taken for weeks or months.

Emollients (section 13.2.1), in addition to their effects on dryness, scaling and cracking, may have an anti-proliferative effect in psoriasis. They are particularly useful in inflammatory psoriasis and in plaque psoriasis of palms and soles, in which irritant factors can perpetuate the condition. Emollients are useful adjuncts to other more specific treatment.

More specific topical treatment for chronic stable plaque psoriasis on extensor surfaces of trunk and limbs involves the use of vitamin D analogues, coal tar, dithranol, and the retinoid tazarotene. However, they can irritate the skin and are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced, if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Widespread unstable psoriasis of erythematous or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously; emollients should be prescribed in quantities of 1 kg or more. More localised acute or subacute inflammatory psoriasis with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcitriol is an active form of vitamin D. Vitamin D and its analogues are used as first-line treatment for plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcitriol are less likely to irritate.

Coal tar has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Crude coal tar (coal tar, BP) is the most effective form, typically in a concentration of 1 to 10% in a soft paraffin base, but few outpatient tolerate the smell and mess. Cleaner extracts of coal tar included in proprietary preparations, are more practicable for home use but they are less effective and improvement takes longer. Contact of coal tar products with normal skin is not normally harmful and they can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. The milder tar extracts can be used on the face and flexures. Tar baths and tar shampoos are also helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. It should be applied to chronic extensor plaques only, carefully avoiding normal skin. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance. Proprietary preparations are more suitable for home use; they are usually washed off after 5 to 60 minutes (‘short contact’). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result
in the psoriasis becoming unstable. When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards.

**Tazarotene**, a retinoid, seems to be less effective than calcipotriol with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin. Tazarotene is clean and odourless.

A topical **corticosteroid** (section 13.4) is not generally suitable as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis). However, it may be appropriate to treat psoriasis in specific sites, such as the face and flexures, usually with a mild corticosteroid, and psoriasis of the scalp, palms, and soles with a potent corticosteroid.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. **Eczema co-existing with psoriasis** may be treated with a corticosteroid, or coal tar, or both.

**Scalp psoriasis** is usually scaly, and the scale may be thick and adherent. This requires softening with an emollient ointment, cream, or oil and usually combined with **salicylic acid** as a keratolytic.

Some preparations prescribed for psoriasis affecting the scalp combine salicylic acid with coal tar or **sulphur**. Preparations containing salicylic acid, sulphur, and coal tar are available as proprietary products. The product should be applied generously and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing it off. If a corticosteroid lotion or gel is required (e.g. erythrodermic psoriasis or generalised pustular psoriasis), it can be used in the morning.

**Tazarotene**, a retinoid, seems to be less effective than calcipotriol with a greater incidence of irritation. Although irritation is common, it is minimised by applying tazarotene sparingly to the plaques and avoiding normal skin. Tazarotene is clean and odourless.

A topical **corticosteroid** (section 13.4) is not generally suitable as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis (e.g. erythrodermic psoriasis or generalised pustular psoriasis). However, it may be appropriate to treat psoriasis in specific sites, such as the face and flexures, usually with a mild corticosteroid, and psoriasis of the scalp, palms, and soles with a potent corticosteroid.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. **Eczema co-existing with psoriasis** may be treated with a corticosteroid, or coal tar, or both.

**Scalp psoriasis** is usually scaly, and the scale may be thick and adherent. This requires softening with an emollient ointment, cream, or oil and usually combined with **salicylic acid** as a keratolytic.

Some preparations prescribed for psoriasis affecting the scalp combine salicylic acid with coal tar or **sulphur**. Preparations containing salicylic acid, sulphur, and coal tar are available as proprietary products. The product should be applied generously and an adequate quantity should be prescribed. It should be left on for at least an hour, often more conveniently overnight, before washing it off. If a corticosteroid lotion or gel is required (e.g. for itch), it can be used in the morning.

**Phototherapy** **Phototherapy** is available in specialist centres under the supervision of a dermatologist. **Ultra-violet B** (UVB) radiation is usually effective for **chronic stable psoriasis** and for **guttate psoriasis**. It may be considered for patients with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis.

**Photochemotherapy** combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including **localised palmoplantar pustular psoriasis**. Early adverse effects include photocotoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions, especially squamous cancer, and pose a theoretical risk of carcinogenesis. Photochemotherapy combined with coal tar, dithranol, tazarotene, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

**Systemic treatment** **Systemic treatment** is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin (see below) and drugs that affect the immune response (such as ciclosporin and methotrexate, section 13.5.3).

Systemic corticosteroids should be used only rarely in psoriasis because rebound deterioration may occur on reducing the dose.

**Acitretin**, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is psoriasis, but it is also used in disorders of keratinisation such as severe **Darier’s disease** (keratosis follicularis), and some forms of **ichthyosis**. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases and it is combined with other treatments. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 to 6 weeks or longer. The manufacturers of acitretin do not recommend continuous treatment for longer than 6 months. However, some patients may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly.

Apart from teratogenicity, which remains a risk for 3 years after stopping, acitretin is the least toxic systemic treatment for psoriasis; in women with a potential for child-bearing, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progestogen-only contraceptives not considered effective). Common side-effects derive from its widespread but reversible effects on epithelia, such as dry and cracking lips, dry skin and mucosal surfaces, hair thinning, paronychia, and soft and sticky palms and soles. Liver function and blood lipid concentration should be monitored.

---

**Topical preparations for psoriasis**

**Vitamin D and analogues**

Calcipotriol, calcitriol, and **tacalcitol** are used for the management of **plaque psoriasis**. They should be avoided by those with calcium metabolism disorders, and used with caution in **generalised pustular or erythrodermic exfoliative psoriasis** (enhanced risk of hypercalcaemia). Local skin reactions (itching, erythema, burning, paraesthesia, dermatitis) are common. Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas. Aggravation of psoriasis has also been reported.

**CALCIPOTRIOL**

**Indications** plaque psoriasis

**Cautions** see notes above; avoid use on face; avoid excessive exposure to sunlight and sunlamps; pregnancy (Appendix 4); breastfeeding (Appendix 5)

**Contra-indications** see notes above

**Side-effects** see notes above; also photosensitivity; rarely facial or perioral dermatitis, skin atrophy

**Dose**

- *Cream or ointment* apply once or twice daily; max. 100 g weekly (less with scalp solution, see below).

- **CHILD** over 6 years, apply twice daily; 6–12 years max. 50 g weekly; over 12 years max. 75 g weekly

**Note** Patient information leaflet for Dovonex cream advises liberal application (but note max. recommended weekly dose, above)
Calcipotriol

**Ointment**, calcipotriol 50 micrograms/g, net price
120 g = £22.70, 120 g = £24.04

**Note** Not licensed for use in children under 18 years

**Dovonex** (LEO)

**Cream**, calcipotriol 50 micrograms/g, net price
60 g = £16.10, 120 g = £23.60

**Excipients** include cetostearyl alcohol, diosodium edetate

**Scalp solution**, calcipotriol 50 micrograms/mL, net price
60 mL = £13.04, 120 mL = £26.07

**Excipients** include propylene glycol

**Dose** scalp psoriasis, apply to scalp twice daily; max. 60 mL weekly (less with cream or ointment, see below); **CHILD** under 18 years, see **BNF for Children**

**Note** When preparations used together max. total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with cream or ointment 30 g or cream or ointment 60 g with scalp solution 30 mL)

**With betamethasone**

For cautions, contra-indications, side-effects, and for comment on the limited role of corticosteroids in psoriasis, see section 13.4.

**Dovobet** (LEO)

**Ointment**, betamethasone 0.05% (as dipropionate), calcipotriol 50 micrograms/g, net price 60 g = £35.00, 120 g = £65.00. Label: 28

**Excipients** none as listed in section 13.1.3

**Dose** initial treatment of stable plaque psoriasis, apply once daily to max. 30% of body surface (max. 15 g daily, max. 100 g weekly) for 4 weeks; if necessary, subsequent courses repeated after an interval of at least 4 weeks; **CHILD** under 18 years see **BNF for Children**

**Note** When different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week

**Xamiol** (LEO)

**Scalp gel**, betamethasone 0.05% (as dipropionate), calcipotriol 50 micrograms/g, net price 60 g = £36.50. Label: 28

**Excipients** include butylated hydroxytoluene, disodium edetate, polysorbate 40

**Dose** scalp psoriasis, **ADULT** over 18 years, apply 1–4 g to scalp once daily; max. 30 g daily; **CHILD** over 12 years, apply twice daily; not more than 35% of body surface to be treated daily, max. 30 g daily

**Note** When different preparations containing calcipotriol used together, max. total calcipotriol 5 mg in any one week

**Calcitriol (Non-proprietary)**

**Ointment**, calcitriol 5 micrograms/g, net price
120 g = £25.88

**Note** Not licensed for use in children under 18 years

**Dovonex** (LEO)

**Cream**, calcipotriol 50 micrograms/g, net price 60 g = £12.02, 120 g = £24.04

**Excipients** include cetostearyl alcohol, diosodium edetate

**Scalp solution**, calcipotriol 50 micrograms/mL, net price
60 mL = £13.04, 120 mL = £26.07

**Excipients** include propylene glycol

**Dose** scalp psoriasis, apply to scalp twice daily; max. 60 mL weekly (less with cream or ointment, see below); **CHILD** under 18 years, see **BNF for Children**

**Note** When preparations used together max. total calcipotriol 5 mg in any one week (e.g. scalp solution 60 mL with cream or ointment 30 g or cream or ointment 60 g with scalp solution 30 mL)

**With betamethasone**

For cautions, contra-indications, side-effects, and for comment on the limited role of corticosteroids in psoriasis, see section 13.4.

**Dovonex** (LEO)

**Ointment**, betamethasone 0.05% (as dipropionate), calcipotriol 50 micrograms/g, net price 60 g = £35.00, 120 g = £65.00. Label: 28

**Excipients** none as listed in section 13.1.3

**Dose** ADULT and **CHILD** over 12 years, apply once daily preferably at bedtime; max. 10 g **ointment** or 10 mL **lotion** daily

**Note** When lotion and ointment used together, max. total tacalcitrol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

**Curatoderm** (Almirall)

**Lotion**, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 mL = £12.73

**Excipients** include diosodium edetate, propylene glycol

**Ointment**, tacalcitol (as monohydrate) 4 micrograms/g, net price 30 g = £13.40, 60 g = £23.14, 100 g = £30.86

**Excipients** none as listed in section 13.1.3

**Tazarotene**

**TAZAROTENE**

**Indications** mild to moderate plaque psoriasis affecting up to 10% of skin area

**Cautions** wash hands immediately after use, avoid contact with eyes, face, intertriginous areas, hair-covered scalp, eczematous or inflamed skin; avoid excessive exposure to UV light (including sunlight, sunlamps, PUVA or UVB treatment); do not apply emollients or cosmetics within 1 hour of application

**Contra-indications** pregnancy—women of child-bearing potential must use effective contraception (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** local irritation (more common with higher concentration and may require discontinuation), pruritus, burning, erythema, desquamation, non-specific rash, contact dermatitis, and worsening of psoriasis; rarely stinging and inflamed, dry or painful skin

**Dose**

- **ADULT** and **CHILD** over 12 years, apply once daily in the evening usually for up to 12 weeks; **CHILD** under 18 years not recommended

**Zorac** (Allergan)

**Gel**, tazarotene 0.05%, net price 30 g = £14.09; 0.1%, 30 g = £14.80

**Excipients** include benzyl alcohol, butylated hydroxyanisole, butylated hydroxytoluene, diosodium edetate, polysorbate 40

**Tars**

**Indications** psoriasis and occasionally chronic atopic eczema

**Cautions** avoid eyes, mucosa, genital or rectal areas, and broken or inflamed skin; use suitable chemical protection gloves for extemporaneous preparation

**Contra-indications** not for use in sore, acute, or purpuric psoriasis or in presence of infection

**Side-effects** skin irritation and acne-like eruptions, photosensitivity, stains skin, hair, and fabric
**BNF 57**

### 13.5.2 Preparations for psoriasis 633

**Dose**
- Apply 1–3 times daily starting with low-strength preparations

**Note**
For shampoo preparations see section 13.9; impregnated dressings see Appendix 8 (section A8.2.9)

#### Non-proprietary preparations
May be difficult to obtain. Patients may find newer proprietary preparations more acceptable

- **Calamine and Coal Tar Ointment, BP**
  - **Ointment**, calamine 12.5 g, strong coal tar solution 2.5 g, zinc oxide 12.5 g, hydrous wool fat 25 g, white soft paraffin 47.5 g
  - **Excipients** include wool fat
  - **Dose** apply 1–2 times daily

- **Coal Tar and Salicylic Acid Ointment, BP**
  - **Ointment**, coal tar 2 g, salicylic acid 2 g, emulsifying wax 11.4 g, white soft paraffin 19 g, coconut oil 54 g, polysorbate ‘80’ 4 g, liquid paraffin 7.6 g
  - **Excipients** include cetostearyl alcohol
  - **Dose** apply 1–2 times daily

- **Coal Tar Paste, BP**
  - **Paste**, strong coal tar solution 7.5%, in compound zinc paste
  - **Dose** apply 1–2 times daily

- **Zinc and Coal Tar Paste, BP**
  - **Paste**, zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 38%, yellow soft paraffin 45%
  - **Excipients** include cetostearyl alcohol
  - **Dose** apply 1–2 times daily

#### Proprietary preparations

- **Carbo-Dome** (Sandoz)
  - **Cream**, coal tar solution 10%, in a water-miscible basis, net price 30 g = £4.77, 100 g = £16.38
  - **Excipients** include beeswax, hydroxybenzoates (parabens)
  - **Dose** psoriasis, apply to skin 2–3 times daily

- **Clinitar** (CHS)
  - **Cream**, coal tar extract 1%, net price 100 g = £10.99
  - **Excipients** include cetostearyl alcohol, isopropyl palmitate, propylene glycol
  - **Dose** psoriasis and eczema, apply to skin 1–2 times daily

- **Cocos®** (UCB Pharma)
  - **Scalp ointment**, coal tar solution 12%, salicylic acid 2%, precipitated sulphur 4%, in a coconut oil emollient basis, net price 40 g (with applicator nozzle) = £6.22, 100 g = £11.69
  - **Excipients** include cetostearyl alcohol
  - **Dose** scalable scalp disorders including psoriasis, eczema, seborrheic dermatitis and dandruff, apply to scalp once weekly as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour, CHILD 6–12 years, medical supervision required (not recommended under 6 years)

- **Exorex®** (Forest)
  - **Lotion**, prepared coal tar 1% in an emollient basis, net price 100 mL = £8.11, 250 mL = £16.24
  - **Excipients** include hydroxybenzoates (parabens), polysorbate 80
  - **Dose** psoriasis, apply to skin or scalp 2–3 times daily, CHILD under 12 years and ELDERLY, lotion can be diluted with a few drops of water before applying

- **Psoriderm®** (Dermal)
  - **Cream**, coal tar 6%, lecithin 0.4%, net price 225 mL = £9.85
  - **Excipients** include isopropyl palmitate, propylene glycol
  - **Dose** psoriasis, apply to skin or scalp 1–2 times daily
  - **Scalp lotion**—section 13.9

### Sebco® (Centrapharm)

- **Scalp ointment**, coal tar solution 12%, salicylic acid 2%, precipitated sulphur 4%, in a coconut oil emollient basis, net price 40 g = £4.54, 100 g = £8.52
  - **Excipients** include cetostearyl alcohol
  - **Dose** scalable scalp disorders including psoriasis, eczema, seborrheic dermatitis and dandruff, apply to scalp as necessary (if severe use daily for first 3–7 days), shampoo off after 1 hour, CHILD 6–12 years, medical supervision required (not recommended under 6 years)

#### Bath preparations

- **Coal Tar Solution, BP**
  - **Solution**, coal tar 20%, polysorbate ‘80’ 5%, in alcohol (96%), net price 500 mL = £7.22
  - **Excipients** include polysorbates
  - **Dose** use 100 mL in a bath
  - **Note** Strong Coal Tar Solution BP contains coal tar 40%

- **Pinetarsol®** (Crawford)
  - **Bath oil**, tar 2.3% in a light liquid paraffin basis, net price 200 mL = £4.75, 500 mL = £7.95
  - **Excipients** include fragrance
  - **Dose** eczema and psoriasis, use 15–30 mL in a bath or apply directly to wet skin and rinse after a few minutes; can be used as soap substitute
  - **Gel**, tar 1.6%, net price 100 g = £4.95
  - **Dose** eczema and psoriasis, apply directly to wet skin and rinse after a few minutes; can be used as soap substitute
  - **Solution**, tar 2.3%, net price 200 mL = £4.45, 500 mL = £7.45
  - **Dose** eczema and psoriasis, use 15–30 mL in a bath or dilute 15 mL with 3 litres of water and apply to affected areas or apply solution directly to wet skin and rinse after a few minutes; can be used as soap substitute

- **Polytar Emollient®** (Stiefel)
  - **Bath additive**, coal tar solution 2.5%, arachis (peanut) oil extract of coal tar 7.5%, tar 7.5%, cadel oil 7.5%, liquid paraffin 35%, net price 500 mL = £5.78
  - **Excipients** include isopropl palmitate
  - **Dose** psoriasis, eczema, atopic and pruritic dermatoses, use 2–4 capfuls (15–30 mL) in bath and soak for 20 minutes

- **Psoriderm®** (Dermal)
  - **Bath emulsion**, coal tar 40%, net price 200 mL = £2.87
  - **Excipients** include polysorbate 20
  - **Dose** psoriasis, use 30 mL in a bath and soak for 5 minutes

#### With corticosteroids

- **Alphosyl HC®** (GSK Consumer Healthcare)
  - **Cream**, coal tar extract 5%, hydrocortisone 0.5%, allantoin 2%, net price 100 g = £3.54. Label: 28.
  - **Potency:** mild
  - **Excipients** include beeswax, cetyl alcohol, hydroxybenzoates (parabens), isopropl palmitate, wool fat
  - **Dose** ADULT and CHILD over 5 years, psoriasis, apply thinly twice daily

### Dithranol

#### DITHRANOL (Anthratin)

**Indications** subacute and chronic psoriasis, see notes above

**Cautions** avoid use near eyes and sensitive areas of skin; see also notes above

**Contra-indications** hypersensitivity; acute and pustular psoriasis

**Side-effects** local burning sensation and irritation; stains skin, hair, and fabrics
**Dose**

- See notes above and under preparations

**Note** Some of these dithranol preparations also contain coal tar or salicylic acid—for cautions, contra-indications, and side-effects see under Tars (above) or under Salicylic Acid

### Non-proprietary preparations

**1. Dithranol Ointment, BP**

**Ointment**
- dithranol, in yellow soft paraffin; usual strengths 0.1–2%. Part of basis may be replaced by hard paraffin if a stiffer preparation is required.
- Label: 28

**2. Dithranol Paste, BP**

**Paste**
- dithranol in zinc and salicylic acid (Lassar’s) paste. Usual strengths 0.1–1% of dithranol. Label: 28

### Proprietary preparations

**Dithrocream® (Derma)**

**Cream**
- dithranol 0.1%, net price 50 g = £3.94; 0.25%, 50 g = £4.23; 0.5%, 50 g = £4.87; 1%, 50 g = £5.67. **(Pf) 2%, 50 g = £7.10. Label: 28

**Excipients**
- cetostearyl alcohol, chlorocresol

**Dose**
- for application to skin or scalp: 0.1–0.5% cream suitable for overnight treatment; 1–2% cream for max. 1 hour

**Micanol® (GP Pharma)**

**Cream**
- dithranol 1% in a lipid-stabilised basis, net price 50 g = £13.48; 0.25%, 50 g = £16.79. **(Lab) 0.1%, 50 g = £3.94; 0.25%, 50 g = £4.23; 0.5%, 50 g = £4.87; 1%, 50 g = £5.67; 2%, 50 g = £7.10. Label: 28

**Excipients**
- cetostearyl alcohol, chlorocresol

**Dose**
- for application to skin or scalp, apply 1% cream for up to 30 minutes once daily, if necessary; 3% cream can be used under medical supervision

**Note** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after cream has been rinsed off, use shampoo before applying cream to scalp and if necessary after cream has been rinsed off

**Psorin® (LPC)**

**Ointment**
- dithranol 0.11%, coal tar 1%, salicylic acid 1.6%, net price 50 g = £9.22, 100 g = £18.44. **(Lab) 0.1%, 50 g = £3.94; 0.25%, 50 g = £4.23; 0.5%, 50 g = £4.87; 1%, 50 g = £5.67; 2%, 50 g = £7.10. Label: 28

**Excipients**
- beeswax, wool fat

**Dose**
- for application to skin up to twice daily

**Scalp gel**, dithranol 0.25%, salicylic acid 1.6% in gel basis containing methyl salicylate, net price 50 g = £7.03. **Label: 28**

**Scalp gel**
- none as listed in section 13.1.3

**Dose**
- for application to scalp, initially apply on alternate days for 10–20 minutes; may be increased to daily application for max. 1 hour and then wash off

### Salicylic acid

**SALICYLIC ACID**

For coal tar preparations containing salicylic acid, see under Tars, p. 632; for dithranol preparations containing salicylic acid see under Dithranol, p. 633

**Indications** hyperkeratotic skin disorders; acne (section 13.6.1); warts and calluses (section 13.7); scalp conditions (section 13.9); fungal nail infections (section 13.10.2)

**Cautions** see notes above; avoid broken or inflamed skin

**Salicylate toxicity** If large areas of skin are treated, salicylate toxicity may occur

**Side-effects** sensitivity, excessive drying, irritation, systemic effects after widespread use (see under Cautions)

**Dose**

- See preparations

### Oral retinoids for psoriasis

**ACITRETIN**

**Note** Acitretin is a metabolite of etretinate

**Indications** severe extensive psoriasis resistant to other forms of therapy; palmoplantar pustular psoriasis; severe congenital ichthyosis; severe Darier’s disease (keratosis follicularis)

**Cautions** exclude pregnancy before starting (test for pregnancy within 2 weeks before treatment and monthly thereafter; start treatment on day 2 or 3 of menstrual cycle)—women (including those with history of infertility) should avoid pregnancy for at least 1 month before, during, and for at least 3 years after treatment; patients should avoid concomitant tetracycline or methotrexate, high doses of vitamin A (more than 4000–5000 units daily) and use of keratolytics, and should not donate blood during or for at least 1 year after stopping therapy (teratogenic risk); check liver function at start, then every 1–2 weeks for 2 months, then every 3 months; monitor plasma lipids; diabetes (can alter glucose tolerance—initial frequent blood glucose checks); radiographic assessment on long-term treatment; investigate atypical musculoskeletal symptoms; in children use only in exceptional circumstances (premature epiphyseal closure reported); avoid excessive exposure to sunlight and unsupervised use of sunlamps; **interactions**: Appendix 1 (retinoids)

**Contra-indications** hepatic impairment (Appendix 2); renal impairment (Appendix 3); hyperlipidaemia, pregnancy (important teratogenic risk): see Cautions and Appendix 4); breast-feeding

**Side-effects** dryness of mucous membranes (sometimes erosion), of skin (sometimes scaling, thinning, erythema especially of face, and pruritus), and of conjunctiva (sometimes conjunctivitis and decreased tolerance of contact lenses); sticky skin, dermatitis; other side-effects reported include palmoplantar exfoliation, epistaxis, epidermal and nail fragility, oedema, paronychia, granulomatous lesions, bullous eruptions, reversible hair thinning and alopecia, myalgia and arthralgia, occasional nausea, headache, malaise, drowsiness, rhinitis, sweating, taste disturbance, gingivitis; benign intracranial hypertension (discontinue if severe headache, vomiting, diarrhoea, abdominal pain, and visual disturbance occur; avoid concomitant tetracyclines); photosensitivity, corneal opacity, ringing in ears, hearing loss, abdominal pain, and visual disturbance occur; **avoid** concomitant tetracyclines; photosensitivity, concomitant methotrexate; raised liver enzymes, rarely jaundice and hepatitis (**avoid** concomitant methotrexate); raised serum triglycerides or cholesterol; decreased night vision reported; skeletal hyperostosis and extra-ossseous calcification reported following long-term administration of etretinate and premature epiphyseal closure in children, see Cautions

**Dose**

- Under expert supervision, initially 25–30 mg daily (Darier’s disease 10 mg daily) for 2–4 weeks, then adjusted according to response, usual range 25–50 mg daily; up to 75 mg daily for short periods in psoriasis and ichthyosis; **CHILD** (important) exception
cumstances only, see Cautions), 500 micrograms/kg daily (occasionally up to 1 mg/kg daily to max. 35 mg daily) with careful monitoring of musculoskeletal development (see p. 631)

**Neotigason** (Actavis) [FR]

Capsules, acitretin 10 mg (brown/white), net price 60-cap pack = £25.25; 25 mg (brown/yellow), 60-cap pack = £58.59. Label: 10, patient information leaflet, 21

### 13.5.3 Drugs affecting the immune response

Drugs affecting the immune response are used for eczema or psoriasis. Systemic drugs acting on the immune system are used under specialist supervision.

**Pimecrolimus** by topical application is licensed for **mild to moderate atopic eczema**. **Tacrolimus** is licensed for topical use in **moderate to severe atopic eczema**. Both are drugs whose long-term safety and place in therapy is still being evaluated and they should not usually be considered first-line treatments unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Short-term treatment with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in treating atopic eczema; continuous long-term treatment should be avoided.

**NICE guidance**

**Tacrolimus and pimecrolimus for atopic eczema (August 2004)**

Topical pimecrolimus and tacrolimus are options for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years and topical tacrolimus is recommended for moderate to severe atopic eczema in adults and children over 2 years. Pimecrolimus and tacrolimus should be used within their licensed indications.

For the role of topical corticosteroids in eczema, see section 13.5.1, and for comment on their limited role in psoriasis, see section 13.4. A short course of a systemic corticosteroid (section 6.3.2) can be given for eczema flares that have not improved despite appropriate corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

**Ciclosporin** (cyclosporin) by mouth can be used for **severe psoriasis** and for **severe eczema**. **Azathioprine** (section 8.2.1) or **mycophenolate mofetil** (section 8.2.1) are used for severe refractory eczema [unlicensed indication]. **Hydroxyurea** (hydroxyurea) (section 8.1.5) is used by mouth for severe psoriasis [unlicensed indication].

**Methotrexate** can be used for **severe psoriasis**, the dose being adjusted according to severity of the condition and haematological and biochemical measurements; the usual dose is methotrexate 10 to 25 mg **once weekly**, by mouth. Folic acid 5 mg (section 9.1.2) can be given once weekly to reduce the possibility of side-effects associated with methotrexate; alternative regimens of folic acid may be used in some settings.

**Etanercept**, a cytokine modulator, is used for **severe plaque psoriasis** either refractory to at least 2 systemic treatments and photochemotherapy, or in patients intolerant of these treatments. **Efalizumab** (which inhibits T-cell activation) or another cytokine modulator, **adalimumab** or **infliximab**, are alternatives. Adalimumab, etanercept, and infliximab are also licensed for psoriatic arthritis (section 10.1.3).

**NICE guidance**

**Etanercept and efalizumab for plaque psoriasis in adults** (July 2006)

Etanercept is recommended for severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Etanercept should be withdrawn if the response is not adequate after 12 weeks.

Efalizumab is recommended for severe plaque psoriasis which has failed to respond to etanercept or when etanercept cannot be used because of intolerance or contra-indications. Efalizumab should be withdrawn if the response is not adequate after 12 weeks.

**NICE guidance**

**Infliximab for plaque psoriasis in adults** (January 2008)

Infliximab is recommended for the treatment of very severe plaque psoriasis which has failed to respond to standard systemic treatments (including ciclosporin and methotrexate) and to photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications. Infliximab should be withdrawn if the response is not adequate after 10 weeks.

### Ciclosporin

**Ciclosporin** (Cyclosporin)

**Indications** see under Dose; severe acute ulcerative colitis (section 1.5.3); transplantation and graft-versus-host disease (section 8.2.2)

**Cautions** see section 8.2.2

**Additional cautions in atopic dermatitis and psoriasis Contra-indicated** in abnormal renal function, uncontrolled hypertension (see also below), infections not under control, and malignancy (see also below). Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting. During treatment, monitor serum creatinine every 2 weeks

13 Skin hypersensitivity reactions, asthenia, immunodeficiency, severe infection.

Cautions moderate to severe chronic plaque psoriasis.

Dose moderate to severe chronic plaque psoriasis.

Side-effects see section 8.2.2

Dose Short-term treatment (usually for max. 8 weeks but can be longer under specialists) of severe atopic dermatitis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, by mouth, ADULT and CHILD over 16 years, initially 2.5 mg/kg daily in 2 divided doses, if good initial response not achieved within 2 weeks, increase rapidly to max. 5 mg/kg daily; initial dose of 5 mg/kg daily in 2 divided doses if very severe; CHILD under 16 years, see BNF for Children.

Severe psoriasis where conventional therapy ineffective or inappropriate, administered in accordance with expert advice, by mouth, ADULT and CHILD over 16 years, initially 2.5 mg/kg daily in 2 divided doses, increased gradually to max. 5 mg/kg daily if no improvement within 1 month (discontinue if response still insufficient after 6 weeks); initial dose of 5 mg/kg daily; CHILD under 16 years, see BNF for Children.

Important For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

EFALIZUMAB

Indications moderate to severe chronic plaque psoriasis for those whose disease is unresponsive to, or who are intolerant of other systemic therapy or photochemotherapy.

Cautions low platelet count (monitor platelet count before treatment, monthly during initial therapy then every 3 months); monitor for neurological deficits—if progressive multifocal leuкоencephalopathy suspected, suspend treatment until exclude; hepatic impairment; renal impairment; interactions: Appendix 1 (efalizumab).

Contra-indications immunodeficiency, severe infection, active tuberculosis; history of malignancy; pregnancy and breast-feeding (Appendix 5).

Side-effects hypersensitivity reactions, asthenia, influenza-like symptoms, leucocytosis, arthralgia, exacerbation of psoriasis or development of variant forms including psoriatic arthritis (discontinue treatment); less commonly thrombocytopenia and injection-site reactions; also reported progressive multifocal leuкоencephalopathy (see also under Contraindations) and inflammatory polyradiculoneuropathy.

Dose by subcutaneous injection, initially 700 micrograms/kg then 1 mg/kg weekly; discontinue if inadequate response after 12 weeks; CHILD and ADOLESCENT not recommended.

RAPTIVA (Serono) injection, powder for reconstitution, efalizumab, net price 125-mg vial = £169.20 (with 1.3 mL water for injections in prefilled syringe)

METHOTREXATE

Indications severe psoriasis unresponsive to conventional therapy (specialist use only); Crohn’s disease (section 1.5.3); malignant disease (section 8.1.3); rheumatoid arthritis (section 10.1.3).

Cautions section 10.1.3; also photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported).

Contra-indications section 10.1.3

Side-effects section 10.1.3

Dose by mouth or by intramuscular or intravenous injection, 2.5–10 mg once weekly, increased according to response; max. weekly dose 30 mg; ELDERLY consider dose reduction (extreme caution); CHILD 12–18 years see BNF for Children.

Important Note that the above dose is a weekly dose. To avoid error with low dose methotrexate, it is recommended that:

- the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Preparations Section 8.1.3 (parenteral) and section 10.1.3 (oral).

PIMECROLIMUS

Indications short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used; see also notes above.

Cautions UV light (avoid excessive exposure to sunlight and sunlamps), avoid other topical treatments except emollients at treatment site; alcohol consumption (risk of facial flushing and skin irritation).

Contra-indications contact with eyes and mucous membranes, application under occlusion, injection at treatment site; congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions.

Side-effects burning sensation, pruritus, erythema, skin infections (including folliculitis and less commonly impetigo, herpes simplex and zoster, molluscum contagiosum); rarely papilloma, skin discoloration.
local reactions including pain, paraesthesia, peeling, dryness, oedema, and worsening of eczema; skin malignancy reported

**Dose**
- Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks); **CHILD** under 2 years not recommended

**Elidel** (Novartis) **(NM)**

**Cream**, pimecrolimus 1%, net price 30 g = £19.69, 60 g = £37.41, 100 g = £59.07. Label: 4, 28

**Excipients** include benzyl alcohol, cetyl alcohol, propylene glycol, stearyl alcohol

**TACROLIMUS**

**Indications** short-term treatment of moderate to severe atopic eczema (including flares) either unresponsive to, or in patients intolerant of conventional therapy; see also notes above; other indications section 8.2.2

**Cautions** infection at treatment site, UV light (avoid excessive exposure to sunlight and sunlamps); alcohol consumption (risk of facial flushing and skin irritation); pregnancy

**Contra-indications** congenital epidermal barrier defects; generalised erythroderma; immunodeficiency; concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists); application to malignant or potentially malignant skin lesions; avoid contact with eyes and mucous membranes; application under occlusion; breast-feeding (Appendix 5)

**Side-effects** application-site reactions including rash, irritation, pain and paraesthesia; herpes simplex infection, Kaposi’s varicelliform eruption; *less commonly* acne; rosacea and skin malignancy also reported

**Dose**
- **ADULT** and **CHILD** over 16 years initially apply 0.1% ointment thinly twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks); reduce to once daily or switch to 0.03% ointment if condition allows; **CHILD** 2–16 years, initially apply 0.03% ointment twice daily for up to 3 weeks (consider other treatment if eczema worsens or if no improvement after 2 weeks) then reduce to once daily until lesion clears

**Protopic** (Astellas) **(NM)**

**Ointment**, tacrolimus (as monohydrate) 0.03%, net price 30 g = £19.44, 60 g = £36.94; 0.1%, 30 g = £21.60, 60 g = £41.04. Label: 4, 11, 28

**Excipients** include beeswax

**Cytokine modulators**

**ADALIMUMAB**

**Indications** see notes above; Crohn’s disease (section 1.5.3); ankylosing spondylitis, polyarticular juvenile idiopathic arthritis, psoriatic arthritis, rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3

**Contra-indications** section 10.1.3

**Side-effects** section 10.1.3

**Dose**
- By subcutaneous injection, plaque psoriasis, **ADULT** over 18 years, initially 80 mg, then 40 mg on alternate weeks starting 1 week after initial dose; discontinue treatment if no response within 16 weeks

**Preparations** Section 10.1.3

**ETANERCEPT**

**Indications** see notes above; ankylosing spondylitis, psoriatic arthritis, polyarticular course juvenile idiopathic arthritis, rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3

**Contra-indications** section 10.1.3

**Side-effects** section 10.1.3

**Dose**
- By subcutaneous injection, plaque psoriasis, **ADULT** over 18 years, 25 mg twice weekly or 50 mg once weekly; max. treatment duration 24 weeks; discontinue if no response after 12 weeks

**Preparations** Section 10.1.3

**INFLIXIMAB**

**Indications** see notes above; inflammatory bowel disease (section 1.5.3); ankylosing spondylitis, psoriatic arthritis, rheumatoid arthritis (section 10.1.3)

**Cautions** section 10.1.3

**Contra-indications** section 10.1.3

**Side-effects** section 10.1.3

**Dose**
- By intravenous infusion, plaque psoriasis, **ADULT** over 18 years, 5 mg/kg, repeated 2 weeks and 6 weeks after initial infusion, then every 8 weeks; discontinue if no response by 14 weeks of initial infusion

**Preparations** Section 10.1.3

**13.6 Acne and rosacea**

**13.6.1 Topical preparations for acne**

**13.6.2 Oral preparations for acne**

**Acne** Treatment of acne should be commenced early to prevent scarring. Patients should be counselled that an improvement may not be seen for at least a couple of months. The choice of treatment depends on whether the acne is predominantly inflammatory or comedonal and its severity.

*Mild to moderate acne* is generally treated with topical preparations (section 13.6.1). Systemic treatment (section 13.6.2) with oral antibacterials is generally used for moderate to severe acne or where topical preparations are not tolerated or are ineffective or where application to the site is difficult. Another oral preparation used for acne is the hormone treatment co-cyprindiol (cyproterone acetate with ethinylestradiol); it is for women only.

*Severe acne*, acne unresponsive to prolonged courses of oral antibacterials, scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe isotretinoin for administration by mouth.
13.6.1 Topical preparations for acne

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide (see below) or to a topical retinoid (see p. 639). Alternatively, topical application of an antibacterial such as erythromycin or clindamycin may be effective for inflammatory acne. If topical preparations prove inadequate, oral preparations may be needed (section 13.6.2).

Benzoyl peroxide and azelaic acid

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with treatment continued at a reduced frequency of application. If the acne does not respond after 2 months then use of a topical antibiotic should be considered.

Azelaic acid has antimicrobial and anticomедoinal properties. It may be an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face. Some patients prefer azelaic acid because it is less likely to cause local irritation than benzoyl peroxide.

### BENZOYL PEROXIDE

#### Indications
acne vulgaris

#### Cautions
avoid contact with eyes, mouth, and mucous membranes; may bleach fabrics and hair; avoid excessive exposure to sunlight

#### Side-effects
skin irritation (reduce frequency or suspend use until irritation subsides and re-introduce at reduced frequency)

#### Dose
- Apply 1–2 times daily preferably after washing with soap and water, start treatment with lower-strength preparations
- Note: May bleach clothing

#### Acnecide® (Galderma)

- **Gel**: benzoyl peroxide 5% in an aqueous gel basis, net price 60 g = £5.69
  - Excipients include propylene glycol

### AZELAIC ACID

#### Indications
see preparations

#### Cautions
avoid contact with eyes, mouth, and mucous membranes

#### Side-effects
local irritation (reduce frequency or discontinue temporarily); less commonly skin discoloration; very rarely photosensitisation

#### Finacea® (Valeant)  

- **Gel**: azelaic acid 15%, net price 30 g = £7.48
  - Excipients include disodium edetate, propylene glycol, isopropyl palmitate
  - Dose: facial acne vulgaris; ADULT and CHILD over 14 years, apply twice daily; discontinue if no improvement after 1 month
  - Papulopustular rosacea, ADULT over 18 years, apply twice daily

#### Skinoren® (Valeant)  

- **Cream**: azelaic acid 20%, net price 30 g = £3.74
  - Excipients include propylene glycol
  - Dose: acne vulgaris, apply twice daily (sensitive skin, once daily for first week). Extended treatment may be required but manufacturer advises period of treatment should not exceed 5 months

### Topical antibacterials for acne

For many patients with mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for patients who wish to avoid oral antibacterials or who cannot tolerate them. Topical preparations of erythromycin and clindamycin are effective for inflammatory acne. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation. Antibacterial resistance of Propionibacterium acnes is increasing; there is cross-resistance between erythromycin and clindamycin.
**mycanyl and clindamycin. To avoid development of resistance:**
- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (however, treatment with a topical preparation should be continued for at least 6 months).

**ANTIBACTERIALS**

**Indications** acne vulgaris

**Cautions** some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide

**Dalacin T** (Pharmacia) (£)

- **Topical solution**, clindamycin 1% (as phosphate), in an aqueous alcoholic basis, net price (both with applicator) 30 mL = £4.34, 50 mL = £7.23
- **Excipients** include propylene glycol
- **Dose** apply twice daily

**Lotion**, clindamycin 1% (as phosphate) in an aqueous basis, net price 30 mL = £5.08, 50 mL = £8.47
- **Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)
- **Dose** apply twice daily

**Stiemycin** (Stiefel) (£)

- **Solution**, erythromycin 2% in an alcoholic basis, net price 50 mL = £8.00
- **Excipients** include propylene glycol
- **Dose** apply twice daily

**Zindacin** (Crawford) (£)

- **Gel**, clindamycin 1% (as phosphate), net price 30 g = £8.66
- **Excipients** include propylene glycol
- **Dose** apply once daily

**Zineryt** (Astellas) (£)

- **Topical solution**, powder for reconstitution, erythromycin 40 mg, zinc acetate 12 mg/mL when reconstituted with solvent containing ethanol, net price per pack of powder and solvent to provide 30 mL = £7.71, 90 mL = £22.24
- **Excipients** none as listed in section 13.1.3
- **Dose** apply twice daily

**Topical retinoids and related preparations for acne**

Topical **tretinoin** and its isomer **isotretinoin** are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling may occur initially but settles with time. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Isotretinoin is given by mouth in severe acne; see section 13.6.2 for warnings relating to use by mouth.

Adapalene, a retinoid-like drug, is licensed for mild to moderate acne. It is less irritating than topical retinoids.

**Cautions** Topical retinoids should be avoided in severe acne involving large areas. Contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin should be avoided. These drugs should be used with caution in sensitive areas such as the neck, and accumulation in angles of the nose should be avoided. Exposure to UV light (including sunlight, solariums) should be avoided; if sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used. Use of retinoids with abrasive cleaners, comedogenic or astringent cosmetics should be avoided. Allow peeling (e.g. resulting from use of benzoyl peroxide) to subside before using a topical retinoid; alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application).

**Contra-indications** Topical retinoids are contra-indicated in pregnancy (Appendix 4); women of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective). Tretinoin is contra-indicated in personal or familial history of cutaneous epithelioma.

**Side-effects** Local reactions include burning, erythema, stinging, pruritus, dry or peeling skin (discontinue if severe). Increased sensitivity to UVB light or sunlight occurs. Temporary changes of skin pigmentation have been reported. Eye irritation and oedema, and blistering or crumbling of skin have been reported rarely.

**ADAPALENE**

**Indications** mild to moderate acne

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Apply thinly once daily before retiring

**Differin** (Galderma) (£)

- **Cream**, adapalene 0.1%, net price 45 g = £11.40
- **Excipients** include disodium edetate, hydroxybenzoates (parabens)
- **Dose** apply once daily

**TRETINOIN**

**Note** Tretinoin is the acid form of vitamin A

**Indications** see preparations; malignant disease (section 8.1.5)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- See preparations

**Retin-A** (Janssen-Cilag) (£)

- **Gel**, tretinoin 0.01%, net price 60 g = £3.61; 0.025%, 60 g = £5.61
- **Excipients** include butylated hydroxytoluene
- **Dose** acne vulgaris, apply thinly 1–2 times daily

**With antibacterial**

**Aknemycin® Plus** (Almirall) (£)

- **Solution**, tretinoin 0.025%, erythromycin 4% in an alcoholic basis, net price 25 mL = £7.05
- **Excipients** none as listed in section 13.1.3
- **Dose** acne, apply thinly 1–2 times daily
ISOTRETINOIN

Note
Isotretinoin is an isomer of tretinoin

Important
For indications, cautions, contra-indications and side-effects of isotretinoin when given by mouth, see p. 641

Indications
see notes above; oral treatment (see section 13.6.2)

Cautions
(topical application only) see notes above

Contra-indications
(topical application only) see notes above

Dose
- Apply thinly 1–2 times daily

Isotrexin\(^\text{c}\) (Stiefel) \(\text{PH}\)
Gel, isotretinoin 0.05%, net price 30 g = £6.18
Excipients include butylated hydroxytoluene

With antibacterial

Isotrexin\(^\text{c}\) (Stiefel) \(\text{PH}\)
Gel, isotretinoin 0.05%, net price 30 g = £7.78
Excipients include butylated hydroxytoluene

Other topical preparations for acne

Salicylic acid is available in various preparations for sale direct to the public for the treatment of mild acne. Other products are more suitable for acne; salicylic acid is used mainly for its keratolytic effect.

Preparations containing sulphur and abrasive agents are not considered beneficial in acne.

Topical corticosteroids should not be used in acne.

A topical preparation of nicotinamide is available for inflammatory acne.

ABRASIVE AGENTS

Indications
acne vulgaris (but see notes above)

Cautions
avoid contact with eyes; discontinue use temporarily if skin becomes irritated

Contra-indications
superficial venules, telangiectasia

Brasivol\(^\text{c}\) (Stiefel) \(\text{PH}\)
Paste No. 1, aluminium oxide 38.09% in fine particles, in a soap-detergent basis, net price 75 g = £2.21
Excipients include fragrance, \(N\)-(3-Chloroallyl)hexaminium chloride (quaternium 15)
Dose
use instead of soap 1–3 times daily

CORTICOSTEROIDS

Indications
use in acne not recommended (see notes above)

Cautions
see section 13.4 and notes above

Contra-indications
see section 13.4 and notes above

Side-effects
see section 13.4 and notes above

Actinac\(^\text{c}\) (Peckforton) \(\text{PH}\)
Lotion (powder for reconstitution with solvent), chloramphenicol 40 mg, hydrocortisone acetate 40 mg, allantoin 24 mg, butoxyethyl nicotinate 24 mg, precipitated sulphur 320 mg/g. Discard 21 days after reconstitution, net price 2 × 6.25-g bottles powder with 2 × 20-mL bottles solvent = £16.28. Label: 28. Potency: mild
Excipients none as listed in section 13.1.3

NICOTINAMIDE

Indications
see under preparation

Cautions
avoid contact with eyes and mucous membranes (including nose and mouth); reduce frequency of application if excessive dryness, irritation or peeling

Side-effects
dryness of skin; also pruritus, erythema, burning and irritation

Nicam\(^\text{c}\) (Dermal) \(\text{PH}\)
Gel, nicotinamide 4%, net price 60 g = £7.42
Excipients none as listed in section 13.1.3
Dose
inflammatory acne vulgaris, apply twice daily; reduce to once daily or on alternate days if irritation occurs

SALICYLIC ACID

Indications
acne; psoriasis (section 13.5.2), warts and calluses (section 13.7); fungal nail infections (section 13.10.2)

Cautions
avoid contact with mouth, eyes, mucous membranes; systemic effects after excessive use (see section 4.7.1)

Side-effects
local irritation

Acnisal\(^\text{c}\) (Alliance) \(\text{PH}\)
Topical solution, salicylic acid 2% in a detergent and emollient basis, net price 177 mL = £4.03.
Excipients include benzyl alcohol
Dose
use up to 3 times daily

13.6.2 Oral preparations for acne

Oral antibacterials for acne

Systemic antibacterial treatment is useful for inflammatory acne if topical treatment is not adequately effective or if it is inappropriate. Anticomendal treatment (e.g. with topical benzoyl peroxide) may also be required.

Either oxytetracycline or tetracycline (section 5.1.3) is usually given for acne in a dose of 500 mg twice daily. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer.

Doxycycline and lymecycline (section 5.1.3) are alternatives to tetracycline. Doxycycline can be used in a dose of 100 mg daily. Lymecycline is given in a dose of 408 mg daily.

Although minocycline is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation; it is given in a dose of 100 mg once daily or 50 mg twice daily.

Erythromycin (section 5.1.5) in a dose of 500 mg twice daily is an alternative for the management of acne but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response.

Trimethoprim (section 5.1.8) in a dose of 300 mg twice daily may be used for acne resistant to other antibacterials [unlicensed indication]. Prolonged treatment with
trimethoprim may depress haematopoiesis; it should generally be initiated by specialists. Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

### Hormone treatment for acne

**Co-cyprindiol** (cyproterone acetate with ethinylestradiol) contains an anti-androgen. It is no more effective than an oral broad-spectrum antibacterial but is useful in women who also wish to receive oral contraception. Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some women with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent. Contra-indications of co-cyprindiol include pregnancy and a predisposition to thrombosis.

**Side-effects** see under Combined Hormonal Contraceptives, section 7.3.1

**Contra-indications** see under Combined Hormonal Contraceptives, section 7.3.1

**Dose**

- 1 tablet daily for 21 days starting on day 1 of menstrual cycle and repeated after a 7-day interval, usually for several months; withdraw 3–4 months after acne or hirsutism completely resolved (repeat courses may be given if recurrence); long-term treatment may be necessary for severe symptoms

**Co-cyprindiol** (Non-proprietary) *(Schering Health)*

- **Tablets**, co-cyprindiol 2000/35 (cyproterone acetate 2 mg, ethinylestradiol 35 micrograms), net price 21-tab pack = £3.74
- **Brands** include Acnecin, Cicafem, Clairette, Diva

**Dianette** *(Schering Health)*

- **Tablets**, beige, s/c, co-cyprindiol 2000/35 (cyproterone acetate 2 mg, ethinylestradiol 35 micrograms), net price 21-tab pack = £3.70

### Oral retinoid for acne

The retinoid **isotretinoin** reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, scarring, acne which has not responded to an adequate course of a systemic antibacterial, or acne which is associated with psychological problems. It is also useful in women who develop acne in the third or fourth decades of life, since late onset acne is frequently unresponsive to antibacterials. Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required.

**Side-effects of isotretinoin** include severe dryness of the skin and mucous membranes, nose bleeds, and joint pains. The drug is **teratogenic** and must not be given to women of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. Women must also be registered with a pregnancy prevention programme (see under Cautions below).

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

### ISOTRETINOIN

**Note** Isotretinoin is an isomer of tretinoin

**Indications** see notes above

**Cautions** exclude pregnancy before starting (perform pregnancy test 2–3 days before expected menstruation, start treatment on day 2 or 3 of menstrual cycle)—women must practice effective contraception at least 1 month before, during, and for at least 1 month after treatment (see also notes above); avoid blood donation during treatment and for at least 1 month after treatment; history of depression; measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised); discontinue if uncontrolled hypertriglyceridaemia or pancreatitis; diabetes; dry eye syndrome (associated with risk of keratitis); avoid keratolytics; renal impairment (Appendix 3); interactions: Appendix 1 (retinoids)

**Counselling** Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.

**Contra-indications** pregnancy (important teratogenic risk: see Cautions above and Appendix 4); breast-feeding; hepatic impairment (Appendix 2); hypervitaminosis A, hyperlipidaemia

**Side-effects** dryness of skin (with dermatitis, scaling, thinning, erythema, puritus), epidermal fragility (trauma may cause blistering), dryness of lips (sometimes cheilitis), dryness of eyes (with blepharitis and conjunctivitis), dryness of pharyngeal mucosa (with hoarseness), dryness of nasal mucosa (with epistaxis), headache, myalgia and arthralgia, raised plasma concentration of triglycerides, of glucose, of serum
transaminases, and of cholesterol (risk of pancreatitis if triglycerides above 9 mmol/litre), haematuria and proteinuria, thrombocytopenia, thrombocytosis, neutropenia and anaemia; rarely mood changes (depression, suicidal ideation, aggressive behaviour, anxiety)—expert referral required, exacerbation of acne, acne fulminans, allergic skin reactions, and hypersensitivity, alopecia; very rarely nausea, inflammatory bowel disease, diarrhoea (discontinue if severe), benign intracranial hypertension (avoid concomitant tetracyclines), convulsions, malaise, drowsiness, dizziness, lymphadenopathy, increased sweating, hyperuricaemia, raised serum creatinine concentration and glomerulonephritis, hepatitis, tendinitis, bone changes (including reduced bone density, early epiphyseal closure, and skeletal hyperostosis following long-term administration), visual disturbances (papilloedema, corneal opacities, cataracts, decreased night vision, photophobia, blurred vision, colour blindness)—expert referral required and consider withdrawal, decreased tolerance to contact lenses and keratitis, impaired hearing, Gram-positive infections of skin and mucous membranes, allergic vasculitis and granulomatous lesions, paronychia, hirsutism, nail dystrophy, skin hyperpigmentation, photosensitivity

**Dose**

- ADULT and CHILD over 12 years, 500 micrograms/kg daily increased if necessary to 1 mg/kg (1–2 divided doses) for 16–24 weeks (repeat treatment course after a period of at least 8 weeks if failure or relapse after first course); max. cumulative dose 150 mg/kg per course

**Isotretinoin (Non-proprietary)** [FR]

- **Capsules**; isotretinoin 5 mg, net price 56-cap pack = £14.99; 20 mg, 56-cap pack = £39.99. Label: 10, patient information leaflet, 11, 21

**Roaccutane® (Roche)** [FR]

- **Capsules**; isotretinoin 5 mg (red-violet/white), net price 30-cap pack = £9.08; 20 mg (red-violet/white), 30-cap pack = £25.02. Label: 10, patient information leaflet, 11, 21

- Excipients include arachis (peanut) oil

**13.7 Preparations for warts and calluses**

Warts (verrucas) are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region (see below); treatment usually relies on local tissue destruction. Warts may regress on their own and treatment is required only if the warts are painful, unsightly, persistent, or cause distress.

Preparations of salicylic acid, formaldehyde, gluconolactone or silver nitrate are available for purchase by the public; they are suitable for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation.

An ointment combining salicylic acid with podophyllin resin (Posaflin®) is available for treating plantar warts. Cryotherapy causes pain, swelling, and blistering and may be no more effective than topical salicylic acid in the treatment of warts.

### SALICYLIC ACID

**Indications** see under preparations; psoriasis (section 13.5.2); acne (section 13.6.1); fungal nail infections (section 13.10.2)

**Cautions** significant peripheral neuropathy, patients with diabetes at risk of neuropathic ulcers; protect surrounding skin and avoid broken skin; not suitable for application to face, anogenital region, or large areas

**Side-effects** skin irritation, see notes above

**Dose**

- See under preparations; advise patient to apply carefully to wart and to protect surrounding skin (e.g. with soft paraffin or specially designed plaster); rub wart surface gently with file or pumice stone once weekly; treatment may need to be continued for up to 3 months

**Cuplex® (Crawford)**

- Gel, salicylic acid 11%, lactic acid 4%, in a collodion basis, net price 5 g = £2.23. Label: 15

**Duofilm® (Stiefel)**

- Paint, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 15 mL (with applicator) = £2.25. Label: 15

**Occusal® (Alliance)**

- Cutaneous solution, salicylic acid 26% in polyacrylic solution, net price 10 mL (with applicator) = £3.39. Label: 15

**Salactol® (Dermal)**

- Paint, salicylic acid 16.7%, lactic acid 16.7%, in flexible collodion, net price 10 mL (with applicator) = £1.79. Label: 15

**Salatac® (Dermal)**

- Gel, salicylic acid 12%, lactic acid 4% in a collodion basis, net price 8 g (with applicator) = £3.12. Label: 15

**Verrugon® (Ransom)**

- Ointment, salicylic acid 50% in a paraffin basis, net price 6 g = £2.83

### With podophyllum

**Posaflin® (Norgine)**

- Ointment, podophyllin resin 20%, salicylic acid 25%, net price 10 g = £3.51

**Note** Owing to the salicylic acid content, not suitable for genital warts; owing to the podophyllin content also contra-indicated in pregnancy and breast-feeding
### FORMALDEHYDE

**Indications** see under preparations

**Cautions** see under Salicylic Acid

**Side-effects** see under Salicylic Acid

**Veracur®** (Typharm)

* Gel, formaldehyde 0.75% in a water-miscible gel basis, net price 15 g = £2.41.

**Dose** for warts, particularly planter warts, apply twice daily

### GLUTARALDEHYDE

**Indications** warts, particularly planter warts

**Cautions** protect surrounding skin; not for application to face, mucosa, or anogenital areas

**Side-effects** rashes, skin irritation (discontinue if severe); stains skin brown

**Dose**
- Apply twice daily (see also under Salicylic acid)

**Glutarol®** (Dermal)

* Solution (= application), glutaraldehyde 10%, net price 10 mL (with applicator) = £2.17

### SILVER NITRATE

**Indications** warts, verrucas, umbilical granulomas, over-granulating tissue, cauterisation

**Cautions** protect surrounding skin and avoid broken skin; not suitable for application to face, ano-genital region, or large areas

**Side-effects** chemical burns on surrounding skin; stains skin and fabric

**Dose**
- Common warts and verrucas, apply moistened caustic pencil tip for 1–2 minutes; repeat after 24 hours up to max. 3 applications for warts or max. 6 applications for verrucas
- Instructions in proprietary packs generally incorporate advice to remove dead skin before use by gentle filing and to cover with adhesive dressing after application
- Umbilical granulomas, apply moistened caustic pencil tip (usually containing silver nitrate 40%) for 1–2 minutes while protecting surrounding skin with soft paraffin

**Silver nitrate** (Non-proprietary)

* Caustic pencil, tip containing silver nitrate 40%, potassium nitrate 60%, net price = 93p

**AVOCA®** (Bray)

* Caustic pencil, tip containing silver nitrate 95%, potassium nitrate 5%, net price, treatment pack (including emery file, 6 adhesive dressings and protector pads) = £1.94.

### IMIQUIMOD

**Indications** see under Dose

**Cautions** avoid normal or broken skin, and open wounds; not suitable for internal genital warts; uncircumcised males (risk of phimosis or stricture of foreskin); autoimmune disease; immunosuppressed patients; pregnancy (Appendix 4)

**Side-effects** local reactions (including itching, burning sensation, erythema, erosion, oedema, excoriation, and scabbing); headache; influenza-like symptoms; myalgia; less commonly local ulceration and alopecia; rarely Stevens-Johnson syndrome and cutaneous lupus erythematosus-like effect; very rarely dysuria in women; permanent hypopigmentation or hyperpigmentation reported

**Dose**
- Warts (external genital and perianal), apply thinly 3 times a week at night until lesions resolve (max. 16 weeks)
- Superficial basal cell carcinoma, apply to lesion (and 1 cm beyond it) on 5 days each week for 6 weeks; assess response 12 weeks after completing treatment
- Actinic keratosis, apply to lesion 3 times a week for 4 weeks; assess response after a 4 week treatment-free interval; repeat 4-week course if lesions persist; max. 2 courses
- **CHILD** under 18 years, see BNF for Children

**Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours for warts or for 8 hours for basal cell carcinoma and actinic keratosis, then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact

**Aldara®** (3M)

* Cream, imiquimod 5%, net price 12-sachet pack = £61.32. Label: 10, patient information leaflet

**Excipients** include benzyl alcohol, cetyl alcohol, hydroxybenzamides (parabens), polysorbate 60, stearyl alcohol

**Condoms** may damage latex condoms and diaphragms

### PODOPHYLLOTOXIN

**Indications** see under preparations

**Cautions** avoid normal skin and open wounds; keep away from face; very irritant to eyes

**Contra-indications** pregnancy and breast-feeding; children

**Side-effects** see notes above

**Condyline®** (Ardern)

* Solution, podophyllotoxin 0.5% in alcohol basis, net price 3.5 mL (with applicators) = £14.49. Label: 15

**Dose** condylomata acuminata affecting the penis or the female external genitalia, apply twice daily for 3 consecutive days.

**Condyline®** (Ardern) may be used for soft, non-keratinised external anogenital warts; it may cause considerable irritation of the treated area. It can also cause severe systemic toxicity on excessive application including gastro-intestinal, renal, haematological, and CNS effects. Patients with a limited number of external warts or keratinised lesions may be better treated with cryotherapy or other forms of physical ablation.

### Anogenital warts

The treatment of anogenital warts (condylomata acuminata) should be accompanied by screening for other sexually transmitted diseases. Podophyllotoxin (the major active ingredient of podophyllum) may be used for soft, non-keratinised external anogenital warts; it can cause considerable irritation of the treated area. It can also cause severe systemic toxicity on excessive application including gastro-intestinal, renal, haematological, and CNS effects. Patients with a limited number of external warts or keratinised lesions may be better treated with cryotherapy or other forms of physical ablation.

Imiquimod cream is licensed for the treatment of external anogenital warts; it may be used for both keratinised and non-keratinised lesions. It is also licensed for the treatment of superficial basal cell carcinoma and actinic keratosis (section 13.8.1).

Inosine pranobex (section 5.3.2.1) is licensed for adjunctive treatment of genital warts but it has been superseded by more effective drugs.
Skin

13.8 Sunscreens and camouflage

13.8.1 Sunscreen preparations

Solar ultraviolet irradiation can be harmful to the skin. It
is responsible for disorders such as polymorphic light
eruption, solar urticaria, and it provokes the various
cutaneous porphyrias. It also provokes (or at least aggra-
vates) skin lesions of lupus erythematosus and may
aggravate rosacea and some other dermatoses. Certain
drugs, such as demeclocycline, phenothiazines, or ami-
darone, can cause photosensitivity. All these conditions
(as well as sunburn) may occur after relatively short
periods of exposure to the sun. Solar ultraviolet irradia-
tion may provoke attacks of recurrent herpes labialis
(but it is not known whether the effect of sunlight
exposure is local or systemic).
The effects of exposure over longer periods include
ageing changes and more importantly the initiation of
skin cancer.
Solar ultraviolet radiation is approximately 200–400 nm
in wavelength. The medium wavelengths (290–320 nm, known as UVA) cause sunburn. The long wavelengths
(320–400 nm, known as UVA) are responsible for many
photosensitivity reactions and photodermatoses. Both UVA
and UVB contribute to long-term photodamage and to
the changes responsible for skin cancer and ageing.
Sunscreen preparations contain substances that protect
the skin against UVA and UVB radiation, but they are no
substitute for covering the skin and avoiding sunlight.
The sun protection factor (SPF, usually indicated in the
preparation title) provides guidance on the degree of
protection offered against UVB; it indicates the multiply-
ies of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a person to remain 8 times longer in the sun without burning. However, in practice, users do not apply sufficient sunscreen product and the protection is lower than that found in experimental studies.

Some manufacturers use a star rating system to indicate
the protection against UVA relative to protection against
UVB for sunscreen products. However, the usefulness of
the star rating system remains controversial. The EU
Commission (September 2006) has recommended that
the UVA protection factor for a sunscreen should be at
least one-third of the sun protection factor (SPF); pro-
ducts that achieve this requirement will be labelled with a
UVA logo alongside the SPF classification. Prepara-
tions that also contain reflective substances, such as
titanium dioxide, provide the most effective protection
against UVA.
Sunscreen preparations may rarely cause allergic reac-
tions.

Borderline substances
The preparations marked ‘ACBS’ are regarded as drugs when prescribed for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic dis-
orders or photodermatoses, including vitiligo and those
resulting from radiotherapy; chronic or recurrent herpes
simplex labialis. Preparations with SPF less than 30
should not normally be prescribed. See also Appendix 7.

Delph (Fenton)
Lotion, (UVA and UVB protection; UVB-SPF 30), avoben-
zone 4%, octinoxate 4.8%, oxybenzone 1.5%, titanium
dioxide 2.5%, net price 200 mL = £3.53. ACBS
Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens), imidurea
E45 Sun (Crookes)
Reflective Sunscreen (UVA and UVB protection; UVB-SPF 50), water resistant, avobenzone 2%, oxybenzone 3%, padimate-O 8%,
titanium dioxide 2%, net price 150 mL = £7.09. ACBS
Excipients include hydroxybenzoates (parabens), isopropyl palmitate
Spectran (Stiefel)
Ultra lotion (UVA and UVB protection; UVB-SPF 28), water resistant, avobenzone 2%, oxybenzone 3%, padimate-O 8%,
titanium dioxide 2%, net price 150 mL = £6.54. ACBS
Excipients include benzyl alcohol, disodium edetate, sorbic acid, fragrance
Sunsense Ultra (Crawford)
Lotion (UVA and UVB protection; UVB-SPF 60), octinoxate
7.5% oxybenzone 3%, titanium dioxide 3.5%, net price 50-
Ml bottle with roll-on applicator = £3.11, 125 mL = £5.10.
ACBS
Excipients include butylated hydroxytoluene, cetyl alcohol, fragrance, hydroxybenzoates (parabens), propylene glycol
Uvistat (LPC)
Cream (UVA and UVB protection; UVB-SPF 30), avoben-
zone 5%, bisoctoctrizole 1.5%, octinoxate 7.5%, octocorraine 4%, titanium dioxide 5.2%, net price 125 mL = £7.45. ACBS
Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol
Cream (UVA and UVB protection; UVB-SPF 50), amiloxole 2%, avobenzone 5%, bisoctoctrizole 6%, octinoxate 10%,
ococtorraine 4%, titanium dioxide 4.8%, net price 125 mL = £8.45. ACBS
Excipients include disodium edetate, polyborate 60, propylene glycol
Lipscreen (UVA and UVB protection; UVB-SPF 50), avoben-
zone 5%, bemozatinol 3%, octinoxate 10%, octocorraine 4%, titanium dioxide 3%, net price 5 g = £2.99. ACBS
Excipients include butylated hydroxytoluene, hydroxybenzoates (parabens)
Photodamage

Patients should be advised to use a high-SPF sunscreen and to minimise exposure of the skin to direct sunlight or sun lamps.

Topical treatments are used for non-hypertrophic actinic keratosis. An emollient may be sufficient for mild lesions. Diclofenac gel is suitable for the treatment of superficial lesions in mild disease. Fluorouracil cream is effective against most types of non-hypertrophic actinic keratosis. Imiquimod (section 13.7) is used for lesions on the face and scalp when cryotherapy or other topical treatments cannot be used. Fluorouracil and imiquimod produce a more marked inflammatory reaction than diclofenac but lesions resolve faster. Photodynamic therapy in combination with methyl-5-aminolevulinate cream (Metvix®, available from Galderma) is used in specialist centres for treating superficial and confluent, non-hypertrophic actinic keratosis when other treatments are inadequate or unsuitable; it is particularly suitable for multiple lesions, for periorbital lesions, or for lesions located at sites of poor healing.

Imiquimod or topical fluorouracil is used for treating superficial basal cell carcinomas. Photodynamic therapy in combination with methyl-5-aminolevulinate cream is used in specialist centres for treating superficial, nodular basal cell carcinomas when other treatments are unsuitable.

**DICLOFENAC SODIUM**

**Indications** actinic keratosis

**Cautions** as for topical NSAIDs, see section 10.3.2

**Contra-indications** as for topical NSAIDs, see section 10.3.2

**Side-effects** as for topical NSAIDs, see section 10.3.2; also paraesthesia; application of large amounts may result in systemic effects, see section 10.1

**Dose**

- Apply thinly twice daily for 60–90 days; max. 8 g daily

Solaraze® (Almirall) **Gel**, diclofenac sodium 3% in a sodium hyaluronate basis, net price 50 g = £33.30

Excipients include benzyl alcohol

**FLUOROURACIL**

**Indications** superficial malignant and pre-malignant skin lesions; other malignant disease (section 8.1.3)

**Caution** avoid contact with mucous membranes; caution in handling—irritant to tissues

**Contra-indications** pregnancy (Appendix 4); breastfeeding

**Side-effects** local irritation (use a topical cortico-steroid for severe discomfort associated with inflammatory reactions), photosensitivity; rarely erythema multiforme

**Dose**

- Apply thinly to the affected area once or twice daily; if possible, cover malignant lesions with occlusive dressing; max. area of skin treated at one time, 500 cm²; usual duration of initial therapy, 3–4 weeks

**Note** Alternative regimens may be in use in some settings

Efudix® (Valeant) **Cream**, fluorouracil 5%, net price 20 g = £17.72, 40 g = £35.44

Excipients include hydroxybenzoates (parabens), polysorbate 60, propylene glycol, stearyl alcohol

**13.9 Shampoos and other preparations for scalp and hair conditions**

**Dandruff** is considered to be a mild form of seborrhoeic dermatitis (see also section 13.5.1). Shampoos containing antimicrobial agents such as pyrithione zinc (which are widely available) and selenium sulphide may have beneficial effects. Shampoos containing tar extracts may be useful and they are also used in psoriasis. Ketoconazole shampoo should be considered for more persistent or severe dandruff or for seborrhoeic dermatitis of the scalp.

**Corticosteroid** gels and lotions (section 13.4) can also be used.

Shampoos containing coal tar and salicylic acid may also be useful. A cream or an ointment containing coal tar and salicylic acid is very helpful in psoriasis that affects the scalp (section 13.5.2). Patients who do not respond to these treatments may need to be referred to exclude the possibility of other skin conditions.

**Cradle cap** in infants may be treated with coconut oil or olive oil applications followed by shampooing.
See below for male-pattern baldness and also section 13.5 (psoriasis and eczema), section 13.10.4 (lice), and section 13.10.2 (ringworm).

### Shampoos

1. **Ketoconazole** (Non-proprietary) *(NH)*
   - **Cream**—section 13.10.2
   - **Shampoo**, ketoconazole 2%, net price 120 mL = £2.26
     - **Excipients** include imidurea
     - **Brands** include **Dandraxol**
     - **2% Shampoo, Nizoral**
     - **Dose**—treatment of seborrhoeic dermatitis and dandruff apply twice weekly for 2–4 weeks (prophylaxis apply every 1–2 weeks); treatment of pityriasis versicolor apply once daily for max. 5 days (prophylaxis apply once daily for up to 3 days before sun exposure); leave preparation on at least 3–5 minutes before rinsing

2. **Can be sold to the public for the prevention and treatment of**
   - **Ketoconazole** section 13.10.2 (ringworm).
   - **Ketoconazole** section 13.5 (psoriasis and eczema), section 13.10.4 (lice), and
   - **See below for male-pattern baldness and also section 646**

### Other preparations for scalp and hair conditions

#### Shampoos and other preparations for scalp and hair conditions BNF 57

- **Section 13.9**

**Psoriderm** *(Dermal)*
- **Scalp lotion** *(= shampoo)*, coal tar 2.5%, lecinthin 0.3%, net price 250 mL = £4.96
  - **Excipients** include disodium edetate
  - **Dose**—scalp psoriasis, seborrhoeic dermatitis, and dandruff, use as necessary

**Selsun** *(Chattem UK)*
- **Shampoo**, selenium sulphide 2.5%, net price 50 mL = £1.44, 100 mL = £1.96, 150 mL = £2.75
  - **Excipients** include fragrance
  - **Cautions** avoid using 48 hours before or after applying hair colouring, straightening or waving preparations
  - **Dose**—seborrhoeic dermatitis and dandruff, apply twice weekly for 2 weeks then once weekly for 2 weeks and then as necessary; **CHILD** under 5 years not recommended, pityriasis versicolor, section 13.10.2 [unlicensed indication]

#### T/Gel (® & ™)
- **Shampoo**, coal tar extract 2%, net price 125 mL = £3.18, 250 mL = £4.78
  - **Excipients** include fragrance, hydroxybenzoates (parabens), imidurea, tetradecimid edetate
  - **Dose**—scalp psoriasis, seborrhoeic dermatitis, dandruff, apply as necessary

### Other scalp preparations

#### Cocos®
- **Section 13.5.2**

#### Etrivex®
- **Section 13.4**

#### Polytar® (® & ™)
- **Dermal**
  - **Liquid**, arachis (peanut) oil extract of coal tar 0.3%, cade oil 0.3%, coal tar solution 0.1%, oleyl alcohol 1%, tar 0.3%, net price 250 mL = £2.23
    - **Excipients** include fragrance, hydroxybenzoates (parabens), imidurea, polsorbate 80
    - **Dose**—scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff, apply 1–2 times weekly

#### Polytar Plus® (® & ™)
- **Liquid**, ingredients as **Polytar®** liquid with hydrolysed animal protein 3%, net price 500 mL = £3.91
  - **Excipients** include fragrance, hydroxybenzoates (parabens), polsorbate 80
  - **Dose**—scalp disorders including psoriasis, seborrhoea, eczema, pruritus, and dandruff, apply 1–2 times weekly

### Hirustim

Hirustim may result from hormonal disorders or as a side-effect of drugs such as minoxidil, corticosteroids, anabolic steroids, androgens, danazol, and progestogens.

Weight loss can reduce hirustim in obese women. Women should be advised about local methods of hair removal, and in the mildest cases this may be all that is required.

Eflornithine, an antiprotozoal drug, inhibits the enzyme ornithine decarboxylase in hair follicles. Topical eflornithine can be used as an adjunct to laser therapy for facial hirustim in women. Eflornithine should be discontinued in the absence of improvement after treatment for 4 months.

**Co-cyprindiol** *(section 13.6.2)* may be effective for moderately severe hirustim. **Metformin** *(section 6.1.2.2)* is an alternative in women with polycystic ovary syndrome [unlicensed indication]. Systemic treatment is required for 6–12 months before benefit is seen.
**EFLORNITHINE**

**Indications**
- see notes above

**Contra-indications**
- pregnancy (Appendix 4); breastfeeding (Appendix 5)

**Side-effects**
- acne, application site reactions including burning and stinging sensation, rash; less commonly abnormal hair texture and growth

**Dose**
- Apply thinly twice daily; CHILD under 12 years not recommended
  - Note Preparation must be rubbed in thoroughly; cosmetics may be applied over treated area 5 minutes after eflornithine; do not wash treated area for 4 hours after application

**Vaniqa® (Almirall) ▼ (OH)**
- Cream, eflornithine (as hydrochloride) 11.5%, net price 30 g = £26.04
- Excipients include cetostearyl alcohol, hydroxybenzoates, stearyl alcohol
  - Note The Scottish Medicines Consortium has advised (September 2005) that eflornithine for facial hirsutism be restricted for use in women in whom alternative drug treatment cannot be used

**Androgenetic alopecia**

Finasteride is licensed for the treatment of androgenetic alopecia in men. Continuous use for 3–6 months is required before benefit is seen, and effects are reversed 6–12 months after treatment is discontinued.

Topical application of minoxidil may stimulate limited hair growth in a small proportion of adults but only for as long as it is used.

**FINASTERIDE**

**Indications**
- androgenetic alopecia in men

**Cautions**
- see section 6.4.2

**Side-effects**
- see section 6.4.2

**Dose**
- By mouth 1 mg daily

**Propecia® (MSD) ▼ (MS)**
- Tablets, 1/c, beige, finasteride 1 mg, net price 28-tab pack = £26.99, 84-tab pack = £81.55

**MINOXIDIL**

**Indications**
- androgenetic alopecia (men and women)

**Cautions**
- section 2.5.1 (only about 1.4–1.7% absorbed); avoid contact with eyes, mouth and mucous membranes, broken, infected, shaved, or inflamed skin; avoid inhalation of spray mist; avoid occlusive dressings and topical drugs which enhance absorption

**Contra-indications**
- section 2.5.1

**Side-effects**
- section 2.5.1; irritant dermatitis, allergic contact dermatitis, changes in hair colour or texture, discontinue if increased hair loss persists for more than 2 weeks

**Dose**
- Apply 1 mL twice daily to dry hair and scalp (discontinue if no improvement after 1 year); 5% strength licensed for use in men only

**Regaine® (McNeil) ▼ (MS)**
- **Regaine® Regular Strength topical solution**, minoxidil 2% in an aqueous alcohol basis, net price 60-mL bottle with applicators = £14.16
- Excipients include propylene glycol
  - Cautions flammable; wash hands after application

**13.10 Anti-infective skin preparations**

**13.10.1 Antibacterial preparations only used topically**

**13.10.1.1 Antibacterial preparations only used topically**

**13.10.1.2 Antibacterial preparations also used systemically**

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment (see Table 1, section 5.1); it often involves staphylococcal infection. Lower leg infections or infections spreading around wounds are almost always cellulitis. Erysipelas, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial (see Table 1, section 5.1); it usually involves streptococcal infection.

In the community acute impetigo on small areas of the skin may be treated by short-term topical application of fusidic acid; mupirocin should be used only to treat methicillin-resistant *Staphylococcus aureus*. If the impetigo is extensive or longstanding, an oral antibacterial such as *fluoxacillin* (or *erythromycin* in penicillin-allergy) (Table 1, section 5.1) should be used. Mild antiseptics such as *povidone–iodine* (section 13.11.4) should be used to soften crusts and exudate.

Although many antibacterial drugs are available in topical preparations, some are potentially hazardous and frequently their use is not necessary if adequate hygiene measures can be taken. Moreover, not all skin conditions that are oozing, crusted, or characterised by pustules are actually infected. Topical antibacterials should be avoided on leg ulcers unless used in short courses for defined infections; treatment of bacterial colonisation is generally inappropriate.

To minimise the development of resistant organisms it is advisable to limit the choice of antibacterials applied topically to those not used systemically. Unfortunately some of these, for example neomycin, may cause sensitisation, and there is cross-sensitivity with other aminoglycoside antibiotics, such as gentamicin. If *large areas of skin* are being treated, ototoxicity may also be a hazard with aminoglycoside antibiotics (and also with polymyxins), particularly in children, in the elderly, and in those
with renal impairment. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

**Mupirocin** is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibiotics. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antisepptic such as povidone–iodine, chlorhexidine, or alcohol can be used; their use should be discussed with the local microbiologist.

**Retapamulin** can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA. The Scottish Medicines Consortium (p. 3) has advised (March 2008) that retapamulin (*Altargo*®) is not recommended for use within NHS Scotland for the treatment of superficial skin infections.

**Silver sulfadiazine** (silver sulphadiazine) is used in the treatment of infected burns.

---

**13.10.1 Antibacterial preparations only used topically**

**MUPIROCIN**

**Indications** bacterial skin infections (see also notes above)

**Side-effects** local reactions including urticaria, pruritus, burning sensation, rash

**Dose**

- **ADULT** and **CHILD** over 1 year, apply up to 3 times daily for up to 10 days; **CHILD** under 1 year see **BNF for Children**

**Bactroban®** (GSK)

---

**NEOMYCIN SULPHATE**

**Indications** bacterial skin infections

**Cautions** large areas, see below

**Large areas** If large areas of skin are being treated ototoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment

**Contra-indications** neonates

**Side-effects** sensitisation (see also notes above)

**Neomycin Cream BPC**

Cream, neomycin sulphate 0.5%, cetomacrogol emulsifying ointment 30%, chlorocresol 0.1%, disodium edetate 0.01%, in freshly boiled and cooled purified water, net price 15 g = £2.17

**Excipients** include cetostearyl alcohol, edetic acid (EDTA)

**Dose** apply up to 3 times daily (short-term use)

---

**POLYMIXINS**

**Indications** bacterial skin infections

**Cautions** large areas, see below

**Large areas** If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children, in the elderly, and in those with renal impairment

**Side-effects** sensitisation (see also notes above)

**Polyfax**® (**PLIVA**) Ointment, polymyxin B sulphate 10 000 units, bacitracin zinc 500 units/g, net price 4 g = £3.26, 20 g = £4.62

**Excipients** none as listed in section 13.1.3

**Dose** apply twice daily or more frequently if required

---

**RETPAMULIN**

**Indications** superficial bacterial skin infections (see also notes above)

**Contra-indications** contact with eyes and mucous membranes

**Side-effects** local reactions including irritation, erythema, pain, and pruritus

**Dose**

- **ADULT** and **CHILD** over 9 months, apply thinly twice daily for 5 days; review treatment if no response within 2–3 days

**Altargo**® (GSK) Ointment, retapamulin 1%, net price 5 g = £7.89.

Label: 28

**Excipients** include butylated hydroxytoluene

---

**SILVER SULFADIAZINE**

(Silver sulphadiazine)

**Indications** prophylaxis and treatment of infection in burn wounds; as an adjunct to short-term treatment of infection in leg ulcers and pressure sores; as an adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions; for conservative management of finger-tip injuries

**Cautions** hepatic impairment; renal impairment; G6PD deficiency; pregnancy and breast-feeding (avoid in late pregnancy and in neonate—see also Appendix 4); may inactivate enzymatic debriding agents—concomitant use may be inappropriate; for large amounts see also **interactions**—Appendix 1 (sulphonamides)

**Large areas** Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and **interactions** as for sulphonamides (see section 5.1.8) if large areas of skin are treated. Owing to the association of sulphonamides with severe blood and skin disorders treatment should be stopped immediately if blood disorders or rashes develop—but leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days. Argyria may also occur if large areas of skin are treated (or if application is prolonged).

**Contra-indications** pregnancy (Appendix 4) and breast-feeding (Appendix 5); sensitivity to sulphonamides; not recommended for neonates (see also Appendix 4)
13.10.2 Antifungal preparations

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy (section 5.2) is necessary for nail or scalp infection or if the skin infection is widespread, disseminated, or intractable. Skin scrapings should be examined if systemic therapy is being considered or where there is doubt about the diagnosis.

**Dermatophyotoses** Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete’s foot), or nail (tinea unguium). Scalp infection requires systemic treatment (section 5.2); additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of ringworm. Most other local ringworm infections can be treated adequately with topical antifungal preparations including chloretamizole, econazole,
Skin

If topical therapy fails, or if the infection is widespread, contra-indications to systemic therapy. Limited to mild distal disease in up to 2 nails, or for treating early onychomycosis when involvement is more effective than topical therapy. However, topical antifungals are on sale to the public. This may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal (section 5.2) is more effective than topical therapy. However, topical application of amorolfine or tioconazole may be useful for treating early onychomycosis when involvement is limited to mild distal disease in up to 2 nails, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy.

**Pityriasis versicolor**

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo (section 13.9). Alternatively, selenium sulphide shampoo [unlicensed indication] (section 13.9) can be used as a lotion (diluted with water to reduce irritation) and left on for at least 30 minutes or overnight; it is applied 2–7 times over a fortnight and the course repeated if necessary.

Topical imidazole antifungals clotrimazole, econazole, ketocanazole, and miconazole and topical terbinafine are alternatives but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with a triazole antifungal (section 5.2). Relapse is common, especially in the immunocompromised.

**Candidiasis**

Candidal skin infections can be treated with a topical imidazole antifungal, such as clotrimazole, econazole, ketoconazole, miconazole, or sulconazole; topical terbinafine is an alternative. Topical application of nystatin is also effective for candidiasis but it is ineffective against dermatophytons. Refractory candidiasis requires systemic treatment (section 5.2) generally with a triazole such as fluconazole; systemic treatment with terbinafine is not appropriate for refractory candidiasis.

**Angular cheilitis**

Miconazole cream is used in the fissures of angular cheilitis when associated with Candida. For further information on angular cheilitis, see p. 610.

**Compound topical preparations**

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1%) (section 13.4) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of intertrigo associated with candida.

**Side-effects**

Occasional local irritation and hypersensitivity reactions include mild burning sensation, erythema, and itching. Treatment should be discontinued if these are severe.

**AMOROLFINE**

**Indications** see under preparations

**Cautions** see notes above; also avoid contact with ears; pregnancy and breast-feeding

**Side-effects** see notes above

**Loceryl** (Guilderma) (BNF)

Cream, amorolfine (as hydrochloride) 0.25%, net price 20 g = £4.83. Label: 10, patient information leaflet

Exipients include cetostearyl alcohol, disodium edetate

Dose fungal skin infections, apply once daily after cleansing in the evening for at least 2–3 weeks (up to 6 weeks for foot infection) continuing for 3–5 days after lesions have healed

Nail lacquer, amorolfine (as hydrochloride) 5%, net price 5-mL pack (with nail files, spatulas and cleansing swabs) = £18.71. Label: 10, patient information leaflet

Exipients none as listed in section 13.1.3

Dose fungal nail infections, apply to infected nails 1–2 times weekly after filing and cleansing; allow to dry (approx. 3 minutes); treat finger nails for 6 months, toe nails for 9–12 months (review at intervals of 3 months); avoid nail varnish or artificial nails during treatment

**Note** Amorolfine nail lacquer can be sold to the public if supplied for the treatment of mild cases of distal and lateral subungual onychomycoses caused by dermatophytons, yeasts and moulds; subject to treatment of max. 2 nails, max. strength of nail lacquer amorolfine 5% and a pack size of 3 mL

**BENZOIC ACID**

**Indications** ringworm (tinea), but see notes above

**BENZOIC ACID OINTMENT, COMPOUND, BP** (Whitfield’s ointment)

Ointment, benzoic acid 6%, salicylic acid 3%, in emulsifying ointment

Exipients include cetostearyl alcohol

Dose apply twice daily

**CLOTRIMAZOLE**

**Indications** fungal skin infections; vaginal candidiasis (section 7.2.2); otitis externa (section 12.1.1)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- Apply 2–3 times daily

**Clotrimazole** (Non-proprietary)

Cream, clotrimazole 1%, net price 20 g = £1.92

**Canesten** (Bayer Consumer Care)

Cream, clotrimazole 1%, net price 20 g = £2.14, 50 g = £3.80

Exipients include benzyl alcohol, cetearyl alcohol, polysorbate 60

Powder, clotrimazole 1%, net price 30 g = £1.52

Exipients none as listed in section 13.1.3

Solution, clotrimazole 1% in macrogol 400 (polyethylene glycol 400), net price 20 mL = £2.43. For hairy areas

Exipients none as listed in section 13.1.3

Spray, clotrimazole 1%, in 30% isopropyl alcohol, net price 40-mL atomiser = £4.99. Label: 15. For large or hairy areas

Exipients include propylene glycol
ECONAZOLE NITRATE

**Indications**  fungal skin infections; vaginal candidiasis (section 7.2.2)

**Cautions**  see notes above

**Side-effects**  see notes above

**Dose**
- Skin infections: apply twice daily; nail infections, apply once daily under occlusive dressing

**Ecocystatin**  (Squibb)

**Cream**, econazole nitrate 1%, net price 15 g = £1.49; 30 g = £2.75

**Exipients**  include butylated hydroxyanisole, fragrance

**Pevaryl**  (Janssen-Cilag)

**Cream**, econazole nitrate 1%, net price 30 g = £2.65

**Exipients**  include butylated hydroxyanisole, fragrance

GRISEOFULVIN

**Indications**  tinea pedis; resistant fungal infections (section 5.2)

**Cautions**  see notes above

**Side-effects**  see notes above

**Dose**
- Apply 400 micrograms (1 spray) to an area approx. 13 cm once daily, increased to 1.2 mg (3 sprays, allowing each spray to dry between applications) once daily if necessary; max. treatment duration 4 weeks

**Grisol AF**  (Transdermal)

**Spray**, griseofulvin 400 micrograms/metered spray, net price 20 mL (400-dose) spray = £4.00. Label: 15

**Exipients**  include benzyl alcohol

KETOCONAZOLE

**Indications**  fungal skin infections; systemic or resistant fungal infections (section 5.2); vulval candidiasis (section 7.2.2)

**Cautions**  see notes above; do not use within 2 weeks of a topical corticosteroid for seborrhoeic dermatitis—risk of skin sensitisation

**Side-effects**  see notes above

**Dose**
- Tinea pedis, apply twice daily; other fungal infections, apply 1–2 times daily

**Nizoral**  (Janssen-Cilag)

**Cream**, ketoconazole 2%, net price 30 g = £3.54

**Exipients**  include cetyl alcohol, polysorbates, propylene glycol, stearyl alcohol

**Note**  A 15-g tube is available for sale to the public

**Shampoo**—section 13.9

1. **SLS** except for seborrhoeic dermatitis and pityriasis versicolor and endorsed ‘SLS’

MICONAZOLE NITRATE

**Indications**  fungal skin infections; oral and intestinal fungal infections (section 12.3.2); vaginal candidiasis (section 7.2.2)

**Cautions**  see notes above

**Side-effects**  see notes above

**Dose**
- Apply twice daily continuing for 10 days after lesions have healed; nail infections, apply 1–2 times daily

Miconazole  (Non-proprietary)

**Cream**, miconazole nitrate 2%, net price 20 g = £2.05, 45 g = £1.97

**Dental prescribing on NHS**  Miconazole cream may be prescribed

Daktarin  (Janssen-Cilag)

**Cream**, miconazole nitrate 2%, net price 30 g = £1.93

**Exipients**  include butylated hydroxyanisole

**Note**  A 15-g tube is on sale to the public

**Powder**, miconazole nitrate 2%, net price 20 g = £1.81

**Exipients**  none as listed in section 13.13

**Dual Action Spray powder**, miconazole nitrate 0.16%, in an aerosol basis, net price 100 g = £2.27

**Exipients**  none as listed in section 13.13

NYSTATIN

**Indications**  skin infections due to *Candida* spp.; intestinal candidiasis (section 5.2); oral fungal infections (section 12.3.2)

**Cautions**  see notes above

**Side-effects**  see notes above

**Nystaform**  (Typharm)

**Cream**, nystatin 100 000 units/g, chlorhexidine hydrochloride 1%, net price 30 g = £2.62

**Exipients**  include benzyl alcohol, cetostearyl alcohol, polysorbate 60

**Dose**  apply 2–3 times daily continuing for 7 days after lesions have healed.

**Tinaderm-M**  (Schering-Plough)

**Cream**, nystatin 100 000 units/g, tolnaftate 1%, net price 20 g = £1.83

**Exipients**  include butylated hydroxytoluene, cetostearyl alcohol, hydroxybenzoates (parabens), fragrance

**Dose**  apply 2–3 times daily

SALICYLIC ACID

**Indications**  fungal nail infections, particularly tinea; hyperkeratotic skin disorders (section 13.5.2); acne vulgaris (section 13.6.1); warts and calluses (section 13.7)

**Cautions**  avoid broken or inflamed skin

**Salicylate toxicity**  Salicylate toxicity can occur particularly if applied on large areas of skin

**Contra-indications**  pregnancy

**Side-effects**  see notes above

**Dose**
- **ADULT** and **CHILD** over 5 years, apply twice daily and after washing

**Phytex**  (Wynlit)

**Paint**, salicylic acid 1.46% (total combined), tannic acid 4.89% and boric acid 3.12% (as borotannic complex), in a vehicle containing alcohol and ethyl acetate, net price 25 mL (with brush) = £1.56

**Exipients**  none as listed in section 13.13

**Note**  Flammable

SULCONAZOLE NITRATE

**Indications**  fungal skin infections

**Cautions**  see notes above

**Side-effects**  see notes above; also blistering

**Dose**
- Apply 1–2 times daily continuing for 2–3 weeks after lesions have healed
13 Skin

TERBINAFINE

**Indications** fungal skin infections

**Side-effects** see notes above

**Dose**

- Apply thinly 1–2 times daily usually for up to 1 week in tinea pedis, 1–2 weeks in tinea corporis and tinea cruris, 2 weeks in cutaneous candidiasis and pityriasis versicolor; review after 2 weeks; CHILD see BNF for Children

1 Terbinafine (Non-proprietary) THM.

**Cream**, terbinafine hydrochloride 1%, net price 15 g = £4.86, 30 g = £8.76

1. Preparations of terbinafine hydrochloride (max. 1%) can be prescribed to the public for external use for the treatment of tinea pedis as a cutaneous solution in a pack containing max. 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing max. 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing max. 30 mL spray or as a gel in a pack containing max. 20 g gel

Lamisil® (Novartis Consumer Health) THM.

**Cream**, terbinafine hydrochloride 1%, net price 15 g = £4.86, 30 g = £8.76

**Excipients** include benzyl alcohol, cetyl alcohol, polysorbate 60, stearyl alcohol

**Tablets**—section 5.2

TOCONAZOLE

**Indications** fungal nail infections

**Contra-indications** pregnancy

**Side-effects** see notes above

**Dose**

- Apply to nails and surrounding skin twice daily usually for up to 6 months (may be extended to 12 months)

Trosyl® (Pfizer) THM.

**Cutaneous solution**, tioconazole 28%, net price 12 mL (with applicator brush) = £27.38

**Excipients** none as listed in section 13.1.3

UNDECENOATES

**Indications** see under preparations below

**Side-effects** see notes above

**Dose**

- See under preparations below

Mycotha® (Thornton & Ross)

**Cream**, zinc undecenoate 20%, undecenoic acid 5%, net price 25 g = £1.37

**Excipients** include fragrance

**Dose** treatment of athlete’s foot, apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete’s foot, apply once daily

Prevention of athlete’s foot, apply once daily

**Spray application**, undecenoic acid 3.9%, dichlorophen 0.4% (pressurised aerosol pack), net price 100 mL = £2.28

**Excipients** include fragrance

**Dose** treatment of athlete’s foot, apply twice daily continuing for 7 days after lesions have healed

Prevention of athlete’s foot, apply once daily

13.10.3 Antiviral preparations

Aciclovir cream is licensed for the treatment of initial and recurrent labial and genital herpes simplex infections; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections and for herpes zoster (shingles) (for details of systemic use see section 5.3.2.1).

Idoxuridine solution (5% in dimethyl sulfoxide) is of little value.

**Herpes labialis** Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream. These creams should not be used in the mouth.

Systemic treatment is necessary if cold sores recur frequently or for infections in the mouth (see p. 343).

ACICLOVIR (Acyclovir)

**Indications** see notes above; herpes simplex and varicella–zoster infections (section 5.3.2.1); eye infections (section 11.3.3)

**Contra-indications** avoid contact with eyes and mucous membranes

**Side-effects** transient stinging or burning; occasionally erythema, itching or drying of the skin

**Dose**

- Apply to lesions every 4 hours (5 times daily) for 5–10 days, starting at first sign of attack

1 Aciclovir (Non-proprietary) THM.

**Cream**, aciclovir 5%, net price 2 g = £1.10, 10 g = £2.16

**Excipients** include propylene glycol

**Brands include** Zarcon (excipients also include cetyl alcohol, propylene glycol)

**Dental prescribing on NHS** Aciclovir Cream may be prescribed

1. A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores

Zovirax® (GSK) THM.

**Cream**, aciclovir 5%, net price 2 g = £3.98, 10 g = £14.82

**Excipients** include cetostearyl alcohol, propylene glycol

**Eye ointment**—section 11.3.3

**Tablets**—section 5.3.2.1
**13.10.4 Parasiticidal preparations**

### Indications

- **PENCICLOVIR**
  - Notes above
- **Cautions**
  - Avoid contact with the eyes and mucous membranes.
- **Side-effects**
  - Transient stinging, burning, numbness; hypersensitivity reactions also reported.
- **Vectavir®** (Novartis Consumer Health) (TMR)
  - **Cream**
    - Penciclovir 1%
    - Net price 2 g = £4.20
  - **Excipients**
    - Include cetostearyl alcohol, propylene glycol.
  - **Dose**
    - Herpes labialis, apply to lesions every 2 hours during waking hours for 4 days, starting at first sign of attack; **CHILD** under 12 years, not recommended.
  - **Dental prescribing** on NHS May be prescribed as Penciclovir Cream.

### Indications

- **IDOXURIDINE IN DIMETHYL SULFOXIDE**
  - **Indications**
    - Herpes simplex and herpes zoster infection but of little value.
  - **Cautions**
    - Avoid contact with the eyes, mucous membranes, and textiles; breast-feeding (Appendix 5); interactions: Appendix 1 (dimethyl sulfoxide).
  - **Contra-indications**
    - Pregnancy (Appendix 4); not to be used in mouth.
  - **Side-effects**
    - Stinging on application, changes in taste; overuse may cause maceration.
  - **Herpid®** (Astellas) (TMR)
    - **Application**
      - Idoxuridine 5% in dimethyl sulfoxide, net price 5 mL (with applicator) = £6.33
    - **Dose**
      - Apply to lesions 4 times daily for 4 days, starting at first sign of attack; **CHILD** under 12 years, not recommended.

### Scabies

- **Permethrin** is used for the treatment of scabies (*Sarcoptes scabiei*); *malathion* can be used if permethrin is inappropriate.
- Aqueous preparations are preferable to alcoholic lotions, which are not recommended owing to irritation of excoriated skin and the genitalia.
- **Benzybenzoate** is an irritant and should be avoided in children; it is less effective than malathion and permethrin.
- **Ivermectin** (available on a named patient basis from ‘special-order’ manufacturers or specialist importing companies, see p. 939) in a single dose of 200 micrograms/kg by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone.

### Application

- Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.
- All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzybenzoate up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed.
- Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

### Itching

- **The itch** and **eczema** of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema (section 13.5.1) may be required. Application of crotamiton can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a sedating antihistamine (section 3.4.1) at night may also be useful.

### Head lice

- **Malathion** and the pyrethroid (phenothrin) can be used against head lice (*Pediculus humanus capitis*) but lice in some districts have developed resistance; resistance to two or more parasiticidal preparations has also been reported. Careful application of **dimeticone**, which acts on the surface of head lice, is also effective. Benzyl benzoate is licensed for the treatment of head lice but it is less effective than other drugs.
- **Application**
  - Head lice infestation (pediculosis) should be treated using lotion or liquid formulations. Shampoos are diluted too much in use to be effective. Alcoholic formulations are effective but aqueous formulations are preferred in severe eczema, for patients with asthma, and small children. A contact time of 12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.
  - In general, a course of treatment for head lice should be 2 applications of product 7 days apart to prevent lice emerging from any eggs that survive the first application.
  - The policy of rotating insecticides on a district-wide basis is now considered outmoded. To overcome the development of resistance, a mosaic strategy is required whereby, if a course of treatment fails to cure, a different insecticide is used for the next course. If a course of treatment with either permethrin or phenothrin fails, then a non-pyrethroid parasiticidal product should be used for the next course.
**Wet combing methods**  Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks; hair conditioner or vegetable oil can be used to facilitate the process. Several products are available and some are prescribable on the NHS.

---

**Crab lice**

Permethrin, phenothrin, and malathion are used to eliminate crab lice (*Pthirus pubis*). An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails. Alcoholic lotions are not recommended (owing to irritation of excoriated skin and the genitalia).

---

**Benzyl benzoate**

Benzyl benzoate is effective for scabies but is not a first-choice for scabies (see notes above).

---

**DIMETICONE**

**Indications** head lice

**Cautions** avoid contact with eyes; children under 6 months, medical supervision required

**Side-effects** skin irritation

**Dose**

- Rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight); repeat application after 7 days

**Hedrin** (Thornton & Ross)

Lotion, dimeticone 4%, net price 50 mL = £2.98, 120 mL spray pack = £7.14, 150 mL = £6.83

**Note** Patients should be told to keep hair away from fire and flames during treatment

---

**MALATHION**

**Indications** see notes above and under preparations

**Cautions** avoid contact with eyes; do not use on broken or secondarily infected skin; do not use lotion more than once a week for 3 consecutive weeks; children under 6 months, medical supervision required; alcoholic lotions not recommended for head lice in severe eczema or in small children, or for scabies or crab lice

**Side-effects** skin irritation

**Dose**

- Head lice, rub 0.5% preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours (see also notes above); repeat application after 7 days
- Crab lice, apply 0.5% aqueous preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight; repeat application after 7 days
- Scabies, apply 0.5% preparation over whole body, and wash off after 24 hours; if hands are washed with soap within 24 hours, they should be retreated; see also notes above; repeat application after 7 days

**Note** For scabies, manufacturer recommends application to the body but not necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears

**Derbac-M** (SSL)

Liquid, malathion 0.5% in an aqueous basis, net price 50 mL = £2.27, 200 mL = £5.70

**Excipients** include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens)

For crab lice, head lice, and scabies

**Prioderm** (SSL)

Lotion, malathion 0.5%, in an alcoholic basis, net price 50 mL = £2.22, 200 mL = £5.70. Label: 15

**Excipients** include fragrance

For head lice (alcoholic formulation, see notes above)

Cream shampoo prioderm malathion 1%, net price 40 g = £2.77

**Excipients** include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens), sodium edetate, wool fat

**Dose** head and crab lice, not recommended, therefore no dose stated (product too diluted in use and insufficient contact time)

**Phenothrin**

Indications

- see notes above and under preparations

Cautions

- avoid contact with eyes; do not use on broken or secondarily infected skin; do not use more than once a week for 3 weeks at a time; children under 6 months, medical supervision required; alcoholic preparations not recommended for head lice in severe eczema, in asthma, in small children, or for crab lice (see notes above)

Side-effects

- skin irritation

Dose

- See under preparations

Full Marks® (SSL)

- Liquid, phenothrin 0.5% in an aqueous basis, net price 50 mL = £2.22, 200 mL = £5.70
- Excipients include cetostearyl alcohol, fragrance, hydroxybenzoates (parabens)
- Dose head lice, apply to dry hair; allow to dry naturally; shampoo after 12 hours or next day, comb wet hair; repeat application after 7 days [unlicensed use]

- Lotion, phenothrin 0.2% in basis containing isopropyl alcohol 69.3%, net price 50 mL = £2.22, 200 mL = £5.70. Label: 15
- Excipients include fragrance
- Dose crab lice and head lice (alcoholic formulation, see notes above), apply to dry hair, allow to dry naturally; shampoo after 12 hours [unlicensed contact duration], comb wet hair; repeat application after 7 days [unlicensed use]

- Mousse (= foam application) phenothrin 0.5% in an alcoholic basis, net price 50 g = £2.53, 150 g = £6.11. Label: 15
- Excipients include cetostearyl alcohol
- Dose head lice (alcoholic formulation, see notes above), apply to dry hair, shampoo after 30 minutes, comb wet hair—but product not recommended because contact time insufficient (longer contact time not recommended because of risk of irritation)

---

**Permethrin**

Permethrin is effective for scabies and crab lice (for details see notes above). Permethrin is active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice.

**PERMETHRIN**

**Indications**

- see notes above and under Dose

**Cautions**

- avoid contact with eyes; do not use on broken or secondarily infected skin; children under 6 months, medical supervision required for cream rinse (head lice); children aged 2 months–2 years, medical supervision required for dermal cream (scabies)

**Side-effects**

- pruritus, erythema, and stinging; rarely rashes and oedema

**Dose**

- Scabies, apply 5% preparation over whole body and wash off after 8–12 hours; CHILD (see also Cautions, above) apply over whole body including face, neck, scalp and ears; if hands washed with soap within 8 hours of application, they should be treated again with cream (see notes above); repeat application after 7 days

**Note**

- Manufacturer recommends application to the body but to exclude head and neck. However, application should be extended to the scalp, neck, face, and ears
- Larger patients may require up to two 30-g packs for adequate treatment
- Crab lice, ADULT over 18 years, apply 5% cream over whole body, allow to dry naturally and wash off after 12 hours or after leaving on overnight; repeat application after 7 days

**Permethrin** (Non-proprietary)

- Cream, permethrin 5%, net price 30 g = £5.55

**Lyclear® Creme Rinse** (Chefaro UK)

- Cream rinse, permethrin 1% in basis containing isopropyl alcohol 20%, net price 59 mL = £2.38, 2 x 59 mL pack = £4.32
- Excipients include cetyl alcohol
- Dose head lice, not recommended, therefore no dose stated (insufficient contact time)

**Lyclear® Dermal Cream** (Chefaro UK)

- Dermal cream, permethrin 5%, net price 30 g = £5.71
- Label: 10, patient information leaflet
- Excipients include butylated hydroxytoluene, wool fat derivative

**Phenothrin**

Phenothrin is recommended for head lice and crab lice (for details see notes above).
Preparations for boils

Magnesium Sulphate Paste, BP

Paste, dried magnesium sulphate 45 g, glycerol 55 g, phenol 500 mg, net price 25 g = 69p, 50 g = 81p

Note Should be stirred before use

Dose apply under dressing

Collodion

Flexible collodion may be used to seal minor cuts and wounds that have partially healed.

Collodion, Flexible, BP

Collodion, castor oil 2.5%, colophony 2.5% in a collodion basis, prepared by dissolving pyroxylin (10%) in a mixture of 3 volumes of ether and 1 volume of alcohol (90%), net price 10 mL = 25p. Label: 15

Contra indications allergy to colophony in elastic adhesive

Skin tissue adhesive

Tissue adhesives are used for closure of minor skin wounds and for additional suture support. They should be applied by an appropriately trained healthcare professional. Skin tissue adhesives may cause skin sensitisation.

Dermabond ProPen (Ethicon)

Topical Skin Adhesive, sterile, octyl 2-cyanoacrylate, net price 0.5 mL = £18.38

Epiglu (Schuco)

Tissue adhesive, sterile, ethyl-2-cyanoacrylate 954.5 mg/g, polymethylmethacrylate, net price 4 × 3-g vials = £49.50 (with dispensing pipettes and pallete)

Histacryl (Braun)

Tissue adhesive, sterile, enbucrilate, net price 500-mg unit (clear or blue) = £34.65, 10 × 500-mg unit (blue) = £69.30

LiquiBand (MedLogic)

Tissue adhesive, sterile, enbucrilate, net price 0.5-g amp = £5.50

13.11 Skin cleansers and antiseptics

13.11.1 Alcohols and saline

ALCOHOL

Indications skin preparation before injection

Cautions flammable; avoid broken skin; patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

Industrial Methylated Spirit, BP

Solution, 19 volumes of ethanol and 1 volume approved wood naphtha, net price ‘65 OP’ (containing 95% by volume alcohol) 100 mL = 39p; ‘74 OP’ (containing 99% by volume alcohol) 100 mL = 39p. Label: 15

Surgical Spirit, BP

Spirit, methyl salicylate 0.5 mL, diethyl phthalate 2%, castor oil 2.5%, in industrial methylated spirit, net price 100 mL = 20p. Label: 15

SODIUM CHLORIDE

Indications see notes above; nebuliser diluent (section 3.1.5); sodium depletion (section 9.2.1.2); electrolyte imbalance (section 9.2.2.1); eye (section 11.8.1); oral hygiene (section 12.3.4)

Sodium Chloride (Non-proprietary)

Solution (sterile), sodium chloride 0.9%, net price 25 × 20-ml unit = £5.50, 200-ml can = £2.65, 1 litre = 97p

Flowfusor® (Fresenius Kabi)

Solution (sterile), sodium chloride 0.9%, net price 120-ml Bellows Pack = £1.53

Irriclens® (Convatec)

Solution in aerosol can (sterile), sodium chloride 0.9%, net price 240-ml can = £3.24

Irripod® (C D Medical)

Solution (sterile), sodium chloride 0.9%, net price 25 × 20-ml sachet = £5.50

Miniversol® (Aguettant)

Solution (sterile), sodium chloride 0.9%, net price 30 × 45-ml unit = £13.20; 30 × 100-ml unit = £19.50

Normasol® (Medlock)

Solution (sterile), sodium chloride 0.9%, net price 25 × 25-ml sachet = £5.98; 10 × 100-ml sachet = £7.27

Soap or detergent is used with water to cleanse intact skin; emollient preparations such as aqueous cream or emulsifying ointment (section 13.2.1) that do not irritate the skin are best used in place of soap or detergent for cleansing dry skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine, triclosan, or povidone–iodine, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics (section 13.2.1).

Antiseptics such as chlorhexidine or povidone–iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution is used, but tap water is often appropriate.

Potassium permanganate solution 1 in 10,000, a mild antiseptic with astringent properties, can be used for exudative eczematous areas; treatment should be stopped when the skin becomes dry. It can stain skin and nails especially with prolonged use.
Stericlen® (C D Medical)  
**Solution** in aerosol can (sterile), sodium chloride 0.9%, net price 100-mL can = £1.94, 240-mL can = £2.95  

Steripod® Sodium Chloride (Medlock)  
**Solution** (sterile), sodium chloride 0.9%, net price 25 x 20-mL sachet = £7.36

### 13.11.2 Chlorhexidine salts

#### CHLORHEXIDINE

**Indications** see under preparations; bladder irrigation and catheter patency solutions (see section 7.4.4)  
**Cautions** avoid contact with eyes, brain, meninges and middle ear; not for use in body cavities; alcoholic solutions not suitable before diathermy  
**Side-effects** occasional sensitivity

Chlorhexidine 0.05% (Baxter)  
**2000 Solution** (sterile), pink, chlorhexidine acetate 0.05%, net price 500 mL = 72p, 1000 mL = 77p  
For cleansing and disinfecting wounds and burns

Cepton® (LPC)  
**Skin wash** (= solution), red, chlorhexidine gluconate 1%, net price 150 mL = £2.48  
For use as skin wash in acne  
**Lotion**, blue, chlorhexidine gluconate 0.1%, net price 150 mL = £2.48  
For skin disinfection in acne

Chloraprep® (Enturia)  
**Cutaneous solution**, sterile, chlorhexidine gluconate 2% in isopropyl alcohol 70%, net price (single applicator) 0.67 mL = 30p, 1.5 mL = 55p, 3 mL = 85p, 10.5 mL = £2.92, 26 mL = £6.50  
For skin disinfection before invasive procedures; **CHILD** under 2 months, not recommended  
**Note** Flammable

CX Antiseptic Dusting Powder® (Ecolab)  
**Dusting powder**, sterile, chlorhexidine acetate 1%, net price 15 g = £2.68  
For skin disinfection

Hibiscrub® (Regent Medical)  
**Cleansing solution**, red, chlorhexidine gluconate 4%, perfumed, in a surfactant solution, net price 250 mL = £4.25, 500 mL = £5.25, 5 litres = £16.20  
**Excipients** include fragrance  
Use instead of soap for pre-operative hand and skin preparation and for general hand and skin disinfection

Hibisol® (Regent Medical)  
**Solution**, chlorhexidine gluconate 0.5%, in isopropyl alcohol 70% with emollients, net price 500 mL = £5.25  
To be used undiluted for hand and skin disinfection

Hibitane Obstetric® (Centrapharm)  
**Cream**, chlorhexidine gluconate solution 5% (= 1% chlorhexidine gluconate), in a pourable water-miscible basis, net price 250 mL = £4.44  
For use in obstetrics and gynaecology as an antiseptic and lubricant (for application to skin around vulva and perineum and to hands of midwife or doctor)

Hydrex® (Ecolab)  
**Solution**, chlorhexidine gluconate solution 2.5% (= chlorhexidine gluconate 0.5%), in an alcoholic solution, net price 600 mL (clear) = £2.06; 600 mL (pink) = £2.06, 200-mL spray = £1.77, 500-mL spray = £3.01; 600 mL (blue) = £2.26  
For pre-operative skin disinfection  
**Note** Flammable

**Surgical scrub**, chlorhexidine gluconate 4% in a surfactant solution, net price 250 mL = £1.93, 500 mL = £2.05  
For pre-operative hand and skin preparation and for general hand disinfection

Unisept® (Medlock)  
**Solution** (sterile), pink, chlorhexidine gluconate 0.05%, net price 25 x 25-mL sachet = £5.40; 10 x 100-mL sachet = £6.67  
For cleansing and disinfecting wounds and burns and swabbing in obstetrics  

- **With cetrimide**

  Tisept® (Medlock)  
  **Solution** (sterile), yellow, chlorhexidine gluconate 0.015%, cetrimide 0.15%, net price 25 x 25-mL sachet = £5.20; 10 x 100-mL sachet = £6.68  
  To be used undiluted for general skin disinfection and wound cleansing

  **Travasept 100**® (Baxter)  
  **Solution** (sterile), yellow, chlorhexidine acetate 0.015%, cetrimide 0.15%, net price 500 mL = 72p, 1 litre = 77p  
  To be used undiluted in skin disinfection such as wound cleansing and obstetrics

- **Concentrates**

  Hibitane 5% Concentrate® (Regent Medical)  
  **Solution**, red, chlorhexidine gluconate 5%, in a perfumed aqueous solution, net price 5 litres = £14.50  
  **Dose** to be used diluted 1 in 10 (0.5%) with alcohol 70% for pre-operative skin preparation, or 1 in 100 (0.05%) with water for general skin disinfection  
  **Note** Alcoholic solutions not suitable before diathermy (see Alcohol, p. 656)

### 13.11.3 Cationic surfactants and soaps

#### CETRIMIDE

**Indications** skin disinfection  
**Cautions** avoid contact with eyes; avoid use in body cavities  
**Side-effects** skin irritation and occasionally sensitization

**Preparations** Ingredient of Tisept® and Travasept® 100, see above

### 13.11.4 Iodine

#### Povidone–Iodine

**Indications** skin disinfection  
**Cautions** pregnancy (Appendix 4), breast-feeding (Appendix 5); broken skin (see below); renal impairment (Appendix 3)  
**Large open wounds** the application of povidone–iodine to large wounds or severe burns may produce systemic adverse
effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

**Contra-indications** preterm neonate gestational age under 32 weeks; avoid regular use in patients with thyroid disorders or those receiving lithium therapy

**Side-effects** rarely sensitivity; may interfere with thyroid function tests

**Betadine** (Mölnlycke)

Dry powder spray, povidone–iodine 2.5% in a pressurised aerosol unit, net price 150-g unit = £2.63
For skin disinfection, particularly minor wounds and infections; CHILD under 2 years not recommended
Note Not for use in serous cavities

Ointment, povidone–iodine 10%, in a water-miscible basis, net price 20 g = £1.33, 80 g = £2.66
Excipients none as listed in section 13.1.3
For skin disinfection, particularly minor wounds and infections; CHILD under 2 years not recommended

**Savlon** Dry (Novartis Consumer Health)

Powder spray, povidone–iodine 1.14% in a pressurised aerosol unit, net price 50-mL unit = £2.39
For minor wounds

**Videne** (Ecolab)

Alcoholic tincture, povidone–iodine 10%, net price 500 mL = £2.50
To be applied undiluted in pre-operative skin disinfection

Antiseptic solution, povidone–iodine 10% in aqueous solution, net price 500 mL = £2.50
To be applied undiluted in pre-operative skin disinfection and general antisepsis

Surgical scrub, povidone–iodine 7.5% in aqueous solution, net price 500 mL = £2.50
To be used as a pre-operative scrub for hand and skin disinfection

**Solution 3%** (10 vols), net price 200 mL = 41p
For skin disinfection, particularly cleansing and deodorising wounds and ulcers
Note The BP directs that when hydrogen peroxide is prescribed, hydrogen peroxide solution 6% (20 vols) should be dispensed.

**Important** Strong solutions of hydrogen peroxide which contain 27% (90 vols) and 30% (100 vols) are only for the preparation of weaker solutions

**Crystacide** (GP Pharma)

Cream, hydrogen peroxide 1%, net price 10 g = £4.82, 25 g = £8.07, 40 g = £11.62
Dose superficial bacterial skin infection, apply 2–3 times daily for up to 3 weeks
Excipients include edetic acid (EDTA), propylene glycol

**POTASSIUM PERMANGANATE**

**Indications** cleansing and deodorising suppurating eczematous reactions and wounds

**Cautions** irritant to mucous membranes

**Dose**
- Wet dressings or baths, approx. 0.01% solution
Note Stains skin and clothing

**Potassium Permanganate Solution**

**Solution**, potassium permanganate 0.1% (1 in 1000) in water
Dose to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution

**Permitabs** (Alliance)

**Solution tablets**, for preparation of topical solution, potassium permanganate 400 mg, net price 30-tab pack = £6.22
Note 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution

**13.11.5 Phenolics**

**TRICLOSAN**

**Indications** skin disinfection

**Cautions** avoid contact with eyes

**Aquasept** (Medlock)

Skin cleanser, blue, triclosan 2%, net price 250 mL = £1.08, 500 mL = £1.67
Excipients include chlorocresol, propylene glycol, fragrance, trisodium edetate
For disinfection and pre-operative hand preparation

**Ster-Zac Bath Concentrate** (Medlock)

**Solution**, triclosan 2%, net price 28.5 mL = 40p, 500 mL = £2.24
Dose for prevention of cross-infection use 28.5 mL/bath
Excipients include trisodium edetate

**13.11.6 Oxidisers and dyes**

**HYDROGEN PEROXIDE**

**Indications** see under preparations below

**Cautions** large or deep wounds; avoid on healthy skin and eyes; bleaches fabric; incompatible with products containing iodine or potassium permanganate

**Hydrogen Peroxide Solution, BP**

**Solution 6%** (20 vols), net price 200 mL = 42p

**Desloughing agents**

Alginate, hydrogel and hydrocolloid dressings (Appendix 8) are effective at wound debrideinent. Sterile larvae (maggots) (LarvE, Zoobiotic) are also used for manageing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised; gravitational dermatitis may be complicated by superimposed contact sensitivity to substances such as neomycin or lanolin.

For further information on wound management products see Appendix 8, p. 883.

**13.11.7 Preparations for promotion of wound healing**

**Growth factor**

A topical preparation of becaplermin (recombinant human platelet-derived growth factor) is licensed as an adjunct treatment of full-thickness, neuropathic, diabetic ulcers. It enhances the formation of granulation tissue, thereby promoting wound healing.
BECAPLERMIN
(Recombinant human platelet-derived growth factor)

**Indications** see notes above

**Cautions** malignant disease; avoid on sites with infection, malignancy, or peripheral arteriopathy

**Side-effects** pain; infections including cellulitis and osteomyelitis; local reactions including erythema; rarely bullous eruption, oedema, and hypertrophic granulation

**Dose**
- Full-thickness, neuropathic, diabetic ulcers (no larger than 5 cm), apply thin layer daily and cover with gauze dressing moistened with physiological saline; max. duration of treatment 20 weeks (reassess if no healing after first 10 weeks);
- CHILD under 18 years, see BNF for Children

Regranex® (Janssen-Cilag)
Gel, becaplermin (recombinant human platelet-derived growth factor) 0.01%, net price 15 g = £255.75

**Excipients** include hydroxybenzoates (parabens)

13.12 Antiperspirants

Aluminium chloride is a potent antiperspirant used in the treatment of hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use glycopyrronium bromide as a 0.05% solution in the iontophoretic treatment of hyperhidrosis of plantar and palmar areas.

Botulinum A toxin-haemagglutinin complex (section 4.9.3) is licensed for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other anticholinergic treatment.

**ALUMINIUM SALTS**

**Indications** see under Dose below

**Cautions** avoid contact with eyes or mucous membranes; avoid use on broken or irritated skin; do not shave axillae or use depilatories within 12 hours of application; avoid contact with clothing

**Side-effects** skin irritation

**Dose**
- Hyperhidrosis affecting axillae, hands or feet, apply liquid formulation at night to dry skin, wash off the following morning, initially daily then reduce frequency as condition improves—do not bathe immediately before use
- Hyperhidrosis, bromhidrosis, intertrigo, and prevention of tinea pedis and related conditions, apply powder to dry skin

Anhydrol® Forte (Dermal)
**Solution (= application), aluminium chloride hexahydrate 20% in an alcoholic basis, net price 60-mL bottle with roll-on applicator = £2.62. Label: 15**

**Excipients** none as listed in section 13.1.3

GLYCOPYRRONIUM BROMIDE

**Indications** iontophoretic treatment of hyperhidrosis; other indications section 15.1.3

**Cautions** see section 15.1.3 (but poorly absorbed and systemic effects unlikely)

**Contra-indications** see section 15.1.3 (but poorly absorbed and systemic effects unlikely), infections affecting the treatment site

**Side-effects** see section 15.1.3 (but poorly absorbed and systemic effects unlikely), tingling at administration site

**Dose**
- Consult product literature; only 1 site to be treated at a time, max. 2 sites treated in any 24 hours, treatment not to be repeated within 7 days

Robinul® (Antigen)
**Powder, glycopyrronium bromide, net price 3 g = £110.00**

13.13 Topical circulatory preparations

These preparations are used to improve circulation in conditions such as bruising, superficial thrombophlebitis, chilblains and varicose veins but are of little value. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective. Sclerotherapy of varicose veins is described in section 2.13.

Rubefacients are described in section 10.3.2.

Hirudoid® (Genus)
**Cream, heparinoid 0.3% in a vanishing-cream basis, net price 50 g = £3.99**

**Excipients** include cetostearyl alcohol, hydroxybenzoates (parabens)

**Gel, heparinoid 0.3%, net price 50 g = £3.99**

**Excipients** include propylene glycol, fragrance

**Dose** apply up to 4 times daily on superficial soft-tissue injuries and superficial thrombophlebitis
14 Immunological products and vaccines

14.1 Active immunity

Active immunity can be acquired by natural disease or by vaccination. Vaccines stimulate production of antibodies and other components of the immune mechanism; they consist of either:
1. a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
2. inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
3. extracts of or detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce adequate antibody response and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice in this chapter reflects that in the handbook *Immunisation against Infectious Disease* (2006), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI). Chapters from the handbook are available at www.dh.gov.uk

The advice in this chapter also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Cautions Most individuals can safely receive the majority of vaccines. Vaccination may be postponed if the individual is suffering from an acute illness, however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset. See also Predisposition to Neurological Problems, below. For individuals with bleeding disorders, see Route of administration, below. If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When two live virus vaccines are required (and are not available as a combined preparation) they should be given either simultaneously at different sites or separated by an interval of at least 4 weeks. For interactions see Appendix 1 (vaccines).

See also Cautions under individual vaccines

Contra-indications Vaccines are contra-indicated in those who have a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens or vaccine component (such as bacteria in viral vaccines). The presence of the following excipients in vaccines and immunological products has been noted under the relevant entries:

- Hypersensitivity to egg: with evidence of previous anaphylactic reaction, contra-indicates influenza vaccine, tick-borne encephalitis vaccine, and yellow fever vaccine.
- See also Contra-indications under individual vaccines.

**Contra-indications under individual vaccines.**

**Immunised response** Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines. Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency). Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: adults, at least 40 mg daily for more than 1 week; children, 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. For special reference to HIV infection, see below.

Pregnancy and breast-feeding Live vaccines should not be administered routinely to pregnant women.

---

1. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).
2. Use of normal immunoglobulin should be considered after exposure to measles (see p. 681) and varicella–zoster immunoglobulin considered after exposure to chickenpox or herpes zoster (see p. 682).
Side-effects

Injection of a vaccine may be followed by local reactions such as pain, inflammation, redness, and lymphangitis. An induration or sterile abscess may develop at the injection site. Gastro-intestinal disturbances, fever, headache, irritability, loss of appetite, fatigue, myalgia, and malaise are among the most commonly reported side-effects. Other side-effects include influenza-like symptoms, dizziness, paraesthesia, asthena, drowsiness, arthralgia, rash, and lymphadenopathy. Hypersensitivity reactions, such as bronchospasm, angioedema, urticaria, and anaphylaxis, are very rare but can be fatal (see section 3.4.3 for management of allergic emergencies).

Oral vaccines such as cholera, live poliomyelitis, rotavirus, and live typhoid can also cause gastro-intestinal disturbances such as nausea, vomiting, abdominal pain and cramps, and diarrhoea.

See also Predisposition to neurological problems, below.

Some vaccines (e.g. poliomyelitis) produce very few reactions, while others (e.g. measles, mumps and rubella) may cause a very mild form of the disease. Occasionally more serious adverse reactions can occur—these should always be reported to the CHM (see Adverse Reactions to Drugs, p. 11).

There is no evidence that premature babies are at increased risk of adverse reactions from vaccines, see also Prematurity, below.

Predisposition to neurological problems

When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the prevention of fever (see Post-immunisation pyrexia in infants, above) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and perinatal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule. Where there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

Further information on adverse effects associated with specific vaccines can be found under individual vaccines.

Vaccines and HIV infection

HIV-positive individuals with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired), varicella-zoster (but avoid if immunity significantly impaired—consult product literature); 1, 2

and the following inactivated vaccines:

- anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papilloma virus, influenza, meningococcal, pertussis, pneumococcal, polio-vaccine, rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive individuals should not receive:

- BCG, typhoid (oral), yellow fever

Note The above advice differs from that for other immunocompromised patients: Immunisation Guidelines for HIV-infected Adults issued by British HIV Association (BHIVA) are available at www.bhiva.org and, Immunisation of HIV-infected Children issued by Children’s HIV Association (CHIVA) are available at www.chiva.org.uk

Vaccines and asplenia

The following vaccines are recommended for asplenic patients or those with splenic dysfunction:

- haemophilus influenzae type b, influenza, meningococcal group C, pneumococcal.

For antibiotic prophylaxis in asplenia see p. 288.

Route of administration

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route; some vaccines are given by others routes—the intradermal route for BCG vaccine, deep subcutaneous route for Japanese encephalitis, and varicella vaccine, and the oral route for cholera, live poliomyelitis, rotavirus, and live typhoid vaccines. The intramuscular route should not be used in patients with bleeding disorders such as haemophilia or thrombocytopenia. Vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

Note The Department of Health has advised against the use of jet guns for vaccination owing to the risk of transmitting bloodborne infections, such as HIV.

1. Use of normal immunoglobulin should be considered after exposure to measles (see p. 681) and varicella—zoster immunoglobulin considered after exposure to chickenpox or herpes zoster (see p. 682).

2. The Royal College of Paediatrics and Child Health recommends that MMR is not given to a child with HIV infection whilst severely immunosuppressed.

3. If yellow fever risk is unavoidable, specialist advice should be sought.
## Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from local health organisations or direct from Movianto—not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).

### Prematurity

Children born prematurely should receive all routine immunisations based on the actual date of birth. There is no evidence that premature infants are at increased risk of adverse reactions from vaccines. Seroconversion may be unreliable in babies born earlier than 28 weeks’ gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against *Haemophilus influenzae* (type b), meningococcal C, and hepatitis B after primary immunisation.

### When to immunise (for premature infants—see note above)

### During adult life

**Women of child-bearing age susceptible to rubella**

- **Measles, Mumps and Rubella Vaccine, Live (MMR)**
- Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation, but see also section 14.4, Measles, Mumps and Rubella Vaccine

### During adult life

**If not previously immunised**

- **Measles, Mumps and Rubella Vaccine, Live (MMR)**
- 3 doses at intervals of 1 month
- Booster dose at least 1 year after primary course and again 5–10 years later

---

1. For children born between 13 March 2003 and 3 September 2005 who have not received a booster dose of *Haemophilus Type b Conjugate Vaccine* at 12 months of age, see also p. 677.

2. The two human papilloma virus vaccines are not interchangeable and one vaccine product should be used for the entire course; however for individuals with previous incomplete vaccination with *Gardasil* who are eligible for HPV vaccination under the national programme, *Cervarix* can be used to complete the vaccination course if necessary; the individual must be informed that *Cervarix* does not protect against genital warts.

3. For females aged 14 to under 18 years, see ‘Catch-Up’ Programme, p. 671.
High-risk groups

Tetanus Vaccines

14.2 Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins, section 14.5). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; where necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antiserum, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

14.3 Storage and use

Care must be taken to store all vaccines and other immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many vaccines and immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Vaccines and immunoglobulins should be protected from light. Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

14.4 Vaccines and antisera

Availability Anthrax and yellow fever vaccines, botulism antitoxin, diphtheria antitoxin, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning, p. 36.

Enquiries for vaccines not available commercially can also be made to:

Immunisation Policy, Monitoring and Surveillance Department of Health
Wellington House
133–155 Waterloo Road
London, SE1 8UG
Tel: (020) 7972 4047

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health. In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff, CF14 4XW
Tel: (029) 2074 2979

and in Northern Ireland:
Regional Pharmacist (procurement co-ordination) United Hospitals Trust Pharmacy Dept
Whiteabbey Hospital
Doagh Road
Newtownabbey, BT37 9RH
Tel: (028) 9086 5181 ext 2386

For further details of availability, see under individual vaccines.

Anthrax vaccine

Anthrax vaccine is made from antigens from *B. anthracis*. Anthrax immunisation is indicated for individuals who handle infected animals, for those exposed to imported infected animal products, and for laboratory staff who work with *Bacillus anthracis*. A 4-dose regimen is used for primary immunisation; booster doses should be given annually to workers at continued risk of exposure to anthrax.

In the event of possible contact with *B. anthracis*, post-exposure immunisation may be indicated, in addition to antimicrobial prophylaxis (section 5.1.12). Advice on the use of anthrax vaccine for post-exposure prophylaxis must be obtained from the Centre for Infections, Health Protection Agency (tel. 020 8200 4400).

**ANTHRAX VACCINE**

**Indications** pre-exposure immunisation against anthrax; post-exposure immunisation (see notes above)

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Side-effects** see section 14.1

**Dose**

- By intramuscular injection in deltoid region, initial course 3 doses of 0.5 mL at intervals of 3 weeks followed by a fourth dose after an interval of 6 months; booster, 0.5 mL every 12 months

**Anthrax Vaccine (parenteral)**

**Injection**, suspension of anthrax antigens (not less than 0.125 mL/0.5 mL dose), sterile filtrate, adsorbed on to aluminium potassium sulphate

Excipients include thiomersal

Available from the Health Protection Agency’s Centre for Emergency Preparedness and Response (Porton Down)
BCG vaccines

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from Mycobacterium bovis which stimulates the development of hypersensitivity to M. tuberculosis. BCG vaccine should be given intradermally by operators skilled in the technique (see below).

The expected reaction to successful BCG vaccination is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small, flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see under Diagnostic Agents, below). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

BCG is recommended for the following groups if BCG immunisation has not previously been carried out:

- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–35 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts aged under 36 years of those with active tuberculosis (for healthcare or laboratory workers who have had contact with clinical materials or patients with tuberculosis, age limit does not apply);
- healthcare workers and laboratory staff (irrespective of age) who are likely to have contact with patients, clinical materials, or derived isolates; other individuals under 35 years of age with occupational risk including veterinary and other staff who handle animal species susceptible to tuberculosis, and staff working directly with prisoners, in care homes for the elderly, or in hostels or facilities for the homeless or refugees;
- individuals under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000 (section 14.6).

BCG vaccine can be given simultaneously with another live vaccine (see also section 14.1), but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

Bladder instillations of BCG are licensed for the management of bladder carcinoma (section 8.2.4).

For advice on chemoprophylaxis against tuberculosis, see section 5.1.9; for the treatment of infection following vaccination, seek expert advice.

**BACILLUS CALMETTE-GUÉRIN VACCINE**

**BCG Vaccine**

**Indications** immunisation against tuberculosis

**Cautions** see section 14.1; **Interactions**: Appendix 1 (vaccines)

**Contra-indications** see section 14.1; also neonate in household contact with known or suspected case of active tuberculosis; generalised septic skin conditions (for patients with eczema, lesion-free site should be used)

**Side-effects** see section 14.1 and notes above; also at the injection site, subcutaneous abscess, prolonged ulceration; rarely disseminated complications such as osteitis or osteomyelitis

**Dose**

- By intradermal injection **ADULT** and **CHILD** over 1 year, 0.1 mL; **NEONATE** and **CHILD** under 1 year, 0.05 mL

**Intradermal injection technique** Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb = 0.1 mL injection, 3.5 mm bleb = 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

To be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.

**Intradermal Bacillus Calmette-Guérin Vaccine (PoP)**

BCG Vaccine, Dried/Tub/BCG

Injection (powder for suspension), freeze-dried preparation of live bacteria of a strain derived from the bacillus of Calmette and Guérin.

Available from health organisations or direct from Movianto (SSI brand, multidose vial with diluent)

**Diagnostic agents**

The Mantoux test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at [www.immunisation.nhs.uk](http://www.immunisation.nhs.uk).

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD).
The Heaf test (involving the use of multiple-puncture apparatus) is no longer available. **Note** Response to tuberculin may be suppressed by live viral vaccines, viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment. Tuberculin testing should not be carried out within 4 weeks of receiving a live viral vaccine.

**Tuberculin Purified Protein Derivative** (Tuberculin PPD)

**Injection**, heat-treated products of growth and lysis of appropriate Mycobacterium spp. 20 units/mL (2 units/0.1 mL dose) (for routine use), 1.5-mL vial; 100 units/mL (10 units/0.1 mL dose), 1.5-mL vial

**Dose** by intradermal injection, for Mantoux test, 2 units (0.1 mL of 20 units/mL strength) for routine Mantoux test; if first test is negative and a further test is considered appropriate 10 units (0.1 mL of 100 units/mL strength)

**Available from** Movianto (SSI brand)

**Note** The strength of tuberculin PPD in this product may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength

**Botulism antitoxin**

A polyvalent botulism antitoxin is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

**Botulism Antitoxin**

A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*. **Note** The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

**Dose** prophylaxis, consult product literature

**Available from** local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the duty doctor at the Health Protection Agency (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank

**Cholera vaccine**

**Cholera vaccine** (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V.cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations (see also section 14.6). Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential. **Injectable cholera vaccine** provides unreliable protection and is no longer available in the UK.

**CHOLERA VACCINE**

**Indications** see notes above

**Cautions** see section 14.1 and notes above

**Contra-indications** see section 14.1

**Side-effects** see section 14.1; also rarely respiratory symptoms such as rhinitis and cough; very rarely sore throat, insomnia

**Dose**

- **ADULT and CHILD** over 6 years 2 doses separated by an interval of 1–6 weeks; **CHILD** 2–6 years 3 doses each separated by an interval of 1–6 weeks

**Note** If more than 6 weeks have elapsed between doses, the primary course should be restarted

- A single booster dose can be given 2 years after primary course for adults and children over 6 years, and 6 months after primary course for children 2–6 years. If more than 2 years have elapsed since the last vaccination, the primary course should be repeated

**Counselling** Dissolve effervescent sodium bicarbonate granules in a glassful of water (approximately 150 mL). For adults and children over 6 years, add vaccine suspension to make one dose. For child 2–6 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination

**Dukoral®** (Novartis Vaccines)

**Oral suspension**, for dilution with solution of effervescent sodium bicarbonate granules, heat- and formaldehyde-inactivated Inaba (including El-Tor biotype) and Ogawa strains of *Vibrio cholerae* bacteria and recombinant cholera toxin B-subunit produced in *V. cholerae*, net price 2-dose pack = £23.42. Counselling, administration

**Diphtheria vaccines**

Diphtheria vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as ‘high dose’ or ‘low dose’. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule, section 14.1). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and inactivated poliomyelitis vaccine.
A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and inactivated poliomyelitis vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and inactivated poliomyelitis vaccine; for children requiring a booster dose of haemophilus influenzae type b vaccine as part of a ‘catch-up’ programme see p. 687. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and inactivated poliomyelitis vaccine.

A second booster dose, of adsorbed diphtheria [low dose], tetanus and inactivated poliomyelitis vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed).

**Travel**

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule (see also section 14.6). If more than 10 years have lapsed since completion of the UK schedule, a dose of adsorbed diphtheria [low dose], tetanus and inactivated poliomyelitis vaccine should be administered.

**Contacts**

Staff in contact with diphtheria patients or with potentially pathogenic clinical specimens or working directly with C. diphtheriae or C. ulcerans should receive a booster dose if fully immunised (with 5 doses of diphtheria-containing vaccine given at appropriate intervals); further doses should be given at 10-year intervals if risk persists. Individuals at risk who are not fully immunised should complete the primary course; a booster dose should be given after 5 years and then at 10-year intervals. Adsorbed diphtheria [low dose], tetanus and inactivated poliomyelitis vaccine is used for this purpose; immunity should be checked by antibody testing at least 3 months after completion of immunisation.

Advice on the management of cases, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected individuals and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. For advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune individual, see Table 2, section 5.1.

### Diphtheria-containing vaccines for children under 10 years

**Important**

Not recommended for persons aged 10 years or over (see Diphtheria-containing Vaccines for Children over 10 years and Adults, below)

**Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed)**

- **Injection**, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £17.56
- **Excipients** may include neomycin, polymyxin B and streptomycin
- **Dose** by intramuscular injection, CHILD 2 months–10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month; see also notes on booster doses, above
- **Brands include** Infanrix-IPV+Hib, Pedvax ; available as part of childhood immunisation schedule, from health organisations or Movianto

**Adsorbed Diphtheria, Tetanus, Pertussis (Acellular, Component) and Inactivated Poliomyelitis Vaccine**

- **Injection**, suspension of diphtheria toxoid, tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £11.98
- **Excipients** may include neomycin, polymyxin B and streptomycin
- **Dose** by intramuscular injection, CHILD 3–10 years, first booster dose 3 years after primary immunisation, 0.5 mL; see also notes on booster doses, above
- **Brands include** Infanrix-IPV ; available as part of childhood immunisation schedule, from health organisations or Movianto

### Diphtheria-containing vaccines for children over 10 years and adults

A low dose of diphtheria toxoid is sufficient to recall immunity in individuals previously immunised against diphtheria but whose immunity may have diminished with time; it is insufficient to cause serious reactions in an individual who is already immune. Preparations containing low dose diphtheria should be used for adults and children over 10 years, for both primary immunisation and booster doses.

**Adsorbed Diphtheria [low dose], Tetanus and Inactivated Poliomyelitis Vaccine**

- **Injection**, suspension of diphtheria toxoid [low dose], tetanus toxoid, acellular pertussis and inactivated poliomyelitis vaccine components adsorbed on a mineral carrier, net price 0.5-mL prefilled syringe = £14.00
- **Excipients** may include neomycin, polymyxin B and streptomycin
- **Dose** by intramuscular injection, ADULT over 10 years, primary immunisation, 3 doses each of 0.5 mL separated by intervals of 1 month, second booster dose, 0.5 mL given 10 years after first booster dose (may be also used as first booster dose in those over 10 years who have received only 3 previous doses of a diphtheria-containing vaccine); see also notes on booster doses and contact above
- **Brands include** Revanex ; available as part of immunisation schedule, from health organisations or Movianto
Diphtheria antitoxin

Diphtheria antitoxin is used for passive immunisation in suspected cases of diphtheria only (without waiting for bacteriological confirmation); tests for hypersensitivity should be first carried out. It is derived from horse serum, and reactions are common after administration; resuscitation facilities should be available immediately.

It is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis (section 5.1, table 2) and vaccine (see Contacts above).

Diphtheria Antitoxin

Dose prophylaxis, not recommended therefore no dose stated (see notes above)

Treatment, consult product literature

Available from Centre for Infections (Tel (020) 8200 6868) or in Northern Ireland from Public Health Laboratory, Belfast City Hospital (Tel (028) 9032 9241)

Haemophilus type B conjugate vaccine

Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular, component) and inactivated poliomyelitis vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule, section 14.1) (see under Diphtheria-containing Vaccines). For infants under 1 year, the course consists of 3 doses of a vaccine containing haemophilus influenzae type b component with an interval of 1 month between doses. A booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at around 12 months of age.

‘Catch-up’ programme

Children born between 13 March 2003 and 3 September 2005 who have not received a booster dose of haemophilus influenzae type b vaccine at 12 months of age will be offered combined diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) as part of a 'catch-up' programme before school entry; children who have already received their pre-school immunisation without the Hib component will be offered haemophilus influenzae type b vaccine combined with meningococcal group C conjugate vaccine. The ‘catch-up’ dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed).

Children 1–10 years who have not been immunised against Haemophilus influenzae type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive H. influenzae type b disease (such as those with sickle-cell disease and those receiving treatment for malignancy).

For use of Rifampicin in the prevention of secondary cases of Haemophilus influenzae type b disease, see Table 2, section 5.1.

Asplenia or splenic dysfunction

Haemophilus influenzae type b vaccine is recommended for patients with asplenia or splenic dysfunction. Immunised adults and children over 1 year, who develop splenic dysfunction, should be given 1 additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). For elective splenectomy, the vaccine should ideally be given at least 2 weeks before surgery. Adults and children over 1 year, who are not immunised against haemophilus influenzae type b, should be given 2 doses of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) with an interval of 2 months between doses. However, children under 10 years, who are not immunised against diphtheria, tetanus, pertussis, poliomyelitis, and haemophilus influenzae type b should be given 3 doses (with an interval of 1 month between doses) of combined diphtheria, tetanus, pertussis (acellular component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine.

HAEMOPHILUS TYPE B CONJUGATE VACCINE

Indications see notes above

Cautions see section 14.1

Contra-indications see section 14.1

Side-effects see section 14.1; also atopic dermatitis and hypotonia

Dose

- Primary immunisation, see under Diphtheria
- Booster dose, see notes above and under preparation below

Menitorix® (GSK)

Injection, powder for reconstitution, capsular polysaccharide of Haemophilus influenzae type b and capsular polysaccharide of Neisseria meningitidis group C (both conjugated to tetanus protein), net price single-dose vial (with syringe containing 0.5 mL diluent) = £39.87

Dose by intramuscular injection, CHILD 1–10 years, 0.5 mL

ADULT and CHILD over 1 year, with asplenia or splenic dysfunction (see notes above), 0.5 mL

Available as part of the childhood immunisation schedule from Movianto

Combined vaccines

See also under Diphtheria-containing Vaccines
Hepatitis A vaccine

Hepatitis A vaccine is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells.

Immunisation is recommended for:
- laboratory staff who work directly with the virus;
- staff and residents of homes for those with severe learning difficulties;
- workers at risk of exposure to untreated sewage;
- individuals who work with primates;
- patients with haemophilia treated with plasma-derived clotting factors;
- patients with severe liver disease;
- travellers to high-risk areas (see p. 684);
- individuals who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:
- patients with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 7 days of onset of disease in the primary case.

A booster dose is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

HEPATITIS A VACCINE

Indications immunisation against hepatitis A infection
Cautions see section 14.1
contra-indications see section 14.1
Side-effects see section 14.1; for combination vaccines, see also Typhoid vaccine, p. 679

Dose
- See under preparations

Single component

Avaxim® (Sanofi Pasteur) (UK)
Injection, suspension of formaldehyde-inactivated hepatitis A virus (GBM grown in human diploid cells) 320 antigen units/mL adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £19.19
Exipients include neomycin
Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose
Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with Avaxim. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

Epalax® (MASTA) (UK)
Injection, suspension of formaldehyde-inactivated hepatitis A virus (RG-SB grown in human diploid cells) at least 48 units/mL, net price 0.5-mL prefilled syringe = £23.81
Dose by intramuscular injection (see note below), ADULT and CHILD over 1 year, 0.5 mL as a single dose; booster dose 0.5 mL 6–12 months after initial dose (1–6 months if splenectomised)
Note Booster dose may be delayed by up to 4 years in adults if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Important Epalax contains influenza virus haemagglutinin grown in the allantoic cavity of chick embryos, therefore contra-indicated in those hypersensitive to eggs or chicken protein.

Havrix Monodose® (GSK) (UK)
Injection, suspension of formaldehyde-inactivated hepatitis A virus (HM 175 grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, net price 1-mL prefilled syringe = £22.14, 0.5-mL (720 ELISA units) prefilled syringe (Havrix Junior Monodose®) = £16.77
Exipients include neomycin
Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, 1 mL as a single dose; booster dose, 1 mL 6–12 months after initial dose; CHILD 1–15 years 0.5 mL, booster dose 0.5 mL 6–12 months after initial dose
Note Booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose with Havrix Monodose®. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders

Vaqta® Paediatric (Sanofi Pasteur) (UK)
Injection, suspension of formaldehyde-inactivated hepatitis A virus (grown in human diploid cells) 50 antigen units/mL adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL prefilled syringe = £15.65
Exipients include neomycin
Dose by intramuscular injection (see note below) CHILD 1–17 years, 0.5 mL as a single dose; booster dose 0.5 mL 6–18 months after initial dose; under 1 year, not recommended
Note The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced)

With hepatitis B vaccine

Ambrix® (GSK) (UK)
Injection, suspension of inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide, and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe = £31.18
Exipients include neomycin and traces of thiomersal
Dose CHILD 1–15 years, by intramuscular injection (see note below) primary course, 2 doses of 1 mL, the second 6–12 months after initial dose
Note Primary course should be completed with Ambrix (single component vaccines given at appropriate intervals may be used for booster dose); the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

Important Ambrix is not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus

Twinrix® (GSK) (UK)
Injection, inactivated hepatitis A virus (grown in human diploid cells) 720 ELISA units/mL adsorbed onto aluminium hydroxide and recombinant (DNA) hepatitis B surface antigen (grown in yeast cells) 20 micrograms/mL adsorbed onto aluminium phosphate, net price 1-mL prefilled syringe (Twinrix® Adult) = £27.76, 0.5-mL prefilled syringe (Twinrix® Paediatric) = £20.79
Exipients include neomycin and traces of thiomersal
Dose by intramuscular injection (see note below), ADULT and CHILD over 16 years, primary course of 3 doses of 1 mL, the second 1 month and the third 6 months after the first dose; CHILD 1–15 years, 3 doses of 0.5 mL.
Accelerated schedule (e.g. for travellers departing within 1 month), ADULT, second dose 7 days after first dose, third dose after further 14 days and a fourth dose 12 months after the first dose
Note Primary course should be completed with Twinrix (single component vaccines given at appropriate intervals may be
used for booster dose); the deltoid region is the preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced); subcutaneous route used for patients with bleeding disorders (but immune response may be reduced).

**Important**

Twinrix® not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular or mucous membrane exposure to hepatitis B virus.

**With typhoid vaccine**

**Hepatix®** (GSK) \( \text{REM} \)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 1440 ELISA units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £32.08

**Excipients** include neomycin

**Dose** by intramuscular injection (see note below), ADULT and CHILD over 15 years, 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 679

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

**VIATIM** (Sanofi Pasteur) \( \text{REM} \)

**Injection**, suspension of inactivated hepatitis A virus (grown in human diploid cells) 160 antigen units/mL adsorbed onto aluminium hydroxide, combined with typhoid vaccine containing 25 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 1-mL prefilled syringe = £30.22

**Excipients** include neomycin

**Dose** by intramuscular injection (see note below), ADULT and CHILD over 15 years, 1 mL as a single dose; booster doses, see under single component hepatitis A vaccine (above) and under polysaccharide typhoid vaccine, p. 679

**Note** The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced)

### Hepatitis B vaccine

**Hepatitis B vaccine** contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed on aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, groups at high-risk of hepatitis B include:

- parents of drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- individuals who change sexual partners frequently;
- close family contacts of a case or carrier;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and hepatitis B immunoglobulin (see p. 682) given at the same time (but preferably at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother’s e-antigen antibody status);
- individuals with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- patients with chronic renal failure including those on haemodialysis. Haemodialysis patients should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- individuals with chronic liver disease;
- healthcare personnel (including trainees) who have direct contact with blood or blood-stained body fluids or with patients’ tissues;
- laboratory staff who handle material that may contain the virus;
- other occupational risk groups such as morticians and embalmers;
- staff and patients of day-care or residential accommodation for those with severe learning difficulties;
- staff and inmates of custodial institutions;
- those travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods (see p. 684);
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances (see under individual preparations). Generally, three or four doses are required for primary immunisation; an ‘accelerated schedule’ is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis (see below).

Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult Guidance for Clinical Health Care Workers Protection against Infection with Blood-borne Viruses (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the first dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the memorandum Immunisation against Infectious Disease. Specific hepatitis B immunoglobulin (‘HBIG’) is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection (section 14.5).

A combined hepatitis A and hepatitis B vaccine is also available.
HEPATITIS B VACCINE

**Indications** Immunisation against hepatitis B infection

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Side-effects** see section 14.1

**Dose**

- See under preparations

### Single component

**Engerix B** (GSK) (Sanofi Pasteur)

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 20 micrograms/mL adsorbed onto aluminium hydroxide, net price 0.5-mL (paediatric) vial = £9.16, 0.5-mL (paediatric) prefilled syringe = £9.67, 1-mL vial = £12.34, 1-mL prefilled syringe = £12.99

**Excipients** include traces of thiomersal

**Dose** by intramuscular injection (see note below), ADULT and CHILD over 16 years, 3 doses of 20 micrograms, the second 1 month and the third 6 months after the first dose, NEONATE (except if born to hepatitis B surface antigen positive mother, see below) and CHILD 1 month–16 years, 3 doses of 10 micrograms Accelerated schedule (all ages), second dose 1 month after first dose, third dose 2 months after first dose and fourth dose 12 months after first dose; exceptionally (e.g. for travellers departing within 1 month), ADULT over 18 years, second dose 7 days after first dose, third dose 21 days after first dose, and fourth dose 12 months after first dose

**Alternative schedule for CHILD 11–15 years, 2 doses of 20 micrograms, the second dose 6 months after the first dose (this schedule not suitable if high risk of infection between doses or if compliance with second dose uncertain)**

**NEONATE** born to hepatitis B surface antigen positive mother (see also notes above), 4 doses of 10 micrograms, first dose at birth, hepatitis B immunoglobulin injection (separate site) the second 1 month, the third 2 months and the fourth 12 months after the first dose

Renal insufficiency (including haemodialysis patients), by intramuscular injection (see note below), ADULT and CHILD over 16 years, 4 doses of 40 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration; **NEONATE** (except if born to hepatitis B surface antigen positive mother, see above) and CHILD 1 month–16 years 3 doses of 10 micrograms, second dose 1 month and third dose 6 months after first dose or accelerated schedule, 4 doses of 10 micrograms, second dose 1 month, third dose 2 months and fourth dose 12 months after first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

**Note** Deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in neonates and infants; not to be injected into the buttoc (vaccine efficacy reduced)

**Fendrix** (GSK) (Sanofi Pasteur)

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 40 micrograms/mL adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £38.10

**Excipients** include traces of thiomersal

**Dose** ADULT and CHILD over 15 years with renal insufficiency (including pre-haemodialysis and haemodialysis patients), by intramuscular injection (see note below) 4 doses of 20 micrograms, the second 1 month, the third 2 months and the fourth 6 months after the first dose; immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration

**Note** Deltoid muscle is preferred site of injection; not to be injected into the buttoc (vaccine efficacy reduced)

**HBVaxPRO** (Sanofi Pasteur)

**Injection**, suspension of hepatitis B surface antigen (prepared from yeast cells by recombinant DNA technique) 10 micrograms/mL adsorbed onto aluminium hydroxyphosphosphate sulphate, net price 0.5-mL (5-microgram) prefilled syringe = £9.50, 1-mL (10-microgram) prefilled syringe = £12.95; 40 micrograms/mL, 1-mL (40-microgram) vial = £29.30

**Dose** by intramuscular injection (see note below), ADULT and CHILD over 16 years, 3 doses of 10 micrograms, the second 1 month and the third 6 months after the first dose, CHILD under 16 years, 3 doses of 5 micrograms

**Accelerated schedule (all ages)**, second dose 1 month after first dose, third dose 2 months after first dose with fourth dose at 12 months

Booster doses may be required in immunocompromised patients with low antibody concentration

**NEONATE** born to hepatitis B surface antigen-positive mother (see also notes above), 5 micrograms, first dose at birth with hepatitis B immunoglobulin injection (separate site), the second 1 month, the third 2 months and the fourth 12 months after the first dose

**Cervarix** (GSK) is licensed for use in females for the prevention of cervical cancer, genital warts and pre-cancerous lesions caused by human papilloma virus types 16 and 18. **Gardasil** is licensed for use in females for the prevention of cervical cancer, genital warts and pre-cancerous lesions caused by human papilloma virus types 6, 11, 16, and 18. The two vaccines are not interchangeable and one vaccine product should be used for an entire course. However, the Department of Health (November 2008) states that for individuals with previous incomplete vaccination with Gardasil®, who are eligible for HPV vaccination under the national programme, Cervarix® can be used to complete the vaccination course if necessary; the individual must be informed that Cervarix® does not protect against genital warts.

Human papilloma virus vaccine will be most effective if given before sexual activity starts. The first dose is given to females aged 12 to 13 years, the second and third doses are given 1–2 and 6 months after the first dose (see Immunisation schedule, section 14.1); all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed but not repeated, allowing the appropriate interval between the remaining doses. Where there are significant challenges in scheduling vaccinations, or a high likelihood that the third dose will not be given, the third dose of Cervarix® can be given 3 months after the second dose. Where appropriate, immunisation with human papilloma virus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

As the vaccines do not protect against all strains of human papilloma virus, routine cervical screening should continue.
**Human papilloma virus vaccine ‘Catch-up’ programme for England, Wales, and Northern Ireland**

A ‘catch-up’ programme will be offered as follows:
- from September 2008 to all females born between 1 September 1990 and 31 August 1991 (aged 17–18 years)
- from September 2009 to all females born between 1 September 1991 and 31 August 1995 (aged 14–18 years) [under review in Wales]

**Human papilloma virus vaccine ‘Catch-up’ programme for Scotland**

The ‘catch-up’ programme in Scotland will be offered as follows:
- from 1 September 2008 to all females aged 16–17 years
- from September 2009 to all females aged 14–16 years

**HUMAN PAPILLOMA VIRUS VACCINES**

**Indications** see notes above and under preparations

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Side-effects** see section 14.1

**Dose**
- see notes above and under preparations

**Note** To avoid confusion, prescribers should specify the brand to be dispensed

**Cervarix® (GSK)** ▼ ▼

*Injection*, suspension of virus-like particles of human papilloma virus type 16 (40 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared by recombinant DNA technique using a Baculovirus expression system) in monophosphoryl lipid A adjuvant adsorbed onto aluminium hydroxide, net price 0.5-mL prefilled syringe = £80.50

**Dose** prevention of premalignant genital lesions and cervical cancer, by intramuscular injection into deltoid region, ADULT and CHILD 9–25 years, 3 doses of 0.5 mL, the second 1 month and the third 6 months after the first dose

**Gardasil® (Sanofi Pasteur)** ▼ ▼

*Injection*, suspension of Virus-like particles of human papilloma virus type 6 (40 micrograms/mL), type 11 (80 micrograms/mL), type 16 (80 micrograms/mL), type 18 (40 micrograms/mL) capsid protein (prepared from yeast cells by recombinant DNA technique) adsorbed onto aluminium hydroxyphosphate sulphate, net price 0.5-mL prefilled syringe = £80.50

**Dose** prevention of premalignant genital lesions, cervical cancer and genital warts, by intramuscular injection preferably into deltoid region or higher anterolateral thigh, ADULT and CHILD 9–26 years, 3 doses of 0.5 mL, the second 2 months and the third 6 months after the first dose

Alternative schedule for ADULT and CHILD 9–26 years, 3 doses of 0.5 mL, the second at least 1 month, and the third at least 4 months after the first dose; schedule should be completed within 12 months

**Influenza vaccines**

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccines in use contain the H and N components of the prevalent strain or strains as recommended each year by the World Health Organization.

**Influenza vaccines** will not control epidemics—immunisation is recommended only for persons at high risk. Annual immunisation is strongly recommended for individuals aged over 6 months with the following conditions:
- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease;
- chronic neurological disease
- diabetes mellitus
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged corticosteroid treatment);
- HIV infection (regardless of immune status).

Influenza immunisation is also recommended for all persons aged over 65 years, for residents of nursing or residential homes for the elderly and other long-stay facilities, and for carers of persons whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

As part of winter planning, NHS employers should offer vaccination to healthcare workers who are directly involved in patient care. Employers of social care workers should consider similar action.

Where possible, pregnant women and children should receive a thiomersal-free influenza vaccine; if this is not available, a thiomersal-containing influenza vaccine should be given.

For people who work in close contact with poultry on a regular basis, influenza immunisation is recommended as a precautionary public health measure. Seasonal human influenza vaccine does not protect against avian influenza, but it reduces the risk of poultry workers contracting both human and avian influenza simultaneously, and therefore also reduces the risk of a new influenza virus emerging.

Information on pandemic influenza and avian influenza may be found at [www.dh.gov.uk/pandemicflu](http://www.dh.gov.uk/pandemicflu) and at [www.hpa.org.uk](http://www.hpa.org.uk).

**INFLUENZA VACCINE**

**Indications** annual immunisation against influenza

**Cautions** see section 14.1 interactions: Appendix 1 (vaccines)

**Contra-indications** see section 14.1

**Side-effects** see section 14.1; also reported febrile convulsions and transient thrombocytopenia

**Dose**
- By intramuscular injection ADULT and CHILD over 13 years, 0.5 mL as a single dose; CHILD 6 months–3 years, 0.25–0.5 mL; 3–13 years 0.5 mL; for children 6 months to 13 years who have not been previously vaccinated repeat after 4–6 weeks
Inactivated Influenza Vaccine (Split Virion) *(Flu)*

Injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £6.59

Excipients may include neomycin and polymyxin B

Available from Novartis Vaccines

**Note** Not licensed for children under 4 years

Agrippal® *(Novartis Vaccines)* *(Flu)*

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £5.85

Excipients include kanamycin and neomycin

Begrivac® *(Novartis Vaccines)* *(Flu)*

Injection, suspension of formaldehyde-inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £5.55

Excipients include polymyxin B

Enzira® *(Wyeth)* *(Flu)

Injection, suspension of inactivated influenza virus (split virion, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £4.49

Excipients include gentamicin

Fluvirin® *(Novartis Vaccines)* *(Flu)*

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £5.55

Excipients may include neomycin and polymyxin B

**Note** Not licensed for use in children under 4 years

Imuvac® *(Solvay)* *(Flu)*

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £6.59

Excipients include gentamicin

Influvac Sub-unit® *(Solvay)* *(Flu)*

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £5.22

Excipients include gentamicin

Mastalu® *(MASTA)* *(Flu)*

Injection, suspension of formaldehyde-inactivated influenza virus (surface antigen, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £6.50

Excipients include gentamicin

Viroflu® *(Sanofi Pasteur)* *(Flu)*

Injection, suspension of inactivated influenza virus (surface antigen, virosoome, grown in fertilised hens’ eggs), net price 0.5-mL prefilled syringe = £6.59

Excipients include neomycin and polymyxin B

**Measles vaccine**

Measles vaccine has been replaced by a combined live measles, mumps and rubella vaccine (MMR vaccine). MMR vaccine may be used in the control of outbreaks of measles (see under MMR Vaccine).

- **Single antigen vaccine**
  - No longer available in the UK

- **Combined vaccines**
  - See MMR vaccine

**Measles, Mumps and Rubella (MMR) vaccine**

A combined live measles, mumps, and rubella vaccine (MMR vaccine) aims to eliminate measles, mumps, and rubella (and congenital rubella syndrome).

Every child should receive two doses of MMR vaccine by entry to primary school, unless there is a valid contra-indication (see section 14.1). MMR vaccine should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of MMR vaccine is given to children aged 13 months. A second dose is given before starting school at 3–5 years of age (see Immunisation Schedule, section 14.1).

When protection against measles is required urgently (e.g. during a measles outbreak), the second dose of MMR vaccine can be given 1 month after the first dose; if the second dose is given before 18 months of age, then children should still receive the routine dose before starting school at 3–5 years of age.

Children presenting for pre-school booster who have not received the first dose of MMR vaccine should be given a dose of MMR vaccine followed 3 months later by a second dose. At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In a young adult who has received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of MMR vaccine are required, the second dose should be given one month after initial dose.

MMR vaccine should be used to protect against rubella in seronegative women of child-bearing age (see Immunisation Schedule, section 14.1); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella (or measles) should be vaccinated. MMR vaccine may also be offered to previously unimmunised and seronegative post-partum women—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

**Contacts** MMR vaccine may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection; these children should still receive routine MMR vaccinations at the recommended ages. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin (section 14.5) after exposure to measles; rou-
tine MMR immunisation should then be given after at least 3 months at the appropriate age.

MMR vaccine is not suitable for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children and adults with impaired immune response should not receive live vaccines (for advice on HIV see section 14.1). If they have been exposed to measles infection they should be given normal immunoglobulin (section 14.5).

Travel Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive MMR vaccine. Children immunised before 12 months of age should still receive two doses of MMR at the recommended ages. If one dose of MMR has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3–5 years should still be given.

Side-effects See section 14.1; also malaise, fever, or a rash may occur after the first dose of MMR vaccine, most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol). Febrile seizures occur less commonly 6 to 11 days after MMR vaccination; the incidence of febrile seizures is lower than that following measles infection. Parotid swelling occurs occasionally, usually in the third week, and rarely, arthopathy 2 to 3 weeks after immunisation. Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first dose.

Hypersensitivity to egg— there is increasing evidence that MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg (dislike of egg or refusal to eat eggs is not a contra-indication). For children with a confirmed anaphylactic reaction to egg-containing food, MMR vaccine should be administered in a hospital setting.

Contra-indications see section 14.1; also pregnancy

Side-effects see section 14.1; also less commonly sleep disturbances, unusual crying in infants; also reported peripheral and optic neuritis

Dose

- By intramuscular or deep subcutaneous injection, ADULT and CHILD over 9 months (but see also notes above), primary immunisation, 2 doses each of 0.5 mL, see Immunisation Schedule , section 14.1, p. 662; see also notes above for use in outbreaks, for contacts of cases, and for travel

Combined vaccines

MMRvaxPro® (Sanofi Pasteur) Injection, powder for reconstitution, live attenuated, measles virus (Edners’ Edmonston strain) and mumps virus (Jeryl Lynn strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); single-dose vial (with syringe containing solvent). Excipients include gelatin and neomycin. Only available as part of childhood immunisation schedule from health organisations or Movianto

Priorix (GSK) Injection, powder for reconstitution, live attenuated, measles virus (Schwarz strain) and mumps virus (RIT 4385 strain) prepared in chick embryo cells, and rubella virus (Wistar RA 27/3 strain); net price single-dose vial (with syringe containing solvent) = £6.37 Excipients include neomycin. Also available as part of childhood immunisation schedule from health organisations or Movianto

Meningococcal vaccines

Almost all childhood meningococcal disease in the UK is caused by Neisseria meningitidis serogroups B and C. Meningococcal group C conjugate vaccine protects only against infection by serogroup C. The risk of
mucococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

**Childhood immunisation** Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of *Neisseria meningitidis*. Immunisation consists of 2 doses given at 3 months and 4 months of age; a booster should be given at 12 months of age, usually combined with haemophilus influenzae type b vaccine. This routine booster dose should be given one month before the booster dose of pneumococcal conjugate vaccine (see Immunisation schedule, section 14.1, p. 662). It is recommended that meningococcal group C conjugate vaccine be given to anyone aged under 25 years who has not been vaccinated previously with this vaccine; those over 1 year receive a single dose.

A single dose of meningococcal group C conjugate vaccine is also recommended for unimmunised individuals attending university, irrespective of age.

**Meningococcal group C conjugate vaccine in patients with asplenia or splenic dysfunction** Meningococcal group C conjugate vaccine is recommended for patients with asplenia or splenic dysfunction. Children under 1 year should be vaccinated according to the Immunisation Schedule (section 14.1). Unimmunised adults and children over 1 year should be given 2 doses of meningococcal group C conjugate vaccine (usually combined with haemophilus influenzae type b vaccine) with an interval of 2 months between doses. Immunised adults and children who develop splenic dysfunction should be given 1 additional dose of meningococcal group C conjugate vaccine (usually combined with haemophilus influenzae type b vaccine).

**Travel** Individuals travelling to countries of risk (see below) should be immunised with a meningococcal polysaccharide vaccine that covers serotypes A, C, W135, and Y, even if they have previously received meningitis C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 2 weeks should be allowed before administration of the tetravalent (A, C, W135, and Y) vaccine. The antibody response to serotype C in unconjugated meningococcal polysaccharide vaccines in children under 18 months may be suboptimal.

**Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org).

Proof of vaccination with the tetravalent (A, C, W135, and Y) meningococcal vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

**Contacts** For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidance for Public Health Management of Meningococcal Disease in the UK at www.hpa.org.uk. See Table 2, section 5.1 for antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

The need for immunisation of laboratory staff who work directly with *Neisseria meningitidis* should be considered.

### Meningococcal Vaccines

#### Indications

Immunisation against *Neisseria meningitidis*

**Cautions** see section 14.1

**Contra-indications** see section 14.1

**Side-effects** see section 14.1; also rarely symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)

**Dose**

- See under preparations

#### Meningococcal group C conjugate vaccine

**Menigitec®** (Wyeth)  
Injection, suspension of capsular polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to *Corynebacterium diphtheriae* protein), adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £7.50

**Dose** by intramuscular injection, ADULT and CHILD over 1 year 0.5 mL as a single dose, for routine immunisation in CHILD 2 months–1 year, 0.5 mL, see notes above and Immunisation schedule, section 14.1

Available as part of childhood immunisation schedule from Movianto

**Menjugate Kit®** (Sanofi Pasteur)  
Injection, powder for reconstitution, capsular polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to *Corynebacterium diphtheriae* protein), adsorbed onto aluminium hydroxide, single-dose vial with diluent

**Dose** by intramuscular injection, ADULT and CHILD over 1 year 0.5 mL as a single dose, for routine immunisation in CHILD 2 months–1 year, 0.5 mL, see notes above and Immunisation schedule, section 14.1

**NeisVac-C®** (Baxter)  
Injection, suspension of polysaccharide antigen of *Neisseria meningitidis* group C (conjugated to tetanus toxoid protein), adsorbed onto aluminium hydroxide, 0.5-mL prefilled syringe

**Dose** by intramuscular injection, ADULT and CHILD over 1 year 0.5 mL as a single dose, for routine immunisation in CHILD 3 months–1 year, 0.5 mL, see notes above and Immunisation schedule, section 14.1

**Meningococcal Group C conjugate vaccine with Haemophilus Influenzae type B vaccine**

See Haemophilus Influenzae type B vaccine

**Meningococcal polysaccharide A, C, W135 and Y vaccine**

**ACWY Vax®** (GSK)  
Injection, powder for reconstitution, capsular polysaccharide antigens of *Neisseria meningitidis* groups A, C, W135, and Y, net price single-dose vial (with syringe containing diluent) = £16.73

**Dose** by deep subcutaneous injection, ADULT and CHILD over 2 years 0.5 mL as a single dose; booster dose for those at
Pneumococcal vaccines

Pneumococcal vaccines protect against infection with *Streptococcus pneumoniae* (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. 

**Pneumococcal polysaccharide vaccine** contains purified polysaccharide from 23 capsular types of pneumococcus whereas** pneumococcal polysaccharide conjugate vaccine** (adsorbed) contains polysaccharide from 7 capsular types, the polysaccharide being conjugated to protein. The conjugate vaccine is used for childhood immunisation schedule. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 13 months (see Immunisation Schedule, section 14.1).

Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:

- age over 65 years;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- diabetes mellitus requiring insulin or oral hypoglycaemic drugs;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid may occur;
- child under 5 years with a history of invasive pneumococcal disease.

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, and chemotherapy; patients should be given advice about increased risk of pneumococcal infection. Prophylactic antibacterial therapy against pneumococcal infection (Table 2, section 5.1) should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Executive, Public Health Division 1 (Tel (0131) 244 2501).

**Choice of vaccine** Children under 2 years at increased risk of pneumococcal infection (see list above) should receive pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday (see below). Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months

### Mumps vaccine

- **Single antigen vaccine**
  - No longer available in the UK

- **Combined vaccines**
  - See MMR Vaccine

### Pertussis vaccine

**Pertussis vaccine** is given as a combination preparation containing other vaccines (see Diphtheria-containing Vaccines). Acellular vaccines are derived from highly purified components of *Bordetella pertussis*. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule, section 14.1), given at intervals of 1 month from the age of 2 months.

A booster dose of an acellular pertussis-containing vaccine should be given 3 years after the primary course.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed). Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not currently recommended in individuals over 10 years of age.

**Cautions** Section 14.1.

**Contra-indications** Section 14.1.

**Side-effects** See also section 14.1. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses (see below).

The vaccine should not be withheld from children with a history to a preceding dose of:

- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

These side-effects were associated with whole-cell pertussis vaccine.

### Combined vaccines

Combined vaccines, see under Diphtheria-containing vaccines

---

**Note** Two doses of 0.5 mL separated by an interval of 3 months can be given to children under 5 years of age when first vaccinated, should be given a booster dose after 2–3 years.

**Note** Two doses of 0.5 mL separated by an interval of 3 months can be given to CHILD 3 months–2 years [unlicensed] but antibody response may be suboptimal.
in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 7-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years and adults who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

Revaccination In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

PNEUMOCOCCAL VACCINE

Indications immunisation against pneumococcal infection

Cautions see section 14.1

Contra-indications see section 14.1

Side-effects see section 14.1; also Revaccination, above

Dose

● See under preparations

Pneumococcal polysaccharide vaccine

Pneumovax® II (Sanofi Pasteur) [PM]

Injection, polysaccharide from each of 23 capsular types of pneumococcus, net price 0.5-mL vial = £8.83

Dose by intramuscular or subcutaneous injection, ADULT and CHILD over 2 years, 0.5 mL, revaccination, see notes above

Pneumococcal polysaccharide conjugate vaccine (adsorbed)

Prevenar® (Wyeth) [PM]

Injection, polysaccharide from each of 7 capsular types of pneumococcus (conjugated to diphtheria toxin) adsorbed onto aluminium phosphate, net price 0.5-mL prefilled syringe = £34.50

Dose by intramuscular injection, CHILD 2 months–5 years, 0.5 mL (see notes above and Immunisation schedule, section 14.1)

Note Deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

The dose in the BNF may differ from that in product literature

Travel Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3-dose course of a preparation containing inactivated poliomyelitis vaccine. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria (low dose), tetanus and inactivated poliomyelitis vaccine. Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre (www.nathnac.org).

POLIOMYELITIS VACCINES

Indications immunisation against poliomyelitis

Cautions see section 14.1; also for live vaccine, interactions: Appendix 1 (vaccines)

Contra-indications see notes above and section 14.1

Side-effects see notes above and section 14.1

Dose

● See under preparations

Combined vaccines

See under Diphtheria-containing Vaccines

Inactivated (Salk) vaccine

Inactivated Poliomyelitis Vaccine (Non-proprietary) [PN]

IPV

Injection, inactivated suspension of suitable strains of poliomyelitis virus, types 1, 2, and 3, net price 0.5-mL prefilled syringe = £10.35

Excipients may include neomycin, polymyxin B and streptomycin

Dose by intramuscular injection, ADULT and CHILD over 2 months, 0.5 mL (see notes above)

Note Only combination vaccines are recommended for routine immunisation and boosters (see Immunisation schedule, section 14.1) and travel (see notes above)
Post-exposure management

Pre-exposure prophylaxis

embryo cells; vaccines are used for pre- and post-vaccinated in either human diploid cells or purified chick embryo cells, net price single-dose vial = £24.40

Rabies vaccine

Rabies vaccine contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and post-exposure prophylaxis.

Pre-exposure prophylaxis

Immunisation should be offered to those at high risk of exposure to rabies—laboratory staff who handle the rabies virus, those working in quarantine stations, animal handlers, veterinary surgeons and field workers who are likely to be bitten by infected wild animals, certain port officials, and bat handlers. Transmission of rabies by humans has not been recorded but it is advised that those caring for patients with the disease should be vaccinated.

Immunisation against rabies is also recommended where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk.

Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at continued risk. To ensure continued protection in persons at high risk (e.g. laboratory workers), the concentration of antirabies antibodies in plasma is used to determine the intervals between doses.

Post-exposure management

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the Health Protection Agency Virus Reference Department, Colindale, London (tel. (020) 8200 4400) or the Centre for Infections (tel. (020) 8200 6868), in Scotland from Health Protection Scotland (tel. (0141) 300 1100), in Northern Ireland from the Public Health Laboratory, Belfast City Hospital (tel. (028) 9032 9241).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a patient has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine, given on day 0 and day 3, are likely to be sufficient. Rabies immunoglobulin is not necessary in such cases.

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and 30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin (section 14.5) is given on day 0. The immunisation course can be discontinued if it is proved that the individual was not at risk.

Rabies Vaccine

Indications

immunisation against rabies

Cautions

see section 14.1

Contra-indications

see section 14.1; but see also Post-exposure Management in notes above

Side-effects

see section 14.1; also reported paresis

Dose

- Pre-exposure prophylaxis, by intramuscular injection in deltoid region or anterolateral thigh in infants, 1 mL on days 0, 7, and 21 or 28; for those at continued risk give a single reinforcing dose 1 year after the primary course is completed and booster doses every 3–5 years; for those at intermittent risk give booster doses every 2–5 years
- Post-exposure prophylaxis, by intramuscular injection in deltoid region or anterolateral thigh in infants, 1 mL (see notes above)

Rabipur® (Novartis Vaccines)

Injection, powder for reconstitution, freeze-dried inactivated Wister rabies virus strain PM/WI 38 1503-3M cultivated in human diploid cells, net price single-dose vial with syringe containing diluent = £24.40

Excipients include neomycin and polymyxin B

Rotavirus vaccine

Rotavirus vaccine a live, oral vaccine is licensed for immunisation of infants over 6 weeks of age for protection against gastro-enteritis caused by rotavirus infection. The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; the vaccine should be used with caution in those with immunosup-
pressed close contacts. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

**ROTAVIRUS VACCINE**

**Indications** immunisation against gastro-enteritis caused by rotavirus

**Cautions** see section 14.1; also diarrhoea or vomiting (postpone vaccination); immunosuppressed close contacts (see notes above); interactions: Appendix 1 (vaccines)

**Contra-indications** see section 14.1; also predisposition to, or history of, intussusception

**Side-effects** see section 14.1

- By mouth, **CHILD** over 6 weeks, 2 doses of 1 mL separated by an interval of at least 4 weeks; course should be completed before 24 weeks of age (preferably before 16 weeks)

**Rotarix** (GSK) ▼ ▼ ➯

**Oral suspension**, powder for reconstitution, live attenuated rotavirus (RIX4414 strain), net price single-dose vial (with oral syringe containing diluent) = £41.38

**Rubella vaccine**

A combined measles, mumps and rubella vaccine (MMR vaccine) aims to eliminate rubella (German measles) and congenital rubella syndrome. MMR vaccine is used for childhood vaccination as well as for vaccinating adults (including women of child-bearing age) who do not have immunity against rubella (see MMR vaccine, p. 672)

**Single antigen vaccine** No longer available in the UK, the combined live measles, mumps and rubella vaccine is a suitable alternative

**Combined vaccines** see MMR vaccine

**Smallpox vaccine**

Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Health Protection Agency (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.dh.gov.uk

**Tetanus Vaccines**

**Tetanus vaccine** contains a cell-free purified toxin of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine (see Diphtheria-containing Vaccines), with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school. (see Immunisation schedule, section 14.1).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and inactivated poliomyelitis vaccine are given with an interval of 1 month between doses (see Diphtheria-containing Vaccines).

**Cautions** See also section 14.1. When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Travel recommendations see section 14.6.

**Contra-indications** See section 14.1.

**Side effects** See section 14.1.

**Wounds** Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or masure) or show much devitalised tissue or are septic or have compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For clean wounds: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need).

- For tetanus-prone wounds: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin (section 14.5) given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the...
risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

**Combined vaccines**
See Diphtheria-containing Vaccines

---

**Tick-borne encephalitis vaccine**

Tick-borne encephalitis vaccine contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel, section 14.6). Those working, walking or camping in warm forested areas of Central and Eastern Europe and Scandinavia, particularly from April to October when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

---

**TICK-BORNE ENCEPHALITIS VACCINE, INACTIVATED**

- **Indications** immunisation against tick-borne encephalitis
- **Cautions** see section 14.1
- **Side-effects** see section 14.1
- **Dose**
  - Initial immunisation, by intramuscular injection in deltoid region or anterolateral thigh in infants, ADULT and CHILD over 16 years, 3 doses each of 0.5 mL, second dose after 1–3 months and third dose after further 5–12 months; CHILD 1–16 years 3 doses of 0.25 mL, second dose after 1–3 months and third dose after further 5–12 months; ELDERLY over 60 years and immunocompromised (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
- **Note** To achieve more rapid protection, second dose may be given 14 days after first dose
- **Booster doses** give first dose within 3 years after initial course completed, then every 3–5 years

**TicoVac® (MASTA)**
Injection, suspension, formaldehyde-inactivated Neudörfl tick-borne encephalitis virus strain (cultivated in chick embryo cells) adsorbed onto hydrated aluminium hydroxide, net price 0.25–mL prefilled syringe = £9.93, 0.5-mL prefilled syringe = £32.00

**Excipients** include gentamicin and neomycin

---

**Typhoid vaccines**

Typhoid vaccine is available as Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and as live attenuated *Salmonella typhi* for oral use.

Typhoid immunisation is advised for
- **travellers to areas where typhoid is endemic, especially if staying with or visiting local people**
- **travellers to endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely**
- **laboratory personnel who, in the course of their work, may be exposed to *Salmonella typhi***

Typhoid vaccination is not a substitute for scrupulous personal hygiene (see p. 685).

Capsular polysaccharide typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Booster doses are needed every 3 years on continued exposure.

Oral typhoid vaccine is a live attenuated vaccine contained in an enteric-coated capsule. 3 doses of one capsule taken on alternate days, provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to *Salmonella typhi*, but occasional travellers require further courses at intervals of 1 year.

**Interactions** Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:
- **Antibacterials** should be avoided for 3 days before and after oral typhoid vaccination;
- **Mefloquine** should be avoided for at least 12 hours before or after oral typhoid; vaccination with oral typhoid should preferably be completed at least 3 days before the first dose of mefloquine;
- For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

---

**TYPHOID VACCINE**

- **Indications** immunisation against typhoid fever
- **Cautions** see section 14.1; **interactions**: see above and Appendix 1 (vaccines)
- **Contra-indications** section 14.1; also for oral vaccine, acute gastro-intestinal illness
- **Side-effects** section 14.1
- **Dose**
  - **See under preparations**

**Typhoid polysaccharide vaccine for injection**

**Typherix® (GSK)**
Injection, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.93

**Dose** by intramuscular injection, 0.5 mL at least 2 weeks before potential exposure to typhoid infection; CHILD under 2 years (see notes above)

**Typhim Vi® (Sanofi Pasteur)**
Injection, Vi capsular polysaccharide typhoid vaccine, 50 micrograms/mL virulence polysaccharide antigen of formaldehyde-inactivated *Salmonella typhi*, net price 0.5-mL prefilled syringe = £9.49

**Dose** by intramuscular injection, 0.5 mL, at least 2 weeks before potential exposure to typhoid infection CHILD under 2 years (see notes above)

**Polysaccharide vaccine with hepatitis A vaccine**
See Hepatitis A Vaccine
Typhoid vaccine, live (oral)

**Vivotif® (MASTA)**
Capsules, e/c, live attenuated Salmonella typhi (Ty21a), net price 3-cap pack = £14.77. Label: 23, 25, counselling, administration

**Dose**
- **ADULT** and **CHILD** over 6 years, 1 capsule on days 1, 3, and 5

**Counselling**
Swallow as soon as possible after placing in mouth with a cold or lukewarm drink; it is important to store capsules in a refrigerator

Varicella–zoster vaccine

Varicella–zoster vaccine (live) is licensed for immunisation against varicella in seronegative individuals. It is not recommended for routine use in children but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections. The Department of Health recommends varicella–zoster vaccine for seronegative healthcare workers who come into direct contact with patients. Those with a history of chickenpox or shingles can be considered immune, but healthcare workers with a negative or uncertain history should be tested.

Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:
- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with susceptible individuals (see notes above);

- varicella-susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Yellow fever vaccine

Live yellow fever vaccine is indicated for those travelling or living in areas where infection is endemic (see p. 684) and for laboratory staff who handle the virus or who handle clinical material from suspected cases. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Very rare, vaccine-associated adverse effects have been reported, such as viscerotropic disease (yellow fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually have occurred after the first dose of yellow fever vaccine in those with no previous immunity.

Pregnancy and breast-feeding

Live yellow fever vaccine should not be given during pregnancy but if a significant risk of exposure cannot be avoided then vaccination should be delayed to the third trimester if possible (but the need for immunisation usually outweighs risk to the fetus). Vaccination should be considered in breast-feeding women when there is a real risk to the mother from yellow fever disease.

**VARICELLA-ZOSTER VACCINE**

**Indications**
immunisation against varicella infection

(see notes above)

**Cautions**
see section 14.1; also post-vaccination close-contact with susceptible individuals (see notes above);

**interactions:** Appendix 1 (vaccines)

**Contra-indications**
see section 14.1; also pregnancy (avoid pregnancy for 3 months after vaccination)

**Side-effects**
see section 14.1; also varicella-like rash; rarely thrombocytopenia

**Dose**
- See under preparations

**Varivax® (Sanofi Pasteur)**
Injection powder for reconstitution, live attenuated varicella-zoster virus (Oka/Merck strain) propagated in human diploid cells, net price 0.5-mL vial (with diluent) = £32.14

**Excipients**
include gelatin and neomycin

**Dose**
- by intramuscular or subcutaneous injection into deltoid region (or higher anterolateral thigh in children), ADULT and CHILD over 13 years (see notes above), 2 doses of 0.5 mL separated by 4–8 weeks; CHILD 1–13 years (but see notes above), 0.5 mL as a single dose (2 doses separated by 12 weeks in children with asymptomatic HIV infection)

**Yellow Fever Vaccine, Live**

**Yel(live)**
Injection, powder for reconstitution, live, attenuated 17D-204 strain of yellow fever virus, cultivated in chick embryos; single dose vial with syringe containing 0.5 mL diluent

Available (only to designated Yellow Fever Vaccination centres) as Stamari

in human diploid cells, net price 0.5-mL vial (with diluent) = £32.14

**Excipients**
include gelatin and neomycin

**Dose**
- by intramuscular or subcutaneous injection into deltoid region (or higher anterolateral thigh in children), ADULT and CHILD over 13 years (see notes above), 2 doses of 0.5 mL separated by 4–8 weeks; CHILD 1–13 years (but see notes above), 0.5 mL as a single dose (2 doses separated by 12 weeks in children with asymptomatic HIV infection)
**14.5 Immunoglobulins**

Human immunoglobulins have replaced immunoglobulins of animal origin (antiserum) which were frequently associated with hypersensitivity. Injection of immunoglobulins produces immediate protection lasting for several weeks.

Immunoglobulins are produced from pooled human plasma or serum, and are tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2)

The two types of human immunoglobulin preparation are **Normal immunoglobulin** and **Specific immunoglobulins**.

Further information about immunoglobulins is included in *Immunisation against Infectious Disease* (see section 14.1), in the Health Protection Agency’s Immunoglobulin Handbook [www.hpa.org.uk](http://www.hpa.org.uk), and in the Department of Health’s *Clinical Guidelines for Immunoglobulin use* [www.dh.gov.uk](http://www.dh.gov.uk).

**Availability** Normal immunoglobulin is available from Health Protection and microbiology laboratories only for contacts and the control of outbreaks. It is available commercially for other purposes.

**Specific immunoglobulins** are available from Health Protection and microbiology laboratories with the exception of **tetanus immunoglobulin** which is distributed through BPL to hospital pharmacies or blood transfusion departments and is also available to general medical practitioners. **Rabies immunoglobulin** is available from the Specialist and Reference Microbiology Division, Health Protection Agency. The large amounts of **hepatitis B immunoglobulin** required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Blood Transfusion Service. **Tetanus immunoglobulin** is distributed by the Blood Transfusion Service to hospitals and general medical practitioners on demand.

**Normal immunoglobulin**

Human **normal immunoglobulin** (‘HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains antibody to measles, mumps, varicella, hepatitis A, and other viruses that are currently prevalent in the general population.

**Cautions and side-effects** Normal immunoglobulin is **contra-indicated** in patients with known class-specific antibody to immunoglobulin A (IgA). **CHM advice**

Intravenous normal immunoglobulin may very rarely induce thromboembolic events and should be used with caution in those with risk factors for arterial or venous thrombotic events and in obese individuals.

Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

Side-effects of immunoglobulins include malaise, chills, fever, and rarely anaphylaxis.

**Uses** Normal immunoglobulin is administered by intramuscular injection for the protection of susceptible contacts against **hepatitis A** virus (infectious hepatitis), **measles** and, to a lesser extent, **rubella**.

Special formulations of immunoglobulins for intravenous administration are available for **replacement therapy** for patients with congenital agammaglobulinaemia and hypogammaglobulinaemia, for the treatment of idiopathic thrombocytopenic purpura and Kawasaki syndrome, and for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin may also be given intramuscularly or subcutaneously for replacement therapy, but intravenous formulations are normally preferred.

Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome in preference to plasma exchange.

**Hepatitis A** Hepatitis A vaccine is preferred for individuals at risk of infection (see p. 668) including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers but it may be indicated for immunocompromised patients if their antibody response to vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is of value in the prevention of infection in close contacts of confirmed cases of hepatitis A where there has been a delay of more than 7 days in identifying contacts, or for close contacts at high risk of severe disease.

**Measles** Intramuscular normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Children and adults with compromised immunity who have come into contact with measles should receive intramuscular normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days. For individuals receiving intravenous immunoglobulin, 100 mg/kg given within 3 weeks before measles exposure should prevent measles. Intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women;
- infants under 9 months.

Further advice should be sought from the Centre for Infections, Health Protection Agency (tel. (020) 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given MMR vaccine (section 14.4) for prophylaxis following exposure to measles.

**Rubella** Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune
contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. It should be used only if termination of pregnancy would be unacceptable to the pregnant woman, when it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin. For routine prophylaxis, see MMR vaccine (p. 672).

**For intramuscular use**

**Normal Immunoglobulin**

Normal immunoglobulin injection. 250-mg vial; 750-mg vial

Dose by deep intramuscular injection, to control outbreaks of hepatitis A (see notes above), 500 mg; CHILD under 10 years 250 mg

Measles prophylaxis, CHILD under 1 year 250 mg, 1–2 years 500 mg, 3 years and over 750 mg

Rubella in pregnancy, prevention of clinical attack, 750 mg

Available from the Centre for Infections and other regional Health Protection Agency offices (for contacts and control of outbreaks only, see above)

**For subcutaneous use**

Subcuvia® (Baxter) (NB)

Normal immunoglobulin injection, net price 5-mL vial = £22.56; 10-mL vial = £28.50

Dose by subcutaneous injection, antibody deficiency syndromes, consult product literature

Note May be administered by intramuscular injection (if subcutaneous route not possible) but not for patients with thrombocytopenia or other bleeding disorders

Subgam® (BPL) (NB)

Normal immunoglobulin injection, net price 250-mg vial = £11.20, 750-mg vial = £28.50, 1.5-g vial = £57.00

Dose by subcutaneous injection, antibody deficiency syndromes, consult product literature

Note May be administered by intramuscular injection (if subcutaneous route not possible) but not for patients with thrombocytopenia or other bleeding disorders

Subcuvia® (BPL) (NB)

Normal immunoglobulin injection, net price 3-mL vial = £17.76, 10-mL vial = £28.50, 20-mL vial = £11.8.40

Dose by subcutaneous injection, antibody deficiency syndromes, consult product literature

**For intravenous use**

**Normal Immunoglobulin for Intravenous Use**

Brands include Flabogamma 5% (0.5 g, 2.5 g, 5 g, 10 g); Gammagard S/D (0.5 g, 2.5 g, 5 g, 10 g); Octagam (5%/—2.5 g, 5 g, 10 g, 10%—5 g, 10 g); Privigen (5 g, 10 g, 20 g); Sandoglobulin NF Liquid (6 g, 12 g); Vigam S (2.5 g, 5 g); Vigam Liquid (2.5 g, 5 g, 10 g)

Dose consult product literature

**Specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected donors with high levels of the specific antibody required.

Although a hepatitis B vaccine is now available for those at high risk of infection, specific hepatitis B immunoglobulin (‘HBIG’) is available for use in association with hepatitis B vaccine for the prevention of infection in laboratory and other personnel who have been accidentally inoculated with hepatitis B virus, and in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see Hepatitis B Vaccine, p. 669).

Following exposure of an unimmunised individual to an animal in or from a high-risk country, the site of the bite should be washed with soapy water and specific rabies immunoglobulin of human origin administered; as much of the dose as possible should be injected in and around the cleansed wound. Rabies vaccine should also be given (for details see Rabies Vaccine, p. 677).

For the management of tetanus-prone wounds, tetanus immunoglobulin of human origin (‘HTIG’) should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine (section 14.4). Tetanus immunoglobulin, together with metronidazole (section 5.11) and wound cleansing, should also be used for the treatment of established cases of tetanus.

Varicella–zoster immunoglobulin (VZIG) is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to varicella–zoster virus and who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks’ gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunosuppressed individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone: children 2 mg/kg daily for at least 1 week or 1 mg/kg daily for 1 month; adults about 40 mg daily for more than 1 week.

Important: for full details consult Immunisation against Infectious Disease. Varicella–zoster vaccine is available—see section 14.4.

**Hepatitis B**

**Hepatitis B Immunoglobulin**

See notes above

Dose by intramuscular injection (as soon as possible after exposure; ideally within 12 hours, but no later than 7 days after exposure), ADULT and CHILD over 10 years 500 units; CHILD under 5 years 200 units, 5–9 years 300 units, NEONATE 200 units as soon as possible after birth; for full details consult Immunisation against Infectious Disease

Available from selected Health Protection Agency and NHS laboratories (except for Transplant Centres, see p. 681), also available from BPL

Note Hepatitis B immunoglobulin for intravenous use is available from BPL on a named-patient basis

**Rabies**

Rabies Immunoglobulin

(Antirabies Immunoglobulin Injection)

See notes above

Dose 20 units/kg by infiltration in and around the cleansed wound; if wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

Available from Specialist and Reference Microbiology Division, Health Protection Agency (also from BPL)
**Anti-D (Rh) immunoglobulin**

Anti-D (Rh) immunoglobulin is available to prevent a rhesus-negative mother from forming antibodies to fetal rhesus-positive cells which may pass into the maternal circulation. The objective is to protect any subsequent child from the hazard of haemolytic disease of the newborn.

Anti-D immunoglobulin should be administered following any sensitising event (e.g. abortion, miscarriage and birth); it should be injected within 72 hours of the episode but even if a longer period has elapsed it may still give protection and should be administered. The dose of anti-D immunoglobulin is determined according to the level of exposure to rhesus-positive blood.

For routine antenatal prophylaxis (see also NICE guidance below), two doses of at least 500 units of anti-D immunoglobulin should be given, the first at 28 weeks' gestation and the second at 34 weeks; alternatively a single dose of 1500 units given between 28 and 30 weeks gestation can be used.

**NICE guidance**

Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008)

Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.

Use of routine antenatal anti-D prophylaxis should not be affected by previous anti-D prophylaxis for a sensitising event early in the same pregnancy. Similarly, postpartum anti-D prophylaxis should not be affected by previous routine antenatal anti-D prophylaxis or by antenatal anti-D prophylaxis for a sensitising event.

**Note**

MMR vaccine may be given in the postpartum period with anti-D (Rh) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.
episode (after 12 weeks, 1500 units) immediately or within 72 hours
Antenatal prophylaxis, by intramuscular or intravenous injection, 1500 units given at week 28 of pregnancy, if infant rhesus positive; a further dose is still needed immediately or within 72 hours of delivery
Following Rh (D) incompatible blood transfusion, by intravenous injection, 50 units per mL transfused rhesus-positive blood (or 100 units per mL of erythrocyte concentrate), if intramuscular route used give in divided doses over several days
Following Rh (D) incompatible thrombocyte transfusion in rhesus-negative female child or woman of child-bearing age, by intravenous injection, 600 units
Autoimmune (idiopathic) thrombocytopenic purpura, consult product literature
Note Intravenous route used for patients with bleeding disorders

Interferons
Interferon gamma-1b is licensed to reduce the frequency of serious infection in chronic granulomatous disease and in severe malignant osteopetrosis.

INTERFERON GAMMA-1b
(Innate interferon)
Indications see notes above
Cautions severe hepatic impairment (Appendix 2), renal impairment (Appendix 3); seizure disorders (including seizures associated with fever); cardiac disease (including ischaemia, congestive heart failure, and arrhythmias); monitor before and during treatment; haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis; avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response); pregnancy (Appendix 4); breast-feeding (Appendix 5);
interactions: Appendix 1 (interferons)
Driving May impair ability to drive or operate machinery; effects may be enhanced by alcohol
Side-effects nausea, vomiting; headache, fatigue, fever; myalgia, arthralgia; rash, injection-site reactions; rarely confusion and systemic lupus erythematosus; also reported, neutropenia, thrombocytopenia, and raised liver enzymes
Dose
• See under Preparations

immunokin® (Boehringer Ingelheim) 
Injection recombinant human interferon gamma-1b 200 micrograms/mL, net price 0.5-mL vial = £88.00
Dose by subcutaneous injection, 50 micrograms/m 2 times a week; patients with body surface area of 0.5 m 2 or less, 1.5 micrograms/kg 3 times a week; not yet recommended for children under 6 months with chronic granulomatous disease

14.6 International travel

Note For advice on malaria chemoprophylaxis, see section 5.4.1.
No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date). Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.
Travellers to areas that have a high incidence of poliomyelitis or tuberculosis should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised adults may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine (see p. 676). BCG immunisation (see p. 664) is recommended for travellers aged under 35 years 1 proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 2; it should preferably be given three months or more before departure.

Yellow fever immunisation (see p. 680) is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas, whilst other countries require a certificate from all entering travellers (consult the Department of Health handbook, Health Information for Overseas Travel, www.dh.gov.uk).
Immunisation against meningococcal meningitis is recommended for a number of areas of the world (for details, see p. 673).
Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine (see p. 668) is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised (see p. 681). Special care must also be taken with food hygiene (see below).
Hepatitis B vaccine (see p. 669) is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may place themselves at risk by their sexual behaviour when abroad.
Prophylactic immunisation against rabies (see p. 677) is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.
Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and inactivated poliomyelitis vaccine (see p. 665), even if they have received 5 doses of a tetanus-containing vaccine previously.
Typhoid vaccine (see p. 679) is indicated for travellers to those countries where typhoid is endemic but the vaccine is no substitute for personal precautions (see below).

1 There is inadequate evidence of protection by BCG vaccine in adults aged over 35 years; however, vaccination is recommended for healthcare workers irrespective of age because of the increased risk to them or their patients
2 List of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.hpa.org.uk
There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine (see p. 665) may be considered for backpackers and those travelling to situations where the risk is greatest (e.g., refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene (see below).

Advice on diphtheria (see p. 666), on Japanese encephalitis (vaccine available on named-patient basis from Sanofi Pasteur and MASTA) and on tick-borne encephalitis (see p. 679) is included in Health Information for Overseas Travel, see below.

Food hygiene In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled, or treated with sterilising tablets should be used for drinking.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

1. Japanese encephalitis vaccine not prescribable on the NHS; health authorities may investigate circumstances under which vaccine prescribed
15 Anaesthesia

15.1 General anaesthesia

15.1.1 Intravenous anaesthetics

15.1.2 Inhalational anaesthetics

15.1.3 Antimuscarinic drugs

15.1.4 Sedative and analgesic peri-operative drugs

15.1.4.1 Anxiolytics and neuroleptics

15.1.4.2 Non-opioid analgesics

15.1.4.3 Opioid analgesics

15.1.5 Neuromuscular blocking drugs

15.1.6 Drugs for reversal of neuromuscular blockade

15.1.7 Antagonists for central and respiratory depression

15.1.8 Drugs for malignant hyperthermia

Note: The drugs in section 15.1 should be used only by experienced personnel and where adequate resuscitation equipment is available.

Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation (section 15.1.2) or with an intravenously administered drug (section 15.1.1); anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics (section 15.1.4), usually short-acting opioids, are also used. The use of neuromuscular blocking drugs (section 15.1.5) necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases (section 15.1.6) can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists (section 15.1.7) can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local anaesthetic (section 15.2) can be used to reduce pain at the injection site. Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated patients and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Surgery and long-term medication The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use (section 6.3.2) may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate post-operative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include antiepileptics, antiparkinsonian drugs, antipsychotics, anxiolytics, bronchodilators, cardiovas-
cular drugs (but see potassium-sparing diuretics, angiotensin-converting enzyme inhibitors, and angiotensin-II receptor antagonists below), glaucoma drugs, immunosuppressants, drugs of dependence, and thyroid or antithyroid drugs. Expert advice is required for patients receiving antivirals for HIV infection. For general advice on surgery in diabetic patients see section 6.1.1.

Patients taking aspirin or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether aspirin or the anticoagulant should be stopped or replaced with heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives (see Surgery, section 7.3.1 for details); for advice on hormone replacement therapy, see section 6.4.1.1. If antidepresants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. In view of their hazardous interactions MAOIs should normally be stopped 2 weeks before surgery. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Angiotensin-converting enzyme (ACE) inhibitors and angiotensin-II receptor antagonists can be associated with severe hypotension after induction of anaesthesia; these drugs may need to be discontinued 24 hours before surgery.

**Anaesthesia and driving**

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving afterwards. For intravenous benzodiazepines and for a short general anaesthetic the risk extends to the morning after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**Prophylaxis of acid aspiration**

Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) is an important complication of general anaesthesia, particularly in obstetrics and during emergency surgery, and requires prophylaxis against acid aspiration. Prophylaxis is also needed in those with gastro-oesophageal reflux disease and in circumstances where gastric emptying may be delayed.

An H-receptor antagonist (section 1.3.1) or a proton pump inhibitor (section 1.3.5) such as omeprazole may be used before surgery to increase the pH and reduce the volume of gastric fluid. They do not affect the pH of fluid already in the stomach and this limits their value in emergency procedures; oral H-receptor antagonists can be given 1–2 hours before the procedure but omeprazole must be given at least 12 hours earlier. Antacids are frequently used to neutralise the acidity of the fluid already in the stomach; ‘clear’ (non-particulate) antacids such as sodium citrate are preferred. Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

**Gas cylinders**

Each gas cylinder bears a label with the name of the gas contained in the cylinder. The name or chemical symbol of the gas appears on the shoulder of the cylinder and is also clearly and indelibly stamped on the cylinder valve.

The colours on the valve end of the cylinder extend down to the shoulder; in the case of mixed gases the colours for the individual gases are applied in four segments, two for each colour.

Gas cylinders should be stored in a cool well-ventilated room, free from flammable materials.

**No lubricant of any description should be used on the cylinder valves.**

**Anaesthesia, sedation, and resuscitation in dental practice**

For details see A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in Conscious Sedation in the Provision of Dental Care; report of an Expert Group on Sedation for Dentistry (commissioned by the Department of Health), 2003. Both documents are available at www.dh.gov.uk.

Guidance is also included in Standards for Dental Professionals, London, General Dental Council, May 2005 (and as amended subsequently), and Conscious Sedation in Dentistry: Dental Clinical Guidance, Scottish Dental Effectiveness Programme, May 2006.

**15.1.1 Intravenous anaesthetics**

Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time and can cause apnoea and hypotension, and so adequate resuscitative facilities must be available. They are contra-indicated if the anaesthetist is not confident of being able to maintain the airway (e.g. in the presence of a tumour in the pharynx or larynx). Extreme care is required in surgery of the mouth, pharynx, or larynx and in patients with acute circulatory failure (shock) or fixed cardiac output.

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug (section 15.1.3) or short-acting opioid (section 15.1.4.3).

**Total intravenous anaesthesia**

This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air. Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movements. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations in ventilated adult patients.

**Anaesthesia and driving**

See section 15.1.
Barbiturates

Thiopental sodium (thiopentone sodium) is used widely for induction of anaesthesia, but it has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiorespiratory depression can occur.

Awakening from a moderate dose of thiopental is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect and recovery is much slower.

**THIOPENTAL SODIUM**
(Thiopentone sodium)

**Indications** induction of general anaesthesia; anaesthesia of short duration; reduction of raised intracranial pressure if ventilation controlled; status epilepticus (see also section 4.8.2)

**Cautions** see notes above; cardiovascular disease; reconstituted solution is highly alkaline—extravasation causes tissue necrosis and severe pain; avoid intra-arterial injection; hepatic impairment (Appendix 2); pregnancy (Appendix 4); interactions: Appendix 1 (anaesthetics, general)

**Contra-indications** see notes above; acute porphyria (section 9.8.2); myotonic dystrophy; breast-feeding (Appendix 5)

**Side-effects** hypotension, arrhythmias, myocardial depression, laryngeal spasm, cough, sneezing, hypersensitivity reactions, rash, injection-site reactions; excessive doses associated with hypothermia and profound cerebral impairment

**Dose**
- Induction of general anaesthesia, by slow intravenous injection usually as a 2.5% (25 mg/mL) solution, ADULT over 18 years, fit and premedicated, initially 100–150 mg (reduced in elderly or debilitated) over 10–15 seconds (longer in elderly or debilitated), followed by further quantity if necessary according to response after 30–60 seconds; or up to 4 mg/kg (max. 500 mg); CHILD 1 month–18 years, initially up to 4 mg/kg, then 1 mg/kg repeated as necessary (max. total dose 7 mg/kg)
- Raised intracranial pressure, by slow intravenous injection, 1.5–3 mg/kg, repeated as required
- Status epilepticus (only if other measures fail, see section 4.8.2), by slow intravenous injection as a 2.5% (25 mg/mL) solution, ADULT over 18 years, 75–125 mg as a single dose; CHILD 1 month–18 years, initially up to 4 mg/kg by slow intravenous injection, then up to 8 mg/kg/hour by continuous intravenous infusion, adjusted according to response

**Injection**, powder for reconstitution, thiopental sodium, net price 500-mg vial = £3.06

Other intravenous anaesthetics

Propofol is associated with rapid recovery without a hangover effect and is widely used. There is sometimes pain on intravenous injection, which can be reduced by intravenous lidocaine. Significant extraneous muscle movements may occur. Convulsions, anaphylaxis, and delayed recovery from anaesthesia can occur after propofol administration; since the onset of convulsions can be delayed the CSM has advised special caution after day surgery. Propofol is associated with bradycardia, occasionally profound; intravenous administration of an antimuscarinic drug may prevent this.

**Etomidate** is an induction agent associated with rapid recovery without a hangover effect. It causes less hypotension than thiopental and propofol during induction. It produces a high incidence of extraneous muscle movement, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction. Pain on injection can be reduced by injecting into a larger vein or by giving an opioid analgesic just before induction. Etomidate can suppress adrenocortical function, particularly during continuous administration, and it should not be used for maintenance of anaesthesia.

**Ketamine** is used rarely. It has good analgesic properties at sub-anaesthetic dosage and is used under specialist supervision in palliative care for pain that is unresponsive to standard treatment. Ketamine causes less hypotension than thiopental and propofol during induction. It is used mainly for paediatric anaesthesia, particularly when repeated administration is required (such as for serial burns dressings); recovery is relatively slow and there is a high incidence of extraneous muscle movements. The main disadvantage of ketamine is the high incidence of hallucinations, nightmares, and other transient psychotonic effects; these can be reduced by a benzodiazepine such as diazepam or midazolam. Ketamine also has abuse potential and can itself cause dependence.

**ETOMIDATE**

**Indications** induction of anaesthesia

**Cautions** see under Intravenous Anaesthetics and notes above; hepatic impairment (Appendix 2); avoid in acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (anaesthetics, general)

**Contra-indications** see under Intravenous Anaesthetics and notes above

**Side-effects** see notes above; also coughing, hiccups, shivering, allergic reaction (including bronchospasm and anaphylaxis); respiratory depression, arrhythmia, and convulsions also reported

**Dose**
- See under preparations

**Etomidate-Lipuro®** (Braun) (†)

**Injection** (emulsion), etomidate 2 mg/mL, net price 10-mL amp = £1.53

**Dose** ADULT and CHILD over 6 months, by slow intravenous injection, 150–300 micrograms/kg; CHILD under 10 years may need up to 400 micrograms/kg; ELDERLY 150–200 micrograms/kg

**Hypnomidate®** (Janssen-Cilag) (†)

**Injection**, etomidate 2 mg/mL, net price 10-mL amp = £1.47

**Excipients** include propylene glycol (see Excipients, p. 2)

**Dose** ADULT and CHILD, by slow intravenous injection, 300 micrograms/kg max. total dose 60 mg; ELDERLY 150–200 micrograms/kg; max. total dose 60 mg

**KETAMINE**

**Indications** induction and maintenance of anaesthesia (but rarely used)
Cautions see under Intravenous Anaesthetics and notes above; increased cerebrospinal fluid pressure; predisposition to hallucinations or nightmares; pregnancy (Appendix 4); interactions: Appendix 1 (anaesthetics, general)

Contra-indications see under Intravenous Anaesthetics; hypertension, pre-eclampsia or eclampsia, severe cardiac disease, stroke; raised intracranial pressure; head trauma; acute porphyria (section 9.8.2)

Side-effects see notes above; also tachycardia, hypertension, arrhythmias, hypotension, bradycardia; increased salivation, laryngospasm; anxiety, insomnia; diaphoria, nystagmus, raised intra-ocular pressure; rashes, injection-site reactions; anaphylaxis also reported

Dose

- By intramuscular injection, short procedures, initially 6.5–13 mg/kg, adjusted according to response (10 mg/kg usually produces 12–25 minutes of surgical anaesthesia)
- By intravenous injection over at least 60 seconds, short procedures, initially 1–4.5 mg/kg, adjusted according to response (2 mg/kg usually produces 5–10 minutes of surgical anaesthesia)
- By intravenous infusion of a solution containing 1 mg/mL, longer procedures, induction, total dose of 0.5–2 mg/kg; maintenance, 10–45 micrograms/kg/minute, rate adjusted according to response

Ketalar® (Pfizer) ℜ

Injection, ketamine (as hydrochloride) 10 mg/mL, net price 20-mL vial = £4.22, 50 mg/mL, 10-mL vial = £8.77, 100 mg/mL, 10-mL vial = £16.10

Note For intravenous injection, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9% or Water for Injections

PROPOFOL

Indications see under dose

Cautions see under Intravenous Anaesthetics and notes above; cardiac impairment; respiratory impairment; elderly; hypovolaemia; epilepsy; hypotension; raised intracranial pressure; monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days; hepatic impairment; renal impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (anaesthetics, general)

Contra-indications see notes above; sedation of ventilated children under 17 years in intensive care (risk of potentially fatal effects including metabolic acidosis, cardiac failure, rhabdomyolysis, hyperlipidaemia, and hepatomegaly)

Side-effects see notes above; also hypotension, tachycardia, flushing; transient apnoea, hyperventilation, coughing, and hiccup during induction; headache; less commonly thrombosis, phlebitis; rarely arrhythmia, headache, vertigo, shivering, euphoria; very rarely pancreatitis, pulmonary oedema, sexual disinhibition, and discoloration of urine; serious and sometimes fatal side-effects reported with prolonged infusion of doses exceeding 5 mg/kg/hour, including metabolic acidosis, rhabdomyolysis, hyperkalaemia, and cardiac failure, dystonia and dyskinesia also reported

Dose

- 1% injection
- Induction of anaesthesia, by intravenous injection or infusion, 1.5–2.5 mg/kg (1–1.5 mg in those over 55 years) at a rate of 20–40 mg every 10 seconds until response; CHILD over 1 month, administer slowly until response (usual dose in child over 8 years 2.5 mg/kg, may need more in younger child e.g. 2.5–4 mg/kg)
- Maintenance of anaesthesia, by intravenous infusion, 4–12 mg/kg/hour or by intravenous injection, 25–50 mg repeated according to response; CHILD over 1 month, by intravenous infusion, 9–15 mg/kg/hour
- Sedation of ventilated patients in intensive care, by intravenous infusion, ADULT and CHILD over 17 years, 0.3–4 mg/kg/hour
- Sedation for surgical and diagnostic procedures, ADULT and CHILD over 17 years, initially by intravenous injection over 1–5 minutes, 0.5–1 mg/kg; maintenance, by intravenous infusion, 1.5–4.5 mg/kg/hour (additionally, if rapid increase in sedation required, by intravenous injection, 10–20 mg); patients over 55 years may require lower dose

- 2% injection
- Induction of anaesthesia, by intravenous infusion, 1.5–2.5 mg/kg (1–1.5 mg in those over 55 years) at a rate of 20–40 mg every 10 seconds; CHILD over 3 years, administer slowly until response (usual dose in child over 8 years 2.5 mg/kg, may need more in younger child e.g. 2.5–4 mg/kg)
- Maintenance of anaesthesia, by intravenous infusion, 4–12 mg/kg/hour; CHILD over 3 years, by intravenous infusion, 9–15 mg/kg/hour
- Sedation in intensive care, by Intravenous infusion, ADULT and CHILD over 17 years, 0.3–4 mg/kg/hour

Propofol (Non-proprietary) ℜ

1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £2.33, 50-mL bottle = £5.82, 100-mL bottle = £11.64
2% injection (emulsion), propofol 20 mg/mL, net price 50-mL vial = £11.64
Brands include Propofol-Lipuro®, Propoven

Diprivan® (AstraZeneca) ℜ

1% injection (emulsion), propofol 10 mg/mL, net price 20-mL amp = £3.88, 50-mL prefilled syringe (for use with Diprifusor® TCI system) = £10.67
2% injection (emulsion), propofol 20 mg/mL, net price 50-mL prefilled syringe (for use with Diprifusor® TCI system) = £20.37

Note Diprifusor® TCI (target controlled infusion) system is licensed only for induction and maintenance of general anaesthesia in adults

15.1.2 Inhalational anaesthetics

Inhalational anaesthetics may be gases or volatile liquids. They can be used both for induction and maintenance of anaesthesia and can also be used following induction with an intravenous anaesthetic (section 15.1.1).

Gaseous anaesthetics require suitable equipment for storage and administration. They may be supplied via hospital pipelines or from metal cylinders. Volatile liquid...
Anaesthesics are administered using calibrated vapourisers, using air, oxygen, or nitrous oxide–oxygen mixtures as the carrier gas; all can trigger malignant hyperthermia (section 15.1.8) and are contra-indicated in those susceptible to malignant hyperthermia. Volatile liquid anaesthetics can increase cerebrospinal pressure and should be used with caution in those with raised intracranial pressure.

In children with neuromuscular disease, inhalational anaesthetics are associated with very rare cases of hyperkalaemia resulting in cardiac arrhythmias and death. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide is being administered.

**Anaesthesia and driving**  See section 15.1.

**Volatile liquid anaesthetics**

**Isoflurane** is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise, particularly in younger patients. Systemic arterial pressure can fall and cardiac output can decrease, owing to a decrease in systemic vascular resistance. Respiration is depressed. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane may also cause hepatotoxicity in those sensitised to halogenated anaesthetics.

**Desflurane** is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract; cough, breath-holding, apnoea, laryngospasm, and increased secretions can occur. The risk of hepatotoxicity with desflurane in those sensitised to halogenated anaesthetics appears to be remote.

**Sevoflurane** is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia. Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevo-flurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

**Halothane** is a volatile liquid anaesthetic. It has largely been superseded by newer agents but is useful for inhalation induction of anaesthesia. Its advantages are that it is potent, induction is smooth, and the vapour is non-irritant and seldom induces coughing or breath holding. Despite these advantages, halothane is not widely used because of its association with severe hepatotoxicity (important: see CSM advice, below).

Halothane causes cardiorespiratory depression. Respiratory depression results in raised arterial carbon dioxide tension and sometimes ventricular arrhythmias. Halothane also depresses the cardiac muscle fibres and can cause bradycardia, resulting in diminished cardiac output and fall of arterial pressure. Adrenaline (epinephrine) infiltrations should be avoided in patients anaesthetised with halothane because ventricular arrhythmias can result.

Halothane produces moderate muscle relaxation, but this may be inadequate for major abdominal surgery for which specific muscle relaxants should be used.

---

**CSM advice (halothane hepatotoxicity)**

Severe hepatotoxicity can follow halothane anaesthesia. The CSM has reported that this occurs more frequently after repeated exposure to halothane and has a high mortality. The risk of severe hepatotoxicity appears to be increased by repeated exposures within a short time interval, but even after a long interval (sometimes of several years), susceptible patients have been reported to develop jaundice. Since there is no reliable way of identifying susceptible patients, the CSM recommends the following precautions before the use of halothane:

- a careful anaesthetic history should be taken to determine previous exposure and previous reactions to halothane;
- repeated exposure to halothane within a period of at least 3 months should be avoided unless there are overriding clinical circumstances;
- a history of unexplained jaundice or pyrexia in a patient following exposure to halothane is an absolute contra-indication to its future use in that patient.

---

**DESFLURANE**

**Indications**  see notes above

**Cautions**  see notes above; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (anaesthetics, general)

**Contra-indications**  see notes above; susceptibility to malignant hyperthermia

**Side-effects**  see notes above

**Dose**

- Induction of anaesthesia, by inhalation through specifically calibrated vaporiser, ADULT over 18 years, 4–11%; CHILD see BNF for Children
- Maintenance of anaesthesia, by inhalation through specifically calibrated vaporiser, ADULT over 18 years, 2–6% in nitrous oxide; 2.5–8.5% in oxygen or oxygen-enriched air; CHILD see BNF for Children

**Suprane® (Baxter)** (FL)

Desflurane, net price 240 mL = £58.62

---

**HALOTHANE**

**Indications**  see notes above

**Cautions**  see notes above (important: CSM advice above); avoid for dental procedures in those under 18 years, 2–6% in nitrous oxide; 2.5–8.5% in oxygen or oxygen-enriched air; CHILD see BNF for Children

**Contra-indications**  see notes above; susceptibility to malignant hyperthermia

**Side-effects**  see notes above
Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia it is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage. For analgesia (without loss of consciousness) a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equanox®) is used. Self-administration using a demand valve is popular in obstetric practice, for changing painful dressings, as an aid to postoperative physiotherapy, and in emergency ambulances. Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in the presence of a pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury. Following administration of nitrous oxide, hypoxia can occur; additional oxygen should always be administered for several minutes to prevent hypoxaemia. Special care is needed to avoid hypoxia if an anaesthetic machine is being used; machines should incorporate an anti-hypoxia device. Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B12; neurological toxic effects can occur without preceding overt haematological changes. For the same reason, exposure of theatre staff to nitrous oxide should be minimised. Depression of white cell formation may also occur. Assessment of plasma-vitamin B concentration should be considered in those at risk of deficiency, including the elderly, those who have a poor or vegetarian diet, and those with a history of anaemia. Nitrous oxide should not be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.
Hyoscine hydrobromide reduces secretions and also provides a degree of amnesia, sedation and anti-emesis. Unlike atropine it may produce bradycardia rather than tachycardia. In some patients, especially the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

Glycopyrronium bromide reduces salivary secretions. When given intravenously it produces less tachycardia than atropine. It is widely used with neostigmine for reversal of non-depolarising neuromuscular blocking drugs (section 15.1.5).

Phenothiazines do not effectively reduce secretions when used alone.

### ATROPINE SULPHATE

**Indications** drying secretions; reversal of excessive bradycardia; with anticholinesterases for reversal of non-depolarising neuromuscular block; antidote to organophosphorous poisoning (see Emergency Treatment of Poisoning p. 36), antispsychotic (section 1.2); bradycardia (section 2.3.1); cardiopulmonary resuscitation (section 2.7.3); eye (section 11.5)

**Cautions** section 1.2; also paralytic ileus; pyloric stenosis; cardiovascular disease; myasthenia gravis; prostatic enlargement; pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (antimuscarinics)

**Duration of action** Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary

**Side-effects** section 1.2

**Dose**

- Premedication, by intravenous injection, 300–600 micrograms immediately before induction of anaesthesia; CHILD 20 micrograms/kg (max. 600 micrograms)

By subcutaneous or intramuscular injection, 300–600 micrograms 30–60 minutes before induction; CHILD 20 micrograms/kg (max. 600 micrograms)

- Intra-operative bradycardia, by intravenous injection, 300–600 micrograms (larger doses in emergencies); CHILD [unlicensed indication] 1–12 years 10–20 micrograms/kg

- Control of muscarinic side-effects of neostigmine or edrophonium in reversal of competitive neuromuscular block, by intravenous injection, 0.6–1.2 mg; CHILD under 12 years 20 micrograms/kg (max. 600 micrograms)

- Arrhythmias after myocardial infarction, see section 2.3.1 and 2.7.3; see also cardiopulmonary resuscitation algorithm, inside back cover

**Special strengths**

- **Atropine (Non-proprietary)**
  - Injection, atropine sulphate 100 micrograms/mL, net price 5 mL = £4.58, 10 mL = £5.39, 30 mL = £8.95
  - 1. **Minijet® Atropine** (UCB Pharma) Injection, atropine sulphate 100 micrograms/mL, net price 5 mL = £4.58, 10 mL = £5.39, 30 mL = £8.95
  - 2. **Robinul® (Anpharm)** Injection, glycopyrronium bromide 200 micrograms/mL, net price 1-mL amp = 70p; 3-mL amp = £1.50
    - **Note** May be difficult to obtain

**With neostigmine metilsulphate** Section 15.1.6

### GLYCOPHYRONIUM BROMIDE

**(Glycopyrrolate)**

**Indications** drying secretions (see Prescribing in Palliative Care, p. 16); reversal of excessive bradycardia; with neostigmine for reversal of non-depolarising neuromuscular block; hyperhidrosis (section 13.12)

**Cautions** section 1.2; also paralytic ileus, pyloric stenosis; cardiovascular disease; myasthenia gravis; prostatic enlargement; interactions: Appendix 1 (antimuscarinics)

**Side-effects** see section 1.2

**Dose**

- Premedication, by intramuscular or intravenous injection, 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms); CHILD by intramuscular or by intravenous injection, 4–8 micrograms/kg (max. 200 micrograms)

- Intra-operative use, by intravenous injection, 200–400 micrograms or 4–5 micrograms/kg (max. 400 micrograms), repeated if necessary; CHILD under 18 years 4–8 micrograms/kg (max. 200 micrograms), repeated if necessary

- Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block, by intravenous injection, 200 micrograms per 1 mg of neostigmine, or 10–15 micrograms/kg; CHILD 10 micrograms/kg

**With neostigmine metilsulphate** Section 15.1.6

### HYOSCINE HYDROBROMIDE

**(Scopolamine hydrobromide)**

**Indications** drying secretions (see Prescribing in Palliative Care, p. 16), amnesia; other indications (section 4.6)

**Cautions** see under Hyoscine Butylbromide (section 1.2); also paralytic ileus, myasthenia gravis, epilepsy, prostatic enlargement; avoid in the elderly (see notes above)

**Side-effects** see under Atropine Sulphate; also bradycardia

**Dose**

- Premedication, by subcutaneous or intramuscular injection, 200–600 micrograms 30–60 minutes before induction of anaesthesia; CHILD 15 micrograms/kg

**Hyoscine** (Non-proprietary) Injection, hyoscine hydrobromide 400 micrograms/mL, net price 1-mL amp = £2.67; 600 micrograms/mL, 1-mL amp = £2.67

**With papaveretum**

See under papaveretum (section 4.7.2)
### 15.1.4 Sedative and analgesic peri-operative drugs

#### 15.1.4.1 Anxiolytics and neuroleptics

Anxiolytic benzodiazepines are widely used for premedication; neuroleptics such as chlorpromazine are rarely used.

#### 15.1.4.2 Non-opioid analgesics

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. They have no analgesic effect so an opioid analgesic may sometimes be required for pain.

Benzodiazepines can alleviate anxiety at doses that do not necessarily cause excessive sedation and they are of particular value during short procedures or during operations under local anaesthesia (including dentistry).

Amnesia reduces the likelihood of any unpleasant memories of the procedure (although benzodiazepines, particularly when used for more profound sedation, can sometimes induce sexual fantasies). Benzodiazepines are also used in intensive care units for sedation, particularly in those receiving assisted ventilation.

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil (section 15.1.7) is used to antagonise the effects of benzodiazepines. They are best avoided in myasthenia gravis, especially peri-operatively.

**Diazepam** is used to produce mild sedation with amnesia. It is a long-acting drug with active metabolites and a second period of drowsiness can occur several hours after its administration. Peri-operative use of diazepam in children is not generally recommended; its effect and timing of response are unreliable and paradoxical effects may occur.

Diazepam is relatively insoluble in water and preparations formulated in organic solvents are painful on intravenous injection and give rise to a high incidence of venous thrombosis (which may not be noticed for several days after the injection). Intramuscular injection of diazepam is painful and absorption is erratic. An emulsion formulated for intravenous injection is less irritant and reduces the risk of venous thrombosis; it is not suitable for intramuscular injection. Diazepam is also available as a rectal solution but this preparation is not used for premedication or sedation.

**Temazepam** is given by mouth and has a shorter duration of action and a more rapid onset than diazepam given by mouth. It has been used as a premedicant in inpatient and day-case surgery; anxiolytic and sedative effects last about 90 minutes although there may be residual drowsiness.

**Lorazepam** produces more prolonged sedation than temazepam and it has marked amnesic effects. It is used as a premedicant the night before major surgery; a further, smaller dose may be required the following morning if any delay in starting surgery is anticipated. Alternatively the first dose may be given early in the morning on the day of operation.

**Midazolam** is a water-soluble benzodiazepine which is often used in preference to intravenous diazepam; recovery is faster than from diazepam. Midazolam is associated with profound sedation when high doses are given intravenously or when used with certain other drugs.

There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil (section 15.1.7) is available where midazolam is used, to reverse the effects if necessary.

**DIAZEPAM**

**Indications** premedication; sedation with amnesia, and in conjunction with local anaesthesia; other indi-
cations (section 4.1.2, section 4.8.2, and section 10.2.2).

**Contraindications** see notes above, section 4.1.2, and section 4.8.2.

**Side-effects** see notes above and section 4.1.2.

**Dose**
- **By mouth,** 5 mg on night before minor or dental surgery then 5 mg 2 hours before procedure; **Elderly** (or debilitated), half adult dose
- **By intravenous injection** into a large vein, sedative cover for minor surgical and medical procedures, **Adult** over 18 years, 10–20 mg over 2–4 minutes, immediately before procedure; premedication 100–200 micrograms/kg, **Child** under 18 years see **BNF for Children**
- **By rectum, Child** 1–18 years, see **BNF for Children**

**LORAZEPAM**

**Indications** sedation with amnesia; premedication; other indications (section 4.1.2 and section 4.8.2).

**Cautions** see notes above and section 4.1.2; **Interactions:** Appendix I (anxiolytics and hypnotics).

**Contra-indications** see notes above and section 4.1.2.

**Side-effects** see notes above and under Diazepam (section 4.1.2).

**Dose**
- **By mouth,** 2–3 mg the night before operation; 2–4 mg 1–2 hours before operation
- **By slow intravenous injection,** preferably diluted with an equal volume of sodium chloride intravenous infusion 0.9% or water for injections, 50 micrograms/kg 30–45 minutes before operation
- **By intramuscular injection,** diluted as above, 50 micrograms/kg 60–90 minutes before operation

**Preparations**

Section 4.1.2

**MIDAZOLAM**

**Indications** sedation with amnesia; sedation in intensive care; premedication, induction of anaesthesia; status epilepticus [unlicensed use], section 4.8.2.

**Cautions** see notes above; cardiac disease; respiratory disease; myasthenia gravis; neonates; children (particularly if cardiovascular impairment); risk of airways obstruction and hypventilation in children under 6 months (monitor respiratory rate and oxygen saturation); history of drug or alcohol abuse; reduce dose in elderly and debilitated; avoid prolonged use (and abrupt withdrawal thereafter); concentration of midazolam in children under 15 kg not to exceed 25 mg/mL; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4) and breast-feeding (Appendix 5); **Interactions:** Appendix I (anxiolytics and hypnotics).

**Contra-indications** marked neuromuscular respiratory weakness including unstable myasthenia gravis; severe respiratory depression; acute pulmonary insufficiency

**Side-effects** see notes above; gastro-intestinal disturbances, increased appetite, jaundice; hypotension, cardiac arrest, heart rate changes, anaphylaxis, thrombosis; laryngospasm, bronchospasm, respiratory depression and respiratory arrest (particularly with high doses or on rapid injection); drowsiness, confusion, ataxia, amnesia, headache; euphoria, hallucinations, convulsions (more common in neonates); dizziness, vertigo, involuntary movements, paradoxical excitement and aggression (especially in children and elderly), dysarthria; urinary retention, incontinence, changes in libido; blood disorders; muscle weakness; visual disturbances; salivation changes; skin reactions; injection-site reactions.

**Dose**
- **Conscious sedation,** by slow intravenous injection (approx. 2 mg/minute) 5–10 minutes before procedure, initially 2–2.5 mg (Elderly 0.5–1 mg), increased if necessary in steps of 1 mg (Elderly 0.5–1 mg); usual total dose 3.5–5 mg (max. 7.5 mg).
- **Elderly** max. 3.5 mg; **Child** by intravenous injection over 2–3 minutes, 6 months–5 years initially 50–100 micrograms/kg, dose increased if necessary in small steps (max. total dose 6 mg), 6–12 years initially 25–50 micrograms/kg, dose increased if necessary in small steps (max. total dose 10 mg)
- **By intramuscular injection,** **Child** 1–15 years 50–150 micrograms/kg; max. 10 mg
- **By rectum, Child** 6 months–18 years, see **BNF for Children**

**Sedative in combined anaesthesia,** by intravenous injection, 30–100 micrograms/kg repeated as required or by continuous intravenous infusion, 30–100 micrograms/kg/hour **(Elderly** lower doses needed); **Child** not recommended.

- **Premedication,** by deep intramuscular injection, 70–100 micrograms/kg **(Elderly** and debilitated) 25–50 micrograms/kg 20–60 minutes before induction; **Child** 1–15 years 80–200 micrograms/kg
- **By intravenous injection,** 1–2 mg repeated as required **(Elderly** and debilitated 0.5 mg, repeat dose slowly as required)
- **By rectum, Child** 6 months–12 years, see **BNF for Children**

**Induction** (but rarely used), by slow intravenous injection, 150–200 micrograms/kg **(Elderly** and debilitated 50–150 micrograms/kg) given in divided doses (max. 5 mg) at intervals of 2 minutes; max. total dose 600 micrograms/kg; **Child** 7–18 years initially 150 micrograms/kg (max. 7.5 mg) given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes then give additional doses of 50 micrograms/kg (max. 2.5 mg) every 2 minutes if necessary; max. total dose 500 micrograms/kg (not exceeding 25 mg).

- **Sedation of patients receiving intensive care,** by slow intravenous injection, initially 30–300 micrograms/kg given in steps of 1–2.5 mg every 2 minutes, then by slow intravenous injection or by continuous intravenous infusion, 30–200 micrograms/kg/hour; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia; lower doses may be adequate if opioid analgesic also used; **Neonate** under 32 weeks gestational age by continuous intravenous infusion, 30 micrograms/kg/hour, **Neonate** over 32 weeks gestational age and **Child** under 6 months 60 micro-
Acemetacin is inadequate for the relief of severe pain. For the relief of postoperative pain, NSAIDs may be useful alternatives (or adjuncts) to the use of opioids. Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastrointestinal motility, and do not cause dependence, they may be preferred to opioid analgesics.

Preparations

Section 4.1.1

15.1.4.2 Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastrointestinal motility, and do not cause dependence, they may be useful alternatives (or adjuncts) to the use of opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Acemetacin, diclofenac, flurbiprofen, ibuprofen, ketoprofen, (section 10.1.1), paracetamol (section 4.7.1), parecoxib, and ketorolac are licensed for postoperative use. Diclofenac, ketoprofen, ketorolac, and paracetamol can be given by injection as well as by mouth. Intramuscular injections of diclofenac and ketoprofen are given deep into the gluteal muscle to minimise pain and tissue damage; diclofenac can also be given by intravenous infusion for the treatment or prevention of postoperative pain. Ketorolac is less irritant on intramuscular injection but pain has been reported; it can also be given by intravenous injection.

Parecoxib (a selective inhibitor of cyclo-oxygenase-2) can be given by intramuscular or intravenous injection (but see also NSAIDs and Cardiovascular Events, section 10.1.1). The Scottish Medicines Consortium has advised (January 2003) that parecoxib should not be used because there is no evidence of a reduction in postoperative haemorrhagic or gastrointestinal complications compared with non-selective NSAIDs.

KETOROLAC TROMETAMOL

Indications short-term management of moderate to severe acute postoperative pain only

Cautions section 10.1.1; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (NSAIDs)

Contra-indications section 10.1.1; also complete or partial syndrome of nasal polyps; haemorrhagic diatheses (including coagulation disorders) and following operations with high risk of haemorrhage or incomplete haemostasis; confirmed or suspected cerebral-vascular bleeding; hypovolaemia or dehydration

Side-effects section 10.1.1; also gastro-intestinal disturbances; flushing, bradycardia, palpitation, chest pain; dyspnoea, asthma; malaise, euphoria, psychosis, paraesthesia, convulsions, abnormal dreams, hyperkinesia; urinary frequency, thirst; hypoponataemia, hyperkalaemia, myalgia; visual disturbances (including optic neuritis); pallor, purpura, pain at injection site

Dose

- **ADULT** and **CHILD** over 16 years, by mouth, 10 mg every 4–6 hours **ELDERLY** every 6–8 hours as required; max. 40 mg daily; max. duration of treatment 7 days
- **ADULT** and **CHILD** over 16 years, by intramuscular injection or by intravenous injection over at least 15 seconds, initially 10 mg, then 10–30 mg every 4–6 hours as required (up to every 2 hours during initial postoperative period); max. 90 mg daily **ELDERLY** and patients weighing less than 50 kg max. 60 mg daily; max. duration of treatment 2 days

**Note** When converting from parenteral to oral administration, total combined dose on the day of converting should not exceed 40 mg (60 mg in the elderly and patients weighing less than 50 kg) of which the oral component should not exceed 40 mg

PARECOXIB

Indications short-term management of acute postoperative pain

Cautions section 10.1.1; dehydration; following coronary artery bypass graft surgery; interactions: Appendix 1 (NSAIDs)

Contra-indications section 10.1.1; also history of allergic drug reactions including sulphonamide hypersensitivity; inflammatory bowel disease

Side-effects section 10.1.1; also flatulence; hyper-tension, hypotension, peripheral oedema; pharyngitis, respiratory insufficiency; hypoaesthesia; alveolar ostitis; oliguria; postoperative anaemia, hypokalaemia; respiratory pain; pruritus; less commonly bradycardia, cardiovascular events, increased blood urea nitrogen, ecchymosis, thrombocytopenia, rarely vomiting, tachycardia, rash (discontinue—risk of serious reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis), anaphylaxis
**Dose**
- By deep intramuscular injection or by intravenous injection, initially 40 mg, then 20–40 mg every 6–12 hours when required; max. 80 mg daily; EDERLY weighing less than 50 kg, initially 20 mg, then max. 40 mg daily; CHILD and ADOLESCENT under 18 years, not recommended.

**Dynastat** (Pharmacia) ▪ Pharmacodynamic
Injection, powder for reconstitution, parecoxib (as sodium salt), net price 40-mg vial = £4.96, 40-mg vial (with solvent) = £5.67.

**15.1.4.3 Opioid analgesics**

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to those patients who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; for general notes on opioid analgesics and their use in postoperative pain, see section 4.7.2.

For the management of opioid-induced respiratory depression, see section 15.1.7.

**Intra-operative analgesia** Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia.

**Alfentanil, fentanyl, and remifentanil** are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of alfentanil or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. Repeated intra-operative doses of alfentanil or fentanyl should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively in patients receiving intensive care, with assisted ventilation, for up to 4 days when required. By intravenous injection, initially 40 mg, then 20–40 mg every 6–12 hours when required; max. 80 mg daily; EDERLY weighing less than 50 kg, initially 20 mg, then max. 40 mg daily; CHILD and ADOLESCENT under 18 years, not recommended.

**Dynastat** (Pharmacia) ▪ Pharmacodynamic
Injection, powder for reconstitution, parecoxib (as sodium salt), net price 40-mg vial = £4.96, 40-mg vial (with solvent) = £5.67.

**RAPifen** (Janssen-Cilag) ▪ Pharmacodynamic
Injection, alfentanil (as hydrochloride) 500 micrograms/mL, net price 2-mL amp = £67 p; 10-mL amp = £3.08

**Intensive care injection, alfentanil (as hydrochloride)** 5 mg/mL. To be diluted before use. Net price 1-mL amp = £2.46.

**FENTANYL**

**Indications** analgesia during operation, enhancement of anaesthesia; respiratory depressant in assisted respiration; analgesia in other situations (section 4.7.2)

**Cautions** section 4.7.2 and notes above

**Contra-indications** section 4.7.2

**Side-effects** section 4.7.2 and notes above; also myoclonic movements; less commonly laryngospasm; rarely asystole, insomnia

**Dose**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

- By slow intravenous injection, with spontaneous respiration, ADULT over 12 years, initially 50–100 micrograms (max. 200 micrograms on specialist advice), then 50 micrograms as required; CHILD 2–12 years, initially 2–3 micrograms/kg, then 1 microgram/kg as required.

- With assisted ventilation, ADULT and CHILD over 12 years, initially 0.3–3.5 mg, then 100–200 micrograms as required; CHILD 2–12 years, initially 2–3 micrograms/kg, then 1 microgram/kg as required.

- By intravenous infusion, with spontaneous respiration, ADULT, 50–80 nanograms/kg/minute adjusted according to response.

- With assisted ventilation, ADULT, initially 10 micrograms/kg over 10 minutes then 100 nanograms/kg/minute adjusted according to response; may require

**ALFENTANIL**

**Indications** analgesia especially during short operative procedure and outpatient surgery; enhancement of anaesthesia; analgesia and suppression of respiratory activity in patients receiving intensive care, with assisted ventilation, for up to 4 days.

**Cautions** section 4.7.2 and notes above

**Contra-indications** section 4.7.2

**Side-effects** section 4.7.2 and notes above; also hypotension, myoclonic movements; less commonly arrhythmias, cough, hiccup, laryngospasm, visual disturbances

**Dose**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

- By intravenous injection, spontaneous respiration, ADULT, initially up to 500 micrograms over 30 seconds; supplemental, 250 micrograms.

- With assisted ventilation, ADULT over 18 years, initially 30–50 micrograms/kg; supplemental, 15 micrograms/kg; CHILD 1 month–18 years, initially 10–20 micrograms/kg; supplemental doses up to 10 micrograms/kg.

- By intravenous infusion, with assisted ventilation, ADULT and CHILD, initially 50–100 micrograms/kg over 10 minutes or as a bolus, followed by maintenance of 0.5–1 micrograms/kg/minute.

- Analgesia and suppression of respiratory activity during intensive care, with assisted ventilation, by intravenous infusion, initially 2 mg/hour subsequently adjusted according to response (usual range 0.5–10 mg/hour); more rapid initial control may be obtained with an intravenous dose of 5 mg given in divided portions over 10 minutes (slowing if hypotension or bradycardia occur); additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures.
15.1.5 Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as muscle relaxants. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders (section 10.2.2) that act on the spinal cord or brain.

Patients who have received a neuromuscular blocking drug should always have their respiration assisted or controlled until the drug has been inactivated or antagonised (section 15.1.6). They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine (section 15.1.6). Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium, rocuronium, and vecuronium, and the benzylisoquinolinium group, comprising atracurium, cisatracurium, and mivacurium.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium and vecuronium, are more widely used than those with a longer duration of action, such as pancuronium.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and infusion rate of at least 100 nanograms/kg/minute for at least 5 minutes before procedure and adjust every 2–5 minutes according to requirements, usual range 250–750 nanograms/kg/minute.

- Cardiac surgery, consult product literature

**Note** Remifentanil doses in BNF may differ from those in product literature

Ultiva® (GSK)  
**Injection**, powder for reconstitution, remifentanil (as hydrochloride), net price 1-mg vial = £5.12; 2-mg vial = £10.23; 5-mg vial = £25.58

## REMIFENTANIL

**Indications** supplementation of general anaesthesia during induction and analgesia during maintenance of anaesthesia (consult product literature for use in patients undergoing cardiac surgery); analgesia and sedation in ventilated, intensive care patients

**Contra-indications** section 4.7.2 (but no dose adjustment necessary in renal impairment) and notes above

**Side-effects** section 4.7.2 and notes above; left ventricular dysfunction

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Induction of anaesthesia, **ADULT** and **CHILD** over 12 years, by intravenous infusion, 0.5–1 micrograms/kg/minute, **with or without** an initial dose by intravenous injection of 0.25–1 microgram/kg over at least 30 seconds

  **Note** If patient to be intubated more than 8 minutes after start of intravenous infusion, initial intravenous injection dose is not necessary

- Maintenance of anaesthesia in ventilated patients, **ADULT** and **CHILD** over 12 years, by intravenous infusion, 0.05–2 micrograms/kg/minute **with or without** an initial dose by intravenous injection of 0.25–1 micrograms/kg over at least 30 seconds according to anaesthetic technique and adjusted according to response; in light anaesthesia supplemental doses by intravenous injection every 2–5 minutes

- Maintenance of anaesthesia with spontaneous respiration, **ADULT** and **CHILD** over 12 years, by intravenous infusion, initially 40 nanograms/kg/minute adjusted according to response, usual range 25–100 nanograms/kg/minute

- Maintenance of anaesthesia, **CHILD** 1–12 years, by intravenous infusion, 0.05–1.3 micrograms/kg/minute **with or without** an initial dose by intravenous injection of 0.1–1 microgram/kg over at least 30 seconds according to anaesthetic technique and adjusted according to response

- Analgesia and sedation in ventilated, intensive-care patients, by intravenous infusion, **ADULT** over 18 years, initially 100–150 nanograms/kg/minute adjusted according to response in steps of 25 nanograms/kg/minute (allow at least 5 minutes between dose adjustments); usual range 6–740 nanograms/kg/minute; if an infusion rate of 200 nanograms/kg/minute does not produce adequate sedation add another sedative (consult product literature for details)

- Additional analgesia during stimulating or painful procedures in ventilated, intensive-care patients, by intravenous infusion, **ADULT** over 18 years, maintain

**Fentanyl** (Non-proprietary)  
**Injection**, fentanyl (as citrate) 50 micrograms/mL, net price 2-mL amp = 54p, 10-mL amp = £1.11

**Sublimaze®** (Janssen-Cilag)  
**Injection**, fentanyl (as citrate) 50 micrograms/mL, net price 2-mL amp = 22p, 10-mL amp = £1.11

**BNF 57 15 Anaesthesia**
side-effects. Rocuronium, with a rapid onset of effect, may facilitate intubation. Atracurium or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

**Cautions** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs. Their activity is prolonged in patients with myasthenia gravis and in hypothermia, and lower doses are required. Non-depolarising neuromuscular blocking drugs should be used with great care in those with other neuromuscular disorders and those with fluid and electrolyte disturbances, as response is unpredictable. Resistance can develop in patients with burns, who may require increased doses; low plasma cholinesterase activity in these patients requires dose titration for mivacurium.

**Interactions:** Appendix 1 (muscle relaxants).

**Side-effects** Benzylisoquinolinium non-depolarising neuromuscular blocking drugs (except cisatracurium) are associated with histamine release, which can cause skin flushing, hypotension, tachycardia, bronchospasm, and very rarely anaphylactoid reactions. Most aminosteroid neuromuscular blocking drugs produce minimal histamine release. Drugs with vagolytic activity can counteract any bradycardia that occurs during surgery. Acute myopathy has also been reported after prolonged use in intensive care.

Atracurium, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in patients with hepatic or renal impairment. Cardiovascular effects are associated with significant histamine release.

Cisatracurium is a single isomer of atracurium. It is more potent and has a slightly longer duration of action than atracurium and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection.

Pancuronium, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in patients receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.

Rocuronium exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity.

Vecuronium, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects.

### atracurium besylate

**Indications** neuromuscular blockade (short to intermediate duration) for surgery or during intensive care

**Cautions** see notes above; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see notes above; seizures also reported

**Dose**

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Surgery or intubation, ADULT and CHILD over 1 month, by intravenous injection, initially 300–600 micrograms/kg; maintenance, by intravenous injection, 100–200 micrograms/kg as required or by intravenous infusion, 5–10 micrograms/kg/minute (300–600 micrograms/kg/hour)

- Intensive care, ADULT and CHILD over 1 month, by intravenous injection, initially 300–600 micrograms/kg (optional) then by intravenous infusion 4.5–29.5 micrograms/kg/minute (usual dose 11–13 micrograms/kg/minute)

**Atracurium** (Non-proprietary)

**Injection** atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.85; 5-mL amp = £3.37; 25-mL amp = £14.45

**Tracrium** (GSK)

**Injection** atracurium besilate 10 mg/mL, net price 2.5-mL amp = £1.86; 5-mL amp = £3.00; 25-mL amp = £12.91

### cisatracurium

**Indications** neuromuscular blockade (intermediate duration) for surgery or during intensive care

**Cautions** see notes above; pregnancy (Appendix 4); breast-feeding

**Side-effects** see notes above

**Dose**

- To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation, by intravenous injection, ADULT and CHILD over 1 month, initially 150 micrograms/kg; maintenance, by intravenous injection, 30 micrograms/kg approx. every 20 minutes; CHILD 2–12 years, 20 micrograms/kg approx. every 9 minutes; or maintenance, by intravenous infusion, ADULT and CHILD over 2 years, initially, 3 micrograms/kg/minute, then after stabilisation, 1–2 micrograms/kg/minute; dose reduced by up to 40% if used with isoflurane

- Intensive care, by intravenous infusion, ADULT 0.5–10.2 micrograms/kg/minute (usual dose 3 micrograms/kg/minute)

**Note** Lower doses can be used for children over 2 years when not for intubation

**Nimbex** (GSK)

**Injection** cisatracurium (as besilate) 2 mg/mL, net price 10-mL amp = £7.55, 50-mL amp = £36.5

**Forte injection** cisatracurium (as besilate) 5 mg/mL, net price 30-mL vial = £31.09
**MIVACURIAM**

**Indications** neuromuscular blockade (short duration) for surgery

**Cautions** see notes above; low plasma cholinesterase activity; elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4)

**Side-effects** see notes above

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- By intravenous injection, 70–250 micrograms/kg; maintenance 100 micrograms/kg every 15 minutes; CHILD 2–6 months initially 150 micrograms/kg, 7 months–12 years initially 200 micrograms/kg; maintenance (CHILD 2 months–12 years) 100 micrograms/kg every 6–9 minutes

**Note** Doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In patients with asthma, cardiovascular disease or those who are sensitive to falls in arterial blood pressure give over 60 seconds

- By intravenous infusion, maintenance of block, 8–10 micrograms/kg/minute, adjusted if necessary every 3 minutes by 1 microgram/kg/minute to usual dose of 6–7 micrograms/kg/minute; CHILD 2 months–12 years, usual dose 11–14 micrograms/kg/minute

**Mivacurium** (GSK) (UK)

Injection, mivacurium (as chloride) 2 mg/mL, net price 5-mL amp = £2.79; 10-mL amp = £4.51

**PANCURONIUM BROMIDE**

**Indications** neuromuscular blockade (long duration) for surgery or during intensive care

**Cautions** see notes above; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Side-effects** see notes above

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Intubation, **ADULT** and **CHILD** over 1 month, by intravenous injection, initially 600 micrograms/kg; maintenance by intravenous injection, 150 micrograms/kg (ELDERLY 75–100 micrograms/kg) or maintenance by intravenous infusion, 300–600 micrograms/kg/hour (ELDERLY up to 400 micrograms/kg/hour) adjusted according to response

- Intensive care, by intravenous injection, **ADULT** initially 600 micrograms/kg; maintenance by intravenous infusion, 300–600 micrograms/kg/hour for first hour, then adjusted according to response

**Esmeron** (Organon) (UK)

Injection, rocuronium bromide 10 mg/mL, net price 5-mL vial = £3.01, 10-mL vial = £6.01

**VECURONIUM BROMIDE**

**Indications** neuromuscular blockade (intermediate duration) for surgery

**Cautions** see notes above; pregnancy (Appendix 4)

**Side-effects** see notes above

**Dose**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- By intravenous injection, intubation, **ADULT** and **CHILD** over 5 months, 80–100 micrograms/kg (CHILD under 1 year, onset more rapid and high intubation dose may not be required); maintenance 20–30 micrograms/kg adjusted according to response; **NEONATE** and **CHILD** up to 4 months, initial test dose 10–20 micrograms/kg then incremental doses to achieve response

- By intravenous infusion, 0.8–1.4 micrograms/kg/minute (after initial intravenous injection of 40–100 micrograms/kg)

**Norcuron** (Organon) (UK)

Injection, powder for reconstitution, vecuronium bromide, net price 10-mg vial = £3.95 (with water for injections)

**Depolarising neuromuscular blocking drugs**

Suxamethonium has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required e.g. with tracheal intubation. Its duration of action is about 2 to 6 minutes after intravenous doses of about 1 mg/kg; repeated doses can be used for longer procedures.

Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium should be given after anaesthetic induction because paralysis is usually preceded by pain.
ful muscle fasciculations. While tachycardia occurs with single use, bradycardia may occur with repeated doses in adults and with the first dose in children. Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium and is caused by the development of a non-depolarising block following the initial depolarising block; edrophonium (section 15.1.6) may be used to confirm the diagnosis of dual block. Individuals with myasthenia gravis are resistant to suxamethonium but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.

SUXAMETHONIUM CHLORIDE (Succinylcholine chloride)

**Indications** neumorscular blockade (rapid onset, short duration)

**Cautions** see notes above; hypersensitivity to other neuromuscular blocking drugs; patients with cardiac, respiratory or neuromuscular disease; raised intraocular pressure (avoid in penetrating eye injury); severe sepsis (risk of hyperkalaemia); pregnancy (Appendix 4); **Interactions**: Appendix 1 (muscle relaxants)

**Contra-indications** family history of malignant hyperthermia, hyperkalaemia; major trauma, severe burns, neurological disease involving acute wasting of major muscle, prolonged immobility—risk of hyperkalaemia, personal or family history of congenital myotonic disease, Duchenne muscular dystrophy, low plasma-cholinesterase activity (including severe liver disease) (Appendix 2)

**Side-effects** see notes above; also increased gastric pressure; hyperkalaemia; postoperative muscle pain, myoglobinuria, myoglobinemia; increased intraocular pressure; flushing, rash; rarely arrhythmias, cardiac arrest; bronchospasm, apnoea, prolonged respiratory depression; limited jaw mobility; very rarely anaphylactic reactions, malignant hyperthermia; also reported hypertension, hypotension, rhabdomyolysis

**Dose**
- By intravenous injection, initially 1 mg/kg; maintenance, usually 0.5–1 mg/kg at 5–10 minute intervals; max. 500 mg/hour; **NEONATE** and **INFANT** under 1 year, 2 mg/kg; **CHILD** over 1 year, 1 mg/kg
- By intravenous infusion of a solution containing 1–2 mg/mL (0.1–0.2%), 2.5–4 mg/minute; max. 500 mg/hour; **CHILD** reduce infusion rate according to body-weight
- By intramuscular injection, **INFANT** under 1 year, up to 4–5 mg/kg; **CHILD** over 1 year, up to 4 mg/kg; max. 150 mg

**Suxamethonium Chloride (Non-proprietary) [75]**

**Injection**, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 64p, 2-mL prefilled syringe = £7.35

**Anectine® (GSK) [75]**

**Injection**, suxamethonium chloride 50 mg/mL, net price 2-mL amp = 71p

---

**15.1.6 Drugs for reversal of neuromuscular blockade**

**Anticholinesterases**

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium.

**Edrophonium** has a transient action and may be used in the diagnosis of suspected dual block due to suxamethonium. Atropine (section 15.1.3) is given before or with edrophonium to prevent muscarinic effects when given for reversal of non-depolarising neuromuscular blockade.

**Neostigmine** has a longer duration of action than edrophonium and is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium or alternatively atropine (section 15.1.3), given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

**EDROPONIUM CHLORIDE**

**Indications** see under Dose; myasthenia gravis (section 10.2.1)

**Cautions** section 10.2.1; atropine should also be given

**Contra-indications** section 10.2.1

**Side-effects** section 10.2.1

**Dose**
- Brief reversal of non-depolarising neuromuscular blockade, by intravenous injection over several minutes, 500–700 micrograms/kg (after or with atropine)
- Diagnosis of dual block, by intravenous injection, 10 mg

**Edrophonium** (Cambridge) [94]

**Injection**, edrophonium chloride 10 mg/mL, net price 1-mL amp = £8.35

**NEOSTIGMINE METILSULFATE** (Neostigmine methylsulphate)

**Indications** see under Dose

**Cautions** section 10.2.1 and notes above; glycopyrronium or atropine should also be given

**Contra-indications** section 10.2.1 and notes above

**Side-effects** section 10.2.1 and notes above

**Dose**
- Reversal of non-depolarising neuromuscular blockade, by intravenous injection over 1 minute, 50–70 micrograms/kg (max. 5 mg) after or with glycopyrronium or atropine
- Myasthenia gravis, see section 10.2.1

**Neostigmine** (Non-proprietary) [94]

**Injection**, neostigmine metilsulfate 2.5 mg/mL, net price 1-mL amp = 58p
With glycopyrronium

Robinitul-Neostigmine (Anpharm) \(^{(a)}\) Injection, neostigmine metilsulfate 2.5 mg, glycopyrronium bromide 500 micrograms/mL, net price 1-ml amp = £15.15

Dose reversal of non-depolarising neuromuscular blockade by intravenous injection over 10–30 seconds; 1–2 mL or 0.02 mL/kg, dose may be repeated if required (total max. 2 mL); CHILD 0.02 mL/kg (or 0.2 mL/kg of a 1 in 10 dilution using water for injections or sodium chloride injection 0.9%), dose may be repeated if required (total max. 2 mL).

Note May be difficult to obtain

Other drugs for reversal of neuromuscular blockade

Sugammadex is a modified gamma cyclodextrin used for reversal of neuromuscular blockade induced by rocuronium or vecuronium (section 15.1.5).

SUGAMMADEX

Indications reversal of neuromuscular blockade induced by rocuronium or vecuronium

Cautions recurrence of neuromuscular blockade—monitor respiratory function until fully recovered; recovery may be delayed in cardiovascular disease and elderly; wait 24 hours before re-administering rocuronium or vecuronium; renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (sugammadex)

Side-effects taste disturbances; less commonly allergic reactions; bronchospasm also reported

Dose To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight

- Routine reversal of neuromuscular blockade induced by rocuronium or vecuronium, by intravenous injection, ADULT over 18 years, 2–4 mg/kg (consult product literature); a further dose of 4 mg/kg may be required if recurrence of neuromuscular blockade occurs
- Routine reversal of neuromuscular blockade induced by rocuronium, by intravenous injection, CHILD 2–18 years, 2 mg/kg (consult product literature)
- Immediate reversal of neuromuscular blockade induced by rocuronium, by intravenous injection, ADULT over 18 years, 16 mg/kg (consult product literature)

Bridion (Schering-Plough) \(^{(a)}\) Injection, sugammadex (as sodium salt) 100 mg/mL, net price 2-mL amp = £59.64, 5-mL amp = £149.10

Electrolytes Na 0.42 mmol/mL

15.1.7 Antagonists for central and respiratory depression

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone. Naloxone will immediately reverse opioid-induced respiratory depression but the dose may have to be repeated because of the short duration of action of naloxone; however, naloxone will also antagonise the analgesic effect.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become reseedated.

Doxapram (section 3.5.1) is a central and respiratory stimulant but is of limited value in anaesthesia.

FLUMAZENIL

Indications reversal of sedative effects of benzodiazepines in anaesthetic, intensive care, and diagnostic procedures

Cautions short-acting (repeat doses may be necessary)—benzodiazepine effects may persist for at least 24 hours; benzodiazepine dependence (may precipitate withdrawal symptoms); prolonged benzodiazepine therapy for epilepsy (risk of convulsions); history of panic disorders (risk of recurrence); ensure neuromuscular blockade cleared before giving; avoid rapid injection in high-risk or anxious patients and following major surgery; head injury (rapid reversal of benzodiazepine sedation may cause convulsions); elderly; children; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding

Contra-indications life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

Side-effects nausea, vomiting, and flushing; if waking too rapid, agitation, anxiety, and fear; transient increase in blood pressure and heart-rate in intensive care patients; very rarely convulsions (particularly in those with epilepsy), hypersensitivity reactions including anaphylaxis

Dose

- By intravenous injection, 200 micrograms over 15 seconds, then 100 micrograms at 60-second intervals if required; usual dose range, 300–600 micrograms; max. total dose 1 mg (2 mg in intensive care); question aetiology if no response to repeated doses
- By intravenous infusion, if drowsiness recurs after injection, 100–400 micrograms/hour, adjusted according to level of arousal

Flumazenil (Non-proprietary) \(^{(a)}\) Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £14.49

Anexate (Roche) \(^{(a)}\) Injection, flumazenil 100 micrograms/mL, net price 5-mL amp = £14.49

NALOXONE HYDROCHLORIDE

Indications reversal of opioid-induced respiratory depression; reversal of neonatal respiratory depression resulting from opioid administration to mother during labour; overdosage with opioids (see Emergency Treatment of Poisoning)

Cautions cardiovascular disease or those receiving cardioactive drugs (serious adverse cardiovascular effects reported); physical dependence on opioids (precipitates withdrawal); pain (see also under Titration of Dose, below); has short duration of action
15.1.8 Drugs for malignant hyperthermia

Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are volatile anaesthetics. Suxamethonium has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium should be avoided during anaesthesia in patients at high risk of malignant hyperthermia.

Dantrolene is used in the treatment of malignant hyperthermia. It acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

**DANTROLENE SODIUM**

**Indications** malignant hyperthermia; chronic severe spasticity of voluntary muscle (section 10.2.2)

**Cautions** avoid extravasation (risk of tissue necrosis); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (muscle relaxants)

**Side-effects** hepatotoxicity, pulmonary oedema, dizziness, weakness, and injection-site reactions including erythema, rash, swelling, and thrombophlebitis

**Dose**
- By rapid intravenous injection, 1 mg/kg, repeated as required to a cumulative max. of 10 mg/kg

**Dantrolene Intravenous** (Procter & Gamble Pharm.)

**Injection**, powder for reconstitution, dantrolene sodium, net price 20-mg vial = £15.08 (hosp. only)

15.2 Local anaesthesia

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

See also section 1.7 (anus), section 11.7 (eye), section 12.3 (oropharynx), and section 13.3 (skin).

**Use of local anaesthetics** Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. The drugs used vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These variations determine their suitability for use by various routes, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural) or spinal block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

**Administration** In estimating the safe dosage of these drugs it is important to take account of the rate at which they are absorbed and excreted as well as their potency. The patient’s age, weight, physique, and clinical condition, the degree of vascularity of the area to which the drug is to be applied, and the duration of administration are other factors which must be taken into account.

Local anaesthetics do not rely on the circulation to transport them to their sites of action, but uptake into the systemic circulation is important in terminating their action and producing toxicity. Following most regional anaesthetic procedures, maximum arterial plasma concentrations of anaesthetic develop within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection. Great care must be taken to avoid accidental intravascular injection. Local anaesthesia around the oral cavity may impair swallowing and therefore increase the risk of aspiration.

Epidural anaesthesia is commonly used during surgery, often combined with general anaesthesia, because of its protective effect against the stress response of surgery. It is often used when good postoperative pain relief is essential (e.g. major thoracic or intra-abdominal surgery).

**Toxicity** Toxic effects associated with local anaesthetics usually result from excessively high plasma concentrations; single application of topical lidocaine preparations does not generally cause systemic side-effects. Effects initially include a feeling of inebriation and lightheadedness followed by sedation, circumsoral paraesthesia and twitching; convulsions can occur in severe reactions. On intravenous injection convulsions and cardiovascular collapse may occur very rapidly. Hypersensitivity reactions occur mainly with the exter-
type local anaesthetics such as benzocaine, cocaine, procaine, and tetracaine (amethocaine); reactions are less frequent with the amide types such as lidocaine (lignocaine), bupivacaine, levobupivacaine, prilocaine, and ropivacaine. Local anaesthetics may be associated with methaemoglobinaemia; prilocaine and benzocaine have been implicated.

When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to the traumatised urethra. In such cases absorption into the blood may increase the possibility of systemic side-effects. The local anaesthetic effect may also be reduced by the altered local pH. Local anaesthetics can also be otoxic and should not be applied to the middle ear.

Use of vasoconstrictors Most local anaesthetics, with the exception of cocaine, cause dilation of blood vessels. The addition of a vasoconstrictor such as adrenaline (epinephrine) diminishes local blood flow, slows the rate of absorption of the local anaesthetic, and prolongs its local effect. Adrenaline must be used in a low concentration (e.g. 1 in 200 000) for this purpose and it should not be given with a local anaesthetic injection in digits and appendages; it may produce ischaemic necrosis.

When adrenaline is included the final concentration should be 1 in 200 000 (5 micrograms/mL), but see also Dental Anaesthesia below.

The total dose of adrenaline should not exceed 500 micrograms and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products. For general cautions associated with the use of adrenaline, see section 2.7.3. For drug interactions, see Appendix 1 (sympathomimetics).

Dental anaesthesia Lidocaine (lignocaine) is widely used in dental procedures; it is most often used in combination with adrenaline (epinephrine). Lidocaine 2% combined with adrenaline 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline.

The local anaesthetics articaine (carticaine) and mepivacaine are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine is available with or without adrenaline (as Scandonest®) and articaine is available with adrenaline (as Septanest®).

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline in a local anaesthetic may be hazardous. For these patients prilocaine with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in patients with coronary artery disease.

Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline.

---

**Lidocaine**

Lidocaine (lignocaine) is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline) is about 90 minutes.

---

**LIDOCAINE HYDROCHLORIDE**

(Lignocaine hydrochloride)

**Indications** see under Dose; also dental anaesthesia (see p. 704); ventricular arrhythmias (section 2.3.2)

**Cautions** see notes above; see section 2.3.2 for effects on heart; epilepsy, respiratory impairment, impaired cardiac conduction, bradycardia, severe shock; acute porphyria (section 9.8.2); myasthenia gravis; reduce dose in elderly or debilitated; resuscitative equipment should be available; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (lidocaine)

**Contra-indications** see notes above; hypovolaemia, complete heart block; do not use solutions containing adrenaline for anaesthesia in appendages

**Side-effects** see notes above and section 2.3.2; also CNS effects include confusion, respiratory depression and convulsions; hypotension and bradycardia (may lead to cardiac arrest); rarely hypersensitivity reported

**Dose**

- Infiltration anaesthesia, by injection, according to patient’s weight and nature of procedure, max. 200 mg (or 500 mg if given in solutions containing adrenaline)—see also Administration on p. 702 and see also important warning below

- Intravenous regional anaesthesia and nerve blocks, seek expert advice

- Surface anaesthesia, usual strengths 2–4%, see preparations below

---

**Lidocaine hydrochloride injections**

**Lidocaine** (Non-proprietary) ( BN 78p)

Injection 0.5%, lidocaine hydrochloride 5 mg/mL, net price 10-mL amp = 35p

Injection 1%, lidocaine hydrochloride 10 mg/mL, net price 2-mL amp = 21p; 5-mL amp = 25p; 10-mL amp = 38p; 10-mL prefilled syringe = £1.04; 20-mL amp = 78p

Injection 2%, lidocaine hydrochloride 20 mg/mL, net price 2-mL amp = 27p; 5-mL amp = 28p

**Xylocaine** (AstraZeneca) ( BN 78p)

Injection 1% with adrenaline 1 in 200 000, anhydrous lidocaine hydrochloride 10 mg/mL, adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = 99p

Injection 2% with adrenaline 1 in 200 000, anhydrous lidocaine hydrochloride 20 mg/mL, adrenaline 1 in 200 000 (5 micrograms/mL), net price 20-mL vial = £1.04
Lidocaine injections for dental use

Note Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia

A variety of lidocaine injections with adrenaline is available in dental cartridges; brands include Lignospan Special®, Rexocaine® and Xylocaine®

Lidocaine for surface anaesthesia

Important Rapid and extensive absorption may result in systemic side-effects

Lidocaine (Non-proprietary)

Ointment Lidocaine hydrochloride 5%, net price 15 g = £88p

Dose dental practice, rub gently into dry gum

Sore nipples from breast-feeding, apply using gauze and wash off immediately before feed

Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis), 1–2 mL applied when necessary, avoid long-term use

Solution Lidocaine hydrochloride 4%, net price 25 mL = £1.35

Dose biopsy in mouth, 3–4 mL with suitable spray (with adrenaline if necessary); max. 5 mL, ELDERLY lower max. dose, CHILD max. 3 mg/kg

Puncture of maxillary sinus or polyectomy, apply with spray for 2–3 minutes (with adrenaline); max. 5 mL ELDERLY lower max. dose, CHILD max. 3 mg/kg

Bronchoscopy and bronchography, 2–3 mL with suitable spray, max. 5 mL ELDERLY lower max. dose, CHILD max. 3 mg/kg

EMLA® (AstraZeneca)

Drug Tariff cream Lidocaine 2.5%, prilocaine 2.5%, net price 5-g tube = £1.73

Surgical pack cream Lidocaine 2.5%, prilocaine 2.5%, net price 30-g tube = £10.25

Premedication pack cream Lidocaine 2.5%, prilocaine 2.5%, net price 5 × 5-g tube with 12 occlusive dressings = £9.75

Cautions not for preterm neonates, children under 1 year receiving treatment with methaemoglobin-inducing agents, wounds, mucous membranes (except genital mucosa in adults), or atopic dermatitis; avoid use near eyes or middle ear; although systemic absorption low, caution in anaemia, in congenital or acquired methaemoglobinemia or in G6PD deficiency (see also Prilocaine, p. 706)

Side-effects include administration site reactions such as transient paleness, redness, oedema, itching, burning sensation, and localised lesions

Dose ADULT and CHILD over 1 year, anaesthesia before minor skin procedures including venepuncture, apply thick layer under occlusive dressing 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting); NEONATE and CHILD under 3 months or body-weight less than 5 kg, single application max. 1 g under occlusive dressing for max. 1 hour, CHILD 3–12 months and body-weight over 5 kg, apply max. 2 g under occlusive dressing for max. 4 hours

Anaesthesia on genital skin before injection of local anaesthetics in adult men, apply under occlusive dressing for max. 4 hours

Anaesthesia before surgical treatment of lesions on genital skin in adults, apply up to 10 g 5–10 minutes before procedure

Instillagel® (Climed)

Gel Lidocaine hydrochloride 2%, chlorhexidine gluconate solution 0.25%, in a sterile lubricant basis in disposable syringe, net price 6–11 mL syringe = £1.41, 11–50 mL syringe = £1.58

Excipients include hydroxybenzoates (parabens)

Dose 6–11 mL into urethra

Laryngojet® (UCB Pharma) Medicated plaster, lidocaine 70 mg, tetracaine 70 mg, net price 25 = £98.00

Excipients include hydroxybenzoates (parabens)

Dose needle puncture or superficial surgical procedures, ADULT over 18 years, apply 1–4 plasters to intact skin 30 minutes before needle puncture or procedure; max. 4 plasters daily, CHILD 3–18 years, needle puncture, apply 1–2 plasters to intact skin 30 minutes before needle puncture; max. 2 plasters daily

The Scottish Medicines Consortium (p. 3) has advised (May 2008) that lidocaine 70 mg/tetracaine 70 mg (Rapydan medicated plaster) is not recommended for use within NHS Scotland for surface anaesthesia of the skin in connection with needle puncture or for cases of superficial surgical procedures on normal skin in adults or children over 3 years

Versatis® (Grünenthal) Medicated plaster, lidocaine 5% (700 mg/medicated plaster), net price 30 = £72.40

Excipients include hydroxybenzoates (parabens), propylene glycol

Cautions should not be applied to mucous membranes

Side-effects include administration site reactions such as skin lesions or injury

Dose postherpetic neuralgia, ADULT over 18 years, apply to intact, dry, non-hairy, non-irritated skin once daily for up to 12 hours, followed by a 12-hour plaster-free period; discontinue if no response after 4 weeks

Note Up to 3 plasters may be used to cover large areas; plasters may be cut

The Scottish Medicines Consortium has advised (December 2006) that Versatis is not recommended for the treatment of postherpetic neuralgia

Xylocaine® (AstraZeneca)

Spray (= pump spray), lidocaine 10% (100 mg/g) supplying 10 mg lidocaine/dose; 500 spray doses per container. Net price 50-g bottle = £3.13

Dose dental practice, 1–5 doses

Maxillary sinus puncture, 3 doses

During delivery in obstetrics, up to 20 doses

Bronchoscopy, laryngoscopy, oesophagoscopy, entodrateschial intubation, up to 20 doses; CHILD up to 3 mg/kg

Note Lidocaine can damage plastic cuffs of entodrateschial tubes

Lidocaine for ear, nose, and oropharyngeal use For cautions, contra-indications and side-effects of phenylephrine, see section 2.7.2

Lidocaine with Phenylephrine (Non-proprietary)

Topical solution, lidocaine hydrochloride 5%, phenylephrine hydrochloride 0.5%, net price 2.5 mL (with nasal applicator) = £9.60.

Bupivacaine

The advantage of bupivacaine over other local anaesthetics is its longer duration of action. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia.
**Bupivacaine Hydrochloride**

**Indications** see under Dose

**Cautions** see under Lidocaine Hydrochloride and notes above; myocardial depression may be more severe and more resistant to treatment; **interactions:** Appendix 1 (bupivacaine)

**Contra-indications** see under Lidocaine Hydrochloride and notes above; intravenous regional anaesthesia (Bier’s block)

**Side-effects** see under Lidocaine Hydrochloride and notes above

**Dose**

**Note** Doses should be adjusted according to patient’s physical status and nature of procedure—**important:** see also under Administration, p. 702

- **Local infiltration**, max. 60 mL, using a 2.5 mg/mL (0.25%) solution
- **Peripheral nerve block**, max. 60 mL, using a 2.5 mg/mL (0.25%) solution; max. 30 mL, using a 5 mg/mL (0.5%) solution
- **Epidural block**
  - Surgery, lumbar, max. 20 mL, using a 5 mg/mL (0.5%) solution
  - Surgery, caudal, max. 30 mL, using a 5 mg/mL (0.5%) solution; **CHILD** (up to 10 years) using a 2.5 mg/mL (0.25%) solution, up to lower-thoracic (T10) 0.3–0.4 mL/kg, up to mid-thoracic (T6) 0.4–0.8 mL/kg
  - Labour, lumbar, max. 12 mL, using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution; **caudal** (but rarely used) max. 20 mL, using a 2.5 mg/mL (0.25%) or 5 mg/mL (0.5%) solution
- **Sympathetic block**, max. 50 mL, using a 2.5 mg/mL (0.25%) solution
- **Intrathecal anaesthesia**, see under preparations

**Important**
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

**Bupivacaine** (Non-proprietary) [P][M]

**Injection**, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), net price 10 mL = £62p; 5 mg/mL (0.5%), 10 mL = £94p

**Note** Bupivacaine hydrochloride injection 0.25% and 0.5% are available in glass or plastic ampoules, and sterile-wrapped glass ampoules

**Infusion**, anhydrous bupivacaine hydrochloride 1 mg/mL (0.1%), net price 100 mL = £8.41, 250 mL = £10.59; 1.25 mg/mL (0.125%), 250 mL = £10.80

**Dose**

Continuous lumbar epidural infusion during labour (once epidural block established), 10–15 mg/hour of 0.1% or 0.125% solution, max. 2 mg/kg over 4 hours and total of 400 mg in 24 hours

Continuous thoracic, upper abdominal, or lower abdominal epidural infusion for postoperative pain (once epidural block established), 4–15 mg/hour of 0.1% or 0.125% solution; max. 2 mg/kg over 4 hours and total of 400 mg in 24 hours; not recommended for use in children

**Marcain**® (AstraZeneca) [P][M]

**Injection**, anhydrous bupivacaine hydrochloride 2.5 mg/mL (Marcain® 0.25%), net price 10-mL Polymamp® = £1.06; 5 mg/mL (Marcain® 0.5%), 10-mL Polymamp® = £1.21

**Marcain Heavy**® (AstraZeneca) [P][M]

**Injection**, anhydrous bupivacaine hydrochloride 5 mg/mL, glucose 80 mg/mL, net price 4-mL amp = £1.21

**Dose**

Intrathecal anaesthesia for surgery; 2–4 mL (dose may need to be reduced in elderly and in late pregnancy)

**With adrenaline**

**Bupivacaine and Adrenaline** (Non-proprietary) [P][M]

**Injection**, anhydrous bupivacaine hydrochloride 2.5 mg/mL (0.25%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £1.23

**Injection**, anhydrous bupivacaine hydrochloride 5 mg/mL (0.5%), adrenaline 1 in 200 000 (5 micrograms/mL), net price 10-mL amp = £1.40

**Levobupivacaine**

Levobupivacaine, an isomer of bupivacaine, has anaesthetic and analgesic properties similar to bupivacaine, but is thought to have fewer adverse effects.

**LEVOBUPIVACAINE**

**Note** Levobupivacaine is an isomer of bupivacaine

**Indications** see under Dose

**Cautions** see under Lidocaine Hydrochloride and notes above; **interactions:** Appendix 1 (levobupivacaine)

**Contra-indications** see under Lidocaine Hydrochloride and notes above; intravenous regional anaesthesia (Bier’s block); paracervical block in obstetrics; do not use 7.5 mg/mL strength in obstetrics

**Side-effects** see under Lidocaine Hydrochloride and notes above

**Dose**

**Note** Doses should be adjusted according to patient’s physical status and nature of procedure—**important:** see also under Administration, p. 702

- **Surgical anaesthesia**
  - Lumbar epidural, 10–20 mL (50–150 mg) of 5 mg/mL or 7.5 mg/mL solution over 5 minutes; caesarean section, 15–30 mL (75–150 mg) of 5 mg/mL solution over 15–20 minutes
  - Intrathecal, 3 mL (15 mg) of 5 mg/mL solution
  - Periperal nerve block, 1–40 mL of 2.5 mg/mL or 5 mg/mL solution (max. 150 mg); ilioinguinal/iliohypogastric block, **CHILD** under 12 years 0.25–0.5 mL/kg (0.625–2.5 mg/kg) of a 2.5 mg/mL or 5 mg/mL solution
  - Peribulbar block, 5–15 mL (37.5–112.5 mg) of 7.5 mg/mL solution
  - Local infiltration, 1–60 mL (max. 150 mg) of 2.5 mg/mL solution
  - **Acute pain**
    - Lumbar epidural, labour pain, 6–10 mL (15–25 mg) of 2.5 mg/mL solution at intervals of at least 15 minutes or 5–12.5 mg/hour as a continuous epidural infusion, postoperative pain, 12.5–18.75 mg/hour as a continuous epidural infusion; max. 400 mg in 24 hours

**Important**
The licensed doses stated above may not be appropriate in some settings and expert advice should be sought

**Chirocaine**® (Abbott) [P][M]

**Injection**, levobupivacaine (as hydrochloride) 2.5 mg/mL, net price 10-mL amp = £1.66; 5 mg/mL, 10-mL amp = £1.90; 7.5 mg/mL, 10-mL amp = £2.85

**Note** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%
**Procaine**

Procaine is now seldom used. It is as potent as lidocaine (lidocaine) but has a shorter duration of action. It provides less intense analgesia because of reduced spread through the tissues. It is of no value as a surface anaesthetic.

**Prilocaine**

Prilocaine is a local anaesthetic of low toxicity which is similar to lidocaine (lidocaine). If used in high doses, methaemoglobinemia may occur which can be treated with intravenous injection of methylenblum chloride (methylene blue) 1% using a dose of 1 mg/kg. Infants under 6 months are particularly susceptible to methaemoglobinemia.

**PRIOCAINE HYDROCHLORIDE**

**Indications** infiltration anaesthesia (higher strengths for dental use only), nerve block

**Cautions** see under Lidocaine Hydrochloride and notes above; severe or untreated hypertension, severe heart disease; concomitant drugs which cause methaemoglobinemia; reduce dose in elderly or debilitated; pregnancy (Appendix 4); interactions: Appendix 1 (prilocaine)

**Contra-indications** see under Lidocaine Hydrochloride and notes above; anaemia or congenital or acquired methaemoglobinemia

**Side-effects** see under Lidocaine Hydrochloride and notes above; ocular toxicity (including blindness) reported with excessively high strengths used for ophthalmic procedures

**Dose**

- See under preparations—important: see also under Administration, p. 702

**Citranest® (AstraZeneca)**

Injection 1%, prilocaine hydrochloride 10 mg/mL, net price 50-mL multidose vial = £0.02

**Dose** adjusted according to site of administration and response, 100–200 mg/minute, or in incremental doses, to max. total dose 400 mg; CHILD over 6 months up to 5 mg/kg

**With lidocaine**

**EMLA®** see Lidocaine, p. 704

**For dental use**

**Note** Consult expert dental sources for specific advice in relation to dose of prilocaine for dental anaesthesia.

**Citranest® (Dentsply)**

Injection 4%, prilocaine hydrochloride 40 mg/mL, net price 2.2-mL cartridge = £0.17p

**Citranest with Octapressin® (Dentsply)**

Injection 3%, prilocaine hydrochloride 30 mg/mL, felypressin 0.03 unit/mL net price 1.8-mL cartridge and self-aspirating cartridge (both) = £0.15p

**Ropivacaine**

Ropivacaine is an amide-type local anaesthetic agent similar to bupivacaine. It is less cardiotoxic than bupivacaine, but also less potent.

**ROPIVACAINE HYDROCHLORIDE**

**Indications** see under Dose

**Cautions** see under Lidocaine Hydrochloride and notes above; interactions: Appendix 1 (ropivacaine)

**Contra-indications** see under Lidocaine Hydrochloride and notes above; intravenous regional anaesthesia (Bier’s block); paracervical block in obstetrics

**Side-effects** see under Lidocaine Hydrochloride and notes above; also nausea, vomiting; hypertension, tachycardia; headache, rigors, impaired temperature regulation; urinary retention; back pain; less commonly syncope, dyspnoea, anxiety; rarely arrhythmia

**Dose**

- See under preparations—important: see also under Administration on p. 702

**Note** Doses should be adjusted according to patient’s physical status and nature of procedure—important: see also under Administration, p. 702

- By injection, up to 1 g (200 mL of 0.5% solution or 100 mL of 1%) with adrenaline 1 in 200 000

**Procaine** (Martindale)

**Injection**, procaine hydrochloride 2% (20 mg/mL) in sodium chloride intravenous infusion, net price 2-mL amp = £0.127

**For lumbar epidural**

- Lumbar epidural injection 3% procaine hydrochloride 6–10 mL/hour of 2 mg/mL solution as a continuous epidural infusion for labour pain

**For thoracic epidural**

- Thoracic epidural incremental doses (max. total dose 150 mg)

**For major nerve block**

- Major nerve block (brachial plexus block), ADULT and CHILD over 12 years, 30–40 mL of 7.5 mg/mL solution

**For field block**

- Field block, ADULT and CHILD over 12 years, 1–30 mL of 7.5 mg/mL solution

**Acute pain**

- Lumbar epidural, ADULT and CHILD over 12 years, 10–20 mL of 2 mg/mL solution followed by 10–15 mL of 2 mg/mL solution at intervals of at least 30 minutes or 6–10 mL/hour of 2 mg/mL solution as a continuous epidural infusion for labour pain or 6–14 mL/hour of 2 mg/mL solution as a continuous epidural infusion for postoperative pain

**For intravenous regional anaesthesia**

- Intravenous regional anaesthesia (but see notes above)

**Pharmacology**

- Important:

  - Lumbar epidural, ADULT and CHILD over 12 years, 15–20 mL of 10 mg/mL solution or 15–25 mL of 7.5 mg/mL solution (max. total dose 200 mg); caesarean section, 15–20 mL of 7.5 mg/mL solution in incremental doses (max. total dose 150 mg)

  - Thoracic epidural (to establish block for postoperative pain), ADULT and CHILD over 12 years, 5–15 mL of 7.5 mg/mL solution

**For major nerve block**

- Major nerve block (brachial plexus block), ADULT and CHILD over 12 years, 30–40 mL of 7.5 mg/mL solution

**For field block**

- Field block, ADULT and CHILD over 12 years, 1–30 mL of 7.5 mg/mL solution

**For acute pain**

- Lumbar epidural, ADULT and CHILD over 12 years, 10–20 mL of 2 mg/mL solution followed by 10–15 mL of 2 mg/mL solution at intervals of at least 30 minutes or 6–10 mL/hour of 2 mg/mL solution as a continuous epidural infusion for labour pain or 6–14 mL/hour of 2 mg/mL solution as a continuous epidural infusion for postoperative pain

**Infusion**, levobupivacaine (as hydrochloride)

- 625 micrograms/mL, net price 100 mL = £7.80, 200 mL = £10.40, 1.25 mg/mL, net price 100 mL = £8.54, 200 mL = £12.20

**Side-effects**

- See notes above; pregnancy (Appendix 4); interactions: Appendix 1 (procaine)

**Contra-indications** see notes above; pregnancy (Appendix 4); interactions: Appendix 1 (procaine)

**Procaine** (Martindale)

**Injection**, procaine hydrochloride 2% (20 mg/mL) in sodium chloride intravenous infusion, net price 2-mL amp = £0.127

**For lumbar epidural**

- Lumbar epidural injection 3% procaine hydrochloride 6–10 mL/hour of 2 mg/mL solution as a continuous epidural infusion for labour pain

**For thoracic epidural**

- Thoracic epidural incremental doses (max. total dose 150 mg)

**For major nerve block**

- Major nerve block (brachial plexus block), ADULT and CHILD over 12 years, 30–40 mL of 7.5 mg/mL solution

**For field block**

- Field block, ADULT and CHILD over 12 years, 1–30 mL of 7.5 mg/mL solution

**Acute pain**

- Lumbar epidural, ADULT and CHILD over 12 years, 10–20 mL of 2 mg/mL solution followed by 10–15 mL of 2 mg/mL solution at intervals of at least 30 minutes or 6–10 mL/hour of 2 mg/mL solution as a continuous epidural infusion for labour pain or 6–14 mL/hour of 2 mg/mL solution as a continuous epidural infusion for postoperative pain

**Pharmacology**

- Important:

  - Lumbar epidural, ADULT and CHILD over 12 years, 15–20 mL of 10 mg/mL solution or 15–25 mL of 7.5 mg/mL solution (max. total dose 200 mg); caesarean section, 15–20 mL of 7.5 mg/mL solution in incremental doses (max. total dose 150 mg)

  - Thoracic epidural (to establish block for postoperative pain), ADULT and CHILD over 12 years, 5–15 mL of 7.5 mg/mL solution

**For major nerve block**

- Major nerve block (brachial plexus block), ADULT and CHILD over 12 years, 30–40 mL of 7.5 mg/mL solution

**For field block**

- Field block, ADULT and CHILD over 12 years, 1–30 mL of 7.5 mg/mL solution

**For acute pain**

- Lumbar epidural, ADULT and CHILD over 12 years, 10–20 mL of 2 mg/mL solution followed by 10–15 mL of 2 mg/mL solution at intervals of at least 30 minutes or 6–10 mL/hour of 2 mg/mL solution as a continuous epidural infusion for labour pain or 6–14 mL/hour of 2 mg/mL solution as a continuous epidural infusion for postoperative pain

**Infusion**, levobupivacaine (as hydrochloride)

- 625 micrograms/mL, net price 100 mL = £7.80, 200 mL = £10.40, 1.25 mg/mL, net price 100 mL = £8.54, 200 mL = £12.20
Thoracic epidural, **ADULT** and **CHILD** over 12 years, 6–14 mL/hour of 2 mg/mL solution as a continuous infusion

Field block, **ADULT** and **CHILD** over 12 years, 1–100 mL of 2 mg/mL solution

Peripheral nerve block, **ADULT** and **CHILD** over 12 years, 5–10 mL/hour of 2 mg/mL solution as a continuous infusion or by intermittent injection

**CHILD** under 12 years, consult product literature

**Naropin**® (AstraZeneca) ®

**Injection**, ropivacaine hydrochloride 2 mg/mL, net price 10-mL Polyamp® = £1.78; 7.5 mg/mL, 10-mL Polyamp® = £2.65; 10 mg/mL, 10-mL Polyamp® = £3.20

**Electrolytes** Na < 0.5 mmol/mL

**Infusion**, ropivacaine hydrochloride 2 mg/mL, net price 200-mL Polybag® = £14.45

**Electrolytes** Na < 0.5 mmol/mL

**TETRACAINE**

Tetracaine (amethocaine) is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia prior to venepuncture or venous cannulation. It is rapidly absorbed from mucous membranes and should never be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy, as lidocaine (lignocaine) is a safer alternative. It is used in ophthalmology (section 11.7) and in skin preparations (section 13.3). Hypersensitivity to tetracaine has been reported.

**TETRACAINE**

(Amethocaine)

**Indications** see under preparation below

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; also erythema, oedema and pruritus; very rarely blistering

**Important**. Rapid and extensive absorption may result in systemic side-effects (see also notes above)

**Ametop**® (S&N Hlth.)

**Gel**, tetracaine 4%, net price 1.5-g tube = £1.08

**Dose** **ADULT** and **CHILD** over 1 month, apply contents of tube to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation

**Note** **ADULT** and **CHILD** over 5 years, max. 5 tubes applied at separate sites at a single time, **CHILD** 1 month–5 years, max. 1 tube applied at separate sites at a single time. Max. in a 24-hour period, **ADULT** 7 tubes, **CHILD** 2 tubes

**NEONATE** see BNF for Children

**With lidocaine**

Rapydan® see Lidocaine, p. 704

**Other local anaesthetics**

Benzocaine is a local anaesthetic of low potency and toxicity. It is used in concentrations of up to 20% for topical anaesthesia of the oral mucosa before injection. It is an ingredient of some proprietary topical preparations for musculoskeletal conditions (section 10.3.2), mouth-ulcer preparations (section 12.3.1), and throat lozenges (section 12.3.3). Benzocaine sprays used in the mouth and throat have been associated with methaemoglobinemia.

Cocaine readily penetrates mucous membranes and is an effective surface anaesthetic with an intense vasoconstrictor action. However, apart from its use in otolaryngology (see below), it has now been replaced by less toxic alternatives. It has marked sympathomimetic activity and should never be given by injection because of its toxicity. As a result of its intense stimulant effect it is a drug of addiction. In otolaryngology cocaine is applied to the nasal mucosa in concentrations of 4 to 10% (40–100 mg/mL); an oromucosal solution and nasal spray both containing cocaine hydrochloride 10% are available (Aurum). In order to avoid systemic effects, the maximum dose recommended for application to the nasal mucosa in fit adults is a total of 1.5 mg/kg, which is equivalent to a total topical dose of approximately 100 mg for an adult male; this dose relates to direct application of cocaine (application on gauze may reduce systemic absorption). It should be used only by those skilled in the precautions needed to minimize absorption and the consequent risk of arrhythmias. Although cocaine interacts with other drugs liable to induce arrhythmias, including adrenaline, some otolaryngologists consider that combined use of topical cocaine with topical adrenaline (in the form of a paste or a solution) improves the operative field and may possibly reduce absorption. Cocaine is a mydriatic as well as a local anaesthetic but owing to corneal toxicity it is now little used in ophthalmology. Cocaine should be avoided in acute porphyria (section 9.8.2).
Appendix 1: Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the CHM as for other adverse drug reactions.

Drug interactions may be pharmacodynamic or pharmacokinetic.

Pharmacodynamic interactions

These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

Pharmacokinetic interactions

These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

Affecting absorption The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

Due to changes in protein binding To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulphonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

Affecting metabolism Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives.

Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of in-vitro information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

Relative importance of interactions

Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antidiabetics) are most often involved.

Patients at increased risk from drug interactions include the elderly and those with impaired renal or liver function.

Hazardous interactions The symbol ● has been placed against interactions that are potentially hazardous and where combined administration of the drugs involved should be avoided (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.
ACE Inhibitors

Clonidine: enhanced hypotensive effect when ACE inhibitors given with clonidine; antihypertensive effect of captopril possibly delayed by previous treatment with clonidine

Corticosteroids: hypotensive effect of ACE inhibitors antagonised by corticosteroids

Cytotoxics: increased risk of anaemia or leucopenia when captopril given with azathioprine especially in renal impairment; increased risk of anaemia when enalapril given with azathioprine especially in renal impairment

Diazoxide: enhanced hypotensive effect when ACE inhibitors given with diazoxide

Diuretics: enhanced hypotensive effect when ACE inhibitors given with diuretics: increased risk of severe hyperkalaemia when ACE inhibitors given with potassium-sparing diuretics and aldosterone antagonists (monitor potassium concentration with low-dose spironolactone in heart failure)

Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with levodopa

Lithium: ACE inhibitors reduce excretion of lithium (increased plasma concentration)

Methyldopa: enhanced hypotensive effect when ACE inhibitors given with methyldopa

Moxisylyte (thymoxamine): enhanced hypotensive effect when ACE inhibitors given with moxisylyte

Moxonidine: enhanced hypotensive effect when ACE inhibitors given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with baclofen or tizanidine

Nitrates: enhanced hypotensive effect when ACE inhibitors given with nitrates

Oestrogens: hypotensive effect of ACE inhibitors antagonised by oestrogens

Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with potassium salts

Probenecid: excretion of captopril reduced by probenecid

Progestogens: risk of hyperkalaemia when ACE inhibitors given with drospirenone (monitor serum potassium during first cycle)

Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with alprostadil

Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with hydralazine, minoxidil or sodium nitroprusside

ACE Inhibitors (continued)

Abacavir:
- Absorption of abacavir possibly reduced by rifampicin
- Increased risk of side-effects when abacavir given with rifampicin
- Values for abacavir interactions as for aciclovir

Aciclovir:
- Increased risk of severe hyperkalaemia when ACE inhibitors given with aciclovir

Adefovir:
- Absorption of adefovir possibly reduced by rifampicin
- Values for adefovir interactions as for aciclovir

Aciclovir, see Aciclovir interactions as for aciclovir

Acenocoumarol (nicoumalone): see Anticoagulants

Acetazolamide: see Diuretics

Aciclovir: see Antiviral
corticosteroids

Anakinra: see Antidiabetics

Anasthetics, General: enhanced hypotensive effect when ACE inhibitors given with general anaesthetics

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ACE inhibitors given with angiotensin-II receptor antagonists

Antacids: absorption of ACE inhibitors possibly reduced by antacids; absorption of captopril, enalapril and fosinopril reduced by antacids

Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with anticoagulants

Antidepressants: increased hypotensive effect of ACE inhibitors possibly enhanced by MAOIs

Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of insulin, metformin and sulphonylureas

Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with antipsychotics

Antidiabetics: see Antidiabetics

Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when ACE inhibitors given with calcium-channel blockers

Captopril possibly increases plasma concentration of digoxin

Clonidine: enhanced hypotensive effect when ACE inhibitors given with clonidine; antihypertensive effect of captopril possibly delayed by previous treatment with clonidine

Corticosteroids: hypotensive effect of ACE inhibitors antagonised by corticosteroids

Cytotoxics: increased risk of anaemia or leucopenia when captopril given with azathioprine especially in renal impairment; increased risk of anaemia when enalapril given with azathioprine especially in renal impairment

Diazoxide: enhanced hypotensive effect when ACE inhibitors given with diazoxide

Diuretics: enhanced hypotensive effect when ACE inhibitors given with diuretics: increased risk of severe hyperkalaemia when ACE inhibitors given with potassium-sparing diuretics and aldosterone antagonists (monitor potassium concentration with low-dose spironolactone in heart failure)

Dopaminergics: enhanced hypotensive effect when ACE inhibitors given with levodopa

Lithium: ACE inhibitors reduce excretion of lithium (increased plasma concentration)

Methyldopa: enhanced hypotensive effect when ACE inhibitors given with methyldopa

Moxisylyte (thymoxamine): enhanced hypotensive effect when ACE inhibitors given with moxisylyte

Moxonidine: enhanced hypotensive effect when ACE inhibitors given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when ACE inhibitors given with baclofen or tizanidine

Nitrates: enhanced hypotensive effect when ACE inhibitors given with nitrates

Oestrogens: hypotensive effect of ACE inhibitors antagonised by oestrogens

Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with potassium salts

Probenecid: excretion of captopril reduced by probenecid

Progestogens: risk of hyperkalaemia when ACE inhibitors given with drospirenone (monitor serum potassium during first cycle)

Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with alprostadil

Vasodilator Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with hydralazine, minoxidil or sodium nitroprusside

Acebutolol: see Beta-blockers

Adefovir: see Antiviral
corticosteroids

Anakinra: see Antidiabetics
Adenosine

Note: Possibility of interaction with drugs tending to impair myocardial condition.

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine.

- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics.
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval.

Beta-blockers: increased myocardial depression when anti-arrhythmics given with beta-blockers.

Dipyridamole: effect of adenosine enhanced and extended by dipyridamole (important risk of toxicity).

Theophylline: anti-arrhythmic effect of adenosine antagonised by theophylline.

Adrenaline (epinephrine) see Sympathomimetics.

Adrenergic Neurone Blockers

Alcohol: enhanced hypotensive effect when adrenergic neurone blockers given with alcohol.

- Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with alpha-blockers.
- Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers antagonised by beta-blockers.
- General anaesthetics: enhanced hypotensive effect of adrenergic neurone blockers antagonised by NSAIDs.

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neurone blockers given with angiotensin-II receptor antagonists.

Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with alpha-blockers.

Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by tricyclics.

Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by haloperidol; enhanced hypotensive effect of adrenergic neurone blockers given with chlorpromazine; enhanced hypotensive effect when adrenergic neurone blockers given with phenothiazines.

Anxiolytics and Hypnotics: enhanced hypotensive effect when adrenergic neurone blockers given with anxiolytics and hypnotics.

Betaxolol: enhanced hypotensive effect when adrenergic neurone blockers given with beta-blockers.

Calcium-channel Blockers: enhanced hypotensive effect when adrenergic neurone blockers given with calcium-channel blockers.

Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with clonidine.

Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by corticosteroids.

Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with diazoxide.

Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with diuretics.

Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with levodopa.

Methyl dopa: enhanced hypotensive effect when adrenergic neurone blockers given with methyl dopa.

Moxisylyte (thymoxamine): enhanced hypotensive effect when adrenergic neurone blockers given with moxisylyte.

Maxidone: enhanced hypotensive effect when adrenergic neurone blockers given with maxidone.

Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with baclofen or tizanidine.

Nitrates: enhanced hypotensive effect when adrenergic neurone blockers given with nitrates.

Opioids: hypotensive effect of adrenergic neurone blockers antagonised by oestrogens.

Pizotifen: hypotensive effect of adrenergic neurone blockers antagonised by pizotifen.

Adrenergic Neurone Blockers (continued)

Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with alprostadil.

- Symptoms (chronic): hypotensive effect of adrenergic neurone blockers antagonised by ephedrine, isometheptene, metaraminol, methyphenidate, noradrenaline (norepinephrine), oxytazolone, phenylephrine, phenylpropanolamine, pseudoephedrine and xylometazoline.

Vasodilators: Hypotensive effect of adrenergic neurone blockers given with hydralazine, minoxidil or sodium nitroprusside.

Adsorbents see Kaolin.

Agalsidase Alfa and Beta

Anti-arrhythmics: effects of agalsidase alfa and beta possibly inhibited by amiodarone (manufacturers of agalsidase alfa and beta advise avoid concomitant use).

Antibacterials: effects of agalsidase alfa and beta possibly inhibited by gentamicin (manufacturers of agalsidase alfa and beta advise avoid concomitant use).

Antimalarials: effects of agalsidase alfa and beta possibly inhibited by chloroquine and hydroxychloroquine (manufacturers of agalsidase alfa and beta advise avoid concomitant use).

Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with alpha-blockers.

Alcohol

ACE Inhibitors: enhanced hypotensive effect when alcohol given with ACE inhibitors.

Adrenergic Neurone Blockers: enhanced hypotensive effect when alcohol given with adrenergic neurone blockers.

Alpha-blockers: increased sedative effect when alcohol given with indoramin; enhanced hypotensive effect when alcohol given with alpha-blockers.

Anxiolytics and Hypnotics: enhanced hypotensive and sedative effects when alcohol given with opioid analgesics.

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alcohol given with angiotensin-receptor antagonists.

Antibacterials: disulfiram-like reaction when alcohol given with metronidazole; possibility of disulfiram-like reaction when alcohol given with tinidazole; increased risk of convulsions when alcohol given with cycloserine.

Anticoagulants: major changes in consumption of alcohol may affect anticoagulant control with coumarins or ephedrine.

Antidepressants: some beverages containing alcohol and some dealcoholised beverages contain tyramine which interacts with MAOIs (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with SSRIs; increased sedative effect when alcohol given with mitrazapine, tricyclic-related antidepressants or tricyclics.

Antidiabetics: alcohol enhances hypoglycaemic effect of antidiabetics; increased risk of lactic acidosis when alcohol given with metformin; flushing, in susceptible subjects, when alcohol given with chlorpropamide.

Antiepileptics: alcohol possibly increases CNS side-effects, increased sedative effect when alcohol given with primidone.

Antifungals: effects of alcohol possibly enhanced by griseofulvin.

Antihistamines: increased sedative effect when alcohol given with antihistamines (possibly less effect with non-sedating antihistamines).

Antimuscarinics: increased sedative effect when alcohol given with hyoscine.

Antipsychotics: increased sedative effect when alcohol given with antipsychotics.

Anxiolytics and Hypnotics: increased sedative effect when alcohol given with anxiolytics and hypnotics.

Barbiturates: increased sedative effect when alcohol given with barbiturates.

Beta-blockers: enhanced hypotensive effect when alcohol given with beta-blockers.
Alcohol (continued)
Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with calcium-channel blockers; plasma concentration of alcohol possibly increased by verapamil
Clonidine: enhanced hypotensive effect when alcohol given with clonidine
Cytotoxics: disulfiram-like reaction when alcohol given with paraldehyde
Diazoxide: enhanced hypotensive effect when alcohol given with diazoxide
Disulfiram: disulfiram reaction when alcohol given with disulfiram (see p. 275)
Diuretics: enhanced hypotensive effect when alcohol given with diuretics
Dopaminergics: alcohol reduces tolerance to bromocriptine
Levamisole: possibility of disulfiram-like reaction when alcohol given with levamisole
Lofexidine: increased sedative effect when alcohol given with lofexidine
Methyldopa: enhanced hypotensive effect when alcohol given with methyldopa
Moxonidine: enhanced hypotensive effect when alcohol given with moxonidine
Muscle Relaxants: increased sedative effect when alcohol given with baclofen, methocarbamol or tizanidine
Nabnilone: increased sedative effect when alcohol given with nabnilone
Nicorandil: alcohol possibly enhances hypotensive effect of nicorandil
Nitrates: enhanced hypotensive effect when alcohol given with nitrates
Paraldehyde: increased sedative effect when alcohol given with paraldehyde
Retinoids: presence of alcohol causes eretinate to be formed from acitretin (increased risk of teratogenicity in women of child-bearing potential)
Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with hydralazine, minoxidil or sodium nitroprusside
Aliskiren (continued)
Antifungals: plasma concentration of aliskiren increased by ketoconazole
Diuretics: aliskiren reduces plasma concentration of furosemide (frusemide); increased risk of hyperkalaemia when aliskiren given with potassium-sparing diuretics and aldosterone antagonists
Potassium Salts: increased risk of hyperkalaemia when aliskiren given with potassium salts
Alitretinoin see Retinoids
Antihypertensive Drugs see Bisulfan, Carmustine, Cyclophosphamide, Ifosamide, Lomustine, Methyldopa, and Thiopeta
Allopurinol
ACE Inhibitors: increased risk of leucopenia and hypersensitivity reactions when allopurinol given with ACE inhibitors especially in renal impairment
Antibacterials: increased risk of rash when allopurinol given with amoxicillin or ampicillin
Anticoagulants: allopurinol possibly enhances anti-coagulant effect of coumarins
α-Vinyls: allopurinol increases plasma concentration of zidovudine (risk of toxicity)—avoid concomitant use
Ciclosporin: allopurinol possibly increases plasma concentration of ciclosporin (risk of nephrotoxicity)
Cytotoxics: allopurinol enhances effects and increases toxicity of azathioprine and mercaptopurine (reduce dose of azathioprine and mercaptopurine to one quarter of usual dose); avoidance of allopurinol advised by manufacturer of mercaptopurine
Diuretics: increased risk of hypersensitivity when allopurinol given with thiazides and related diuretics especially in renal impairment
Theophylline: allopurinol possibly increases plasma concentration of theophylline
Almopitrapan see SHT Agonists
Alpha -adrenoceptor Stimulants see Apraclonidine, Brimonidine, Clonidine and Methyldopa
Alpha-blockers
ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when alpha-blockers given with alcohol; increased sedative effect when inforamin given with alcohol
Aliskiren: enhanced hypotensive effect when alpha-blockers given with aliskiren
Anaesthetics, General: enhanced hypotensive effect when alpha-blockers given with general anaesthetics
Analgesics: hypotensive effect of alpha-blockers antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with angiotensin-II receptor antagonists
Antidepressants: enhanced hypotensive effect when alpha-blockers given with MAOIs; manufacturer of indomethacin advises avoid concomitant use with MAOIs
Antipsychotics: enhanced hypotensive effect when alpha-blockers given with antipsychotics
Antivirals: plasma concentration of alfuzosin possibly increased by ritonavir—avoid concomitant use
Anxiolytics and Hypnotics: enhanced hypotensive and sedative effects when alpha-blockers given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when alpha-blockers given with calcium-channel blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
Captopril, Enalapril, Lisinopril, Perindopril, Ramipril anticongulants and other medications with hypertensive effects
Appendix 1: Interactions

Aminoglycosides

Agalsidase Alfa and Beta (continued) agalsidase alfa and beta advise avoid concomitant use

Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by indometacin

Antibacterials: neomycin reduces absorption of phenoxymethylinicillin; increased risk of nephrotoxicity when aminoglycosides given with colistin or polymyxins; increased risk of nephrotoxicity and ototoxicity when aminoglycosides given with capreomycin, teicoplanin or vancomycin; possible increased risk of nephrotoxicity when aminoglycosides given with cephalosporins

Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with coumarins or ophenindione

Antidiabetics: neomycin possibly enhances hypoglycaemic effect of acarbose, also severity of gastrointestinal effects increased

Antifungals: increased risk of nephrotoxicity when aminoglycosides given with amphoterin

Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with bisphosphonates

Cardiac Glycosides: neomycin reduces absorption of digoxin; gentamicin possibly increases plasma concentration of digoxin

Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with ciclosporin

Cytotoxics: neomycin possibly reduces absorption of methotrexate; increased risk of nephrotoxicity and possibly of ototoxicity when aminoglycosides given with platinum compounds

Diuretics: increased risk of ototoxicity when aminoglycosides given with deep diuretics

Muscle Relaxants: aminoglycosides enhance effects of non-depolarising muscle relaxants and suxamethonium

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)

Parasymptomimetics: aminoglycosides antagonise effects of neostigmine and pyridostigmine

Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Vitamins: neomycin possibly reduces absorption of vitamin A

Aminophylline see Theophylline

Aminosaliclyates Cardiac Glycosides: sulfasalazine possibly reduces absorption of digoxin

Cytotoxics: possible increased risk of leucopenia when aminosalicylates given with azathioprine or mercaptopurine

Folates: sulfasalazine possibly reduces absorption of folic acid

Amiodarone Note Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped

Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Anaesthetics, Local: increased myocardial depression when anti-arrhythmic given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics; increased risk of ventricular arrhythmias when amiodarone given with disopyramide—avoid concomitant use; amiodarone increases plasma concentration of flecainide (half dose of flecainide)

Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with parenteral

Cardiac Glycosides: prazosin increases plasma concentration of digoxin

Clonidine: enhanced hypotensive effect when alpha-blockers given with clonidine

Corticosteroids: hypotensive effect of alpha-blockers antagonised by corticosteroids

Diapride: enhanced hypotensive effect when alpha-blockers given with diazoxide

Diuretics: enhanced hypotensive effect when alpha-blockers given with diuretics, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Dopaminergics: enhanced hypotensive effect when alpha-blockers given with levodopa

Methyldopa: enhanced hypotensive effect when alpha-blockers given with methyldopa

Metoprolol (thymoxamine): possible severe postural hypotension when alpha-blockers given with metoprolol

Moxonidine: enhanced hypotensive effect when alpha-blockers given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when alpha-blockers given with nitrates

Oestrogens: hypotensive effect of alpha-blockers antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when alpha-blockers given with alprostadil

Sildenafil (avoid alpha-blockers for 4 hours after sildenafil)

Sympathomimetics: avoid concomitant use of tolazamide (tolazamide antagonised by oestrogens(risk probably small, see p. 439)

Vasodilator Antihypertensives: enhanced hypotensive effect when alpha-blockers given with hydralazine, minoxidil or sodium nitroprusside

Alpha-blockers (post-synaptic) see Alpha-blockers

Alprostadil see Prostaglandins

Aluminium Hydroxide see Antacids

Aminophylline see Theophylline

Aminosaliclyates Cardiac Glycosides: sulfasalazine possibly reduces absorption of digoxin

Cytotoxics: possible increased risk of leucopenia when aminosaliclyates given with azathioprine or mercaptopurine

Folates: sulfasalazine possibly reduces absorption of folic acid

Amiodarone Note Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped

Agalsidase Alfa and Beta: amiodarone possibly inhibits effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine

Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics; increased risk of ventricular arrhythmias when amiodarone given with disopyramide—avoid concomitant use; amiodarone increases plasma concentration of flecainide (half dose of flecainide)

Antibacterials: increased risk of ventricular arrhythmias when amiodarone given with parenteral
Antipsychotics: increased risk of ventricular arrhythmias when amiodarone given with

Cardiac Glycosides: increased risk of ventricular arrhythmias when amiodarone given with

Beta-blockers: increased plasma concentration of amiodarone (reduce dose of amiodarone ex ethinyl estradiol)

Anticoagulants: increased risk of ventricular arrhythmias when amiodarone given with

Antidepressants: increased risk of ventricular arrhythmias when amiodarone given with

Antiepileptics: increased plasma concentration of amiodarone possibly increased by

Antihistamines: increased risk of ventricular arrhythmias when amiodarone given with

Antimalarials: avoidance of amiodarone advised by manufacturer of artesunate

Antipsychotics: increased risk of ventricular arrhythmias when amiodarone given with

Antivirals: increased risk of ventricular arrhythmias when amiodarone given with

Amiodarone: increased plasma concentration of amiodarone possibly increased by

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Antibacterials: increased risk of nephrotoxicity when amphotericin given with

Antidepressants, Tricyclic: increased risk of nephrotoxicity when amphotericin given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Antidepressants: increased risk of ventricular arrhythmias when amiodarone given with

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Amphotericin: increased plasma concentration of amiodarone possibly increased by

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Amphotericin: increased plasma concentration of amiodarone possibly increased by

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia

Amphotericin: increased risk of ventricular arrhythmias when amiodarone given with

Anticoagulants: amiodarone antagonised by oral anticoagulants

Alpha-blockers: increased risk of Bradycardia
Appendix 1: Interactions

Anaesthetics, General
- Antidepressants (continued)
  Increased risk of arrhythmias and hypotension when general anaesthetics given with tricyclics
- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with antipsychotics
- Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when general anaesthetics given with beta-blockers
- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics or isoflurane given with calcium-channel blockers; general anaesthetics enhance hypotensive effect of everapamil (also AV delay)

Clonidine: enhanced hypotensive effect when general anaesthetics given with clonidine
- Cytotoxics: nitrous oxide increases antifolate effect of methotrexate—avoid concomitant use

Diazoxide: enhanced hypotensive effect when general anaesthetics given with diazoxide
- Diuretics: enhanced hypotensive effect when general anaesthetics given with diuretics
- Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with levodopa
- Ergot Alkaloids: halothane reduces effects of ergometrine on the parturient uterus
- Memantine: increased risk of CNS toxicity when ketamine given with memantine (manufacturer of memantine advises avoid concomitant use)
- Methylphenidate: enhanced hypotensive effect when general anaesthetics given with methylphenidate
- Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with suxamethonium; volatile liquid general anaesthetics enhance effects of non-depolarising muscle relaxants and suxamethonium
- Nitrites: enhanced hypotensive effect when general anaesthetics given with nitrites
- Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with oxytocin
- Probencid: effects of thiopteral possibly enhanced by probencid
- Sympathomimetics: increased risk of arrhythmias when volatile liquid general anaesthetics given with adrenaline (epinephrine); increased risk of hypertensive effect when volatile liquid general anaesthetics given with methylphenidate
- Theophylline: increased risk of convulsions when ketamine given with theophylline; increased risk of arrhythmias when halothane given with theophylline
- Vasodilator Antihypertensives: enhanced hypotensive effect when general anaesthetics given with hydralazine, minoxidil or sodium nitroprusside

Anaesthetics, General (intravenous) see Anaesthetics, General

Anaesthetics, General, Local see Bupivacaine, Levobupivacaine, Lidocaine (lignocaine), Prilocaine, Procaine, and Ropivacaine

Angiotensin-II Receptor Antagonists
- ACE Inhibitors: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alcohol
- Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alcohol
- Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with aldesleukin
- Alliskiren: irbesartan possibly reduces plasma concentration of alliskiren
- Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with alpha-blockers
- Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with general anaesthetics
- Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with NSAIDs, also hypotensive effect antagonised
- Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with heparin
- Antidepressants: hypotensive effect of angiotensin-II receptor antagonists possibly enhanced by MAOIs
- Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with antipsychotics
- Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with anxiolytics and hypnotics
- Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with beta-blockers
- Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with calcium-channel blockers
- Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with ciclosporin
- Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with clonidine
- Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diazoxide
- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with diuretics
- Dopaminergics: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with dopamine
- Lamotrigine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with lamotrigine
- Lithium: angiotensin-II receptor antagonists reduce excretion of lithium (increased plasma concentration)
- Methylprednisolone: enhanced hypotensive effect when angiotensin-II receptor antagonists given with methylprednisolone
- Moxisylyte (thymoxamine): enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxisylyte
- Moxifloxacin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with moxifloxacin
- Muscle Relaxants: enhanced hypotensive effect when angiotensin-II receptor antagonists given with baclofen or tizanidine
Antipsychotics: see Antazoline.

Antacids

• Potassium Salts: increased risk of hyperkalaemia when antipsychotic-II receptor antagonists given with potassium salts

Prostaglandins: risk of hyperkalaemia when antipsychotic-II receptor antagonists given with drosperinone (monitor serum potassium during first cycle)

Prostaglandins: enhanced hypotensive effect when antipsychotic-II receptor antagonists given with alprostadil

Tacrolimus: increased risk of hyperkalaemia when antipsychotic-II receptor antagonists given with tacrolimus

Vasodilator Antihypertensives: enhanced hypotensive effect when antipsychotic-II receptor antagonists given with hydralazine, minoxidil or sodium nitroprusside

Antacids

Note Antacids should preferably not be taken at the same time as other drugs since they may impair absorption

ACE inhibitors: antacids possibly reduce absorption of captopril, enalapril and fosinopril

Analgesics: alkaline urine due to some antacids increases excretion of aspirin

Antibacterials: antacids reduce absorption of azithromycin, cefaclor, cepodoxime, ciprofloxacin, isoniazid, levofloxacin, moxifloxacin, ofloxacin, rifampicin and tetracyclines; oral magnesium salts (as magnesium trisilicate) reduce absorption of nitrofurantoin

Antiepileptics: antacids reduce absorption of gabapentin and phenytoin

Antifungals: antacids reduce absorption of imipenem and cilastatin, amoxicillin and clavulanate, and tetracyclines

Antihistamines: antacids reduce absorption of fexofenadine

Antimalarials: antacids reduce absorption of chloroquine and hydroxychloroquine; oral magnesium salts (as magnesium trisilicate) reduce absorption of proguanil

Antipsychotics: antacids reduce absorption of phenothiazines and sulpiride

Antivirals: antacids possibly reduce plasma concentration of atazanavir; antacids possibly reduce absorption of fosamprenavir; antacids reduce absorption of tipranavir

Bile Acids: antacids possibly reduce absorption of bile acids

Bisphosphonates: antacids reduce absorption of bisphosphonates

Cardiac Glycosides: antacids possibly reduce absorption of digoxin

Corticosteroids: antacids reduce absorption of deflazacort

Cytotoxics: antacids reduce absorption of mycophenolate

Deferasirox: antacids containing aluminium possibly reduce absorption of deferasirox (manufacturer of deferasirox advises avoid concomitant use)

Dipyriramole: antacids possibly reduce absorption of dipyriramole

Iron: oral magnesium salts (as magnesium trisilicate) reduce absorption of oral iron

Lipid-regulating Drugs: antacids reduce absorption of rosuvastatin

Lithium: sodium bicarbonate increases excretion of lithium (reduced plasma concentration)

Penicillamine: antacids reduce absorption of penicillamine

Thyroid Hormones: antacids possibly reduce absorption of levothyroxine (thyroxine)

Ulcercalulating Drugs: antacids possibly reduce absorption of lansoprazole

Antazoline see Antihistamines

Anti-arrhythmics see Adenosine, Amiodarone, Disopyramide, Flecaïnide, Lidocaine (lignocaine), and Propafenone.

Antibacterials see individual drugs.

Antibiotics (cytotoxic) see Bleomycin, Doxorubicin, Epirubicin, Mitomycin.

Anticoagulants see Coumarins, Dabigatran etexilate, Heparins, Phenindione, and Rivaroxaban

Antidepressants see Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John’s Wort; Tryptophan; Venlafaxine

Antidepressants, Noradrenaline Re-uptake Inhibitors see Reboxetine

Antidepressants, SSRIs

Alcohol: sedative effects possibly increased when SSRIs given with alcohol

Anaesthetics, Local: fluvoxamine inhibits metabolism of ropivacaine—avoid prolonged administration of ropivacaine

Analgesics: increased risk of bleeding when SSRIs given with nSAIDs or aspirin; fluvoxamine possibly increases plasma concentration of methadone; increased risk of CNS toxicity when SSRIs given with tramadol

Anti-arrhythmics: fluoxetine increases plasma concentration of flecainide; paroxetine possibly inhibits metabolism of propafenone (increased risk of toxicity)

Anticoagulants: SSRIs possibly enhance anticoagulant effect of warfarin

Antidepressants: avoidance of fluvoxamine advised by manufacturer of reboxetine; possible increased serotonergic effects when SSRIs given with duloxetine; fluvoxamine inhibits metabolism of mirtazapine—avoid concomitant use; citalopram, escitalopram, fluoxetine, paroxetine or sertraline should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine or paroxetine; CNS effects of SSRIs increased by MAOIs (risk of serious toxicity); sertraline should not be started until 2 weeks after stopping fluoxetine; fluoxetine and paroxetine or sertraline: CNS effects of SSRIs increased by MAOIs; also MAOIs should not be started until at least 5 weeks after stopping citalopram, escitalopram, fluvoxamine or paroxetine do not start until 2 weeks after stopping fluoxetine; fluoxetine should not be started until 2 weeks after stopping fluoxetine; increased risk of CNS toxicity when escitalopram given with moclobemide, preferably avoid concomitant use; after stopping citalopram, fluvoxamine or paroxetine do not start moclobemide for at least 1 week; after stopping fluoxetine do not start moclobemide for 5 weeks; after stopping sertraline do not start moclobemide for 2 weeks; increased serotonergic effects when SSRIs given with St John’s wort—avoid concomitant use; SSRIs increase plasma concentration of some tricyclics; agitation and nausea may occur when SSRIs given with tryptophan

Antiepileptics: SSRIs antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); fluvoxamine inhibits fluvoxamine increase plasma concentration of carbamazepine; plasma concentration of paroxetine reduced by carbamazepine, phenytoin and primidone; fluoxetine and fluvoxamine increase plasma concentration of ophenytoin Antithistamines: antidepressant effect of SSRIs possibly antagonised by cyproheptadine

Antimicrobials: avoidance of antidepressants advised by manufacturer of ciprofloxacin/levofloxacin

Antithrombotic: aspirin reduces antiplatelet effect of SSRIs

Antipsychotics: fluoxetine increases plasma concentration of clozapine, haloperidol, risperidone, sulpiride and ziprasidone (paroxetine inhibits metabolism of perphenazine (reduce dose of perphenazine); fluoxetine and paroxetine possibly inhibit metabolism of warfarin—reduce dose of aspiri-
Antidepressants, SSRI
- Antipsychotics (continued)
  - prazepam; fluvoxamine, paroxetine and sertraline increase plasma concentration of clozapine (increased risk of toxicity); fluvoxamine increases plasma concentration of olanzapine; SSRIs possibly increase plasma concentration of pimozone (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of risperidone (increased risk of toxicity); paroxetine increases plasma concentration of sertindole
- Antivirals: plasma concentration of paroxetine and sertraline possibly reduced by darunavir; plasma concentration of paroxetine reduced by efavirenz; plasma concentration of paroxetine possibly reduced by ritonavir; plasma concentration of SSRIs possibly increased by ritonavir
- Anxiolytics and Hypnotics: fluvoxamine increases plasma concentration of some benzodiazepines; fluvoxamine increases plasma concentration of melatonin—avoid concomitant use; sedative effects possibly increased when sertraline given with zolpidem
- Bupropion: plasma concentration of citalopram possibly increased by bupropion
- Calcium-channel Blockers: fluoxetine possibly inhibits metabolism of nifedipine (increased plasma concentration)
- Dopaminergics: caution with paroxetine advised by manufacturer of entacapone; increased risk of CNS toxicity when SSRIs given with rasagiline; fluvoxamine should not be started until 2 weeks after stopping rasagiline; fluoxetine should not be started until 2 weeks after stopping rasagiline, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; increased risk of hypotension and CNS excitation when paroxetine or sertraline given with selegiline; selegiline should not be started until 2 weeks after stopping paroxetine or sertraline, avoid paroxetine or sertraline for 2 weeks after stopping selegiline; increased risk of hyperpnea and CNS excitation when fluvoxamine given with selegiline (selegiline should not be started until 1 week after stopping fluvoxamine, avoid fluvoxamine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when fluoxetine given with selegiline (selegiline should be not started until 1 week after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); theorectical risk of serotonin syndrome if citalopram given with selegline (especially if dose of selegline exceeds 10 mg daily); manufacturer of escitalopram advises caution with selegline
- 5HT Agonists: possible increased serotonergic effects when SSRIs given with troleandomycin; fluvoxamine inhibits the metabolism of troleandomycin; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with sumatriptan; increased risk of CNS toxicity when sertraline given with sumatriptan (manufacturer of sertraline advises avoid concomitant use); fluvoxamine possibly inhibits metabolism of zolmitriptan; increased risk of CNS toxicity when citalopram given with fluoxetine, escitalopram, and paroxetine increases plasma concentration of clozapine (increased risk of toxicity); fluvoxamine increases plasma concentration of olanzapine; SSRIs possibly increase plasma concentration of pimozone (increased risk of ventricular arrhythmias—avoid concomitant use); paroxetine possibly increases plasma concentration of risperidone (increased risk of toxicity); paroxetine increases plasma concentration of sertindole
- Antidepressants, SSRI
- 5HT Agonists (continued)
  - amine possibly inhibits metabolism of zolmitriptan
  - Lithium: increased risk of CNS effects when SSRIs given with lithium (lithium toxicity reported)
  - Muscle Relaxants: fluvoxamine increases plasma concentration of izoxidine (increased risk of toxicity)—avoid concomitant use
  - Parasympathomimetics: paroxetine increases plasma concentration of galantamine
  - Sympathomimetics: metabolism of SSRIs possibly inhibited by methylphenidate
- Theophylline: fluvoxamine increases plasma concentration of theophylline (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)
- Antidepressants, Tricyclic
  - Adrenergic Neurone Blockers: tricyclics antagonise anticonvulsant effect of neurotransmitters
  - Alcohol: increased sedative effect when tricyclics given with alcohol
  - Alpha-adrenergic Stimulants: avoidance of tricyclics by manufacturer of aripiprazole and brimonidine
  - Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with general anaesthetics
  - Analgesics: increased risk of CNS toxicity when tricyclics given with tramadol; side-effects possibly increased when tricyclics given with nefopam; sedative effects possibly increased when tricyclics given with opioid analgesics
  - Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with amiodarone—avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with disopyramide or lefacainide; increased risk of arrhythmias when tricyclics given with propafenone
  - Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with moxifloxacin—avoid concomitant use; plasma concentration of tricyclics possibly reduced by rifampicin
  - Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of coumarins
  - Antidepressants: possible increased serotonergic effects when tricyclics given with amitriptyline or clomipramine given with duloxetine; increased risk of hypertension and CNS excitation when tricyclics given with MAOIs, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start moclobemide for at least 1 week; plasma concentration of some tricyclics increased by SSRIs; plasma concentration of amitriptyline increased by St John’s wort
  - Antiepileptics: tricyclics antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); metabolism of tricyclics accelerated by carbamazepine (reduced plasma concentration and reduced effect); plasma concentration of tricyclics possibly reduced by phenytoin; tricyclics antagonise anticonvulsant effect of primidone (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)
Antidepressants, Tricyclic (continued)

Sympathomimetics (continued) of hypertension and arrhythmias when tricyclics given with

Thyroid Hormones: effects of tricyclics possibly enhanced by thyroid hormones; effects of amitriptyline and imipramine enhanced by thyroid hormones

Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by cimetidine; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by cimetidine (increased plasma concentration)

Antidepressants, Tricyclic (related)

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with alcohol
- Alpha-adrenoceptor Stimulants: avoidance of antidepressants advised by manufacturer of atomoxetine; possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with atomoxetine

Antihistamines: increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with antihistamines

Antimalarials: avoidance of antidepressants advised by manufacturer of artether/lumefantrine

Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with antimuscarinics

Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with anxiolytics and hypnotics

Atomoxetine: increased risk of venricular arrhythmias when tricyclics given with atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine

Barbiturates: tricyclics antagonise anticonvulsant effect of barbiturates (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)

Beta-blockers: plasma concentration of imipramine increased by labetalol and propranolol; increased risk of venricular arrhythmias when tricyclics given with sotalol

Calcium-channel Blockers: plasma concentration of imipramine increased by diltiazem and verapamil; plasma concentration of tricyclics possibly increased by diltiazem and verapamil

Clonidine: tricyclics antagonise hypotensive effect of clonidine, also increased risk of hypertension on clonidine withdrawal

Disulfiram: metabolism of tricyclics inhibited by disulfiram (increased plasma concentration); concommitant amitriptyline reported to increase disulfiram reaction with alcohol

Dihydropyridine calcium antagonists: increased risk of postural hypotension when tricyclics given with diuretics

Dopaminergics: caution with tricyclics advised by manufacturer of entacapone; increased risk of CNS toxicity when tricyclics given with rasagiline; CNS toxicity reported when tricyclics given with selegiline

Lithium: risk of toxicity when tricyclics given with lithium

Muscle Relaxants: tricyclics enhance muscle relaxant effect of baclofen

Nicorandil: tricyclics possibly enhance hypotensive effect of nicorandil

Nitrates: tricyclics reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Oestrogens: increased risk of CNS toxicity when tricyclics given with oestrogens (but side-effects of tricyclics possibly increased due to increased plasma concentration)

Pentamidine Isetionate: increased risk of venricular arrhythmias when tricyclics given with pentamidine isetionate

Sibutramine: increased risk of CNS toxicity when tricyclics given with sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Sodium Oxybate: increased risk of side-effects when tricyclics given with sodium oxybate

Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with dopamine (epinephrine) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by methylphenidate; increased risk

Antifungals, Tricyclic (continued)

Antifungals: plasma concentration of imipramine and norimipramine possibly increased by terbinafine

Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with antihistamines

Antimalaria Drugs: plasma concentration of tricyclics possibly increased by meprofoliate (norephedrine) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by methylphenidate; increased risk

Antimalarials: avoidance of antidepressants advised by manufacturer of artether/lumefantrine

Antimuscarinics: increased risk of antimuscarinic side-effects when tricyclics given with antimuscarinics

Antipsychotics: plasma concentration of tricyclics increased by antipsychotics—possibly increased risk of venricular arrhythmias; possibly increased antimuscarinic side-effects when tricyclics given with clozapine; increased risk of antimuscarinic side-effects when tricyclics given with phenothiazines; increased risk of venricular arrhythmias when tricyclics given with pipemidone—avoid concomitant use

Antivirals: side-effects of tricyclics possibly increased by fosamprenavir; plasma concentration of tricyclics possibly increased by ritonavir

Anxiolytics and Hypnotics: increased sedative effect when tricyclics given with anxiolytics and hypnotics

Atomoxetine: increased risk of venricular arrhythmias when tricyclics given with atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine

Barbiturates: tricyclics antagonise anticonvulsant effect of barbiturates (convulsive threshold lowered), also metabolism of tricyclics possibly accelerated (reduced plasma concentration)

Beta-blockers: plasma concentration of imipramine increased by labetalol and propranolol; increased risk of venricular arrhythmias when tricyclics given with sotalol

Calcium-channel Blockers: plasma concentration of imipramine increased by diltiazem and verapamil; plasma concentration of tricyclics possibly increased by diltiazem and verapamil

Clonidine: tricyclics antagonise hypotensive effect of clonidine, also increased risk of hypertension on clonidine withdrawal

Disulfiram: metabolism of tricyclics inhibited by disulfiram (increased plasma concentration); concommitant amitriptyline reported to increase disulfiram reaction with alcohol

Dihydropyridine calcium antagonists: increased risk of postural hypotension when tricyclics given with diuretics

Dopaminergics: caution with tricyclics advised by manufacturer of entacapone; increased risk of CNS toxicity when tricyclics given with rasagiline; CNS toxicity reported when tricyclics given with selegiline

Lithium: risk of toxicity when tricyclics given with lithium

Muscle Relaxants: tricyclics enhance muscle relaxant effect of baclofen

Nicorandil: tricyclics possibly enhance hypotensive effect of nicorandil

Nitrates: tricyclics reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Oestrogens: increased risk of CNS toxicity when tricyclics given with oestrogens (but side-effects of tricyclics possibly increased due to increased plasma concentration)

Pentamidine Isetionate: increased risk of venricular arrhythmias when tricyclics given with pentamidine isetionate

Sibutramine: increased risk of CNS toxicity when tricyclics given with sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Sodium Oxybate: increased risk of side-effects when tricyclics given with sodium oxybate

Sympathomimetics: increased risk of hypertension and arrhythmias when tricyclics given with dopamine (epinephrine) (but local anaesthetics with adrenaline appear to be safe); metabolism of tricyclics possibly inhibited by methylphenidate; increased risk

Antidepressants, Tricyclic

- Sympathomimetics (continued) of hypertension and arrhythmias when tricyclics given with

Thyroid Hormones: effects of tricyclics possibly enhanced by thyroid hormones; effects of amitriptyline and imipramine enhanced by thyroid hormones

Ulcer-healing Drugs: plasma concentration of tricyclics possibly increased by cimetidine; metabolism of amitriptyline, doxepin, imipramine and nortriptyline inhibited by cimetidine (increased plasma concentration)

Antidepressants, Tricyclic (related)

- Alcohol: increased sedative effect when tricyclic-related antidepressants given with alcohol
- Alpha-adrenoceptor Stimulants: avoidance of tricyclic-related antidepressants advised by manufacturer of apraclonidine and brimonidine

Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start emoclomide for at least 1 week

Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of antiepileptics (convulsive threshold lowered); plasma concentration of mianserin reduced by carbamazepine and phenytoin; metabolism of mianserin accelerated by primidone (reduced plasma concentration)

Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with antihistamines

Antimalarials: avoidance of antidepressants advised by manufacturer of artether/lumefantrine

Antimuscarinics: possibly increased antimuscarinic side-effects when tricyclic-related antidepressants given with antimuscarinics

Antivirals: side-effects possibly increased when trazodone given with ritonavir

Anxiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with anxiolytics and hypnotics

Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine

Barbiturates: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of barbiturates (convulsive threshold lowered); plasma concentration of mianserin reduced by carbamazepine and phenytoin; metabolism of mianserin accelerated by primidone (reduced plasma concentration)

Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with diazoxide

Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of nitrates (failure to dissolve under tongue owing to dry mouth)

Sibutramine: increased risk of CNS toxicity when tricyclic-related antidepressants given with sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with hydralazine or sodium nitroprusside

Antidiabetics

Note Other oral drugs may be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption

ACE inhibitors: hypoglycaemic effect of insulin, metformin and sulphonylureas possibly enhanced by ACE inhibitors

Alcohol: hypoglycaemic effect of antidepressants enhanced by alcohol; increased risk of lactic acidosis when metformin given with alcohol; flushing, in susceptible subjects, when chlorpropamide given with alcohol

Anabolic Steroids: hypoglycaemic effect of anti-diabetes possibly enhanced by anabolic steroids
Antidiabetics (continued)

- Analgesics: effects of sulphonylureas possibly enhanced by NSAIDs; effects of tolbutamide enhanced by disopyramide (avoid concomitant use)

- Anti-arhythmics: hypoglycaemic effect of glitazides, insulin and metformin possibly enhanced by disopyramide

- Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by neomycin; also severity of gastrointestinal effects increased; effects of repaglinide enhanced by daptomycin; effects of glibenclamide possibly enhanced by ciprofloxacin and norfloxacin; plasma concentration of nateglinide reduced by rifampicin; hypoglycaemic effect of repaglinide possibly antagonised by rifampicin; plasma concentration of rosiglitazone reduced by sulphonylureas possibly reduced by trimethoprim—manufacturer advises avoid concomitant use

- Anticoagulants: exenatide possibly enhances anticoagulant effect of warfarin; hypoglycaemic effect of sulphonylureas possibly enhanced by coenzymes, also possible changes to anticoagulant effect

- Antidepressants: hypoglycaemic effect of insulin, metformin and sulphonylureas enhanced by MAOIs; hypoglycaemic effect of antidiabetics possibly enhanced by MAOIs

- Antiepileptics: tolbutamide transiently increases plasma concentration of phenytoin (possibility of toxicity); plasma concentration of gliclazide and glipizide enhanced by sulfinpyrazone; effects of sulphonylureas enhanced by phenothiazines; metabolism of chlorpropamide and tolbutamide accelerated by neflamycins (reduced effect); metabolism of sulphonylureas possibly accelerated by neflamycins (reduced effect); effects of sulphonylureas rarely enhanced by sulphonamides and trimethoprim with hypoglycaemic effect of repaglinide possibly enhanced by trimethoprim—manufacturer advises avoid concomitant use

- Anti-influenzal: hypoglycaemic effect of insulin, metformin and sulphonylureas enhanced by MAOIs; hypoglycaemic effect of antidiabetics possibly enhanced by MAOIs

- Antifungals: plasma concentration of sulphonylureas increased by fluconazole and micafungone; hypoglycaemic effect of glitazides and glipizide enhanced by micafungone—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by posaconazole; plasma concentration of sulphonylureas possibly increased by voriconazole

- Antihistamines: thrombocyte count depressed when metformin given with ketotifen (manufacturer of ketotifen advises avoid concomitant use)

- Antivirals: hypoglycaemic effect of sulphonylureas possibly antagonised by phenothiazines

- Antivirals: plasma concentration of tolbutamide possibly increased by ritonavir

- Aprepitant: plasma concentration of tolbutamide reduced by aprepitant

- Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when β-blockers given; hypoglycaemic effect of insulin enhanced by β-blockers

- Bosentan: increased risk of hepatotoxicity when glibenclamide given with bosentan—avoid concomitant use

- Calcium-channel blockers: glucose tolerance occasionally impaired when insulin given with nifedipine

- Cardiac Glycosides: sitagliptin increases plasma concentration of digoxin; acarbose possibly reduces plasma concentration of digoxin

- Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by ciclosporin

- Corticosteroids: hypoglycaemic effect of antidiabetics antagonised by corticosteroids

- Cytotoxics: avoidance of repaglinide advised by manufacturer of lapatinib; metabolism of rosiglitazone possibly inhibited by paclitaxel

- Diazoxide: hypoglycaemic effect of antidiabetics antagonised by diazoxide

Antidiabetics (continued)

- Diuretics: hypoglycaemic effect of antidiabetics antagonised by loop diuretics and thiazides and related diuretics; increased risk of hypokalaemia when chlorpropamide given with potassium-sparing diuretics and aldosterone antagonists plus thiazide; increased risk of hyponatraemia when chlorpropamide given with thiazides and related diuretics plus potassium-sparing diuretic

- Hormone Antagonists: requirements for insulin, metformin, glibenclamide and sulphonylureas possibly reduced by lanreotide; requirements for insulin, metformin, repaglinide and sulphonylureas possibly reduced by octreotide

- Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by lefunomide

- Lipid-regulating Drugs: hypoglycaemic effect of acarbose possibly enhanced by colchicine; hypoglycaemic effect of nateglinide possibly enhanced by gemfibrozil; increased risk of severe hypoglycaemia when repaglinide given with gemfibrozil—avoid concomitant use; plasma concentration of rosiglitazone increased by gemfibrozil (consider reducing dose of rosiglitazone); plasma concentration of glibenclamide possibly increased by fluvastatin; may be improved glucose tolerance and an additive effect when insulin or sulphonylureas given with fibrates

- Oestrogens: hypoglycaemic effect of antidiabetics antagonised by oestrogens

- Orlistat: avoidance of acarbose advised by manufacturer of orlistat

- Pancreatins: hypoglycaemic effect of acarbose antagonised by panreatin

- Probenecid: hypoglycaemic effect of chlorpropamide possibly enhanced by probenecid

- Progestogens: hypoglycaemic effect of antidiabetics antagonised by progestogens

- Sulfinpyrazone: effects of sulphonylureas enhanced by sulfinpyrazone

- Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by testosterone

- Ulcer-healing Drugs: excroion of metformin reduced by cimetidine (increased plasma concentration); hypoglycaemic effect of sulphonylureas enhanced by cimetidine

Antiepileptics see Carbamazepine, Ethosuximide, Gaba-pentin, Lacosamide, Lamotrigin, Levetiracetam, Oxcarebezpine, Phenytoin, Primidon, Rufinamide, Tiagabine, Topiramate, Valproate, Vigabatrin, and Zonisamide

Antifungals see Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Cefsporin; Flucytosine; Griseofulvin; Micafungin; Terbinafine

Antifungals, Imidazole

- Aliskiren: ketonozonate increases plasma concentration of aliskiren

- Analgesics: ketonozonate inhibits metabolism of suprenorphine (reduce dose of buprenorphine)

- Antacids: absorption of ketonozonate reduced by antacids

- Anti-arhythmics: increased risk of ventricular arrhyth-mias when ketonozonate given with disopyramide—avoid concomitant use

- Antibacterials: metabolism of ketonozonate accelerated by rifampicin (reduced plasma concentration), also plasma concentration of rifampicin may be reduced; plasma concentration of ketonozonate possibly reduced by isoniazid; avoidance of concomitant ketonozonate in severe renal and hepatic impairment advised by manufacturer of telithromycin

- Anticoagulants: ketonozonate enhances anticoagulant effect of coenuramins (micazone oral gel and possibly vaginal formulations absorbed); ketonozonate increases plasma concentration of rivaroxaban—avoid concomitant use
Antifungals, Imidazole (continued)

- Antidepressants: avoidance of imidazoles advised by manufacturer of paroxetine; ketoconazole increases plasma concentration of mirtazapine.

- Anti-inflammatory: miconazole enhances hypoglycaemic effect of glimepiride and glipizide—avoid concomitant use; miconazole increases plasma concentration of sulphonylureas.

- Antiepileptics: ketoconazole and miconazole possibly increase plasma concentration of carbamazepine; plasma concentration of ketoconazole reduced by phenytoin; miconazole enhances anticonvulsant effect of phenytoin (plasma concentration of phenytoin increased) Antifungals: imidazoles possibly antagonise effects of amphotericin.

- Antihistamines: manufacturer of loratadine advises ketoconazole possibly increases plasma concentration of loratadine; imidazoles possibly inhibit metabolism of emozolastine (avoid concomitant use); ketoconazole inhibits metabolism of emozolastine—avoid concomitant use.

- Antimalarials: avoidance of imidazoles advised by manufacturer of artether/luemetanfotin.

- Antimycobacterics: absorption of ketoconazole reduced by antismycobacterics; ketoconazole increases plasma concentration of darifenacin—avoid concomitant use; manufacturer of fosoterodine advises dose reduction when ketoconazole given with fosoterodine—avoid concomitant use; ketoconazole increases plasma concentration of solifenacin; avoidance of ketoconazole advised by manufacturer of tolterodine.

- Antipsychotics: ketoconazole inhibits metabolism of aripiprazole (reduce dose of aripiprazole); increased risk of ventricular arrhythmias when imidazoles given with eperozide—avoid concomitant use; imidazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); increased risk of ventricular arrhythmias when ketoconazole given with sertindole—avoid concomitant use; possible increased risk of ventricular arrhythmias when imidazoles given with sertindole—avoid concomitant use.

- Antivirals: plasma concentration of both drugs increased when ketoconazole given with darunavir; plasma concentration of ketoconazole increased by fosamprenavir; ketoconazole increases plasma concentration of indinavir and maraviroc (consider reducing dose of indinavir and maraviroc); plasma concentration of ketoconazole reduced by nevirapine—avoid concomitant use; combination of ketoconazole with ritonavir may increase plasma concentration of either drug (or both); ketoconazole increases plasma concentration of saquinavir; imidazoles possibly increase plasma concentration of saquinavir.

- Anxiolytics and Hypnotics: ketoconazole increases plasma concentration of alprazolam; miconazole increases plasma concentration of midazolam (risk of prolonged sedation) Aprepitant: ketoconazole increases plasma concentration of aprepitant.

- Bosentan: ketoconazole increases plasma concentration of bosentan.

- Calcium-channel Blockers: ketoconazole inhibits metabolism of diltiazem (increased plasma concentration); avoidance of ketoconazole advised by manufacturer of diltiazem; ketoconazole possibly inhibits metabolism of dihydropyridines (increased plasma concentration).

- Ciclosporin: ketoconazole inhibits metabolism of ciclosporin (increased plasma concentration); miconazole possibly inhibits metabolism of ciclosporin (increased plasma concentration).

- Clobetasol: ketoconazole possibly increases plasma concentration of clobetasol—avoid concomitant use.

- Cinacalcet: ketoconazole inhibits metabolism of cinacalcet (increased plasma concentration).

Antifungals, Imidazole (continued)

- Corticosteroids: ketoconazole possibly inhibits metabolism of dexamethasone; ketoconazole increases plasma concentration of inhaled and oral budesonide; ketoconazole increases plasma concentration of active metabolite of ciclesonide; ketoconazole inhibits the metabolism of methylprednisolone; ketoconazole increases plasma concentration of inhaled mometasone furoate.

- Cytochrome P450: ketoconazole inhibits metabolism of erlotinib and sunitinib (increased plasma concentration); ketoconazole increases plasma concentration of bortezomib and imatinib; ketoconazole increases plasma concentration of elapatinib and nilotinib—avoid concomitant use; ketoconazole increases plasma concentration of active metabolite of temsirolimus—avoid concomitant use; in vitro studies suggest a possible interaction between ketoconazole and docetaxel (consult docetaxel product literature); ketoconazole reduces plasma concentration of irinotecan (but concentration of active metabolite of irinotecan increased)—avoid concomitant use.

- Diuretics: ketoconazole increases plasma concentration of spironolactone—avoid concomitant use.

- Dopemidine: ketoconazole possibly increases risk of arrhythmias with domperidone.

- Ergot Alkaloids: increased risk of ergotism when imidazoles given with ergotamine and methysergide—avoid concomitant use.

- 5HT Agonists: ketoconazole increases plasma concentration of almotriptan (increased risk of toxicity); ketoconazole increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use.

- Ibravadin: ketoconazole increases plasma concentration of ibravadin—avoid concomitant use. Lanthanum: absorption of ketoconazole possibly reduced by lanthanum (give at least 2 hours apart).

- Lipid-Regulating Drugs: possible increased risk of myopathy when imidazoles given with atorvastatin or simvastatin; increased risk of myopathy when ketoconazole given with simvastatin (avoid concomitant use); possible increased risk of myopathy when miconazole given with simvastatin—avoid concomitant use.

- Oestrogens: anecdotal reports of contraceptive failure when imidazoles or ketoconazole given with oestrogens.

- Parasympathomimetics: ketoconazole increases plasma concentration of galantamine.

- Retinoids: ketoconazole increases plasma concentration of allretinoin.

- Rimonabant: ketoconazole increases plasma concentration of rimonabant.

- Sildenafil: ketoconazole increases plasma concentration of sildenafil.

- Sirolimus: ketoconazole increases plasma concentration of sirolimus—avoid concomitant use; miconazole increases plasma concentration of sirolimus.

- Tacrolimus: imidazoles possibly increase plasma concentration of tacrolimus; ketoconazole increases plasma concentration of tacrolimus.

- Tadalafil: ketoconazole increases plasma concentration of tadalafil.

- Theophylline: ketoconazole possibly increases plasma concentration of theophylline.

- Ulcer-healing Drugs: absorption of ketoconazole reduced by histamine H₂-antagonists, proton pump inhibitors and sucralfate.

- Vardenafil: ketoconazole increases plasma concentration of vardenafil—avoid concomitant use.

- Vitamins: ketoconazole possibly increases plasma concentration of paricalcitol.

Antifungals, Polyene see Amphotericin.

Antifungals, Triazole

- Note: In general, fluconazole interactions relate to multiple-dose treatment.

- Analgesics: fluconazole increases plasma concentration of celecoxib (halve dose of celecoxib); flucon-
Antifungals, Triazole
- Analgesics (continued)
aazole increases plasma concentration of parecoxib (parecoxib). Voriconazole increases plasma concentration of alfentanil and methadone (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of alfentanil (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of alfentanil; fluconazole and itraconazole possibly increase plasma concentration of fentanyl.

Antacids: absorption of itraconazole reduced by antacids.
- Anti-arhythmic: manufacturer of itraconazole advises avoid concomitant use with disopyramide.
- Antimicrobials: plasma concentration of itraconazole increased by clarithromycin; triazoles possibly increase plasma concentration of erlubutin (increased risk of uveitis—reduce rifabutin dose); posaconazole increases plasma concentration of rifabutin (also plasma concentration of posaconazole reduced); voriconazole increases plasma concentration of rifabutin; itraconazole and voriconazole possibly reduced by rifabutin; plasma concentration of posaconazole reduced by rifabutin—avoid concomitant use; plasma concentration of posaconazole reduced by rifampicin; plasma concentration of voriconazole reduced by rifampicin—avoid concomitant use; metabolism of fluconazole and itraconazole accelerated by rifampicin.
- Anticoagulants: fluconazole, itraconazole and voriconazole enhance anticoagulant effect of coumarins; avoidance of itraconazole, posaconazole and voriconazole advised by manufacturer of rivaroxaban.
- Antidepressants: avoidance of triazoles advised by manufacturer of esketamine; plasma concentration of voriconazole reduced by St John’s wort—avoid concomitant use.
- Antidiabetics: posaconazole possibly increases hypoglycaemic effect of glipizide; fluconazole possibly enhances hypoglycaemic effect of nateglinide; itraconazole possibly enhances hypoglycaemic effect of repaglinide; fluconazole increases plasma concentration of sulphonylureas; voriconazole possibly increases plasma concentration of sulphonylureas.
- Antiepileptics: plasma concentration of itraconazole and posaconazole possibly reduced by carbamazepine; fluconazole possibly increases plasma concentration of carbamazepine; plasma concentration of voriconazole possibly reduced by carbamazepine and erimidine—avoid concomitant use; voriconazole increases plasma concentration of phenytoin, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); plasma concentration of posaconazole reduced by carbamazepine and erimidine; plasma concentration of itraconazole reduced by erimidine—avoid concomitant use; fluconazole increases plasma concentration of phenytoin (consider reducing dose of phenytoin); plasma concentration of posaconazole possibly reduced by erimidine.
- Antifungals: triazoles possibly antagonise effects of amphotericin; plasma concentration of itraconazole increased by micafungin (consider reducing dose of itraconazole).
- Antihistamines: itraconazole inhibits metabolism of mizolastine—avoid concomitant use.
- Antimalarias: avoidance of triazoles advised by manufacturer of darifenacin and tolterodine; manufacturer of fosoterodine advises dose reduction when itraconazole given with fosoterodine consult fosoterodine package literature; itraconazole increases plasma concentration of solifenacin.

Antipsychotics: itraconazole possibly inhibits metabolism of aripiprazole (reduce dose of aripiprazole); itraconazole increases risk of ventricular arrhythmias when triazoles given with pimozide—avoid concomitant use; triazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); possible increased risk of ventricular arrhythmias when triazoles given with sertindole—avoid concomitant use; increased risk of ventricular arrhythmias when itraconazole given with sertindole—avoid concomitant use.
- Antivirals: posaconazole increases plasma concentration of efavirenz; plasma concentration of voriconazole and posaconazole reduced by efavirenz; plasma concentration of voriconazole possibly increased by fosamprenavir, atazanavir and also monitor for rifabutin toxicity); itraconazole increases plasma concentration of efavirenz (consider increasing voriconazole dose and reducing efavirenz dose); plasma concentration of itraconazole possibly increased by fosamprenavir; voriconazole increases plasma concentration of indinavir (consider reducing dose of indinavir); fluconazole increases plasma concentration of nevirapine, ritonavir and tipranavir; plasma concentration of voriconazole reduced by ritonavir—avoid concomitant use; combination of itraconazole with ritonavir may increase plasma concentration of either drug (or both); voriconazole possibly increase plasma concentration of saquinavir; fluconazole increases plasma concentration of zidovudine (increased risk of toxicity).
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of alprazolam; posaconazole increases plasma concentration of midazolam; fluconazole and itraconazole increase plasma concentration of ziprasidone; voriconazole and also monitor for phenytoin toxicity); voriconazole and also monitor for phenytoin toxicity); voriconazole increases plasma concentration of ziprasidone; itraconazole and voriconazole advised by manufacturer of fesoterodine—consult fesoterodine package literature; itraconazole increases plasma concentration of solifenacin.

Antifungals, Triazole
- Antimuscarinics (continued)
itraconazole given with fesoterodine consult fesoterodine package literature; itraconazole increases plasma concentration of solifenacin.
- Antipsychotics: itraconazole possibly inhibits metabolism of aripiprazole (reduce dose of aripiprazole); itraconazole increases risk of ventricular arrhythmias when triazoles given with pimozide—avoid concomitant use; triazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); possible increased risk of ventricular arrhythmias when triazoles given with sertindole—avoid concomitant use; increased risk of ventricular arrhythmias when itraconazole given with sertindole—avoid concomitant use.
- Antivirals: posaconazole increases plasma concentration of efavirenz; plasma concentration of voriconazole and posaconazole reduced by efavirenz; plasma concentration of voriconazole possibly increased by fosamprenavir; voriconazole increases plasma concentration of indinavir (consider reducing dose of indinavir); fluconazole increases plasma concentration of nevirapine, ritonavir and tipranavir; plasma concentration of voriconazole reduced by ritonavir—avoid concomitant use; combination of itraconazole with ritonavir may increase plasma concentration of either drug (or both); voriconazole possibly increase plasma concentration of saquinavir; fluconazole increases plasma concentration of zidovudine (increased risk of toxicity).
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of alprazolam; posaconazole increases plasma concentration of midazolam; fluconazole and itraconazole increase plasma concentration of ziprasidone; voriconazole and also monitor for phenytoin toxicity); voriconazole increases plasma concentration of ziprasidone; itraconazole and voriconazole advised by manufacturer of fesoterodine—consult fesoterodine package literature; itraconazole increases plasma concentration of solifenacin.

Antifungals, Triazole
- Antimuscarinics (continued)
itraconazole given with fesoterodine consult fesoterodine package literature; itraconazole increases plasma concentration of solifenacin.
- Antipsychotics: itraconazole possibly inhibits metabolism of aripiprazole (reduce dose of aripiprazole); itraconazole increases risk of ventricular arrhythmias when triazoles given with pimozide—avoid concomitant use; triazoles possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); possible increased risk of ventricular arrhythmias when triazoles given with sertindole—avoid concomitant use; increased risk of ventricular arrhythmias when itraconazole given with sertindole—avoid concomitant use.
- Antivirals: posaconazole increases plasma concentration of efavirenz; plasma concentration of voriconazole and posaconazole reduced by efavirenz; plasma concentration of voriconazole possibly increased by fosamprenavir; voriconazole increases plasma concentration of indinavir (consider reducing dose of indinavir); fluconazole increases plasma concentration of nevirapine, ritonavir and tipranavir; plasma concentration of voriconazole reduced by ritonavir—avoid concomitant use; combination of itraconazole with ritonavir may increase plasma concentration of either drug (or both); voriconazole possibly increase plasma concentration of saquinavir; fluconazole increases plasma concentration of zidovudine (increased risk of toxicity).
- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of alprazolam; posaconazole increases plasma concentration of midazolam; fluconazole and itraconazole increase plasma concentration of ziprasidone; voriconazole and also monitor for phenytoin toxicity); voriconazole increases plasma concentration of ziprasidone; itraconazole and voriconazole advised by manufacturer of fesoterodine—consult fesoterodine package literature; itraconazole increases plasma concentration of solifenacin.

Antifungals, Triazole
- Antimuscarinics (continued)
itraconazole given with fesoterodine consult fesoterodine package literature; itraconazole increases plasma concentration of solifenacin.
Antifungals, Triazole (continued)

- Diuretics: fluconazole increases plasma concentration of thiazides (reduce dose of thiazide); itraconazole increases plasma concentration of spironolactone—avoid concomitant use; plasma concentration of fluconazole increased by hydrochlorothiazide
- Ergot Alkaloids: increased risk of ergotism when triazoles given with ergotamine and methysergide—avoid concomitant use
- 5HT Agonists: itraconazole increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use
- Ixavudrine: fluconazole increases plasma concentration of ivabradine—reduce initial dose of ivabradine; itraconazole possibly increases plasma concentration of ivabradine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when triazoles given with atorvastatin or simvastatin; increased risk of myopathy when itraconazole or posaconazole given with atorvastatin (avoid concomitant use); fluconazole increases plasma concentration of fluvastatin; itraconazole and voriconazole increase plasma concentration of simvastatin—avoid concomitant use
- Oestrogenergines: anecdotal reports of contraceptive failure when fluconazole or itraconazole given with oestrogenergines
- Sildenafil: itraconazole increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Sirolimus: posaconazole possibly increases plasma concentration of sirolimus; itraconazole and voriconazole increase plasma concentration of sirolimus—avoid concomitant use
- Tacrolimus: triazoles possibly increase plasma concentration of tacrolimus; posaconazole increases plasma concentration of tacrolimus (reduce dose of tacrolimus); fluconazole, itraconazole, and voriconazole increase plasma concentration of tacrolimus
- Tadalafil: itraconazole possibly increases plasma concentration of tadalafil
- Theophylline: fluconazole possibly increases plasma concentration of theophylline
- Ulcer-healing Drugs: plasma concentration of posaconazole reduced by cimetidine; voriconazole possibly increases plasma concentration of esomeprazole; voriconazole increases plasma concentration of omeprazole (consider reducing dose of omeprazole); absorption of itraconazole reduced by histamine H2 antagonists and proton pump inhibitors
- Vardenafil: itraconazole possibly increases plasma concentration of vardenafil—avoid concomitant use

Antihistamines

Note: Sedative interactions apply to a lesser extent to the non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)

Alcohol: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)

Analgesics: sedative effects possibly increased when antihistamines given with opioid analgesics

Antacids: absorption of fexofenadine reduced by antacids

Anti-arthritics: increased risk of ventricular arrhythmias when mizolastine given with amiodyarone, disopyramide or propafenone—avoid concomitant use

Antibacterials: manufacturer of loratadine advises plasma concentration possibly increased by erythromycin; metabolism of mizolastine inhibited by erythromycin—avoid concomitant use; increased risk of ventricular arrhythmias when mizolastine given with moxifloxacin—avoid concomitant use; metabolism of mizolastine possibly inhibited by macrolides (avoid concomitant use)

Antidepressants: increased antimuscarinic and sedative effects when antihistamines given with MAOIs or tricyclics; cyproheptadine possibly antagonises antidepressant effect of SSRIs; possible increased antimuscarinic and sedative effects when antihistamines given with tricyclic-related antidepressants

Antidiabetics: thrombocyte count depressed when ketotifen given with metformin (manufacturer of ketotifen advises avoid concomitant use)

Antifungals: manufacturer of loratadine advises plasma concentration possibly increased by ketoconazole; metabolism of mizolastine inhibited by itraconazole or ketoconazole—avoid concomitant use; metabolism of mizolastine possibly inhibited by imidazoles (avoid concomitant use)

Antimuscarinics: increased risk of antimuscarinic side-effects when antihistamines given with antimuscarinics

Antivirals: plasma concentration of loratadine possibly increased by fosamprenavir; plasma concentration of chlorphenamine (chlorpheniramine) possibly increased by lopinavir; plasma concentration of non-sedating antihistamines possibly increased by ritonavir

Anxiolytics and Hypnotics: increased sedative effect when antihistamines given with anxiolytics and hypnotics

Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with sotalol—avoid concomitant use

Betahistine: antimuscarinics theoretically antagonise effect of betahistine

Ulcet-healing Drugs: manufacturer of loratadine advises plasma concentration possibly increased by cimetidine

Antihistamines, Non-sedating: see Antihistamines

Antihistamines, Sedating: see Antihistamines

Antimalarials: manufacturer of Lumefantrine, Chloroquine and Hydroxychloroquine, Mefloquine, Primaquine, Proguanil, and Quinine

Antimetabolites: see Cytarabine, Fludarabine, Fluorouracil, Mercaptopurine, Methotrexate, and Thioguanine

Antimuscarinics

Note: Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation; concomitant use can also lead to confusion in the elderly. Interactions do not generally apply to antimuscarinics used by inhalation

Alcohol: increased sedative effect when loratadine given with alcohol

Analgesics: increased risk of antimuscarinic side-effects when antihistamines given with nefopam

Anti-arthritics: increased risk of ventricular arrhythmias when tolterodine given with amiodyarone, disopyramide or propafenone—increased risk of antimuscarinic side-effects when antihistamines given with disopyramide

Antibacterials: manufacturer of fesoterodine advises dose reduction when fesoterodine given with clarithromycin and telithromycin—consult fesoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with clarithromycin and erythromycin; plasma concentration of darifenacin possibly increased by erythromycin; plasma concentration of active metabolite of fesoterodine reduced by rifampicin

Antidepressants: plasma concentration of darifenacin and propoxyphene increased by paroxetine; increased risk of antimuscarinic side-effects when antimuscarinics given with MAOIs or tricyclics; possibly increased antimuscarinic side-effects when antimuscarinics given with tricyclic-related antidepressants

Antifungals: antimuscarinics reduce absorption of ketoconazole; manufacturer of fesoterodine advises dose reduction when fesoterodine given with itraconazole and ketoconazole—consult fesoterodine...
Anti-arrhythmics
Antifungals (continued)

Antipsychotics: increased risk of antimuscarinic side-effects when antimuscarinics given with antipsychotics (increased risk of antimuscarinic side-effects); possible increased risk of ventricular arrhythmias when amisulpride, haloperidol, phenothiazines, pimozide, sertindole or zuclopenthixol given with amisulpride or sertindole; increased risk of ventricular arrhythmias when sulpiride given with amisulpride or sulpiride; possible increased risk of ventricular arrhythmias when pimozide given with amisulpride or sulpiride; increased risk of ventricular arrhythmias when amisulpride or sulpiride given with paroxetine; plasma concentration of clozapine possibly increased by paroxetine; metabolism of aripiprazole possibly inhibited by paroxetine; concentration of clozapine possibly reduced by kaolin

Antipsychotics

Note
Increased risk of toxicity with myelosuppressive drugs
Note
Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis
ACE inhibitors: enhanced hypotensive effect when antipsychotics given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with adrenergic neurone blockers; higher doses of chlorpromazine antagonise hypotensive effect of adrenergic neurone blockers; haloperidol antagonises hypotensive effect of adrenergic neurone blockers

Antipsychotics

Analgesics (continued)

Analgesics: avoided concomitant use of clozapine with

Analgesics: avoided concomitant use of clozapine with

Antipsychotics with tramadol; enhanced hypotensive and sedative effects when antipsychotics given with opioid analgesics

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with angiotensin-II receptor antagonists

Antacids: absorption of phenothiazines and sulpiride reduced by antacids

Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with anti-arrhythmics that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, haloperidol, phenothiazines, pimozide, sertindole or zuclopenthixol given with amiodarone; avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with amiodarone; manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with amiodarone or disopyramide; increased risk of ventricular arrhythmias when amisulpride, pimozide, sertindole or zuclopenthixol given with disopyramide; avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with amiodarone; increased risk of arrhythmias when clozapine given with disopyramide

Antibacterials: increased risk of ventricular arrhythmias when pimozide given with clarithromycin, moxifloxacin or telithromycin; avoid concomitant use; increased risk of ventricular arrhythmias when sertraline given with erythromycin or moxifloxacin; avoid concomitant use; increased risk of ventricular arrhythmias when amitriptyline given with erythromycin; possible increased risk of con-valusions; possible increased risk of ventricular arrhythmias when pimozide given with erythromycin; avoid concomitant use; increased risk of ventricular arrhythmias when sulpiride given with paroxetine; plasma concentration of clozapine possibly increased by ciprofloxacin; plasma concentration of olanzapine possibly increased by ciprofloxacin; increased risk of ventricular arrhythmias when haloperidol, phenothiazines or zuclopenthixol given with moxifloxacin; avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with moxifloxacin—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by rifabutin and rifampicin—increase absorption of clozapine; plasma concentration of clozapine possibly reduced by rifampicin; metabolism of haloperidol accelerated by rifampicin (reduced plasma concentration); avoid concomitant use of clozapine with chloramphenicol or sulphonamides (increased risk of agranulocytosis); plasma concentration of quetiapine possibly increased by macrolides (reduce dose of quetiapine); possible increased risk of ventricular arrhythmias when sertraline given with macrolides—avoid concomitant use

Antidepressants: plasma concentration of clozapine possibly increased by citalopram (increased risk of toxicity); metabolism of aripiprazole possibly inhibited by fluoxetine and paroxetine (reduce dose of aripiprazole); plasma concentration of clozapine, haloperidol, risperidone, sertindole and zotepine increased by fluoxetine; plasma concentration of clozapine and olanzapine increased by fluvoxamine; plasma concentration of clozapine and sertindole increased by paroxetine; plasma concentration of risperidone possibly increased by paroxetine (increased risk of toxicity); metabolism of perphenazine inhibited by paroxetine (reduce dose of perphenazine); plasma concentration of clozapine
Antipsychotics

Antidepressants (continued)

Antidepressants: 
- Increased by: sertraline and venlafaxine; plasma concentration of haloperidol increased by venlafaxine; clozapine possibly increases CNS effects of MAOIs; plasma concentration of pimozide possibly increased by SSRI s (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by St John's wort; increased dose of olanzapine; antipsychotics increase plasma concentration of tricyclics—possibly increased risk of ventricular arrhythmias; increased risk of antimuscarinic side-effects when phenothiazines given with tricyclics; increased risk of ventricular arrhythmias when pimozide given with tricyclics—avoid concomitant use; possibly increased antimuscarinic side-effects when clozapine given with tricyclics

Antidiabetics: phenothiazines possibly antagonise hypoglycaemic effect of sulphonylureas

Antiepileptics: metabolism of clozapine accelerated by carbamazepine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; metabolism of haloperidol, olanzapine, quetiapine, risperidone and sertindole accelerated by carbamazepine (reduced plasma concentration); plasma concentration of aripiprazole reduced by carbamazepine; plasma concentration of pimozide reduced by carbamazepine; antipsychotics antagonise anticonvulsant effect of carbamazepine, ethosuximide, oxcarbazepine, phenytoin, primidone and valproate (convulsive threshold lowered); metabolism of clozapine, quetiapine and sertindole accelerated by phenytoin (reduced plasma concentration); plasma concentration of aripiprazole possibly reduced by phenytoin and valproate; increased dose of aripiprazole; metabolism of haloperidol accelerated by primidone (reduced plasma concentration); increased risk of neutropenia when olanzapine given with valproate

Antifungals: metabolism of aripiprazole inhibited by ketoconazole (reduce dose of aripiprazole); increased risk of ventricular arrhythmias when sertindole given withitraconazole; ketoconazole—avoid concomitant use; metabolism of aripiprazole possibly inhibited byitraconazole (reduce dose of aripiprazole); possible increased risk of ventricular arrhythmias when sertindole given with midazolam or etrizolam—avoid concomitant use; plasma concentration of quetiapine increased by idazoxane and triazolam (reduce dose of quetiapine); increased risk of ventricular arrhythmias when pimozide given with midazolam or triazolam—avoid concomitant use

Antimalarials: avoidance of antipsychotics advised by manufacturer of artether/lumefantrine; increased risk of ventricular arrhythmias when pimozide given with nefopam or quinine—avoid concomitant use

Antimuscarinics: increased risk of antimuscarinic side-effects when clozapine given with antimuscarinics; plasma concentration of phenothiazines reduced by antimuscarinics, but risk of antimuscarinic side-effects increased, effects of haloperidol possibly reduced by antimuscarinics

Antipsychotics: avoid concomitant use of clozapine with depot formulation of iloperidone, iloperidone, risperidone or zuclopenthixol as cannot be withdrawn quickly if neuropenia occurs; increased risk of ventricular arrhythmias when sulphide given with haloperidol; increased risk of ventricular arrhythmias when sertindole given with amisulpride—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with phenothiazines—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with sulpiride

Antivirals: plasma concentration of pimozide possibly increased by atazanavir—avoid concomitant use; metabolism of aripiprazole possibly inhibited by atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir and saquinavir (reduce dose of aripiprazole); plasma concentration of pimozide possibly increased by atazanavir and enveirapine—dose of aripiprazole; plasma concentration of pimozide and sertindole increased by fosamprenavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of aripiprazole possibly reduced by fosamprenavir; plasma concentration of sertindole increased by indinavir, lopinavir, nelfinavir, ritonavir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of clozapine possibly increased by fosamprenavir; plasma concentration of sertindole increased by indinavir, lopinavir, nelfinavir, ritonavir and saquinavir (increased risk of ventricular arrhythmias—avoid concomitant use)

Anxiolytics and Hypnotics: increased sedative effect when antipsychotics given with anxiolytics and hypnotics; plasma concentration of zotepine increased by diazepam; increased risk of hypotension, bradycardia and respiratory depression when intramuscular olanzapine given with parenteral benzodiazepines; plasma concentration of haloperidol increased by buspirone

Aprepitant: avoidance of pimozide advised by manufacturer of aprepitant

Atomoxetine: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with atomoxetine

Barbiturates: antipsychotics antagonise anticonvulsant effect of barbiturates (convulsive threshold lowered); metabolism of haloperidol accelerated by phenobarbital (reduced plasma concentration); plasma concentration of aripiprazole possibly reduced by phenytoin and valproate; increased plasma concentration of clozapine increased by phenobarbital (increased risk of toxicity)—avoid concomitant use; plasma concentration of antipsychotics possibly increased by phenobarbital; plasma concentration of pimozide increased by phenobarbital (increased risk of ventricular arrhythmias—avoid concomitant use)

Beta-blockers: enhanced hypotensive effect when phenothiazines given with beta-blockers; plasma concentration of both drugs may increase when chlorpromazine given with propranolol; increased risk of ventricular arrhythmias when amisulpride, phenothiazines, pimozide, sertindole or sulpiride given with sotalol; increased risk of ventricular arrhythmias when zuclopenthixol given with sotalol—avoid concomitant use

Calcium-channel Blockers: enhanced hypotensive effect when antipsychotics given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when phenothiazines given with clonidine

Cytotoxics: avoid concomitant use of clozapine with cytotoxics (increased risk of agranulocytosis); avoidance of pimozide advised by manufacturer of lapatinib

Desferrioxamine: manufacturer of levmepromazine (methyltrimeprazine) advises avoid concomitant use with desferrioxamine; avoidance of prochlorperazine advised by manufacturer of desferrioxamine

Diazoxide: enhanced hypotensive effect when phenothiazines given with diazoxide
Antipsychotics (continued)

- Diuretics: risk of ventricular arrhythmias with amiloride or sertindole increased by hypokalaemia caused by Diuretics; risk of ventricular arrhythmias with pimozone increased by hypokalaemia caused by diuretics (avoid concomitant use); enhanced hypotensive effect when phenothiazines given with diuretics

Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with amisulpride; antipsychotics antagonise e.g. apomorphine, levodopa and pergolide; antipsychotics antagonise hypoprolactinaemia and antiparkinsonian effects of bromocriptine and cabergoline; manufacturer of amiludipe advises avoid concomitant use of levo-dopa (antagonism of effect); avoidance of antipsychotics caused by membrane effects of: amitriptyline, maprotiline, trazodone, zotepine (antagonism of effect)

- Ixabradine: increased risk of ventricular arrhythmias when pimozone or sertindole given with ixabradine

- Lithium: increased risk of ventricular arrhythmias when sertindole given with lithium—avoid concomitant use; increased risk of extrapyramidal side-effects and possible neuotoxicity when clozapine, flupentixol, haloperidol, phenothiazines or zuclopenthixol given with lithium; increased risk of extrapyramidal side-effects when sulpiride given with lithium

Mecamylamine: effects of antipsychotics possibly reduced by memantine

Methyldopa: enhanced hypotensive effect when antipsychotics given with methyldopa (also increased risk of extrapyramidal effects)

Metoclopramide: increased risk of extrapyramidal side-effects when antipsychotics given with metoclopramide

Moxonidine: enhanced hypotensive effect when phenothiazines given with moxonidine

Muscle Relaxants: promazine possibly enhances effects of sufamethoxine

Nitrates: enhanced hypotensive effect when phenothiazines given with nitrates

Penicillamine: avoid concomitant use of clozapine with penicillamine (increased risk of agranulocytosis)

Pentamidine Isetionate: increased risk of ventricular arrhythmias when amisulpride given with pentamidine isetionate—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with pentamidine isetionate

Sibutramine: increased risk of CNS toxicity when antipsychotics given with sibutramine (manufacturer of sibutramine advises avoid concomitant use)

- Sodium Benzoate: haloperidol possibly reduces effects of sodium benzoate

Sodium Oxylate: antisepsis possibly enhance effects of sodium oxylate

Sodium Phenylbutyrate: haloperidol possibly reduces effects of sodium phenylbutyrate

Sympathomimetics: antipsychotics antagonise hyper-tensive effect of sympathomimetics

Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with tetrabenazine

- Ultra-potent dopamine receptor antagonists: chlorpromazine and clozapine possibly enhanced by cimetidine; increased risk of ventricular arrhythmias when sertindole given with cimetidine—avoid concomitant use; plasma concentration of clozapine possibly reduced by omeprazole; absorption of sulphasalazine reduced by sucralfate

- Vasodilator: Antihypertensives: enhanced hypotensive effect when phenothiazines given with hydralazine, minoxidil or sodium nitroprusside

Antivirals see Abacavir, Aciclovir, Adefovir, Atazanavir, Cidofovir, Darunavir, Didanosine, Efavirenz, Emtricitabine, Etravirine, Famciclovir, Foscarnet, Ganciclovir, Indinavir, Lamivudine, Lopinavir, Maraviroc, Nelfina-vir, Nevirapine, Raltegravir, Ribavirin, Ritonavir, Saquinavir, Stavudine, Telbivudine, Tenofovir, Tipra-navir, Valaciclovir, and Zidovudine

Anxiolytics and Hypnotics

ACE Inhibitors; enhanced hypotensive effect when anxiolytics and hypnotics given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with adrenergic neurone blockers

Alcohol: increased sedative effect when anxiolytics and hypnotics given with alcohol

Alpha-blockers: enhanced hypotensive and sedative effect when anxiolytics and hypnotics given with alpha-blockers

Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with general anaesthetics

Analgesics: increased sedative effect when anxiolytics and hypnotics given with opioid analgesics

Anxiolytics and Hypnotics: increased risk of extrapyramidal side-effects when anxiolytics and hypnotics given with angiotensin-II receptor antagonists

- Antibacterials: metabolism of midazolam inhibited by clarithromycin, erythromycin, quinupristin/ dalfopristin and telithromycin (increased plasma concentration with increased sedation); plasma concentration of midazolam increased by ritonavir given with angiotensin-II receptor antagonists; metabolism of benzodiazepines possibly accelerated by rifampicin (reduced plasma concentration); metabolism of diazepam accelerated by rifampicin (reduced plasma concentration); metabolism of buspirona and zaleplon possibly accelerated by rifampicin; metabolism of zopiclone accelerated by rifampicin (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by rifampicin; metabolism of diazepam inhibited by aminoglycosides

- Antidepressants: chlorimipramine and tricloro may transiently enhance anticoagulant effect of coumarin

- Antidepressants: plasma concentration of melatonin increased by fluvoxamine—avoid concomitant use; plasma concentration of some benzodiazepines increased by fluvoxamine; sedative effects possibly increased when zolpidem given with sertraline; manufacturer of buspirona advises avoid concomitant use with MAOIs; plasma concentration of oral midazolam possibly reduced by St John's wort; increased sedative effect when anxiolytics and hypnotics given with mirtazapine, tricyclic-related antidepressants or tricycles

- Anxiolytics and Hypnotics: plasma concentration of midazolam reduced by carbamazepine; plasma concentration of clonazepam often reduced by carbamazepine, phenytoin and primidone; benzodiazepines possibly increase or decrease plasma concentration of phenytoin; diazepam increases or decreases plasma concentration of phenytoin; clobazam possibly increases plasma concentration of valproate; plasma concentration of diazepam and lorazepam possibly increased by valproate; increased risk of side-effects when clonazepam given with valproate

- Antifungals: plasma concentration of alprazolam increased by itraconazole and ketoconazole; plasma concentration of midazolam increased by itraconazole, ketoconazole and itraconazole (risk of prolonged sedation); plasma concentration of buspirona increased by itraconazole (reduce dose of buspirona); plasma concentration of midazolam increased by posaconazole

- Antihistamines: increased sedative effect when anxiolytics and hypnotics given with antihistamines

- Antipsychotics: increased sedative effect when anxiolytics and hypnotics given with antipsychotics; buspirona increases plasma concentration of haloperidol; increased risk of hypertension, bradycardia and respiratory depression when parenteral benzodiazepines or midazolam given with buspirona; diazepam increases plasma concentration of zolpidem

- Antivirals: plasma concentration of midazolam possibly increased by atazanavir—avoid concomitant use of
Anxiolytics and Hypnotics (continued)

- Antivirals (continued)
  oral midazolam; increased risk of prolonged sedation when midazolam given with 
  efavirenz—avoid concomitant use; increased risk of prolonged sedation and respiratory depression
  when alprazolam, clonazepam, diazepam, flurazepam or midazolam given with
  fosamprenavir; plasma concentration of midazolam possibly increased by
  indinavir, nelfinavir and ritonavir (risk of prolonged sedation—avoid concomitant use of oral midazolam); increased risk of prolonged sedation when alprazolam given with
  indinavir—avoid concomitant use; plasma concentration of alprazolam, diazepam, flurazepam and zolpidem possibly increased by
  ritonavir (risk of extreme sedation and respiratory depression—avoid concomitant use); plasma concentration of anxiolytics and hypnotics possibly increased by
  ritonavir; plasma concentration of buspiron increased by
  ritonavir (increased risk of toxicity); plasma concentration of midazolam increased by
  saquinavir (risk of prolonged sedation—avoid concomitant use of oral midazolam).

Aprepitant: plasma concentration of midazolam increased by aprepitant (risk of prolonged sedation)
Barbiturates: plasma concentration of clonazepam often reduced by phenobarbital
Beta-blockers: enhanced hypnotic effect when anxiolytics and hypnotics given with beta-blockers
Calcium-channel Blockers: enhanced hypnotic effect when anxiolytics and hypnotics given with calcium-channel blockers; midazolam increases absorption of lercanidipine; metabolism of midazolam inhibited by
diltiazem and verapamil (increased plasma concentration with increased sedation); plasma concentration of buspiron increased by
diltiazem and verapamil (reduce dose of buspiron)
Cardiac Glycosides: alprazolam increases plasma concentration of digoxin (increased risk of toxicity)
Clonidine: enhanced hypnotic effect when anxiolytics and hypnotics given with clonidine
Cytotoxics: plasma concentration of midazolam increased by nilotinib
Diferasirox: plasma concentration of midazolam possibly reduced by diferasirox
Diazoxide: enhanced hypnotic effect when anxiolytics and hypnotics given with diazoxide
Disulfiram: metabolism of benzodiazepines inhibited by
disulfiram (increased sedative effects); increased risk of temazepam toxicity when given with
disulfiram
Diuretics: enhanced hypnotic effect when anxiolytics and hypnotics given with diuretics; administration of chloral or triclofos with parenteral
furosemide (frusemide) may displace thyroid hormone from binding sites
Dopaminergics: benzodiazepines possibly antagonise effects of levodopa
Grapefruit Juice: plasma concentration of buspiron increased by grapefruit juice
Lofexidine: increased sedative effect when anxiolytics and hypnotics given with lofexidine
Methylhydrazine-enhanced hypnotic effect when anxiolytics and hypnotics given with methylhydrazine
Moxonidine: enhanced hypnotic effect when anxiolytics and hypnotics given with moxonidine
Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with baclofen or tizanidine
Nabilone: increased sedative effect when anxiolytics and hypnotics given with nabilone
Nitrates: enhanced hypnotic effect when anxiolytics and hypnotics given with nitrates
Oestrogens: plasma concentration of melatonin increased by oestrogens
Probenecid: excretion of lorazepam reduced by probenecid (increased plasma concentration); excretion of nitrazepam possibly reduced by probenecid (increased plasma concentration)
Sodium Oxybate: benzodiazepines enhance effects of sodium oxybate (avoid concomitant use)
Theophylline: effects of benzodiazepines possibly reduced by theophylline
Ulcere-healing Drugs: plasma concentration of melatonin increased by cimetidine; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by
cimetidine (increased plasma concentration); metabolism of midazolam possibly inhibited by
esomeprazole and omeprazole (increased plasma concentration)
Vasodilator Antihypertensives: enhanced hypnotic effect when anxiolytics and hypnotics given with
dihydralazine, minoxidil or sodium nitroprusside

Apomorphine
Antipsychotics: effects of apomorphine antagonised by antipsychotics
Dopaminergics: effects of apomorphine possibly reduced by entacapone
Memantine: effects of dopaminergics possibly enhanced by memantine
Methylhydrazine: antiparkinsonian effect of dopaminergics antagonised by methylhydrazine

Aprepitant
Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Aprepitant
Note: Foaprepitant is a prodrug of aprepitant
Antidepressants: plasma concentration of aprepirant possibly increased by clarithromycin and teithromycin; plasma concentration of aprepirant reduced by rifampicin
Anticoagulants: aprepirant possibly reduces anti-
coagulant effect of warfarin

Antidepressants; manufacturer of aprepirant advises avoid concomitant use with 
St John’s wort
Antidiabetics: aprepirant reduces plasma concentra-
tion of tolbutamide
Antiepileptics: plasma concentration of aprepirant possibly reduced by carbamazepine and phenytoin
Antifungals: plasma concentration of aprepirant increased by ketoconazole

Antipsychotics: manufacturer of aprepirant advises avoid concomitant use with

Antivirals: plasma concentration of aprepirant possibly increased significantly by

Anxiolytics and Hypnotics (continued)

Nitrates: enhanced hypnotic effect when anxiolytics and hypnotics given with nitrates
Oestrogens: plasma concentration of melatonin increased by nitrates
Probenecid: excretion of lorazepam reduced by probenecid (increased plasma concentration); excretion of nitrazepam possibly reduced by probenecid (increased plasma concentration)
Sodium Oxybate: benzodiazepines enhance effects of sodium oxybate (avoid concomitant use)
Theophylline: effects of benzodiazepines possibly reduced by theophylline
Ulcere-healing Drugs: plasma concentration of melatonin increased by cimetidine; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by cimetidine (increased plasma concentration); metabolism of midazolam possibly inhibited by esomeprazole and omeprazole (increased plasma concentration)
Vasodilator Antihypertensives: enhanced hypnotic effect when anxiolytics and hypnotics given with dihydralazine, minoxidil or sodium nitroprusside

Apomorphine
Antipsychotics: effects of apomorphine antagonised by antipsychotics
Dopaminergics: effects of apomorphine possibly reduced by entacapone
Memantine: effects of dopaminergics possibly enhanced by memantine
Methylhydrazine: antiparkinsonian effect of dopaminergics antagonised by methylhydrazine

Aprepitant
Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Aprepitant
Note: Foaprepitant is a prodrug of aprepirant
Antidepressants: plasma concentration of aprepirant possibly increased by clarithromycin and teithromycin; plasma concentration of aprepirant reduced by rifampicin
Anticoagulants: aprepirant possibly reduces anti-
coagulant effect of warfarin

Antidepressants; manufacturer of aprepirant advises avoid concomitant use with 
St John’s wort
Antidiabetics: aprepirant reduces plasma concentra-
tion of tolbutamide
Antiepileptics: plasma concentration of aprepirant possibly reduced by carbamazepine and phenytoin
Antifungals: plasma concentration of aprepirant increased by ketoconazole

Antipsychotics: manufacturer of aprepirant advises avoid concomitant use with

Antivirals: plasma concentration of aprepirant possibly increased significantly by

Anxiolytics and Hypnotics (continued)

Nitrates: enhanced hypnotic effect when anxiolytics and hypnotics given with nitrates
Oestrogens: plasma concentration of melatonin increased by nitrates
Probenecid: excretion of lorazepam reduced by probenecid (increased plasma concentration); excretion of nitrazepam possibly reduced by probenecid (increased plasma concentration)
Sodium Oxybate: benzodiazepines enhance effects of sodium oxybate (avoid concomitant use)
Theophylline: effects of benzodiazepines possibly reduced by theophylline
Ulcere-healing Drugs: plasma concentration of melatonin increased by cimetidine; metabolism of benzodiazepines, clomethiazole and zaleplon inhibited by cimetidine (increased plasma concentration); metabolism of midazolam possibly inhibited by esomeprazole and omeprazole (increased plasma concentration)
Vasodilator Antihypertensives: enhanced hypnotic effect when anxiolytics and hypnotics given with dihydralazine, minoxidil or sodium nitroprusside

Apomorphine
Antipsychotics: effects of apomorphine antagonised by antipsychotics
Dopaminergics: effects of apomorphine possibly reduced by entacapone
Memantine: effects of dopaminergics possibly enhanced by memantine
Methylhydrazine: antiparkinsonian effect of dopaminergics antagonised by methylhydrazine

Aprepitant
Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics

Aprepitant
Note: Foaprepitant is a prodrug of aprepirant
Antidepressants: plasma concentration of aprepirant possibly increased by clarithromycin and teithromycin; plasma concentration of aprepirant reduced by rifampicin
Anticoagulants: aprepirant possibly reduces anti-
coagulant effect of warfarin

Antidepressants; manufacturer of aprepirant advises avoid concomitant use with 
St John’s wort
Antidiabetics: aprepirant reduces plasma concentra-
tion of tolbutamide
Antiepileptics: plasma concentration of aprepirant possibly reduced by carbamazepine and phenytoin
Antifungals: plasma concentration of aprepirant increased by ketoconazole

Antipsychotics: manufacturer of aprepirant advises avoid concomitant use with

Antivirals: plasma concentration of aprepirant possibly increased significantly by

Appendix 1: Interactions 725

Appendix 1: Interactions
Antivirals:

Appendix 1: Interactions

Atazanavir

Antidepressants:

Anticoagulants:

Aspirin

Ulcer-healing Drugs:

Beta-blockers:

Antipsychotics:

Antibacterials:

Artemether with Lumefantrine (continued)

• Antibacterials: manufacturer of artemether/lumefantrine advises avoid concomitant use with macrolides and quinolones

• Antidepressants: manufacturer of artemether/lumefantrine advises avoid concomitant use with antidepressants

• Antifungals: manufacturer of artemether/lumefantrine advises avoid concomitant use with midazolams and azoles

• Antimalarials: manufacturer of artemether/lumefantrine advises avoid concomitant use with antimalarials; increased risk of ventricular arrhythmias when artemether/lumefantrine given with quinine

• Antipsychotics: manufacturer of artemether/lumefantrine advises avoid concomitant use with antipsychotics

• Antivirals: manufacturer of artemether/lumefantrine advises caution with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir

• Beta-blockers: manufacturer of artemether/lumefantrine advises avoid concomitant use with metoprolol and etanol

Grapefruit juice: plasma concentration of artemether/lumefantrine possibly increased by grapefruit juice

• Ulcer-healing Drugs: manufacturer of artemether/lumefantrine advises avoid concomitant use with cimetidine

Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 679

Ascorbic acid see Vitamins

Aspirin

Adsortens: absorption of aspirin possibly reduced by kaolin

• Analgesics: avoid concomitant use of aspirin with NSAIDs (increased side-effects); antiplatelet effect of aspirin possibly reduced by ibuprofen

Antacid: excretion of aspirin increased by alkaline urine due to some antacids

• Anticoagulants: increased risk of bleeding when aspirin given with coumarins or phenindione (due to antiplatelet effect); aspirin enhances anticoagulant effect of leaseparin

• Antidepressants: increased risk of bleeding when aspirin given with SSRIs or venlafaxine

Antiepileptics: aspirin enhances effects of phenytoin and valproate

Cristolazo: manufacturer of cristolazo recommends dose of aspirin should not exceed 80 mg daily when given with cristolazo

Clodiropr: increased risk of bleeding when aspirin given with clodiprogel

Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with corticosteroids, also corticosteroids reduce plasma concentration of salicylate

• Cytotoxics: aspirin reduces excretion of methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 568

Diuretics: aspirin antagonises diuretic effect of spironolactone; increased risk of toxicity when high-dose aspirin given with carbonic anhydrate inhibitors

Iloprost: increased risk of bleeding when aspirin given with iloprost

Leukotriene Antagonists: aspirin increases plasma concentration of zafirlukast

Metoclopramide: rate of absorption of aspirin increased by metoclopramide (enhanced effect)

Probenecid: aspirin antagonises effects of probenecid

Sibutramine: increased risk of bleeding when aspirin given with sibutramine

Sulfispyrazone: aspirin antagonises effects of sulfispyrazone

Atazanavir

Antacids: plasma concentration of atazanavir possibly reduced by antacids

Atazanavir (continued)

• Anti-arrhythmics: atazanavir possibly increases plasma concentration of brendamore and lidocaine (lignocaine)

• Antibacterials: plasma concentration of both drugs increased when atazanavir given with clarithromycin; atazanavir increases plasma concentration of rifabutin (reduce dose of rifabutin); plasma concentration of atazanavir reduced by lamiparin—avoid concomitant use; avoidance of concomitant atazanavir in severe renal and hepatic impairment advised by manufacturer of ertithromycin

Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of warfarin; avoidance of atazanavir advised by manufacturer of rivaroxaban

• Antidepressants: plasma concentration of atazanavir reduced by SS John’s wort—avoid concomitant use

• Antifungals: plasma concentration of atazanavir increased by posaconazole

Antimalarials: caution with atazanavir advised by manufacturer of artemether/lumefantrine

Antimuscarinics: avoidance of atazanavir advised by manufacturer of darifenacin; manufacturer of fesoterodine advises dose reduction when atazanavir given with fesoterodine—consult fesoterodine product literature

Antipsychotics: atazanavir possibly inhibits metabolism of arzipiprazole (reduce dose of arzipiprazole); atazanavir possibly increases plasma concentration of rifapentine—avoid concomitant use

Antivirals: manufacturer of atazanavir advises avoid concomitant use with efavirenz (plasma concentration of atazanavir reduced); avoid concomitant use of atazanavir with indinavir; atazanavir increases plasma concentration of maravir (consider reducing dose of maravir); plasma concentration of atazanavir possibly reduced by nefaviramine—avoid concomitant use; atazanavir increases plasma concentration of saquinavir; plasma concentration of atazanavir reduced by tenofovir, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of tipranavir (also plasma concentration of atazanavir reduced)

• Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of midazolam—avoid concomitant use of oral midazolam

Calcium-channel Blockers: atazanavir increases plasma concentration of dilisiazem (reduce dose of dilisazem); atazanavir possibly increases plasma concentration of verapamil

Ciclosporin: atazanavir possibly increases plasma concentration of ciclosporin

Cytotoxics: atazanavir possibly enhances metabolism of irinotecan (increased risk of toxicity)

Ergot Alkaloids: atazanavir possibly increases plasma concentration of ergot alkaloids—avoid concomitant use

Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with atorvastatin; possible increased risk of myopathy when atazanavir given with rosuvastatin—avoid concomitant use; increased risk of myopathy when atazanavir given with simvastatin (avoid concomitant use)

Oestrogens: atazanavir increases plasma concentration of ethinylestradiol—avoid concomitant use

Sildenafil: atazanavir possibly increases side-effects of sildenafil

Sirolimus: atazanavir possibly increases plasma concentration of sirolimus

Tacroflum: atazanavir possibly increases plasma concentration of tacrolimus

Ulcer-healing Drugs: plasma concentration of atazanavir possibly reduced by histamine H2-antagonists; plasma concentration of atazanavir reduced by proton pump inhibitors

Atenolol see Beta-blockers

Atomoxetine

• Analgesics: increased risk of ventricular arrhythmias when atomoxetine given with methadone; possible
Antivirals: Azithromycin

Antibacterials: Azelastine

Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with amiodarone or disopyramide

Antibacterials: increased risk of ventricular arrhythmias when atomoxetine given with erythromycin; increased risk of ventricular arrhythmias when atomoxetine given with moxifloxacin

Antidepressants: metabolism of atomoxetine possibly inhibited by fluoxetine and paroxetine; possible increased risk of convulsions when atomoxetine given with antidepressants; atomoxetine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; increased risk of ventricular arrhythmias when atomoxetine given with tricyclics

Antimalarials: increased risk of ventricular arrhythmias when atomoxetine given with mefloquine

Antipsychotics: increased risk of ventricular arrhythmias when atomoxetine given with antipsychotics that prolong the QT interval

Beta-blockers: increased risk of ventricular arrhythmias when atomoxetine given with metoprolol

Bupropion: possible increased risk of convulsions when atomoxetine given with bupropion

Diuretics: risk of ventricular arrhythmias with atomoxetine increased by hypokalaemia caused by diuretics

Sympathomimetics, Beta: Increased risk of cardiovascular side-effects when atomoxetine given with parenteral salbutamol

Azatovastatin see Statins

Atovaquone

Antibacterials: plasma concentration of atovaquone reduced by erafabin and rifampicin (possible therapeutic failure of atovaquone); plasma concentration of atovaquone reduced by tetracycline

Antivirals: atovaquone possibly reduces plasma concentration of indinavir; atovaquone possibly inhibits metabolism of zidovudine (increased plasma concentration)

Metoclopramide: plasma concentration of atovaquone reduced by metoclopramide

Atracurium see Muscle Relaxants

Atropine see Antimuscarinics

Auranofin see Gold

Azapropazone see NSAIDs

Azathioprine

ACE inhibitors: increased risk of anaemia or leucopenia when azathioprine given with captopril especially in renal impairment; increased risk of anaemia when azathioprine given with enalapril especially in renal impairment

Allopurinol: enhanced effects and increased toxicity of azathioprine when given with allopurinol; allopurinol (reduce dose of azathioprine to one quarter of usual dose) Aminosaliclylates: possible increased risk of leucopenia when azathioprine given with aminosalicylates

Antibacterials: increased risk of haematological toxicity when azathioprine given with sulfamethoxazole (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with trimethoprim (also with co-trimoxazole)

Anticoagulants: azathioprine possibly reduces anti-coagulant effect of coumarins

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Azelastine see Antihistamines

Azithromycin see Macrolides

Aztreonam

Anticoagulants: aztreonam possibly enhances anti-coagulant effect of coumarins

Antimicrobial antibiotics that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Baclofen see Muscle Relaxants

Balsalazide see Aminosalicylates

Bambuterol see Sympathomimetics, Beta

Barbiturates

Alcohol: increased sedative effect when barbiturates given with alcohol

Antidepressants: barbiturates accelerate metabolism of disopyramide (reduced plasma concentration)

Antibacterials: barbiturates accelerate metabolism of chloramphenicol, doxycycline and metronidazole (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of rifampicin; phenobarbital reduces plasma concentration of telithromycin (avoid during and for 2 weeks after phenobarbital)

Anticoagulants: barbiturates accelerate metabolism of coumarins (reduced anticoagulant effect)

Antidepressants: phenobarbital reduces plasma concentration of paroxetine; phenobarbital accelerates metabolism of aripiprazole; phenobarbital increases plasma concentration of telithromycin, and reduces plasma concentration of SSRIs (convulsive threshold lowered); anti-convulsant effect of barbiturates antagonised by SSRIs, controlled by phenobarbital with co-treatment of barbiturates given with primidone; plasma concentration of phenobarbital increased by valproate (also plasma concentration of valproate reduced); plasma concentration of phenobarbital possibly reduced by vigabatrin

Antifungals: phenobarbital possibly reduces plasma concentration of itraconazole and posaconazole; phenobarbital possibly reduces plasma concentration of voriconazole—avoid concomitant use; phenobarbital reduces absorption of griseofulvin (reduced effect)

Antipsychotics: anticonvulsant effect of barbiturates antagonised by antipsychotics (convulsive threshold lowered); phenobarbital accelerates metabolism of haloperidol (reduced plasma concentration); plasma concentration of both drugs reduced when pheno- barbital given with chlorpromazine; phenobarbital possibly reduces plasma concentration of aripiprazole—increased dose of aripiprazole

Antivirals: phenobarbital possibly reduces plasma concentration of abacavir, darunavir, fosamprenavir and lopinavir; avoidance of phenobarbital advised by manufacturer of etravirine; barbiturates possibly reduce plasma concentration of indinavir, nelfinavir and saquinavir; phenobarbital possibly reduces plasma concentration of indinavir, also plasma concentration of phenobarbital possibly reduced

Anxiolytics and Hypnotics: phenobarbital often reduces plasma concentration of clonazepam
Barbiturates (continued)

Aprepitant: phenobarbital possibly reduces plasma concentration of aprepitant

Beta-blockers: barbiturates reduce plasma concentration of metoprolol and timolol; barbiturates possibly reduce plasma concentration of propranolol

- Calcium-channel Blockers: barbiturates reduce effects of verapamil; plasma concentration of diltiazem and isradipine; barbiturates possibly reduce plasma concentration of trinitocain and its active metabolite

Cardiac Glycosides: barbiturates accelerate metabolism of digoxin (reduced effect)

Ciclosporin: barbiturates accelerate metabolism of ciclosporin (reduced effect)

Corticosteroids: barbiturates accelerate metabolism of corticosteroids (reduced effect)

Cytotoxics: phenobarbital possibly reduces plasma concentration of etoposide; phenobarbital reduces plasma concentration of ifosfamide and its active metabolite

Diuretics: phenobarbital reduces plasma concentration of spironolactone—avoid concomitant use; increased risk of osteomalacia when phenobarbital given with carbonic anhydrase inhibitors

Folates: plasma concentration of phenobarbital possibly reduced by folates

Hormone Antagonists: barbiturates accelerate metabolism of gestrinone (reduced plasma concentration); barbiturates possibly accelerate metabolism of torsemide (reduced plasma concentration)

Leukotriene Antagonists: phenobarbital reduces plasma concentration of mephenytoin

Lofexidine: increased sedative effect when barbiturates given with lofexidine

Mannetmine: effects of barbiturates possibly reduced by memantine

Oestrogens: barbiturates accelerate metabolism of oestrogens (reduced contraceptive effect—see p. 439)

Progestogens: barbiturates accelerate metabolism of progestogens (reduced contraceptive effect—see p. 439)

Sodium Oxybate: barbiturates enhance effects of sodium oxybate (avoid concomitant use)

Symptomimetics: plasma concentration of phenothiazines possibly increased by mexitelidate

Tacrolimus: phenobarbital reduces plasma concentration of tacrolimus

Theophylline: barbiturates accelerate metabolism of theophylline (reduced effect)

Thyroid Hormones: barbiturates accelerate metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)

This action on barbiturates accelerates metabolism of fentanyl (reduced plasma concentration)

Vitamins: barbiturates possibly increase requirements for vitamin D

Beclometasone see Corticosteroids

Belladonna Alkaloids see Antimuscarinics

Benepinar see Heparins

Bendrofluazide (bendrofluazide) see Diuretics

Benfentanill see Antipsychotics

Benzoprine (benzoprin) see Antimuscarinics

Benzodiazepines see Anxiolytics and Hypnotics

Benzthiazide see Diuretics

Benzylminillin see Penicillins

Beta-blockers

Note Since systemic absorption may follow topical application of beta-blockers to the eye the possibility of interaction, in particular, with drugs such as venepamil should be borne in mind

ACE Inhibitors: enhanced hypotensive effect when beta-blockers given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when beta-blockers given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when beta-blockers given with alcohol

Beta-blockers (continued)

Aldesleukin: enhanced hypotensive effect when beta-blockers given with aldesleukin

- Alpha-blockers: enhanced hypotensive effect when beta-blockers given with alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin

Anaesthetic, General: enhanced hypotensive effect when beta-blockers given with general anaesthetics

Anaesthetic, Local: propranolol increases risk of neuraxial toxicity

Analgesics: increased risk of beta-blockers antagonised by NSAIDs; plasma concentration of esmolol possibly increased by morphine

Antiangiotensin-II Receptor Antagonists: enhanced hypotensive effect when beta-blockers given with angiotensin-II receptor antagonists

- Anti-arrhythmics: increased risk of ventricular arrhythmias when beta-blockers given with anti-arrhythmics; increased risk of ventricular arrhythmias when sotalol given with amiodarone or disopyramide—avoid concomitant use; increased risk of atrioventricular block, AV block and myocardial depression when beta-blockers given with flecainide; increased risk of myocardial depression and bradycardia when beta-blockers given with amiodarone; increased risk of myocardial depression and bradycardia when beta-blockers given with sotalol and propranolol accelerated by rifampicin (plasma concentration significantly reduced); plasma concentration of carvedilol, celiprolol and metoprolol reduced by rifampicin

- Antidepressants: plasma concentration of metoprolol increased by citalopram and escitalopram; plasma concentration of propranolol increased by fluvoxamine; plasma concentration of metoprolol possibly increased by paroxetine (enhanced effect); labetalol and propranolol increase plasma concentration of imipramine; increased risk of myocardial infarction when beta-blockers given with MAOIs; increased risk of ventricular arrhythmias when sotalol given with tricyclics

Antidiabetics: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with antidiabetics; beta-blockers enhance hypoglycaemic effect of insulin

- Antihistamines: increased risk of ventricular arrhythmias when sotalol given with mizolastine—avoid concomitant use

- Antimalariaid: avoidance of metoprolol for heart failure advised by manufacturer of arteether/lumefantrine; increased risk of bradycardia when beta-blockers given with mefloquine

- Antimuscarinics: increased risk of ventricular arrhythmias when sotalol given with tiotidine

- Antipsychotics: plasma concentration of both drugs may be increased when propranolol given with chlorpromazine; increased risk of ventricular arrhythmias when sotalol given with zuclopenthixol;avoid concomitant use; increased risk of ventricular arrhythmias when sotalol given with amisulpride, phenothiazines, pimozide, sertrindole or sulpiride; enhanced hypotensive effect when beta-blockers given with phenothiazines

- Antivirals: avoidance of metoprolol for heart failure advised by manufacturer of epilavir

Anxiolytics and Hypnotics: enhanced hypotensive effect when beta-blockers given with anxiolytics and hypnotics

Anxiolytics: enhanced hypotensive effect when sotalol given with atenoloxetin

Barbiturates: plasma concentration of metoprolol and timolol reduced by barbiturates; plasma concentration of propranolol possibly reduced by barbiturates

Appendix 1: Interactions
Beta-blockers (continued)

- Calcium-channel blockers: enhanced hypotensive effect when beta-blockers with calcium-channel blockers; possible severe hypotension and heart failure when beta-blockers with nifedipine; increased risk of AV block and bradycardia when beta-blockers with diltiazem; astyrole, severe hypotension and heart failure when beta-blockers with verapamil (see p. 118).

Cardiac Glycosides: increased risk of AV block and bradycardia when beta-blockers with cardiac glycosides.

- Ciclosporin: carvedilol increases plasma concentration of ciclosporin.

- Clonidine: increased risk of withdrawal hypertension when beta-blockers with carvedilol increases plasma concentration of labetalol; increased risk of severe hypertension and bradycardia when beta-blockers with clonidine.

Corticosteroids: hypotensive effect of beta-blockers antagonised by corticosteroids.

Diazoxide: enhanced hypotensive effect when beta-blockers with diazoxide.

- Diuretics: enhanced hypotensive effect when beta-blockers with diuretics; risk of ventricular arrhythmias with sotalol increased by hypokalaemia caused by loop diuretics or thiazides and related diuretics.

Dopaminergics: enhanced hypotensive effect when beta-blockers with levodopa.

Ergot Alkaloids: increased peripheral vasoconstriction when beta-blockers with ergotamine and methysergide.

5HT Agonists: propranolol increases plasma concentration of 5HT agonists.

- Moxonidine: enhanced hypotensive effect when beta-blockers with moxonidine.

Nitrates: enhanced hypotensive effect when beta-blockers with nitrates.

Oestrogens: hypotensive effect of beta-blockers antagonised by oestrogens.

Parasympathomimetics: propranolol antagonises effects of neostigmine and pyridostigmine; increased risk of arrhythmias when beta-blockers with pyridostigmine.

Prostaglandins: enhanced hypotensive effect when beta-blockers with prostaglandins.

- Sympathomimetics: increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers with adrenaline (epinephrine), also reponse to adrenaline (epinephrine) may be reduced; increased risk of severe hypotension and bradycardia when non-cardioselective beta-blockers with dobutamine; possible increased risk of severe hypertension and bradycardia when non-cardioselective beta-blockers with norepinephrine (norepinephrine).

Thyroid Hormones: metabolism of propranolol accelerated by levothyroxine (thyroxine).

Ulcer-healing Drugs: plasma concentration of labetalol, metoprolol and propranolol increased by cimetidine.

Beta-blockers (continued)

Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers with hydralazine, minoxidil or sodium nitroprusside.

Betahistine

Antihistamines: effect of betahistine theoretically antagonised by antihistamines.

Betamethasone see Corticosteroids.

Betaxolol see Beta-blockers.

Betanechol see Parasympathomimetics.

Bexarotene

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin.

- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis).

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets.

- Lipid-regulating Drugs: plasma concentration of bexarotene increased by gemfibrozil—avoid concomitant use.

Betazole see Fibrates.

Biclutamide

Anticoagulants: bicalutamide possibly enhances anticoagulant effect of coumarins.

Biganuine see Antidiabetics.

Bile Acid Sequestrants see Colesevelam, Colestipol, and Colestyramine.

Bile Acids see Ursodeoxycholic Acid.

Bispironol see Beta-blockers.

Bisphosphonates

Analgesics: bioavailability of tiduronic acid increased by indometacin.

Antacids: absorption of bisphosphonates reduced by antacids.

Antibacterials: increased risk of hypocalcaemia when bisphosphonates given with aminoglycosides.

- Calcium Salts: absorption of bisphosphonates reduced by calcium salts.

Iron: absorption of bisphosphonates reduced by oral iron.

Bleomycin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin.

- Antipsychotics: avoid concomitant use of cytotoxics with clozapine.

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets.

- Antihistamines: cytotoxics possibly reduce absorption of phenytoin.

Antifungals: plasma concentration of bortezomib increased by ketoconazole.

- Antipsychotics: avoid concomitant use of cytotoxics with clozapine.

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets.

Bosantan

- Antibacterials: plasma concentration of bosantan reduced by rifampicin—avoid concomitant use.

Anticoagulants: manufacturer of bosantan recommends monitoring anticoagulant effect of coumarins.

- Antidiabetics: increased risk of hepatotoxicity when bosantan given with cephalexin—avoid concomitant use.

Antifungals: plasma concentration of bosantan increased by ketoconazole—avoid concomitant use.

Antivirals: plasma concentration of bosantan possibly increased by ritonavir.

- Ciclosporin: plasma concentration of bosantan increased by ciclosporin (also plasma concentration of ciclosporin reduced—avoid concomitant use).

Lipid-regulating Drugs: bosantan reduces plasma concentration of simvastatin.
**Antivirals:**
- Oestrogens: bosantan possibly causes contraceptive failure of hormonal contraceptives containing oestrogens (alternative contraception recommended).
- Progestogens: bosantan possibly causes contraceptive failure of hormonal contraceptives containing progestogens (alternative contraception recommended).
- Sildenafil: bosantan reduces plasma concentration of sildenafil.

**Brimonidine**
Antidepressants: manufacturer of brimonidine advises avoid concomitant use with MAOIs, tricyclic-related antidepressants and tricyclics.

**Brinzolamide** see Diuretics

**Bromocriptine**
- Analgesics: plasma concentration of bromocriptine increased by citalopram; manufacturer of bupropion advises caution within 72 hours of busulfan advises caution within 72 hours of paracetamol (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol).
- Antibacterials: plasma concentration of busulfan possibly inhibited by paracetamol (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol).
- Antidepressants: plasma concentration of busulfan possibly increased by metronidazole (increased risk of toxicity).
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin; plasma concentration of busulfan possibly reduced by phenytoin.

**Bosentan** (continued)
- Antifungals: metabolism of bosantan inhibited by itraconazole (increased risk of toxicity).
- Antipsychotics: avoid concomitant use of cytoxics with clozapine (increased risk of agranulocytosis).
- Cardiac Glycosides: cytoxics reduce absorption of digoxin tablets.
- Cytotoxics: increased risk of hepatotoxicity when busulfan given with tioguanine.

**Busulfan**
- Antibacterials: plasma concentration of busulfan increased by erythromycin (increased risk of toxicity); plasma concentration of busulfan possibly increased by macrolides (increased risk of toxicity).
- Antipsychotics: hypoprolactinaemic and antiparkinsonian effects of busulfan antagonised by antipsychotics.
- Domperidone: hypoprolactinaemic effect of busulfan possibly antagonised by domperidone.
- Hormone Antagonists: plasma concentration of bromocriptine increased by octreotide.
- Memantine: effects of dopaminergics possibly enhanced by memantine.
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa.
- Metoclopramide: hypoprolactinaemic effect of busulfan antagonised by metoclopramide.
- Sympathomimetics: risk of toxicity when bromocriptine given with omeprazole or phenylpropanolamine.

**Buclizine** see Antihistamines

**Bumetanide** see Diuretics

**Bupivacaine** see Antivaricella Zoster Virus

**Bupropion**
- Alcohol: plasma concentration of bupropion possibly increased by alcohol.
- Antivirals: plasma concentration of bupropion increased by antivirals.
- Antidepressants: plasma concentration of bupropion possibly increased by atomoxetine.
- Anti-arrhythmics: increased myocardial depression when bupivacaine given with anti-arrhythmics.
- Beta-blockers: increased risk of bupivacaine toxicity when given with propranolol.
- Antipsychotics: plasma concentration of cabergoline increased by antipsychotics.
- Calcium Salts: increased risk of hypercalcaemia when calcium salts given with thiazides and related diuretics.
- Calcium-channel Blockers: increased hypotensive effect when calcium-channel blockers given with ACE inhibitors.
- Calcium-channel Blockers: increased risk of first-dose hypotension with calcium-channel blockers.
- Calcium-channel Blockers: increased hypotensive effect when calcium-channel blockers given with adrenergic neurone blockers.
- Alcohol: increased hypotensive effect when calcium-channel blockers given with alcohol; verapamil possibly increases plasma concentration of alcohol.
- Alpha-blockers: decreased hypotensive effect when calcium-channel blockers given with angiotensin-II receptor antagonists.
- Antihypertensives: increased risk of bradycardia, AV block and myocardial depression when diltiazem or verapamil given with amiodarone; increased risk of...
Calcium-channel Blockers (continued)

- Beta-blockers: enhanced hypotensive effect when calcium-channel blockers given with beta-blockers; increased risk of AV block and bradycardia when diltiazem given with beta-blockers; astyole, severe hypotension and heart failure when verapamil given with beta-blockers (see p. 118); possible severe hypotension and heart failure when nifedipine given with beta-blockers.

Calcium-channel Blockers: plasma concentration of both drugs may increase when diltiazem given with nifedipine.

- Cardiac Glycosides: nifedipine possibly increases plasma concentration of digoxin; diltiazem, lercanidipine and nicardipine increase plasma concentration of digoxin; verapamil increases plasma concentration of digoxin, also increased risk of AV block and bradycardia.

- Ciclosporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciclosporin; combination of lercanidipine with ciclosporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by ciclosporin (increased risk of toxicity including gingival hyperplasia).

- Cilostazol: diltiazem increases plasma concentration of cilostazol—avoid concomitant use.

- Corticosteroids: hypotensive effect of calcium-channel blockers antagonised by corticosteroids.

- Cytoxotics: nifedipine possibly inhibits metabolism of vincristine.

- Diazoxide: enhanced hypotensive effect when calcium-channel blockers given with diazoxide.

- Diuretics: enhanced hypotensive effect when calcium-channel blockers given with diuretics; diltiazem and verapamil increase plasma concentration of eplerenone (reduce dose of eplerenone).

- Dopaminergics: enhanced hypotensive effect when calcium-channel blockers given with levodopa.

- Grapefruit Juice: plasma concentration of felodipine, nimodipine and verapamil increased by grapefruit juice.

- Hormone Antagonists: diltiazem and verapamil increase plasma concentration of dutasteride.

- Ibradilide: diltiazem and verapamil increase plasma concentration of atrasivastatin; possible increased risk of myopathy when diltiazem given with simvastatin; increased risk of myopathy when verapamil given with simvastatin.

- Lithium: neurotoxicity may occur when diltiazem or verapamil given with lithium without increased plasma concentration of lithium.

- Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and magnesium in pre-eclampsia.

- Mefloquine: avoidance of verapamil advised by manufacturer of darifenacin.

- Antipsychotics: enhanced hypotensive effect when calcium-channel blockers given with antipsychotics.

- Antivirals: plasma concentration of verapamil possibly increased by atazanavir which causes significant increase of diltiazem increased by ritazavir (reduce dose of diltiazem); plasma concentration of diltiazem reduced by efavirenz; manufacturer of lercanidipine advises avoid concomitant use with atazanavir and ritonavir; manufacturer of ciclosporin; combination of lercanidipine with ciclosporin increases risk of AV block and bradycardia.

- Antimuscarinics: effects of dihydropropyrindines, diltiazem and nifedipine probably reduced by antimuscarinics.

- Antihistaminics: possible increased risk of bradycardia when calcium-channel blockers given with mefloquine.

- Antifungals: metabolism of itraconazole and ketoconazole (increased plasma concentration); manufacturer of lercanidipine advises avoid concomitant use with itraconazole and ketoconazole; negative inotropic effect possibly increased when calcium-channel blockers given with itraconazole; plasma concentration of nifedipine increased by miconafungin.

- Antihypertensives: increase plasma concentration of atorvasivatin; possible increased risk of myopathy when diltiazem given with simvastatin; increased risk of myopathy when verapamil given with simvastatin.

- Antiparkinsonism: enhanced hypotensive effect when calcium-channel blockers given with mexitridine.

- Muscle Relaxants: verapamil enhances effects of non-depolarising muscle relaxants and suxamethonium; enhanced hypotensive effect when calcium-channel blockers given with beta-blockers; increased risk of AV block and bradycardia when diltiazem given with beta-blockers; astyole, severe hypotension and heart failure when verapamil given with beta-blockers; possible severe hypotension and heart failure when nifedipine given with beta-blockers.
Calcium-channel Blockers (continued)

Nitrates: enhanced hypotensive effect when calcium-channel blockers given with nitrates.

Oestro gens: hypotensive effect of calcium-channel blockers antagonised by oestro gens.

Prostaglandins: enhanced hypotensive effect when calcium-channel blockers given with alprostadil.

Sildenafil: enhanced hypotensive effect when amloidipine given with sildenafil.

- Sildenafil: diltiazem increases plasma concentration of sirolimus; plasma concentration of both drugs increased when verapamil given with sirolimus.

- Tacrolimus: diltiazem and nifedipine increase plasma concentration of tacrolimus; felodipine, nicardipine and verapamil possibly increase plasma concentration of tacrolimus.

- Theophylline: calcium-channel blockers possibly increase plasma concentration of theophylline (enhanced effect); diltiazem increases plasma concentration of theophylline; verapamil increases plasma concentration of theophylline (enhanced effect).

Ultra-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by cimetidine (increased plasma concentration); plasma concentration of isradipine increased by cimetidine (halve dose of isradipine).

Vardenafil: enhanced hypotensive effect when nifedipine given with vardenafil.

Vasodilator Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with hydralazine, minoxidil or sodium nitroprusside.

Calcium-channel Blockers (dihydropyridines) see Calcium-channel Blockers.

Candesartan see Angiotensin-II Receptor Antagonists.

Capcetabine see Fluorouracil.

Cyclosporin see Cyclosporins.

Antibacterials: increased risk of nephrotoxicity when capreomycin given with colistin or polymyxins; increased risk of nephrotoxicity and ototoxicity when capreomycin given with aminoglycosides or vancomycin.

Cytotoxics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with platinum compounds.

Oestro gens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestro gens (risk probably small, see p. 439).

Vaccines: antibacterials inactivate oral typhoid vaccine.

Captopril see ACE Inhibitors.

Carbamazepine

Alcohol: CNS side-effects of carbamazepine possibly increased by alcohol.

- Analgesics: effects of carbamazepine enhanced by dextropropoxyphene; carbamazepine reduces plasma concentration of methadone; carbamazepine reduces effects of tramadol; carbamazepine possibly accelerates metabolism of paracetamol.

- Antibacterials: plasma concentration of carbamazepine increased by eflornithine and erythromycin; plasma concentration of carbamazepine reduced by efavirenz; carbamazepine accelerates metabolism of doxycycline (reduced effect); plasma concentration of carbamazepine increased by isoniazid (also possibly increased isoniazid hepatotoxicity); carbamazepine reduces plasma concentration of ethinyl oestradiol (avoid during and for 2 weeks after carbamazepine).

- Anticonvulsants: carbamazepine possibly accelerates metabolism of ecmuarin (reduced anticonvulsant effect).

- Antidepressants: plasma concentration of carbamazepine increased by nefazodone and fluvoxamine; carbamazepine reduces plasma concentration of mianserin, mirtazapine and paroxetine; manufacturer of carbamazepine advises avoid for 2 weeks after stopping MAOIs, also antagonism of anti-convulsant effect; anticonvulsant effect of anti-epileptics possibly antagonised by MAOIs and antimycotics.

Carbamazepine

- Antidepressants (continued)

- Tricyclic-related antidepressants (conversible threshold lowered); avoid concomitant use of anti-epileptics (reduced plasma concentration and reduced effect).

Antiepileptics: carbamazepine possibly reduces plasma concentration of ethosuximide; carbamazepine often reduces plasma concentration of lamotrigine, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of carbamazepine sometimes reduced by oxcarbazepine (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; plasma concentration of both drugs often reduced when carbamazepine given with phenytoin, also plasma concentration of phenytoin may be increased; plasma concentration of carbamazepine often reduced by primidone, also plasma concentration of primidone sometimes reduced (but concentration of an active metabolite of primidone often increased); carbamazepine reduces plasma concentration of tiagabine and zonisamide; carbamazepine often reduces plasma concentration of topiramate; carbamazepine reduces plasma concentration of valproate, also plasma concentration of an active metabolite of carbamazepine increased.

- Antifungals: plasma concentration of carbamazepine possibly increased by fluconazole and ketoconazole; carbamazepine possibly reduces plasma concentration of itraconazole and posaconazole; carbamazepine possibly reduces plasma concentration of voriconazole—avoid concomitant use; carbamazepine possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin.

- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by mefloquine.

- Antipsychotics: anticonvulsant effect of carbamazepine antagonised by antipsychotics (conversible threshold lowered); carbamazepine accelerates metabolism of haloperidol, olanzapine, quetiapine, risperidone and zoledol (reduced plasma concentration); carbamazepine reduces plasma concentration of aripiprazole—increase dose of aripiprazole; carbamazepine accelerates metabolism of clozapine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine reduces plasma concentration of paliperidone.

- Antivirals: carbamazepine possibly reduces plasma concentration of darunavir, fosamprenavir, lopinavir, nelfinavir, saquinavir and tipranavir; plasma concentration of both drugs reduced when carbamazepine given with efavirenz; avoidance of carbamazepine advocated with nelfinavir, ritonavir, saquinavir and tipranavir; plasma concentration of efavirenz, darunavir, fosamprenavir, lopinavir, ritonavir and etravirine (reduced plasma concentration); also avoidance of drugs with substantial potential for causing agranulocytosis; carbamazepine reduces plasma concentration of indinavir, also plasma concentration of carbamazepine possibly increased; plasma concentration of carbamazepine possibly increased by ritonavir.

- Antioxidants: carbamazepine reduces plasma concentration of midazolam.

Aprepitant: carbamazepine possibly reduces plasma concentration of aprepitant.

Barbiturates: plasma concentration of carbamazepine reduced by phenobarbital.

Bupropion: carbamazepine reduces plasma concentration of bupropion.

- Calcium-channel Blockers: carbamazepine reduces effects of felodipine and isradipine; carbamazepine...
Carbamazepine
- Calcium-channel blockers (continued)
  - probably reduces effects of dihydropryridines, nifedipine and nicardipine; effects of carbamazepine enhanced by diltiazem and verapamil

Cardiac Glycosides: carbamazepine accelerates metabolism of digitoxin (reduced effect)
- Ciclosporin: carbamazepine accelerates metabolism of ciclosporin (reduced plasma concentration)
- Corticosteroids: carbamazepine accelerates metabolism of eprostenoids (reduced plasma concentration)
- Cytotoxics: carbamazepine reduces plasma concentration of tamoxifen and lapatinib—avoid concomitant use; carbamazepine reduces plasma concentration of irinotecan and its active metabolite
- Diuretics: increased risk of hyponatraemia when carbamazepine given with diuretics; plasma concentration of carbamazepine increased by acetazolamide; carbamazepine reduces plasma concentration of spironolactone—avoid concomitant use
- Hormone Antagonists: metabolism of carbamazepine inhibited by danazol (increased risk of toxicity); carbamazepine accelerates metabolism of gestrinone (reduced plasma concentration); carbamazepine possibly accelerates metabolism of toremifene (reduced plasma concentration)
- 5HT Antagonists: carbamazepine accelerates metabolism of ondansetron (reduced effect)
- Lithium: neurotoxicity may occur when carbamazepine given with lithium without increased plasma concentration of lithium
- Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of non-depolarising muscle relaxants (accelerated recovery from neuromuscular blockade)
- Oestrogens: carbamazepine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 439)
- Progestogens: carbamazepine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 439)
- Retinoids: plasma concentration of carbamazepine possibly reduced by isotretinoin
- Theophylline: carbamazepine accelerates metabolism of theophylline (reduced effect)
- Thyroid Hormones: carbamazepine accelerates metabolism of thyroid hormones (may increase requirements for thyroid hormones in hypothyroidism)
- Tobilone: carbamazepine accelerates metabolism of tibilone (reduced plasma concentration)
- Ulcer-healing Drugs: metabolism of carbamazepine increased by amitriptyline (increased plasma concentration)
- Vitamins: carbamazepine possibly increases requirements for vitamin D

Carbapenems
- see Doripenem, Ertapenem, Imipenem with Clastatin, and Meropenem

Carbonic Anhydrase Inhibitors
- see Diuretics

Carboplatin
- see Platinum Compounds

Carprofos
- see Prostaglandins

Cardiac Glycosides
- ACE Inhibitors: plasma concentration of digoxin possibly increased by captopril
- Alpha-blockers: plasma concentration of digoxin increased by prazosin
- Aminosaliclate: absorption of digoxin possibly reduced by salicylates
- Analgesics: plasma concentration of cardiac glycosides possibly increased by NSAIDs, also possible exacerbation of heart failure and reduction of renal function
- Antacids: absorption of digoxin possibly reduced by antacids
- Anti-arrhythmics: plasma concentration of digoxin increased by amiodarone and propafenone (halve dose of digoxin)
- Antibacterials: plasma concentration of digoxin possibly increased by gentamicin, telithromycin and clarithromycin

Cardiac Glycosides
- Antibacterials (continued)
  - trimethoprim: absorption of digoxin reduced by neomycin, plasma concentration of digoxin possibly reduced by rifampicin; plasma concentration of digoxin increased by macrolides (increased risk of toxicity); metabolism of digitoxin accelerated by rifamycins (reduced effect)
- Antidepressants: plasma concentration of digoxin reduced by St John’s wort—avoid concomitant use
- Antidiabetics: plasma concentration of digoxin possibly reduced by acarbose; plasma concentration of digoxin increased by sitagliptin
- Antiepileptics: metabolism of digitoxin accelerated by carbamazepine, phenytoin and primidone (reduced effect); plasma concentration of digoxin possibly reduced by phenytoin
- Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with amphotericin; plasma concentration of digoxin increased by itraconazole
- Antimalarials: plasma concentration of digoxin possibly increased by chloroquine and hydroxychloroquine; possible increased risk of bradycardia when digoxin given with mefloquine; plasma concentration of digoxin increased by quinine
- Antimuscarinics: plasma concentration of digoxin possibly increased by darifenacin
- Antivirals: plasma concentration of digoxin increased by etravirine; plasma concentration of digoxin possibly increased by ritonavir
- Anxiolytics and Hypnotics: plasma concentration of digoxin increased by alprazolam (increased risk of toxicity)
- Barbiturates: metabolism of digitoxin accelerated by barbiturates (reduced effect)
- Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with beta-blockers
- Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large intravenous doses of calcium salts
- Calcium-channel Blockers: plasma concentration of digoxin increased by diltiazem, lercanidipine and nicardipine; plasma concentration of digoxin possibly increased by nifedipine; plasma concentration of digoxin increased by diltiazem and verapamil, also increased risk of AV block and bradycardia
- Ciclosporin: plasma concentration of digoxin increased by ciclosporin (increased risk of toxicity)
- Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with corticosteroids
- Cytotoxics: absorption of digoxin tablets reduced by cytotoxics
- Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with acetazolamide, loop diuretics or thiazides and related diuretics; plasma concentration of digoxin possibly increased by potassium carnenate; plasma concentration of digoxin possibly affected by spironolactone; plasma concentration of digoxin increased by spironolactone
- Lenalidomide: plasma concentration of digoxin possibly increased by lenalidomide
- Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by colesterol and colestyramine; plasma concentration of digoxin possibly increased by atorvastatin
- Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with suxamethonium; possible increased risk of bradycardia when cardiac glycosides given with tizanidine
- Penicillamine: plasma concentration of digoxin possibly increased by penicillamine
- Symptomaticinetics, Beta- plasma concentration of digoxin possibly increased by salbutamol
- Ulcer-healing Drugs: plasma concentration of digoxin possibly slightly increased by proton pump inhibitors;
Appendix 1: Interactions

Cardiac Glycosides

Ulcer-healing Drugs (continued)

absorption of cardiac glycosides possibly reduced by sucralfate

Carmustine

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Ciclosporin: possible increased risk of nephrotoxicity when ciclosporin given with azathioprine (increased risk of toxicity)

Ciclosporin: metabolism of ciclosporin possibly reduced by antileptics—consider increasing dose of ciclosporin

Chloramphenicol

Antiepileptics: avoid concomitant use of chloramphenicol with phenytoin (increased risk of agranulocytosis)

Barbiturates: metabolism of chloramphenicol accelerated by barbiturates (reduced plasma concentration)

Ciclosporin: chloramphenicol possibly increases plasma concentration of ciclosporin

Hydroxocobalamin: chloramphenicol reduces plasma concentration of hydroxocobalamin

Oestrogens: that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)

Tacrolimus: chloramphenicol possibly increases plasma concentration of tacrolimus

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Chloridiazepoxide see Anxiolytics and Hypnotics

Chloroquine and Hydroxychloroquine

Adenoptes: absorption of chloroquine and hydroxychloroquine reduced by kaolin

Agalsidase Alfa and Beta: chloroquine and hydroxychloroquine possibly inhibit effects of agalsidase alfa and beta (manufacturers of agalsidase alfa and beta advise avoid concomitant use)

Antacids: absorption of chloroquine and hydroxychloroquine reduced by antacids

Anti-arrhythmics: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with amiodarone—avoid concomitant use

Antibacterials: increased risk of ventricular arrhythmias when chloroquine and hydroxychloroquine given with moxifloxacin—avoid concomitant use

Antiepileptics: possible increased risk of convulsions when chloroquine and hydroxychloroquine given with antiepileptics

Antimalarials: avoidance of antimalarials advised by manufacturer of artmether/lumefantrine; increased risk of convulsions when chloroquine and hydroxychloroquine given with mefloquine

Cardiac Glycosides: chloroquine and hydroxychloroquine possibly increase plasma concentration of digoxin

Ciclosporin: chloroquine and hydroxychloroquine increase plasma concentration of ciclosporin (increased risk of toxicity)

Lanthanum: absorption of chloroquine and hydroxychloroquine possibly reduced by lanthanum (give at least 2 hours apart)

Laronidase: chloroquine and hydroxychloroquine possibly inhibit effects of laronidase (manufacturer of laronidase advises avoid concomitant use)

Parasympathomimetics: chloroquine and hydroxychloroquine have potential to increase symptoms of myasthenia gravis and thus diminish effect of neostigmine and pyridostigmine

Ulcer-healing Drugs: metabolism of chloroquine and hydroxychloroquine inhibited by cineminidine (increased plasma concentration)

Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 679

Chlorothiazide see Diuretics

Chlorphenamine (chlorpheniramine) see Antihistamines

Chlorpromazine see Antipsychotics

Chlorpropamide see Antidiabetics

Chlorotaldione see Diuretics

Chlorotetracycline see Tetracyclines

Ciclesonide see Corticosteroids

Ciclosporin

ACE Inhibitors: increased risk of hyperkalaemia when ciclosporin given with ACE inhibitors

Allopurinol: plasma concentration of ciclosporin possibly increased by allopurinol (risk of nephrotoxicity)

Analgesics: increased risk of nephrotoxicity when ciclosporin given with NSAIDs; ciclosporin increases plasma concentration of diclofenac (halve dose of diclofenac)
Ciclosporin (continued)

- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with angio-
tensin-II receptor antagonists

- Anti-arthrythmics: plasma concentration of ciclosporin possibly increased by amiodarone and propafenone

- Antibacterials: metabolism of ciclosporin inhibited by clarithromycin and erythromycin (increased plasma concentration); metabolism of ciclosporin accelerated by rifampicin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by saquinavir; plasma concentration of ciclosporin possibly increased by clarithromycin and erythromycin (increased plasma concentration); metabolism of ciclosporin possibly increased by rifampicin; metabolism of ciclosporin possibly increased by diltiazem

- Barbiturates: metabolism of ciclosporin accelerated by phenobarbital

- Bile Acids: metabolism of ciclosporin possibly increased by cholestyramine

- Calcium-channel Blockers: metabolism of ciclosporin possibly increased by nifedipine

- Calcium-channel Blockers: combination of ciclosporin with nifedipine may increase plasma concentra-
tion of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by nifedipine; plasma concentration of ciclosporin increased by amlodipine; plasma concentration of ciclosporin increased by nifedipine (increased risk of toxicity including gingival hyper-
plasia)

- Cardiac Glycosides: ciclosporin increases plasma concentration of digoxin (increased risk of toxicity)

- Corticosteroids: increased risk of nephrotoxicity when ciclosporin given with corticosteroids (increased risk of toxicity)

- Corticosteroids: Plasma concentration of ciclosporin increased by high-dose methylprednisolone (risk of convulsions); ciclosporin increases plasma concentration of methylprednisolone

- Cytotoxic: increased risk of nephrotoxicity when ciclosporin given with melphalan; increased risk of neurotoxicity when ciclosporin given with doxorubicin; risk of toxicity when ciclosporin given with methotrexate; plasma concentration of ciclosporin possibly increased by imatinib; in vitro studies suggest a possible interaction between ciclosporin and docetaxel (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of etoposide (increased risk of toxicity)

- Diuretics: increased risk of hyperkalaemia when ciclosporin given with potassium-sparing diuretics and aldosterone antagonists; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with thiazides and related diuretics

- Grapefruit Juice: plasma concentration of ciclosporin increased by grapefruit juice (increased risk of toxicity)

- Hormone Antagonists: metabolism of ciclosporin inhibited by danazol (increased plasma concentration); metabolism of ciclosporin accelerated by tamoxifen (reduced plasma concentration); increased risk of nephrotoxicity when ciclosporin given with tamoxifen, also plasma concentration of ciclosporin reduced by intravenous trimethoprim

- Antidepressants: plasma concentration of ciclosporin reduced by St John’s Wort—avoid concomitant use Antidiabetics: ciclosporin possibly enhances hypogly-
caeic effect of repaglinide

- Antiepileptics: metabolism of ciclosporin accelerated by carbamazepine and phenytoin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by oxcarbazepine; metabolism of ciclosporin accelerated by primidone (reduced effect)

- Antifungals: metabolism of ciclosporin inhibited by fluconazole, itraconazole, ketoconazole, miconazole, and voriconazole (increased risk of toxicity); metabolism of ciclosporin possibly inhibited by miconazole (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with amphotericin; ciclosporin increases plasma concentration of caspofungin (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclo-
sporin possibly reduced by griseofulvin; plasma concentration of ciclosporin possibly increased by micafungin

- Antimalarials: plasma concentration of ciclosporin increased by chloroquine and hydroxychloroquine (increased risk of toxicity)

- Antithrombins: plasma concentration of ciclosporin advised by manufacturer of darifenacin

- Anti-infectives: risk of ciclosporin advised by manufacturer of saquinavir

- Antivirals: increased risk of nephrotoxicity when ciclosporin given with aciclovir; plasma concentration of ciclosporin possibly increased by atazanavir, nelfinavir and ritonavir; plasma concentration of ciclosporin increased by indinavir; plasma concentration of both drugs increased when ciclosporin given with saquinavir

- Barbiturates: metabolism of ciclosporin accelerated by barbiturates (reduced effect)

- Beta-blockers: plasma concentration of ciclosporin increased by carvedilol

- Bile Acids: absorption of ciclosporin increased by ursodeoxycholic acid

- Breastfeeding: ciclosporin increases plasma concentration of omeprazole (also plasma concentration of ciclo-
sporin reduced—avoid concomitant use)

- Calcium-channel Blockers: combination of ciclosporin with lercanidipine may increase plasma concentra-
tion of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by lercanidipine; plasma concentration of ciclosporin increased by nifedipine (increased risk of toxicity including gingival hyper-
plasia)

- Cardiac Glycosides: ciclosporin increases plasma concentration of digoxin (increased risk of toxicity)

- Corticosteroids: Plasma concentration of ciclosporin increased by high-dose methylprednisolone (risk of convulsions); ciclosporin increases plasma concentration of methylprednisolone

- Cytotoxic: increased risk of nephrotoxicity when ciclosporin given with melphalan; increased risk of neurotoxicity when ciclosporin given with doxorubicin; risk of toxicity when ciclosporin given with methotrexate; plasma concentration of ciclosporin possibly increased by imatinib; in vitro studies suggest a possible interaction between ciclosporin and docetaxel (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of etoposide (increased risk of toxicity)

- Diuretics: increased risk of hyperkalaemia when ciclosporin given with potassium-sparing diuretics and aldosterone antagonists; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with thiazides and related diuretics

- Grapefruit Juice: plasma concentration of ciclosporin increased by grapefruit juice (increased risk of toxicity)

- Hormone Antagonists: metabolism of ciclosporin inhibited by danazol (increased plasma concentration); metabolism of ciclosporin accelerated by tamoxifen (reduced plasma concentration); increased risk of nephrotoxicity when ciclosporin given with tamoxifen, also plasma concentration of ciclosporin reduced by intravenous trimethoprim

- Antidepressants: plasma concentration of ciclosporin reduced by St John’s Wort—avoid concomitant use Antidiabetics: ciclosporin possibly enhances hypogly-
caeic effect of repaglinide

- Antiepileptics: metabolism of ciclosporin accelerated by carbamazepine and phenytoin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by oxcarbazepine; metabolism of ciclosporin accelerated by primidone (reduced effect)

- Antifungals: metabolism of ciclosporin inhibited by fluconazole, itraconazole, ketoconazole, miconazole, and voriconazole (increased risk of toxicity); metabolism of ciclosporin possibly inhibited by miconazole (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with amphotericin; ciclosporin increases plasma concentration of caspofungin (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclo-
sporin possibly reduced by griseofulvin; plasma concentration of ciclosporin possibly increased by micafungin

- Antimalarials: plasma concentration of ciclosporin increased by chloroquine and hydroxychloroquine (increased risk of toxicity)

- Antithrombins: plasma concentration of ciclosporin advised by manufacturer of darifenacin

- Anti-infectives: risk of ciclosporin advised by manufacturer of saquinavir

- Antivirals: increased risk of nephrotoxicity when ciclosporin given with aciclovir; plasma concentration of ciclosporin possibly increased by atazanavir, nelfinavir and ritonavir; plasma concentration of ciclosporin increased by indinavir; plasma concentration of both drugs increased when ciclosporin given with saquinavir

- Barbiturates: metabolism of ciclosporin accelerated by barbiturates (reduced effect)

- Beta-blockers: plasma concentration of ciclosporin increased by carvedilol

- Bile Acids: absorption of ciclosporin increased by ursodeoxycholic acid

- Breastfeeding: ciclosporin increases plasma concentration of omeprazole (also plasma concentration of ciclo-
sporin reduced—avoid concomitant use)

- Calcium-channel Blockers: combination of ciclosporin with lercanidipine may increase plasma concentra-
tion of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by lercanidipine; plasma concentration of ciclosporin increased by nifedipine (increased risk of toxicity including gingival hyper-
plasia)
Appendix 1: Interactions

Clonazepam
- Increased risk of withdrawal hypertension when clonazepam given with betablockers

Clomipramine
- Increased risk of rhabdomyolysis when clomipramine given with cimetidine

Clomethiazole
- Increased risk of rhabdomyolysis when clomethiazole given with cimetidine

Co-careldopa
- Increased risk of rhabdomyolysis when co-careldopa given with cimetidine

Co-beneldopa
- Increased risk of rhabdomyolysis when co-beneldopa given with cimetidine

Cobampicil
- Increased risk of rhabdomyolysis when cobampicil given with cimetidine

Co-amoxiclav
- Increased risk of rhabdomyolysis when co-amoxiclav given with cimetidine

Citrin (quinidine)
- Increased risk of rhabdomyolysis when citrin given with cimetidine

Clindamycin
- Increased risk of rhabdomyolysis when clindamycin given with cimetidine

Cimetidine
- Increased risk of rhabdomyolysis when cimetidine given with clopidogrel

Ciprofibrate
- Increased risk of rhabdomyolysis when ciprofibrate given with cimetidine

Cinnarizine
- Increased risk of rhabdomyolysis when cinnarizine given with cimetidine

Cinacalcet
- Increased risk of rhabdomyolysis when cinacalcet given with cimetidine

Cimetidine
- Increased risk of rhabdomyolysis when cimetidine given with clopidogrel

Clopamide
- Increased risk of rhabdomyolysis when clopamide given with cimetidine

Clonazepam
- Increased risk of rhabdomyolysis when clonazepam given with cimetidine

Clonidine
- Increased risk of rhabdomyolysis when clonidine given with cimetidine

Clonidine (continued)
- Antipsychotics: enhanced hypotensive effect when clonidine given with phenothiazines

Clonidine (continued)
- Beta-blockers: increased risk of withdrawal hypertension when clonidine given with beta-blockers

Calcium-channel Blockers
- Increased risk of withdrawal hypertension when clonidine given with calcium-channel blockers

Corticosteroids
- Increased risk of withdrawal hypertension when clonidine given with corticosteroids

Diazoxide
- Increased risk of withdrawal hypertension when clonidine given with diazoxide

Diuretics
- Increased risk of withdrawal hypertension when clonidine given with diuretics

Methyl dopa
- Increased risk of withdrawal hypertension when clonidine given with methyl dopa

Moxisylyte (thymoxamine)
- Increased risk of withdrawal hypertension when clonidine given with moxisylyte

Muscle Relaxants
- Increased risk of withdrawal hypertension when clonidine given with muscle relaxants

Nalbufin
- Increased risk of withdrawal hypertension when clonidine given with nalbufin

Nalbuphine
- Increased risk of withdrawal hypertension when clonidine given with nalbuphine

Noradrenaline (norepinephrine)
- Increased risk of withdrawal hypertension when clonidine given with noradrenaline (norepinephrine)

Opioid Analgesics
- Increased risk of withdrawal hypertension when clonidine given with opioid analgesics

Oxycodone
- Increased risk of withdrawal hypertension when clonidine given with oxycodone

Penicillin
- Increased risk of withdrawal hypertension when clonidine given with penicillin

Penicillins
- Increased risk of withdrawal hypertension when clonidine given with penicillins

Phenelzine
- Increased risk of withdrawal hypertension when clonidine given with phenelzine

Phenindione
- Increased risk of withdrawal hypertension when clonidine given with phenindione

Phenobarbital
- Increased risk of withdrawal hypertension when clonidine given with phenobarbital

Phenytoin
- Increased risk of withdrawal hypertension when clonidine given with phenytoin

Piroxicam
- Increased risk of withdrawal hypertension when clonidine given with piroxicam

Prostaglandins
- Increased risk of withdrawal hypertension when clonidine given with prostaglandins

Propoxyphene
- Increased risk of withdrawal hypertension when clonidine given with propoxyphene

Quinidine
- Increased risk of withdrawal hypertension when clonidine given with quinidine

Rifampicin
- Increased risk of withdrawal hypertension when clonidine given with rifampicin

Rifabutin
- Increased risk of withdrawal hypertension when clonidine given with rifabutin

Ritonavir
- Increased risk of withdrawal hypertension when clonidine given with ritonavir

Ritonavir and saquinavir
- Increased risk of withdrawal hypertension when clonidine given with ritonavir and saquinavir

Sildenafil
- Increased risk of withdrawal hypertension when clonidine given with sildenafil

Terfenadine
- Increased risk of withdrawal hypertension when clonidine given with terfenadine

Thalidomide
- Increased risk of withdrawal hypertension when clonidine given with thalidomide

Tramadol
- Increased risk of withdrawal hypertension when clonidine given with tramadol

Trichloroethylene
- Increased risk of withdrawal hypertension when clonidine given with trichloroethylene

Tobol
- Increased risk of withdrawal hypertension when clonidine given with tobol

Triglycerides
- Increased risk of withdrawal hypertension when clonidine given with triglycerides

Tramadol
- Increased risk of withdrawal hypertension when clonidine given with tramadol

Tramadol hydrochloride
- Increased risk of withdrawal hypertension when clonidine given with tramadol hydrochloride

Ursodeoxycholic acid
- Increased risk of withdrawal hypertension when clonidine given with ursodeoxycholic acid

Valproate
- Increased risk of withdrawal hypertension when clonidine given with valproate

Vasodilator Antihypertensives
- Increased risk of withdrawal hypertension when clonidine given with vasodilator antihypertensives

Vasopressin
- Increased risk of withdrawal hypertension when clonidine given with vasopressin

Warfarin
- Increased risk of withdrawal hypertension when clonidine given with warfarin

Zopiclone
- Increased risk of withdrawal hypertension when clonidine given with zopiclone

Zolpidem
- Increased risk of withdrawal hypertension when clonidine given with zolpidem

Zonisamide
- Increased risk of withdrawal hypertension when clonidine given with zonisamide

Zotepine
- Increased risk of withdrawal hypertension when clonidine given with zotepine

Zuclopenthixol
- Increased risk of withdrawal hypertension when clonidine given with zuclopenthixol

Zulifem
- Increased risk of withdrawal hypertension when clonidine given with zulifem
**Antibacterials**: reduce plasma concentration of isoniazid; metabolism of corticosteroids accelerated by rifampicins (reduced effect)

**Anticoagulants**: corticosteroids may enhance or reduce anticoagulant effect of coumarins (high-dose corticosteroids enhance anticoagulant effect)

**Antidiabetics**: corticosteroids antagonise hypoglycaemic effect of antidiabetics

**Antiepileptics**: metabolism of corticosteroids accelerated by carbamazepine, phenytoin and primidone (reduced effect)

**Antifungals**: metabolism of corticosteroids possibly inhibited by itraconazole, ketoconazole; plasma concentration of active metabolite of ciclosporin increased by ketoconazole; plasma concentration of inhaled mometasone increased by ketoconazole; metabolism of methylprednisolone inhibited by ketoconazole; increased risk of hypokalaemia when corticosteroids given with amphotericin—avoid concomitant use unless corticosteroids needed to control reactions; plasma concentration of inhaled budesonide increased by ketoconazole; plasma concentration of inhaled and oral budesonide increased by ketoconazole; plasma concentration of inhaled and oral budesonide and fluticasone increased by ritonavir; concentration of inhaled and intranasal budesonide and fluticasone increased by ritonavir; metabolism of dexamethasone and methylprednisolone increased by aprepitant (reduce dose of dexamethasone and methylprednisolone)

**Barbiturates**: metabolism of corticosteroids accelerated by barbiturates (reduced effect)

**Beta-blockers**: corticosteroids antagonise hypotensive effect of beta-blockers

**Calcium-channel Blockers**: corticosteroids antagonise hypotensive effect of calcium-channel blockers

**Cardiac Glycosides**: increased risk of hypokalaemia when corticosteroids given with cardiac glycosides

**Calcium Salts**: corticosteroids reduce absorption of calcium salts

**Calcium-channel Blockers**: corticosteroids antagonise hypotensive effect of calcium-channel blockers

**Diuretics**: corticosteroids antagonise hypotensive effect of diuretics

**Diazoxide**: corticosteroids antagonise hypotensive effect of diazoxide

**Diazoxide**: metabolism of corticosteroids possibly inhibited by diazoxide

**Diuretics**: corticosteroids antagonise diuretic effect of diuretics; increased risk of hypokalaemia when corticosteroids given with acetazolamide, loop diuretics or thiazides and related diuretics

**Diazoxide**: metabolism of corticosteroids possibly inhibited by diazoxide

**Methylprednisolone**: metabolism of corticosteroids possibly inhibited by methylprednisolone

**Mepivacaine**: effect of corticosteroids (including inhaled corticosteroids) may be reduced for 3–4 days after mepivacaine

**Moxonidine**: corticosteroids antagonise hypotensive effect of moxonidine

**Nitrates**: corticosteroids antagonise hypotensive effect of nitrates

**Oestrogens**: plasma concentration of corticosteroids increased by oral contraceptives containing oestrogens
Appendix 1: Interactions

Corticosteroids (continued)

- Sodium Benzoate: corticosteroids possibly reduce effects of sodium benzoate
- Sodium Phenylbutyrate: corticosteroids possibly reduce effects of sodium phenylbutyrate

Somatropin: corticosteroids may inhibit growth-promoting effect of somatropin

- Sympathomimetics: metabolism of dexamethasone accelerated by ephedrine

Sympathomimetics, Beta: increased risk of hypokalaemia when corticosteroids given with high doses of beta sympathomimetics—for CSM advice (hypokalaemia) see p. 153

Phenytoine: increased risk of hypokalaemia when corticosteroids given with phenytoine

- Vaccines: high doses of corticosteroids impair immune response to vaccines, avoid concomitant use with live vaccines (see p. 660)

Vasodilator Antihypertensives: corticosteroids antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Cortisone see Corticosteroids

Co-trimoxazole see Trimethoprim and Sulfamethoxazole

Cumarins

- Note: Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially including salads and vegetables) and in alcohol consumption may also affect anticoagulant control.

- Alcohol: anticoagulant control with cumarins may be affected by major changes in consumption of alcohol

- Allopurinol: anticoagulant effect of cumarins possibly enhanced by allopurinol

- Anabolic Steroids: anticoagulant effect of cumarins possibly enhanced by anabolic steroids

- Analgesics: anticoagulant effect of cumarins possibly enhanced by NSAIDs, celecoxib, dextropropoxyphene, etodolac, etoricoxib, flurbiprofen, ibuprofen, mefenamic acid, meclozine, parecoxib, piroxicam and sulindac; anticoagulant effect of cumarins enhanced by azaproprazone (avoid concomitant use); anticoagulant effect of cumarins possibly enhanced by diclofenac, also increased risk of haemorrhage with intravenous diclofenac (avoid concomitant use); increased risk of bleeding when cumarins given with ketorolac (avoid concomitant use); anticoagulant effect of cumarins enhanced by aspirin (due to antiplatelet effect); anticoagulant effect of cumarins possibly enhanced by prolonged regular use of paracetamol

- Anti-arrhythmics: metabolism of cumarins inhibited by amiodarone (enhanced anticoagulant effect); anticoagulant effect of cumarins enhanced by propafenone

- Antibacterials: experience in anticoagulant clinics suggests that INR possibly altered when cumarins are given with enemycin, enoxacin, etozymycin, etyronycin, ephalexoporina, levofloxacin, metacrystycines, tigecycline and trimethoprim; anticoagulant effect of cumarins enhanced by chloramphenicol, ciprofloxacin, clarithromycin, erythromycin, metronidazole, nalidixic acid, norfloxacain, ofloxacin and sulphonamides; studies have failed to demonstrate an interaction with cumarins, but common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin; metabolism of cumarins accelerated by rifampicin (reduced anticoagulant effect)

Antidepressants: anticoagulant effect of warfarin possibly enhanced by venlafaxine; anticoagulant effect of cumarins possibly enhanced by SSRI; anticoagulant effect of cumarins reduced by St

- Antidepressants (continued)

- John’s WO™ (avoid concomitant use); anticoagulant effect of warfarin enhanced by mirtazapine; anticoagulant effect of cumarins may be enhanced or reduced by tricyclics

- Antidiabetics: anticoagulant effect of warfarin possibly enhanced by exenatide; cumarins possibly enhance hypoglycaemic effect of sitagliptin; also possible changes to anticoagulant effect

- Antiepileptics: metabolism of cumarins accelerated by carbamazepine and primidone (reduced anticoagulant effect); metabolism of cumarins accelerated by phenytoin (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of cumarins possibly enhanced by valproate

- Antifungals: anticoagulant effect of cumarins enhanced by fluconazole, itraconazole, ketoconazole and voriconazole; anticoagulant effect of cumarins enhanced by miconazole (miconazole oral gel and possibly vaginal formulations absorbed); anticoagulant effect of cumarins enhanced by ergotryptophan

- Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by proguanil

- Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by azithromycin, clarithromycin and itraconazole; anticoagulant effect of cumarins may be enhanced or reduced by fosamprenavir; anti-coagulant effect of cumarins possibly enhanced by ritonavir; anticoagulant effect of warfarin possibly enhanced by saquinavir

- Anxiolytics and Hypnotics: anticoagulant effect of cumarins may transiently be enhanced by chloral and triclofos

- Appetisers: anticoagulant effect of warfarin possibly reduced by aprepitant

- Barbiturates: metabolism of cumarins accelerated by barbiturates (reduced anticoagulant effect)

- Bosentan: monitoring anticoagulant effect of cumarins recommended by manufacturer of bosentan

- Clopidogrel: anticoagulant effect of cumarins enhanced due to antiplatelet action of clopidogrel; avoidance of warfarin advised by manufacturer of clopidogrel

- Corticosteroids: anticoagulant effect of cumarins may be enhanced or reduced by corticosteroids (high-dose corticosteroids enhance anticoagulant effect)

- Cranberry Juice: anticoagulant effect of cumarins possibly enhanced by cranberry juice—avoid concomitant use

- Cytotoxics: anticoagulant effect of cumarins possibly enhanced by etoposide, ifosfamide and sorafenib; anticoagulant effect of cumarins enhanced by fluorouracil; anticoagulant effect of cumarins possibly reduced by z胎thioprine, mitotane; increased risk of bleeding when cumarins given with erlotinib; replacement of warfarin with a heparin advised by manufacturer of imatinib (possibility of enhanced warfarin effect)

- Diprydamole: anticoagulant effect of cumarins enhanced due to antiplatelet action of diprydamole

- Diallyliflam: anticoagulant effect of cumarins enhanced by diallyliflam

- Dopamine agonists: anticoagulant effect of warfarin enhanced by entacapone

- Enteral Foods: anticoagulant effect of cumarins antagonised by vitamin K (present in some enteral feeds)

- Glucosamine: anticoagulant effect of warfarin enhanced by glucosamine (avoid concomitant use)

- Hormone Antagonists: anticoagulant effect of cumarins possibly enhanced by bicalutamide and lormifene; metabolism of cumarins inhibited by danazol (enhanced anticoagulant effect); anti-
Cyclophosphamide (continued)
- Cytoxotics: increased toxicity when high-dose cyclophosphamide given with penicillamine—avoid concomitant use
Muscle Relaxants: cyclophosphamide enhances effects of suxamethonium

Cylopteralin
- Alcohol: increased risk of convulsions when cyclophosphamide given with alcohol
Antibacterials: increased risk of CNS toxicity when cyclophosphamide given with isoniazid
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Cyclopyrine see Antihistamines

Cytaibrate
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
Antifungals: cytarabine possibly reduces plasma concentration of fluconazole
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Cytotoxics: intracellular concentration of cytarabine increased by fludarabine

Dabigatran etexilate
- Analgesics: possible increased risk of bleeding when dabigatran etexilate given with NSAIDs
- Anti-arrhythmics: plasma concentration of dabigatan etexilate increased by amiodarone (reduce dose of dabigatran etexilate)
Sibutramine: increased risk of bleeding when anticoagulants given with sibutramine

Dairy Products
Antibacterials: dairy products reduces absorption of ciprofloxacin and norfloxacin; dairy products reduces absorption of tetracyclines (except doxycycline and minocycline)

Dalfopristin see Heparins

Danazol
- Anticoagulants: danazol inhibits metabolism of warfarin (enhanced anticoagulant effect)
- Antiepileptics: danazol inhibits metabolism of carbamazepine (increased risk of toxicity)
- Ciclosporin: danazol inhibits metabolism of ciclosporin (increased plasma concentration)
- Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with simvastatin
Tacrolimus: danazol possibly increases plasma concentration of tacrolimus

Dantrolene see Muscle Relaxants

Dapsone
Antibacterials: plasma concentration of dapsone reduced by rifampicin; plasma concentration of both drugs may increase when dapsone given with trimethoprim
Antivirals: plasma concentration of dapsone possibly increased by fosamprenavir
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
Probencid: excretion of dapsone reduced by probenecid (increased risk of side-effects)
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Daptomycin
- Ciclosporin: increased risk of myopathy when daptomycin given with ciclosporin (preferably avoid concomitant use)
- Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with fibrates or statins
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
Antivirals (continued)

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Darifenacin see Antimuscarinics

Darunavir

Anti-arrhythmics: darunavir possibly increases plasma concentration of lidocaine (lignocaine)—avoid concomitant use

Antibacterials: darunavir increases plasma concentration of efavirenz (reduce dose of efavirenz); plasma concentration of darunavir unexpectedly reduced by rifampicin—avoid concomitant use

Anticoagulants: avoidance of darunavir advised by manufacturer of rivaroxaban

Antidepressants: darunavir possibly reduces plasma concentration of paroxetine and sertraline; plasma concentration of efavirenz reduced by manufacturer of artemether/lumefantrine

Antivirals: plasma concentration of darunavir reduced by efavirenz and saquinavir; plasma concentration of both drugs increased when darunavir given with ketoconazole Antimalarials: caution with darunavir advised by St John’s wort—avoid concomitant use

Antipleptics: plasma concentration of darunavir possibly reduced by carbamazepine and phenytoin

Antifungals: plasma concentration of both drugs increased when darunavir given with indinavir; plasma concentration of darunavir reduced by lopinavir, also plasma concentration of lopinavir increased (avoid concomitant use); darunavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc)

Barbiturates: plasma concentration of darunavir possibly reduced by phenobarbital

Lipid-regulating Drugs: darunavir possibly increases plasma concentration of pravastatin; possible increased risk of myopathy when darunavir given with rosuvastatin—avoid concomitant use

Dasatinib

Antibacterials: metabolism of dasatinib accelerated by rifampicin (reduced plasma concentration—avoid concomitant use)

Antipleptics: cytotoxics possibly reduce absorption of phenytoin

Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of simvastatin; possible enhanced hypotensive effect when dasatinib given with rosuvastatin—avoid concomitant use

Deferasirox

Antacids: absorption of deferasirox possibly reduced by antacids containing aluminium (manufacturer of deferasirox advises avoid concomitant use)

Antipleptics and Hypnotics: deferasirox possibly reduces plasma concentration of midazolam

Deflazacort see Corticosteroids

Demeclocycline see Tetracyclines

Desferrioxamine

Antipsychotics: avoidance of desferrioxamine advised by manufacturer of levonorgestrel (metho-trimeprazine); manufacturer of desferrioxamine advises avoid concomitant use with prochlorperazine

Desflurane see Anaesthetics, General

Desloratadine see Antihistamines

Desmopressin see Opioid Analgesics

Dexamethasone see Corticosteroids

Dexprofetone see NSAIDs

Dextketoprofen see NSAIDs

Dextromethorphan see Opioid Analgesics

Dextropropoxyphene see Opioid Analgesics

Diamorphine see Opioid Analgesics

Diazepam see Anxiolytics and Hypnotics

Diazoxide

ACE Inhibitors: enhanced hypotensive effect when diazoxide given with ACE inhibitors Adrenergic Neurone Blockers: enhanced hypotensive effect when diazoxide given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when diazoxide given with alcohol

Aldesleukin: enhanced hypotensive effect when diazoxide given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when diazoxide given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when diazoxide given with general anaesthetics

Anticoagulants: the enhanced hypotensive effect of diazoxide antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with angiotensin-II receptor antagonists

Antidepressants: enhanced hypotensive effect when diazoxide given with MAOIs or tricyclic-related antidepressants

Antidiabetics: diazoxide antagonises hypoglycaemic effect of antidiabetics

Antipleptics: diazoxide reduces plasma concentration of phenytoin, also effect of diazoxide may be reduced

Antipsychotics: enhanced hypotensive effect when diazoxide given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when diazoxide given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when diazoxide given with clonidine

Corticosteroids: hypotensive effect of diazoxide antagonised by corticosteroids

Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with diuretics

Dopaminergics: enhanced hypotensive effect when diazoxide given with levodopa

Methylxypoxid: enhanced hypotensive effect when diazoxide given with methylxypoxid

Moxisylyte (thymoxamine): enhanced hypotensive effect when diazoxide given with moxisylyte

Moxonidine: enhanced hypotensive effect when diazoxide given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when diazoxide given with baclofen or tizanidine

Nitrates: enhanced hypotensive effect when diazoxide given with nitrates

Oestrogens: hypotensive effect of diazoxide antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when diazoxide given with alprostadil

Vasodilators Antihypertensives: enhanced hypotensive effect when diazoxide given with hydralazine, minoxidil or sodium nitroprusside

Diclofenac see NSAIDs

Dicycloverine (dicyclomine) see Antimuscarinics

Didanosine

Note Antacids in tablet formulation may affect absorption of other drugs

Allopurinol: plasma concentration of didanosine increased by allopurinol (risk of toxicity)—avoid concomitant use

Antivirals: plasma concentration of didanosine possibly increased by ganciclovir; increased risk of side-effects when didanosine given with zidovudine—augment concomitant use; increased risk of side-effects when didanosine given with stavudine; plasma concentration of didanosine increased by tenofovir (increased risk of toxicity)—avoid concomitant use;
Antivirals

- **Disopyramide**
  - **Antipsychotics** (continued)
    - interval given with **antipsychotics** that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with **amisulpiride**, **oipmozide**, **sertindole** or **zuclopenthixol**—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with **phenothiazines** or **sulpiride**

- **Antivirals**: plasma concentration of disopyramide possibly increased by **nonavir** (increased risk of toxicity)

- **Arometoxine**: increased risk of ventricular arrhythmias when disopyramide given with **arometoxine** Barbiturates: metabolism of disopyramide accelerated by **barbiturates** (reduced plasma concentration)

- **Beta-blockers**: increased myocardial depression when anti-arrhythmics given with **beta-blockers**; increased risk of ventricular arrhythmias when disopyramide given with **calcium-channel Blockers**: increased risk of myocardial depression and asystole when disopyramide given with **verapamil**

- **Diuretics**: increased cardiac toxicity with disopyramide if hypokalaemia occurs with **aceazolamide**, **loop diuretics** and related diuretics

- **5HT Antagonists**: increased risk of ventricular arrhythmias when disopyramide given with **dolasetron**—avoid concomitant use

- **Ivabradine**: increased risk of ventricular arrhythmias when disopyramide given with **ivabradine**

- **Nitrates**: disopyramide reduces effects of sublingual tablets of **nitrates** (failure to dissolve under tongue owing to dry mouth)

- **Distigmine**: see Parasympathomimetics

**Disulfram**

- Alcohol: disulfram reaction when disulfram given with **alcohol** (see p. 275)

- **Antibacterials**: psychiatric reaction reported when disulfram given with **metronidazole**

- **Anticoagulants**: disulfram enhances anticoagulant effect of **warfarin**—avoid concomitant use

- **Antidepressants**: increased disulfram reaction with alcohol reported with concomitant amitriptyline; disulfram inhibits metabolism of **tricyclics** (increased plasma concentration)

- **Antiepileptics**: disulfram inhibits metabolism of **phenytoin**; disulfram inhibits metabolism of **benzodiazepines** (increased sedative effects)

- **Paraldehyde**: risk of toxicity when disulfram given with **paraldehyde**

- **Theophylline**: disulfram inhibits metabolism of **theophylline** (increased risk of toxicity)

**Diuretics**

- **Note** Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind

- **Note** Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind

- **ACE Inhibitors**: enhanced hypotensive effect when diuretics given with **ACE inhibitors**; increased risk of severe hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with **ACE inhibitors** (monitor potassium concentration with low-dose spironolactone in heart failure)

- **Adrenergic Neurone Blockers**: enhanced hypotensive effect when diuretics given with adrenergic neurone blockers

- **Alcohol**: enhanced hypotensive effect when diuretics given with **alcohol**

- **Aldesleukin**: enhanced hypotensive effect when diuretics given with **aldesleukin**

- **Alliskiren**: plasma concentration of furosemide (frusemide) reduced by **aliskiren**; increased risk of hyper-
Diuretics
Aliskiren (continued)
kalaemia when potassium-sparing diuretics and aldosterone antagonists given with aliskiren
Allopurinol: increased risk of hypersensitivity when thiazides and related diuretics given with allopurinol especially in renal impairment
• Alpha-blockers: enhanced hypotensive effect when diuretics given with alpha-blockers, also increased risk of first-dose hypotension with post-synaptic alpha-blockers such as prazosin
Anaesthetics, General: enhanced hypotensive effect when diuretics given with general anaesthetics
• Analgesics: Diuretic effect of potassium canrenoate possibly antagonised by NSAIDs; possibly increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with NSAIDs; diuretics increase risk of nephrotoxicity of NSAIDs, also antagonism of diuretic effect; effects of diuretics antagonised by indometacin and ketorolac; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with indometacin; occasional reports of reduced renal function when thiazide given with indometacin—avoid concomitant use; increased risk of toxicity when carbonic anhydride inhibitors given with high-dose aspirin; diuretic effect of spironolactone antagonised by aspirin
• Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diuretics given with angiotensin-II receptor antagonists, increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with angiotensin-II receptor antagonists
• Anti-arrhythmics: plasma concentration of eplerenone increased by amiodarone (reduce dose of eplerenone); hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with amiodarone; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with diospyramide; hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics antagonises action of lidocaine (lignocaine)
• Antibacterials: plasma concentration of eplerenone increased by clarithromycin and telithromycin—avoid concomitant use; plasma concentration of eplerenone increased by erythromycin (reduce dose of eplerenone); plasma concentration of eplerenone reduced by erafampicin—avoid concomitant use; avoidance of diuretics advised by manufacturer of lymecycline; increased risk of ototoxicity when loop diuretics given with aminoglycosides; polymyxins or vancomycin; acetazolamide antagonises effects of methenamine; increased risk of hyperkalaemia when eplerenone given with trimethoprim
• Antidepressants: possible increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with reboxetine; enhanced hypotensive effect when diuretics given with MAOIs; plasma concentration of eplerenone reduced by St John’s wort—avoid concomitant use; increased risk of postural hypotension when diuretics given with tricyclics
Antidiabetics: loop diuretics and thiazides and related diuretics antagonise hypoglycaemic effect of anti-diabetics; increased risk of hypernatraemia when thiazides and related diuretics plus potassium-sparing diuretic given with chlorpropamide; increased risk of hyponatraemia when potassium-sparing diuretics and aldosterone antagonists plus thiazide given with MAOIs
• Antiepileptics: plasma concentration of eplerenone reduced by carbamazepine and phenytoin—avoid concomitant use; increased risk of hyponatraemia

Diuretics
• Antiepileptics (continued)
diuretics given with carbamazepine; acetazolamide increases plasma concentration of carbamazepine; effects of furosemide (frusemide) antagonised by phenytoin; increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenytoin or primidone; acetazolamide possibly reduces plasma concentration of primidone
• Antifungals: plasma concentration of eplerenone increased byitraconazole and ketoconazole—avoid concomitant use; increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with amphotericin; hydrochlorothiazide increases plasma concentration of fluconazole; plasma concentration of eplerenone increased by fluconazole (reduce dose of eplerenone)
• Antipsychotics: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with amisulpride or sertindole; enhanced hypotensive effect when diuretics given with phenothiazines; hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with pimozide (avoid concomitant use)
• Antivirals: plasma concentration of eplerenone increased by nelfinavir and ritonavir—avoid concomitant use; plasma concentration of eplerenone increased by saquinavir (reduce dose of eplerenone)
Anxiolytics and Hypnotics: enhanced hypotensive effect when diuretics given with anxiolytics and hypnotics; administration of parenteral furosemide (frusemide) with chloral or triclofos may displace thyroid hormone from binding sites
• Atomoxetine: hypokalaemia caused by diuretics increases risk of ventricular arrhythmias with atomoxetine
• Barbiturates: increased risk of osteomalacia when carbonic anhydrase inhibitors given with phenobarbital; plasma concentration of eplerenone reduced by phenobarbital—avoid concomitant use
• Beta-blockers: enhanced hypotensive effect when diuretics given with beta-blockers; hypokalaemia caused by loop diuretics or thiazides and related diuretics increases risk of ventricular arrhythmias with sotalol
Calcium Salts: increased risk of hypercalcaemia when thiazides and related diuretics given with calcium salts
Calcium-channel Blockers: enhanced hypotensive effect when diuretics given with calcium-channel blockers; plasma concentration of eplerenone increased by diltiazem and verapamil (reduce dose of eplerenone)
• Cardiac Glycosides: hypokalaemia caused by acetazolamide, loop diuretics or thiazides and related diuretics increases cardiac toxicity with cardiac glycosides; spironolactone possibly affects plasma concentration of digoxin; potassium-sparing diuretics possibly increases plasma concentration of digoxin
• Ciclosporin: increased risk of nephrotoxicity and possibly hypermagnesaemia when thiazides and related diuretics given with ciclosporin; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with ciclosporin
Clonidine: enhanced hypotensive effect when diuretics given with clonidine
Corticosteroids: diuretic effect of diuretics antagonised by corticosteroids; increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with corticosteroids
• Corticotrophins: avoidance of spironolactone advised by manufacturer of mitotane (antagonism of effect); increased risk of nephrotoxicity and oto toxicity when diuretics given with platinum compounds
Diuretics (continued)

Diazoxide: enhanced hypotensive and hyperglycaemic action when diuretics given with diazoxide.

Diuretics: increased risk of hypokalaemia when loop diuretics or thiazides and related diuretics given with acetazolamide; profound diuresis possible when metolazone given with furosemide (frusemide); increased risk of hypokalaemia when thiazides and related diuretics given with loop diuretics.

Dopaminergics: enhanced hypotensive effect when diuretics given with levodopa.

Hormone Antagonists: increased risk of hypercalcaemia when thiazides and related diuretics given with toremifene; increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with triostane.

Lithium: loop diuretics and thiazides and related diuretics reduce excretion of lithium (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; potassium-sparing diuretics and aldosterone antagonists reduce excretion of lithium (increased plasma concentration and risk of toxicity); acetazolamide increases the excretion of lithium.

Methylidopa: enhanced hypotensive effect when diuretics given with methylidopa.

Moxisylyte (thymoxamine): enhanced hypotensive effect when diuretics given with moxisylyte.

Moxonidine: enhanced hypotensive effect when diuretics given with moxonidine.

Muscle Relaxants: enhanced hypotensive effect when diuretics given with baclofen or tizanidine.

Nitrates: enhanced hypotensive effect when diuretics given with nitrates.

Oestrogens: diuretic effect of diuretics antagonised by oestrogens.

Potassium Salts: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with potassium salts.

Progestogens: risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with drospirenone (monitor serum potassium during first cycle).

Prostaglandins: enhanced hypotensive effect when diuretics given with alprostadil.

Sympathomimetics, Beta: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of beta sympathomimetics—for CSM advice (hypokalaemia) see p. 153.

Tacrolimus: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with tacrolimus.

Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with theophylline.

Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with hydralazine, minoxidil or sodium nitroprusside.

Vitamins: increased risk of hypercalcaemia when thiazides and related diuretics given with vitamin D.

Docetaxel (continued)

Antipsychotics: avoid concomitant use of cytoxotics with stiripentol (increased risk of agranulocytosis) Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets.

Ciclosporin: in vitro studies suggest a possible interaction between docetaxel and ciclosporin (consult docetaxel product literature).

Cytotoxics: plasma concentration of docetaxel increased by sorafenib.

Dolasetron see 5HT Antagonists.

Dopem

Antiepileptics: lorazepam possibly reduces plasma concentration of valproate.

Oestrogens: antibiotics that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439).

Probenecid: excretion of dopem reduced by probenecid (manufacturers of dopem advise avoid concomitant use).

Vaccines: antibiotics inactivate oral typhoid vaccine—see p. 679.

Dorzolamide see Diuretics.

Dosulepin (dothiepin) see Antidepressants, Tricyclic.

Doxapram

Antidepressants: effects of doxapram enhanced by MAOIs.

Sympathomimetics: increased risk of hypertension when doxapram given with sympathomimetics.

Theophylline: increased CNS stimulation when doxapram given with theophylline.

Doxazosin see Alpha-blockers.

Doxepin see Antidepressants, Tricyclic.

Doxorubicin

Antiepileptics: cytoxotics possibly reduce absorption of phenytoin.

Antipsychotics: avoid concomitant use of cytoxotics with clobazam (increased risk of agranulocytosis) Antivirals: doxurubicin possibly inhibits effects of stavudine.

Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets.

Ciclosporin: increased risk of neurotoxicity when doxurubicin given with ciclosporin.

Cytoxotics: plasma concentration of doxurubicin possibly increased by sorafenib.

Doxycycline see Tetracyclines.

Drospirenone see Progestogens.

Drotrecogin Alfa

Anticoagulants: manufacturer of drotrecogin alfa advises avoid concomitant use with high doses of warfarin in—consult product literature.

Duloxetine: possible increased serotoninergic effects when duloxetine given with pethidine or tramadol.

Antibacterials: metabolism of duloxetine inhibited by ciprofloxacin—avoid concomitant use.

Antidepressants: metabolism of duloxetine inhibited by fluvoxamine—avoid concomitant use; possible increased serotoninergic effects when duloxetine given with SSRIs, St John’s wort, amitriptyline, clomipa-
Duloxetine

- Antidepressants (continued)
  - nortriptyline, maprotiline, trimipramine; duloxetine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSR1-related antidepressants do not start moclobemide for at least 1 week
- Antimalarials: avoidance of antidepressants advised by manufacturer of arteether/ Lumefantrine
- Ergot alkaloids: increased risk of convulsions when antidepressants given with at least 1 week
- Antipsychotics: increased risk of ergotism when SSR1-related antidepressants given with sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Appendix 1: Interactions

Dutasteride
- Calcium-channel blockers: plasma concentration of dutasteride increased by diltiazem and verapamil

Erythromycin: increased risk of rash when efavirenz given with clarithromycin; efavirenz reduces plasma concentration of rifabutin—increase dose of rifabutin; plasma concentration of efavirenz reduced by rifampicin—increase dose of efavirenz
- Antidepressants: efavirenz plasma concentration of sertraline; plasma concentration of efavirenz reduced by St John's wort—avoid concomitant use
- Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with carbamazepine
- Antifungals: efavirenz reduces plasma concentration of itraconazole and posaconazole; efavirenz reduces plasma concentration of voriconazole, also plasma concentration of efavirenz increased (consider increasing voriconazole dose and reducing efavirenz dose); efavirenz possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antipsychotics: efavirenz possibly reduces plasma concentration of aripiprazole—increase dose of aripiprazole; efavirenz possibly increases plasma concentration of apomorphine; efavirenz increased (risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoidance of efavirenz advised by manufacturer of atazanavir (plasma concentration of efavirenz reduced); efavirenz reduces plasma concentration of darunavir, fosamprenavir and indinavir; efavirenz possibly reduces plasma concentration of stavudine—avoid concomitant use; efavirenz reduces plasma concentration of lopinavir—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of maraviroc—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by nevirapine; toxicity of efavirenz increased by ritonavir; monitor liver function tests; efavirenz significantly reduces plasma concentration of saquinavir
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with midazolam—avoid concomitant use
- Ergot alkaloids: increased risk of ergotism when efavirenz given with ergot alkaloids—avoid concomitant use

Efavirenz (continued)

- Grapefruit juice: plasma concentration of efavirenz possibly increased by grapefruit juice
- Lipid-regulating Drugs: efavirenz reduces plasma concentration of atorvastatin, pravastatin and simvastatin
- Oestrogens: efavirenz possibly reduces contraceptive effect of oestrogens
- Eletriptan: see SHT Agonists

Emtricitabine
- Anticoagulants: manufacturer of emtricitabine advises avoid concomitant use with lamivudine
- Antidepressants: manufacturer of emtricitabine advises caution with moclobemide, paroxetine, tricyclics and venlafaxine; avoid concomitant use of antidepressants with non-selective MAOIs
- Dopaminergics: efavirenz possibly enhances effects of apomorphine; efavirenz possibly reduces plasma concentration of rasagiline; manufacturer of efavirenz advises max. dose of 10 mg selegiline if used concomitantly
- Iron: absorption of efavirenz reduced by oral iron

Enteral Foods
- Anticoagulants: the presence of vitamin K in some enteral feeds can antagonise the anticoagulant effect of coumarins and phenindione
- Antiepileptics: enteral feeds possibly reduce absorption of phenytoin

Ephedrine see Sympathomimetics
- Ephedrine (adrenaline) see Sympathomimetics
- Epirubicin
  - Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
  - Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
  - Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
  - Ulcer-healing Drugs: plasma concentration of epirubicin increased by cimetidine

Eplerenone see Diuretics
- Eprosartan see Angiotensin-I Receptor Antagonists
- Eptifibatide
  - Iloprost: increased risk of bleeding when eptifibatide given with iloprost

Ergometrine see Ergot Alkaloids
- Ergot Alkaloids
  - Anaesthetics, General: effects of ergometrine on the parturient uterus reduced by halothane
  - Antibacterials: increased risk of ergotism when ergotamine and methysergide given with macrolides or telithromycin—avoid concomitant use; avoidance of ergotamine and methysergide advised by manufacturer of quinupristin/dalfopristin; increased risk of ergotism when ergotamine and methysergide given with tetracyclines
  - Antiinfectives: possible risk of hypertension when ergotamine and methysergide given with reboxetine
  - Antibacterials: increased risk of ergotism when ergotamine and methysergide given with ergot alkaloids possibly increased by atazanavir—avoid concomitant use; increased risk of ergotism when ergot alkaloids given with efavirenz—avoid concomitant use; increased risk of ergotism when ergotamine and...
Ergot Alkaloids

- Antivirals (continued)
methysergid see Vaccines (continued)
- 5HT Agonists: increased risk of vasospasm when ergotamine and methysergid given with antimigraine agents or vasoconstrictors

Beta-blockers: increased peripheral vasocstriction when ergotamine and methysergid given with beta-blockers
- 5HT Agonists: increased risk of vasospasm when ergotamine and methysergid given with antimigraine agents or vasoconstrictors

Antidepressants: avoid concomitant use

Antimigraine agents: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of anti-epileptics antagonised by neflfoquine

Antipsychotics: anticonvulsant effect of ethosuximide antagonised by antipsychotics (convulsive threshold lowered)

Antidepressants (continued)

Antibacterials

Antivirals:

Antidepressants:

Antibacterials:

Ethinylestradiol see Vaccines (continued)

Vaccines:

Anakinra:

Estropipate see Vaccines (continued)

Oestrogens (risk probably small, see p. 439)

Antifungals:

Antibacterials:

Antivirals

Antidepressants:

Antibacterials inactivate oral typhoid vaccine—see p. 679

Antiepileptics:

Antidepressants (convulsive threshold lowered); avoid concomitant use with St John's wort

Antiepileptics: plasma concentration of ethosuximide possibly reduced by car bamazepine and primidone; plasma concentration of ethosuximide possibly reduced by phenytoin, also plasma concentration of phenytoin possibly increased; plasma concentration of ethosuximide possibly increased by valproate

Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of anti-epileptics antagonised by neflfoquine

Antipsychotics: anticonvulsant effect of ethosuximide antagonised by antipsychotics (convulsive threshold lowered)

Barbiturates: plasma concentration of ethosuximide possibly reduced by phenobarbital

Etorodolac see NSAIDs

Etomideate see Anaesthetics, General

Etonogestrel see Progestogens

Etoposide

Anticoagulants: increased risk of bleeding when erlotinib given with COUMARINS

Anticonvulsants: increased risk of bleeding when erlotinib given with COUMARINS

Antiepileptics: cytopoietics possibly reduce absorption of phenytoin

Antifungals: metabolism of erlotinib inhibited by ketoconazole (increased plasma concentration)

Antipsychotics: avoid concomitant use of cytopoietics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytopoietics reduce absorption of digoxin tablets

Cytotoxic: plasma concentration of erlotinib possibly increased by clozapine possibly increased by cimetidine—avoid concomitant use

Antiepileptics see Ergot Alkaloids

Erlotinib

Analgesics:

Antidepressants, SSRIs

Proton Pump Inhibitors

Bartumeliz:

Cardiovascular: plasma concentration of erlotinib possibly increased by smoking

Cytotoxic: plasma concentration of erlotinib possibly increased by smoking

Ertapenem

Antiepileptics: ertapenem possibly reduces plasma concentration of valproate

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Erythromycin see Macrolides

Escitalopram see Antidepressants, SSRI

Esmolol see Beta-blockers

Esomeprazole see Proton Pump Inhibitors

Estradiol see Oestrogens

Estradiol see Oestrogens

Estrone see Oestrogens

Estrone see Oestrogens

Estradiol see Oestrogens

Estradiol see Oestrogens

Estradiol see Oestrogens

Etoradiv see Oestrogens

Etoposide

Antibacterials: metabolism of etoposide inhibited by ketoconazole (increased plasma concentration and risk of toxicity)

Antidepressants: antimconvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anti-...
Ezetimibe
Anticoagulants: ezetimibe possibly enhances anticoagulant effect of coumarins and phenindione.
- Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with ciclosporin.
Lipid-regulating Drugs: increased risk of cholelithiasis and gallbladder disease when ezetimibe given with fibrates—discontinue if suspected.

Famciclovir
Probenecid: excretion of famciclovir possibly reduced by probenecid (increased plasma concentration).

Famotidine see Histamine H-antagonists
Felodipine see Calcium-channel Blockers
Fenbufen see NSAIDs
Fenofibrate see Fibrates
Fenoprofen see Anti-inflammatory Drugs
Fenofibrate see Sodium Channel Blockers
Fentanyl see Opioid Analogues
Ferrous Salts see Iron
Fexofenadine see Antihistamines
Flavoxate see Anti-muscarinics
Flecainide (continued)
- Beta-blockers: increased risk of myocardial depression and torsades de pointes when flecainide given with beta-blockers.
- Increased myocardial depression when anti-arrhythmics given with beta-blockers.
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with verapamil.
- Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with loop diuretics or thiazides and related diuretics.
- 5HT Antagonists: increased risk of ventricular arrhythmias when flecainide given with dolasetron—avoid concomitant use.

Fibrates
Antibacterials: increased risk of myopathy when fibrates given with daptomycin (preferably avoid concomitant use).
- Anticoagulants: fibrates enhance anticoagulant effect of coumarins.
- Antidiabetics: gemfibrozil increases plasma concentration of rosiglitazone (consider reducing dose of rosiglitazone); fibrates may improve glucose tolerance and have an additive effect with insulin or sulphonylureas; gemfibrozil possibly enhances hypoglycaemic effect of metaglinide; increased risk of severe hypoglycaemia when fibrates given with repaglinide—avoid concomitant use.
- Ciclosporin: increased risk of renal impairment when bezafibrate or fenofibrate given with ciclosporin.
- Cytotoxics: gemfibrozil increases plasma concentration of bexarotene—avoid concomitant use.
- Lipid-regulating Drugs: increased risk of cholelithiasis and gallbladder disease when fibrates given with ezetimibe—discontinue if suspected; increased risk of myopathy when gemfibrozil given with statins; increased risk of myopathy when gemfibrozil given with fenofibrate—preferably avoid concomitant use.

Filgrastim
Note Pegfilgrastim interactions as for filgrastim.
Cytotoxics: neutropenia possibly exacerbated when filgrastim given with fluorouracil.
Flavoxate see Antimuscarinics
Flecainide
Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with bupivacaine, levobupivacaine, prilocaine or ropivacaine.
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics; plasma concentration of flecainide increased by amiodarone (halve dose of flecainide).
- Antidepressants: plasma concentration of flecainide increased by fluoxetine; increased risk of ventricular arrhythmias when flecainide given with tricyclics.
- Anti-histamines: increased risk of ventricular arrhythmias when flecainide given with mizolastine—avoid concomitant use.
- Antimalarials: avoidance of flecainide advised by manufacturer of artemether/lufanfaine (risk of ventricular arrhythmias); plasma concentration of flecainide increased by quinine.
- Antimuscarinics: increased risk of ventricular arrhythmias when flecainide given with tolterodine.
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with antipsychotics that prolong the QT interval; increased risk of arrhythmias when flecainide given with clozapine.
- Antivirals: plasma concentration of flecainide possibly increased by osmapirennavir, indinavir, lopinavir and ritonavir (increased risk of ventricular arrhythmias—avoid concomitant use).

Flecainide (continued)
- Beta-blockers: increased risk of myocardial depression and torsades de pointes when flecainide given with beta-blockers.
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when flecainide given with verapamil.
- Diuretics: increased cardiac toxicity with flecainide if hypokalaemia occurs with loop diuretics or thiazides and related diuretics.
- 5HT Antagonists: increased risk of ventricular arrhythmias when flecainide given with dolasetron—avoid concomitant use.

Floxacin see Corticosteroids
Fluvastatin see Antidepressants, SSRIs
Fluvastatin see Statins
Fluvoxamine see Antidepressants, SSRIs
Furosemide see Cardiac glycosides
Fusidic acid see Anti-infectives
Fusidic acid see Antibacterial Drugs
Fusidic acid see Cytotoxic Drugs
Fusidic acid see Cytotoxic Drugs
Folates
Aminosaliclylates: absorption of folic acid possibly reduced by rifampicin
Antiepileptics: folate possibly reduce plasma concentration of phenytoin and primidone
Barbiturates: folates possibly reduce plasma concentration of phenobarbital

Folic Acid see Folates
Folic Acid see Folates
Formoterol (eformoterol) see Sympathomimetics, Beta

Fosamprenavir
Note: Fosamprenavir is a prodrug of amprenavir
Analgesics: Fosamprenavir increases plasma concentration of methadone
Antacids: Fosamprenavir possibly reduced by antacids
- Antidipsptides: fosamprenavir possibly increases plasma concentration of amiodarone,
  flecainide and propafenone (increased risk of ventricular arrhythmias—avoid concomitant use);
  fosamprenavir possibly increases plasma concentration of dloicaine (lignocaine)—avoid concomitant use
Antibacterials: plasma concentration of both drugs increased when fosamprenavir given with erythromycin;
  fosamprenavir increases plasma concentration of rifabutin (reduce dose of rifabutin); plasma concentration of fosamprenavir significantly reduced by rifampicin—avoid concomitant use; fosamprenavir possibly increases plasma concentration of dapsone—avoid concomitant use fosamprenavir given with
- Antiallantin: fosamprenavir increases plasma concentration of tiroconazol; fosamprenavir possibly increases plasma concentration of itronatidine Antimalarials: caution with fosamprenavir advised by manufacturer of artemether/lumefantrine
Antimuscarinics: caution with fosamprenavir advised by manufacturer of darifencin and tolterodine

Antipsychotics: fosamprenavir possibly inhibits metabolism of etipiriprazol (reduce dose of ariprazole); fosamprenavir possibly increases plasma concentration of clozapine; fosamprenavir increases plasma concentration of imazodin and esertindol (increased risk of ventricular arrhythmias—avoid concomitant use)
Antivirals: plasma concentration of fosamprenavir reduced by efavirens and sipiravir; plasma concentration of fosamprenavir increased by etravirine (reduce dose of etravirine); plasma concentration of fosamprenavir reduced by lopinavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; plasma concentration of fosamprenavir possibly reduced by nevirapine
Anxiolytics and Hypnotics: increased risk of prolonged sedation and respiratory depression when fosamprenavir given with alprazolam, clonazepam,
  diaepam, efurarazep or emidazolam
Barbiturates: plasma concentration of fosamprenavir possibly reduced by phenobarbital
Cislostatol: fosamprenavir possibly increases plasma concentration of cislostatol—avoid concomitant use
Ergot Alkaloids: increased risk of ergotism when fosamprenavir given with ergotamine and methysergide—avoid concomitant use

Fosamprenavir (continued)
- Lipid-regulating Drugs: possible increased risk of myopathy when fosamprenavir given with atorvastatin; possible increased risk of myopathy when fosamprenavir given with rosuvastatin or simvastatin—avoid concomitant use
Oestrogens: fosamprenavir increases plasma concentration of oestrogens, also plasma concentration of fosamprenavir reduced—alternative contraception recommended
Progestogens: fosamprenavir increases plasma concentration of progestogens, also plasma concentration of fosamprenavir reduced—alternative contraception recommended
Sildenafil: fosamprenavir possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil
Tadalafil: fosamprenavir possibly increases plasma concentration of tadalafil
Ulcer-healing Drugs: fosamprenavir possibly increases plasma concentration of cicemidine
Vardenafil: fosamprenavir possibly increases plasma concentration of vardenafil

Fosaprepitant see Aprepitant
Foscarnet
Antivirals: avoidance of foscarnet advised by manufacturer of lamivudine
Fosinopril see ACE Inhibitors
Fosphenytoin see Phenytoin
Formyamin see Aminoglyceroids
Frovatiran see SHT Agonists
Furosemide (furosemide) see Diuretics
Fusidic Acid
- Antivirals: plasma concentration of both drugs increased when fusidic acid given with ritonavir—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when fusidic acid given with atorvastatin; increased risk of myopathy when fusidic acid given with simvastatin
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
Sugammadex: fusidic acid possibly reduces response to sugammadex
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Gabapentin
Antitamins: avoidance of gabapentin reduced by manufacter
- Antidepressants: anticonvulsivant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anti-convulsivant effect of antiepileptics antagonised by SSRIIs and bretricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wart
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxylororoquine; antiepileptic effect of antiepileptics antagonised by mefloquine

Galantamine see Parasympathomimetics
Gancicllovir
Note: Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
- Antivirals: increased risk of convulsions when ganciclovir given with pimipen with cilastatin
- Antivirals: ganciclovir possibly increases plasma concentration of didanol; avoidance of intravenous ganciclovir advised by manufacturer of lamivudine; profound myelosuppression when ganciclovir given with zidovudine (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)
Cytotoxins: plasma concentration of ganciclovir possibly increased by mycophenolate, also plasma concentration of inactive metabolite of mycophenolate possibly increased
Appendix 1: Interactions

Ganciclovir (continued)

Probencid: excretion of ganciclovir reduced by probenicid (increased plasma concentration and risk of toxicity)

Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with tacrolimus

Gemeprost see Prostaglandins

Gemfibrozil see Fibrates

Gentamicin see Aminoglycosides

Gestodene see Progestogens

Gestrone

Antibacterials: metabolism of gestrione accelerated by rifampicin (reduced plasma concentration)

Antipileptics: metabolism of gestrione accelerated by carbamazepine, phenytoin and primidone (reduced plasma concentration)

Barbiturates: metabolism of gestrione accelerated by barbiturates (reduced plasma concentration)

Glucuronidase see Anti-diabetics

Gliclazide see Anti-diabetics

Glimepride see Anti-diabetics

Glipizide see Anti-diabetics

Glucosamine

• Anticoagulants: glucosamine enhances anticoagulant effect of warfarin (avoid concomitant use)

Glycerol Trinitrate see Nitrates

Glucopyronium see Antimuscarinics

Gold

Penicillamine: avoidance of gold advised by manufacturer of penicillamine (increased risk of toxicity)

Grapefruit Juice

Anti-arrhythmics: grapefruit juice increases plasma concentration of amiodarone

Antimalarials: grapefruit juice possibly increases plasma concentration of artemether/lumefantrine

Antivirals: grapefruit juice possibly increases plasma concentration of efavirenz

Anxiolytics and Hypnotics: grapefruit juice increases plasma concentration of buspirone

Calcium-channel Blockers: grapefruit juice increases plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil

• Cislosporin: grapefruit juice increases plasma concentration of cislosporin (increased risk of toxicity)

• Cytotoxics: avoidance of grapefruit juice advised by manufacturer of lapatinib and nilotinib

Ivabradine: grapefruit juice increases plasma concentration of ivabradine

Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of atorvastatin; grapefruit juice increases plasma concentration of simvastatin—avoid concomitant use

Sildenafil: grapefruit juice possibly increases plasma concentration of sildenafil

• Sirolimus: grapefruit juice increases plasma concentration of sirolimus—avoid concomitant use

• Tacrolimus: grapefruit juice increases plasma concentration of tacrolimus

Tadalafil: grapefruit juice possibly increases plasma concentration of tadalafil

Vardenafil: grapefruit juice possibly increases plasma concentration of vardenafil—avoid concomitant use

Griseofulvin (continued)

• Progestogens: griseofulvin accelerates metabolism of progestogens (reduced contraceptive effect—see p. 439)

Guanythidined see Adrenergic Neurone Blockers

Haloperidol see Antipsychotics

Halothane see Anaesthetics, General

Heparin see Heparins

Heparins

ACE inhibitors: increased risk of hyperkalaemia when heparins given with ACE inhibitors

Alikiren: increased risk of hyperkalaemia when heparins given with alikiren

Anticoagulants: possible increased risk of bleeding when heparins given with NSAIDs; increased risk of haemorrhage when heparins given with intravenous diolbenic (avoid concomitant use, including low-dose heparin); increased risk of haemorrhage when heparins given with metoprolol (avoid concomitant use, including low-dose heparin); anticoagulant effect of heparins enhanced by aspirin

Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with angiotensin-II receptor antagonists

Clopidogrel: increased risk of bleeding when heparins given with clopidogrel

Dipyridamole: anticoagulant effect of heparins enhanced by dipyridamole

Drotrecogin Alfa: avoidance of concomitant use of high doses of heparin with drotrecogin alfa advised by manufacturer of drotrecogin alfa—consult product literature

Iloprost: anticoagulant effect of heparins possibly enhanced by iloprost

Nitrates: anticoagulant effect of heparins reduced by infusion of glycerol trinitrate

Sibutramine: increased risk of bleeding when anti-coagulants given with sibutramine

Histamine H-antagonists

• Alpha-blockers: cimetidine and ranitidine antagonise effects of propranolol

Analgesics: cimetidine possibly increases plasma concentration of azapropropazone; cimetidine inhibits metabolism of opioid analgesics (increased plasma concentration)

• Anti-arrhythmics: cimetidine increases plasma concentration of amiodarone and propafenone; cimetidine inhibits metabolism of flecainide (increased plasma concentration); cimetidine increases plasma concentration of lidocaine (lignocaine) (increased risk of toxicity)

Antibacterials: histamine H-antagonists reduce absorption of cefpodoxime; cimetidine increases plasma concentration of erythromycin (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of metronidazole (increased plasma concentration); metabolism of cimetidine accelerated by rifampicin (reduced plasma concentration)

Anticoagulants: cimetidine inhibits metabolism of coumarins (enhanced anticoagulant effect)

Antidepressants: cimetidine increases plasma concentration of clonazepam, escitalopram, mirtazapine and sertraline; cimetidine inhibits metabolism of amitriptyline, doxepin, imipramine and nortriptyline (increased plasma concentration); cimetidine increases plasma concentration of moclobemide (halve dose of moclobemide); cimetidine possibly increases plasma concentration of tricyclics

Antidiabetics: cimetidine reduces excretion of metformin (increased plasma concentration); cimetidine enhances hypoglycaemic effect of sulphonylureas

Antipileptics: cimetidine inhibits metabolism of carbamazepine, phenytoin and valproate (increased plasma concentration)

Antifungals: histamine H-antagonists reduce absorption of itraconazole and ketoconazole; cimetidine reduces plasma concentration of posaconazole;
Histamine H₁-antagonists
- Antifungals (continued)
cimetidine increases plasma concentration of terbinafine
- Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of loratadine
- Antimalarials: avoidance of cimetidine advised by manufacturer of arteether/luemfantrine; cimetidine inhibits metabolism of chloroquine and hydroxychloroquine and quinine (increased plasma concentration)
- Antipsychotics: cimetidine possibly enhances effects of antipsychotics, chlorpromazine and clozapine; increased risk of ventricular arrhythmias when cimetidine given with sertraline—avoid concomitant use
- Antivirals: histamine H₁-antagonists possibly reduce plasma concentration of atazanavir; plasma concentration of cimetidine possibly increased by fosamprenavir; histamine H₁-antagonists possibly increase plasma concentration of raltegravir—manufacturer of raltegravir advises avoid concomitant use
- Calcium-channel Blockers: cimetidine possibly inhibits metabolism of calcium-channel blockers (increased plasma concentration); cimetidine increases plasma concentration of melatonin
- Beta-blockers: cimetidine increases plasma concentration of labetalol, metoprolol and propranolol
- Calcium-channel Blockers: cimetidine possibly inhibits metabolism of calcium-channel blockers (increased plasma concentration); cimetidine increases plasma concentration of isradipine (halve dose of isradipine)
- Ciclosporin: cimetidine possibly increases plasma concentration of ciclosporin
- Cilostazol: cimetidine possibly increases plasma concentration of cilostazol—avoid concomitant use
- Cytoxics: cimetidine possibly enhances myelosuppressive effects of carmustine and lomustine; cimetidine increases plasma concentration of l-asparaginase; cimetidine inhibits metabolism of fluorouracil (increased plasma concentration); famotidine possibly reduces plasma concentration of daunorubicin; histamine H₁-antagonists possibly reduce absorption of lapatinib
- Dopaminergic: cimetidine reduces excretion of pramipexole (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when cimetidine given with ergotamine and methysergide; cimetidine possibly avoid concomitant use
- Hormone Antagonists: absorption of cimetidine possibly delayed by octracetide
- 5HT Agonists: cimetidine inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)
- Mebendazole: cimetidine possibly inhibits metabolism of mebendazole (increased plasma concentration)
- Sildenafil: cimetidine increases plasma concentration of sildenafil (reduce initial dose of sildenafil)
- Theophylline: cimetidine inhibits metabolism of theophylline (increased plasma concentration)
- Thyroid Hormones: cimetidine reduces absorption of levothyroxine (thyroxine)
- Homatropine see Antimuscarincs
- Hormone Antagonists see Bicalutamide, Danazol, Dutasteride, Exemestane, Flutamide, Gestrinone, Lanreotide, Orectotide, Tamoxifen, Toremifene, and Triostanol

5HT Agonists
- Antidepressants: plasma concentration of eltoprazin increased by citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine; metabolism of fluvoxamine possibly inhibited by fluoxetine; reduction of dose of zolmitriptan
- Antidepressants: increased risk of CNS toxicity when sumatriptan given with citalopram (manufacturer of sertraline advises avoid concomitant use); possible increased serotoninergic effects when 5HT agonists given with duloxetine; risk of CNS toxicity when rizatriptan or sumatriptan given with MAOIs (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); increased risk of CNS toxicity when zolmitriptan given with MAOIs; risk of CNS toxicity when rizatriptan or sumatriptan given with moclobemide (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); risk of CNS toxicity when zolmitriptan given with moclobemide (reduce dose of zolmitriptan); possible increased serotoninergic effects when sumatriptan given with SSRI; increased serotoninergic effects when 5HT agonists given with St John’s wort—avoid concomitant use
- Antifungals: plasma concentration of eltoprazin increased by itraconazole and ketoconazole (risk of toxicity)—avoid concomitant use; plasma concentration of almotriptan increased by ketoconazole (increased risk of toxicity)
- Antivirals: plasma concentration of eletriptan increased by indinavir, nelfinavir and ritonavir (risk of toxicity)—avoid concomitant use
- Beta-blockers: plasma concentration of rizatriptan increased by propranolol (manufacturer of rizatriptan advises halve dose and avoid within 2 hours of propranolol)
- Ergot Alkaloids: increased risk of vasospasm when eltoprazin or frotovatran given with ergotamine and methysergide (avoid ergotamine and methysergide for 24 hours after eltoprazin or frotovatran, avoid eltoprazin or frotovatran for 24 hours after ergotamine and methysergide); increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with ergotamine and methysergide (avoid ergotamine and methysergide for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine and methysergide)
- Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by cimetidine (reduce dose of zolmitriptan)

5HT Antagonists
- Analgesics: ondansetron possibly antagonises effects of tramadol
- Anti-arrhythmics: increased risk of ventricular arrhythmias when dolasetron given with amiodarone, disopyramide, flecainide, lidocaine (lignocaine) or propafenone—avoid concomitant use
- Antibacterials: metabolism of ondansetron accelerated by rifampicin (reduced effect)
- Antiepileptics: metabolism of ondansetron accelerated by carbamazepine and phenytoin (reduced effect)
- Beta-blockers: increased risk of ventricular arrhythmias when dolasetron given with esmolol—avoid concomitant use
- Hydralazine see Vasodilator Antihypertensives
- Hydrochlorothiazide see Diuretics
- Hydrocortisone see Corticosteroids
- Hydroflumethiazide see Diuretics
- Hydrocortisone see Opioid Analgesics
- Hydrochlorothiazide see Diuretics
- Hydrocortisone see Antacids
- Hydroxocobalamin
- Antibacterials: response to hydroxocobalamin reduced by chloramphenicol
- Hydroxyurea
- Antiepileptics: cytoxetics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytoxetics with clozapine (increased risk of agranulocytosis)
Hydroxy carbamides (continued)
- Antivirals: increased risk of toxicity when hydroxy carbamides given with didanosine and stavudine—avoid concomitant use
Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets
Hydroxychloroquine see Chloroquine and Hydroxychloroquine
Hydroxyzine see Antihistamines
Hycosine see Antimuscarinics
Ibandronic Acid see Bisphosphonates
Ibuprofen see NSAIDs
Ilosfamide
- Anticoagulants: irosfamide possibly enhances anticoagulant effect of coumarins
Antiepileptics: cytoxotics possibly reduce absorption of phenytoin
- Antimycotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets
Iloprost
Analgesics: increased risk of bleeding when iloprost given with NSAIDs or aspirin
Anticoagulants: iloprost possibly enhances anticoagulant effect of coumarins and heparins; increased risk of bleeding when iloprost given with phenindione
Clopidogrel: increased risk of bleeding when iloprost given with clopidogrel
Eptifibatide: increased risk of bleeding when iloprost given with eptifibatide
Tirofiban: increased risk of bleeding when iloprost given with tirofiban
Imatinib
- Antibacterials: plasma concentration of imatinib reduced by rifampicin—avoid concomitant use
Anticoagulants: manufacturer of imatinib advises replacement of warfarin with a heparin (possibility of enhanced warfarin effect)
- Antidepressants: plasma concentration of imatinib reduced by St John’s wort—avoid concomitant use
Antiepileptics: plasma concentration of imatinib reduced by phenytoin—avoid concomitant use; cytoxotics possibly reduce absorption of phenytoin
Antifungals: plasma concentration of imatinib increased by ketoconazole
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets
Ciclosporin: imatinib possibly increases plasma concentration of ciclosporin
Lipid-regulating Drugs: imatinib increases plasma concentration of simvastatin
Thyroid Hormones: imatinib possibly reduces plasma concentration of levothyroxine (thyroxine)
Imidapril see ACE Inhibitors
Imipenem with Clastatin
- Antibacterials: increased risk of convulsions when imipenem with clastatin given with ganciclovir
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679
Impiramine see Antidepressants, Tricyclic
Immunoglobulins
Note For advice on immunoglobulins and live virus vaccines, see under Normal Immunoglobulin, p. 681
Immunosuppressants (antiproliferative) see Azathioprine and Mycophenolate Mofetil
Indapamide see Diuretics
Indinavir
- Anti-arrhythmics: indinavir possibly increases plasma concentration of amiiodarone—avoid concomitant use; indinavir possibly increases plasma concentra-
Indinavir (continued)
- Anti-arrhythmics (continued)
- Antiarrhythmics: increased risk of ventricular arrhythmias—avoid concomitant use
- Antibacterials: indinavir increases plasma concentration of rifampicin—avoid concomitant use; metabolism of indinavir accelerated by rifampicin (reduced plasma concentration—avoid concomitant use); avoidance of concomitant indinavir in severe renal and hepatic impairment advised by manufacturer of enfuvirtide
Anticoagulants: avoidance of indinavir advised by manufacturer of rivaroxaban
Antidepressants: plasma concentration of indinavir reduced by St John’s wort—avoid concomitant use
Antiepileptics: plasma concentration of indinavir possibly reduced by carbamazepine and phenytoin, also plasma concentration of carbamazepine and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by primidone
Antifungals: plasma concentration of indinavir increased by itraconazole and ketoconazole (consider reducing dose of indinavir)
Antimycotics: caution with indinavir advised by manufacturer of artemether/lumefantrine
Antimuscarinics: avoidance of indinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when indinavir given with fesoterodine—consult fesoterodine product literature
- Antipsychotics: indinavir possibly inhibits metabolism of arimiprazole (reduce dose of aripiprazole); indinavir possibly increases plasma concentration of pimozide (increased risk of ventricular arrhythmias—avoid concomitant use); indinavir increases plasma concentration of sertraline (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoid concomitant use of indinavir with stavudine; plasma concentration of both drugs increased when indinavir given with darunavir; plasma concentration of indinavir reduced by efavirenz and nevirapine; plasma concentration of indinavir possibly reduced by maraviroc; combination of indinavir with nelfinavir may increase plasma concentration of either drug (or both); plasma concentration of indinavir increased by ritonavir; indinavir increases plasma concentration of saquinavir
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when indinavir given with alprazolam—avoid concomitant use; indinavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
Atovaquone: plasma concentration of indinavir possibly reduced by atovaquone
- Barbiturates: plasma concentration of indinavir possibly reduced by barbiturates; plasma concentration of indinavir possibly reduced by phenobarbital, also plasma concentration of phenobarbital possibly increased
- Ciclosporin: indinavir increases plasma concentration of ciclosporin
Clarithromycin: indinavir possibly increases plasma concentration of clarithromycin—avoid concomitant use
Corticosteroids: plasma concentration of indinavir possibly reduced by dexamethasone
- Ergotalkaloids: increased risk of ergotism when indinavir given with ergotamine and methysergide—avoid concomitant use
- 5HT Agonists: indinavir increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when indinavir given with atorvastatin; possible increased risk of myopathy when indinavir given with rosuvastatin—avoid concomitant use;
Indinavir
- Lipid-regulating Drugs (continued)
  Increased risk of myopathy when indinavir given with simvastatin (avoid concomitant use)
- Sildenafil: indinavir increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Tadalafil: indinavir possibly increases plasma concentration of tadalafil
- Vardenafil: indinavir increases plasma concentration of vardenafil—avoid concomitant use

Indometacin see NSAIDs
Indoramin see Alpha-blockers

Infliximab
- Abatacept: increased risk of side-effects when infliximab given with abatacept
- Anakinra: avoid concomitant use of infliximab with anakinra
- Vaccines: avoid concomitant use of infliximab with live vaccines (see p. 650)

Influenza Vaccine see Vaccines
Insulin see Antidiabetics
Interferon Alfa see Interferons
Interferon Gamma see Interferons

Interferons
Note Peginterferon alfa interactions as for interferon alfa
- Antibiotics: increased risk of peripheral neuropathy when interferon alfa given with telbivudine
- Theophyline: interferon alfa inhibits metabolism of theophyline (increased plasma concentration)
- Vaccines: manufacturer of interferon gamma advises avoid concomitant use with vaccines

Ipratropium see Antimuscarinics
Ivermectin see Angiotensin-II Receptor Antagonists

Irinotecan
- Antidepressants: metabolism of irinotecan accelerated by St John’s wort (reduced plasma concentration—avoid concomitant use)
- Antiepileptics: plasma concentration of irinotecan and its active metabolite reduced by carbamazepine and phenytoin; cytochromes possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of irinotecan reduced by ketoconazole (but concentration of active metabolite of irinotecan increased)—avoid concomitant use
- Antipsychotics: avoid concomitant use of cytochromes (increased risk of agranulocytosis)
- Antivirals: metabolism of irinotecan possibly inhibited by stavudine (increased risk of toxicity)
- Barbiturates: plasma concentration of irinotecan and its active metabolite reduced by phenobarbital
- Cardiac Glycosides: cytochromes reduce absorption of digoxin tablets
- Cytotoxic: plasma concentration of irinotecan possibly increased by sorafenib

Iron
- Antacids: absorption of oral iron reduced by oral magnesium salts (as magnesium trisilicate)
- Antibacterials: oral iron reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin; oral iron reduces absorption of tetracyclines, also absorption of oral iron reduced by tetracyclines
- Bisphosphonates: oral iron reduces absorption of bisphosphonates
- Calcium Salts: absorption of oral iron reduced by calcium salts
- Cytotoxic: oral iron reduces absorption of mycophenolate
- Dimercaprol: avoid concomitant use of iron with dimercaprol
- Dopaminergics: oral iron reduces absorption of entacapone; oral iron possibly reduces absorption of levodopa
- Methyldopa: oral iron antagonises hypotensive effect of methyldopa
- Penicillamine: oral iron reduces absorption of penicillamine

Iron (continued)
- Thyroid Hormones: oral iron reduces absorption of levothyroxine (thyroxine) (give at least 2 hours apart)
- Trientine: absorption of oral iron reduced by trientine
- Zinc: oral iron reduces absorption of zinc, also absorption of oral iron reduced by zinc

Isocarboxazid see MAOIs
Isosfuran see Anaesthetics, General
Isomethyptene see Sympathomimetics

Isoniazid
Anaesthetics, General: hepatotoxicity of isoniazid possibly potentiated by general anaesthetics
- Antacids: absorption of isoniazid reduced by antacids
- Antibacterials: increased risk of CNS toxicity when isoniazid given with cycloserine
- Antiepileptics: isoniazid increases plasma concentration of carbamazepine (also possibly increased plasma hepatoxocity); isoniazid inhibits metabolism of ethoxzolamide (increased plasma concentration and risk of toxicity); isoniazid inhibits metabolism of ophenytoin (increased plasma concentration)
- Antifungals: isoniazid possibly reduces plasma concentration of ketoconazole
- Antihistamines and Sedative Hypnotics: isoniazid inhibits the metabolism of diazepam
- Corticosteroids: plasma concentration of isoniazid possibly reduced by corticosteroids
- Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
- Theophyline: isoniazid possibly increases plasma concentration of theophyline
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Isosorbide Dinitrate see Nitrates
Isosorbide Mononitrate see Nitrates
Isotretinoin see Retinoids
Isradipine see Calcium-channel Blockers
Itraconazole see Antifungals, Triazole

Ivabradine
- Anti-arrhythmics: increased risk of ventricular arrhythmias when ivabradine given with amiodarone or disopyramide
- Antibacterials: plasma concentration of ivabradine possibly increased by chloramphenicol and rifampicin; increased concomitant use; increased risk of ventricular arrhythmias when ivabradine given with erythromycin—avoid concomitant use
- Antidepressants: plasma concentration of ivabradine reduced by St John's wort—avoid concomitant use
- Antifungals: plasma concentration of ivabradine increased by ketoconazole—avoid concomitant use; plasma concentration of ivabradine increased by fluconazole—reduce initial dose of ivabradine; plasma concentration of ivabradine possibly increased byitraconazole—avoid concomitant use
- Antimalarials: increased risk of ventricular arrhythmias when ivabradine given with mefloquine
- Antipsychotics: increased risk of ventricular arrhythmias when ivabradine given with pimozide or sertindole
- Antivirals: plasma concentration of ivabradine possibly increased by nelfinavir and ritonavir—avoid concomitant use

Beta-blockers: increased risk of ventricular arrhythmias when ivabradine given with esmolol
Calcium-channel Blockers: plasma concentration of ivabradine increased by diltiazem and verapamil—avoid concomitant use
Grapefruit Juice: plasma concentration of ivabradine increased by grapefruit juice
Pentamidine isethionate: increased risk of ventricular arrhythmias when ivabradine given with pentamidine isethionate

Kaoalin
Analgesics: kaoalin possibly reduces absorption of aspirin
Appendix 1: Interactions

Kaopectate

Antibacterials: kaopectate possibly reduces absorption of tetracyclines

Antimalarials: kaopectate reduces absorption of chloroquine and hydroxychloroquine

Antipsychotics: kaopectate possibly reduces absorption of phenothiazines

Ketamine see Anaesthetics, General

Ketoconazole see Antifungals, Imidazole

Ketoprofen see NSAIDs

Ketotifen see Antihistamines

Labelalol see Beta-blockers

Lacidipine see Calcium-channel Blockers

Lacosamide

Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered; anti-convulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s Wort

Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by metoquine

Lactulose

Anticoagulants: lactulose possibly enhances anticoagulant effect of coumarins

Lamivudine

Antibacterials: plasma concentration of lamivudine increased by trimethoprim (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole

Antivirals: avoidance of lamivudine advised by manufacturer of emtricitabine; manufacturer of lamivudine advises avoid concomitant use with foscamet; manufacturer of lamivudine advises avoid concomitant use of intravenous ganciclovir

Lamotrigine

Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered; anti-convulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s Wort

Antiepileptics: plasma concentration of lamotrigine often reduced by carbamazepine, also plasma concentration of lamotrigine increased by valproate

Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by metoquine

Barbiturates: plasma concentration of lamotrigine reduced by phenobarbital

Oestrogens: plasma concentration of lamotrigine reduced by oestrogens

Progestogens: plasma concentration of lamotrigine reduced by progestogens

Lanreotide

Antidiabetics: lanreotide possibly reduces requirements for insulin, metformin, repaglinide and sulphonylureas

Ciclosporin: lanreotide reduces plasma concentration of ciclosporin

Lansoprazole see Proton Pump Inhibitors

Lanthanum

Antifungals: lanthanum possibly reduces absorption of ketoconazole (give at least 2 hours apart)

Antimalarials: lanthanum possibly reduces absorption of chloroquine and hydroxychloroquine (give at least 2 hours apart)

Lapatinib

Antibacterials: manufacturer of lapatinib advises avoid concomitant use with rifabutin, rifampicin and telithromycin

Antidepressants: manufacturer of lapatinib advises avoid concomitant use with St John’s Wort

Antidiabetics: manufacturer of lapatinib advises avoid concomitant use with repaglinide

Antiepileptics: plasma concentration of lapatinib reduced by carbamazepine—avoid concomitant use; cytotoxics possibly reduce absorption of phenytoin; manufacturer of lapatinib advises avoid concomitant use with phenytoin

Antifungals: plasma concentration of lapatinib increased by ketoconazole—avoid concomitant use; manufacturer of lapatinib advises avoid concomitant use with efavirenz, posaconazole and voriconazole

Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with valproate

Antivirals: manufacturer of lapatinib advises avoid concomitant use with ritonavir and saquinavir

Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets

Grapefruit juice: manufacturer of lapatinib advises avoid concomitant use with grapefruit juice

Laronidase

Anaesthetics, Local: effects of laronidase possibly inhibited by procaine (manufacturer of laronidase advises avoid concomitant use)

Antimalarials: effects of laronidase possibly inhibited by chloroquine and hydroxychloroquine (manufacturer of laronidase advises avoid concomitant use)

Leflunomide

Note Increased risk of toxicity with other haematotoxic and hepatotoxic drugs

Antibacterials: plasma concentration of active metabolite of leflunomide possibly increased by rifampicin

Anticoagulants: leflunomide possibly enhances anticoagulant effect of warfarin

Antidiabetics: leflunomide possibly enhances hypoglycaemic effect of tolbutamide

Antiepileptics: leflunomide possibly increases plasma concentration of phenytoin

Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by colestyramine (enhanced elimination)—avoid unless drug elimination desired

Vaccines: avoid concomitant use of leflunomide with live vaccines (see p. 660)

Lenalidomide

Cardiac Glycosides: lenalidomide possibly increases plasma concentration of digoxin

Lercanidipine see Calcium-channel Blockers

Leukotriene Antagonists

Analgesics: plasma concentration of zafirlukast increased by aspirin

Antibacterials: plasma concentration of zafirlukast reduced by erythromycin

Anticoagulants: zafirlukast enhances anticoagulant effect of warfarin

Antiepileptics: plasma concentration of montelukast reduced by primidone

Barbiturates: plasma concentration of montelukast reduced by phenobarbital

Theophylline: zafirlukast possibly increases plasma concentration of theophylline, also plasma concentration of zafirlukast reduced

Levamisole

Alcohol: possibility of disulfiram-like reaction when levamisole given with alcohol

Anticoagulants: levamisole possibly enhances anticoagulant effect of warfarin

Antiepileptics: levamisole possibly increases plasma concentration of phenytoin
Levetiracetam
- Anti-convulsants: anticonvulsant effect of antiepileptics antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anti-convulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of anti-epileptics antagonised by mefloquine

Levobupivacaine see Beta-blockers

Levodopa
Anti-arrhythmics: increased myocardial depression when levobupivacaine given with anti-arrhythmics

Levetiracetam see Antihistamines

Levodopa
ACE Inhibitors: enhanced hypotensive effect when levodopa given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with adrenergic neurone blockers
Alpha-blockers: enhanced hypotensive effect when levodopa given with alpha-blockers
- Anaesthetics, General: increased risk of arrhythmias when levodopa given with volatile liquid general anaesthetics
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when levodopa given with angiotensin-II receptor antagonists
- Antidepressants: risk of hypertensive crisis when levodopa given with antidepressants (convulsive threshold lowered); anti-convulsant effect of antiepileptics antagonised by MAOIs, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with moclobemide
Antiepileptics: effects of levodopa possibly reduced by phenytoin
Antimuscarinics: absorption of levodopa possibly reduced by antimuscarinics
Antipsychotics: effects of levodopa antagonised by antipsychotics; avoidance of levodopa advised by manufacturer of amisulpride (antagonism of effect)
Anxiolytics and Hypnotics: effects of levodopa possibly antagonised by benzodiazepines
Beta-blockers: enhanced hypotensive effect when levodopa given with beta-blockers
Bupropion: increased risk of side-effects when levodopa given with bupropion
Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when levodopa given with clonidine
Diazoxide: enhanced hypotensive effect when levodopa given with diazoxide
Diuretics: enhanced hypotensive effect when levodopa given with diuretics
Dopaminergics: enhanced effects and increased toxicity of levodopa when given with selegiline (reduce dose of levodopa)
- Iron: absorption of levodopa possibly reduced by oral iron
Mecamylamine: effects of dopaminergics possibly enhanced by mecamylamine
Methylphenidate: enhanced hypotensive effect when levodopa given with methylphenidate; antiparkinsonian effect of dopaminergics antagonised by methylphenidate
Moxonidine: enhanced hypotensive effect when levodopa given with moxonidine
Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with baclofen
Nitrates: enhanced hypotensive effect when levodopa given with nitrates
Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with hydralazine, manidyl or sodium nitroprusside
Vitamins: effects of levodopa reduced by pyridoxine when given without dopa-decarboxylase inhibitor

Levofloxacin see Quinolones

Levopropamide (methotrimprazine) see Antipsychotics

Levopropamide (methotrimeprazine) see Antipsychotics

Lidocaine (lignocaine)
- Note Interactions less likely when lidocaine used topically
- Antidepressants: increased risk of ventricular arrhythmias when lidocaine (lignocaine) given with trazodone
- Antiepileptics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics
- Antibacterials: increased risk of ventricular arrhythmias when lidocaine (lignocaine) given with other anti-arrhythmics
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other anti-arrhythmics
- Antihistamines: increased risk of CNS effects when lidocaine given with omeprazole
- Antipsychotics: enhanced hypotensive effect when levodopa given with calcium-channel blockers
- Beta-blockers: increased hypotensive effect when levodopa given with beta-blockers
- Beta-blockers: enhanced hypotensive effect when levodopa given with calcium-channel blockers
- Antifungals: possibly antagonised by amphotericin B; avoid concomitant use
- Erythromycin: possibly antagonised by fluoroquinolones, avoid concomitant use
- Macrolides: possibly antagonised by fluoroquinolones, avoid concomitant use
- Omeprazole: possibly antagonised by fluoroquinolones, avoid concomitant use
- Tricyclic antidepressants: possibly antagonised by fluoroquinolones, avoid concomitant use

Lidocaine (lignocaine) see Antipsychotics

Lidothecine

Lipid-regulating Drugs see Colestipol, Colestymarine, Ezetimibe, Fibrates, Nicotinic Acid, and Statins

Lisinopril see ACE Inhibitors

Lithium
- ACE Inhibitors: excretion of lithium reduced by ACE inhibitors (increased plasma concentration)
- Analgesics: excretion of lithium probably reduced by NSAIDs (increased risk of toxicity); excretion of lithium reduced by diclofenac, ibuprofen, indomethacin, mafenamic acid, naproxen, parecoxib and piroxicam (increased risk of toxicity); excretion of lithium reduced by ketorolac (increased risk of toxicity); avoid concomitant use
- Angiotensin-II Receptor Antagonists: excretion of lithium reduced by angiotensin-II receptor antagonists (increased plasma concentration)
- Antacids: excretion of lithium increased by sodium bicarbonate (reduced plasma concentration)
- Anti-arrhythmics: avoidance of lithium advised by manufacturer of amiodarone (risk of ventricular arrhythmias)
- Antibacterials: increased risk of lithium toxicity when given with metronidazole
- Antidepressants: possible increased serotonergic effects when lithium given with venlafaxine; increased risk of CNS effects when lithium given with SSRIs (lithium toxicity reported); risk of toxicity when lithium given with tricyclics
- Antiepileptics: neurotoxicity may occur when lithium given with carbamazepine or phenytoin without
Lithium
Antiepileptics (continued)
increased plasma concentration of lithium; plasma concentration of lithium possibly affected by lamotrigine.
■ Antipsychotics: increased risk of extrapyramidal side-effects and possibly neurotoxicity when lithium given with clozapine, flupenthixol, haloperidol, phenothiazines or zuclopenthixol; increased risk of ventricular arrhythmias when lithium given with sertindole—avoid concomitant use; increased risk of extrapyramidal side-effects when lithium given with sulpiride.
Calcium-channel Blockers: neurotoxicity may occur when lithium given with diltiazem or verapamil without increased plasma concentration of lithium.
■ Diuretics: excretion of lithium increased by loop diuretics and thiazides and related diuretics (increased plasma concentration and risk of toxicity)—loop diuretics—avoid concomitant use; increased risk of extrapyramidal side-effects when lithium given with sulpiride.
Methyldopa: neurotoxicity may occur when lithium given with methyldopa without increased plasma concentration of lithium.
Muscle Relaxants: lithium enhances effects of muscle relaxants; hyperkinesia caused by lithium possibly aggravated by baclofen.
Pathoanatomometrics: lithium antagonises effects of neostigmine and pyridostigmine.
Theophylline: excretion of lithium increased by theophylline (reduced plasma concentration).
Lofepramine see Antidepressants, Tricyclic.
Loratadine see Antihistamines.
Loperamide
Desmopressin: loperamide increases plasma concentration of oral desmopressin.
Lopinavir
Antimuscarinics: avoidance of lopinavir advised by manufacturer of darifenacin and tolterodine.
■ Antipsychotics: lopinavir possibly inhibits metabolism of aripiprazole (reduce dose of aripiprazole); lopinavir increases plasma concentration of esetindole (increased risk of ventricular arrhythmias—avoid concomitant use).
■ Antivirals: lopinavir reduces plasma concentration of saquinavir (consider reducing dose of maraviro)—plasma concentration of lopinavir reduced by nefinavir, also plasma concentration of active metabolite of nelfinavir increased; plasma concentration of lopinavir possibly reduced by nevirapine—consider increasing dose of lopinavir; lopinavir increases plasma concentration of propranolol; plasma concentration of lopinavir reduced by ritonavir.
■ Barbiturates: plasma concentration of lopinavir possibly reduced by phenobarbital.
■ Cilostazol: lopinavir possibly increases plasma concentration of cilostazol—avoid concomitant use. Cilostazol and rifampicin: plasma concentration of lopinavir possibly reduced by dexamethasone.
■ Lipid-regulating Drugs: possible increased risk of myopathy when lopinavir given with atorvastatin; possible increased risk of myopathy when lopinavir given with rosuvastatin or simvastatin—avoid concomitant use.
■ Sirolimus: lopinavir possibly increases plasma concentration of sirolimus.
Lorazepam see Antihistamines. Lorzepam see Antihistamines. Lometazipam see Antihistamines. Losartan see Angiotensin-II Receptor Antagonists. Lumefantrine see Artemether with Lumefantrine. Lymecycline see Tetracyclines.
Macrolides
Note
Note Interactions do not apply to small amounts of erythromycin used topically.
Note: erythromycin increases plasma concentration of antifungal agents: absorption of azithromycin reduced by antacids.
■ Anti-arthromic: increased risk of ventricular arrhythmias when parenteral erythromycin given with amiodarone—avoid concomitant use; erythromycin increases plasma concentration of isosorbide (increased risk of toxicity); clarithromycin possibly increases plasma concentration of isosorbide (increased risk of toxicity).
■ Antibacterials: increased risk of ventricular arrhythmias when parenteral erythromycin given with metronidazole—avoid concomitant use; macrolides possibly increase plasma concentration of rifabutin (increased risk of uveitis—reduce rifabutin dose); clarithromycin increases plasma concentration of rifabutin (increased risk of uveitis—reduce rifabutin dose); plasma concentration of clarithromycin reduced by ritonavir.
■ Antifungals: azithromycin possibly enhances anticoagulant effect of coumarins; clarithromycin and erythromycin enhance anticoagulant effect of coumarins.
■ Antidepressants: avoidance of macrolides advised by manufacturer of ebeketine. Antiepileptics: clarithromycin enhances effects of carbamazepine.
Antiepileptics: clarithromycin and erythromycin increase plasma concentration of carbamazepine;
Macrolides
- Antiepileptics (continued)
  - Clarithromycin inhibits metabolism of phenytoin (increased plasma concentration); erythromycin possibly inhibits metabolism of valproate (increased plasma concentration)
- Antifungals: clarithromycin increases plasma concentration of itraconazole
- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of loratadine; macrolides possibly inhibit metabolism of emizolastine (avoid concomitant use); erythromycin inhibits metabolism of emizolastine—avoid concomitant use
- Antiarrhythmics: avoidance of macrolides advised by manufacturer of amtermether/leumfanetine
- Antimuscarnicics: erythromycin possibly increases plasma concentration of darifenacin; manufacturer of fosoterodine advises dose reduction when clarithromycin given with fosoterodine—consult fosoterodine product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of tolterodine
- Antipsychotics: increased risk of ventricular arrhythmias when parenteral erythromycin given with amisulpride or zuclopenthixol—avoid concomitant use; erythromycin possibly increases plasma concentration of amisulpride (reduce dose of amisulpride); possible increased risk of convulsions; increased risk of ventricular arrhythmias when clarithromycin given with pipamuzide—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with pipamuzide—avoid concomitant use; macrolides possibly increase plasma concentration of quetiapine (reduce dose of quetiapine); possible increased risk of ventricular arrhythmias when macrolides given with sertindole—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with sertindole—avoid concomitant use; increased risk of ventricular arrhythmias when parenteral erythromycin given with olanzapine
- Antivirals: plasma concentration of both drugs increased when clarithromycin given with atazanavir; increased risk of rash when clarithromycin given with efavirenz; clarithromycin increases plasma concentration of etravirine, also plasma concentration of clarithromycin reduced; plasma concentration of both drugs increased when erythromycin given with fosamprenavir; clarithromycin possibly increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of azithromycin and erythromycin possibly increased by ritonavir; plasma concentration of clarithromycin increased by ritonavir (reduce dose of clarithromycin in renal impairment); plasma concentration of clarithromycin increased by tipranavir (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of zidovudine (give at least 2 hours apart)
- Antiarrhythmics: clarithromycin and erythromycin inhibit metabolism of midazolam (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of buspirone (reduce dose of buspirone); erythromycin inhibits the metabolism of zopiclone
- Antiretrovirals: clarithromycin possibly increases plasma concentration of aprepitant
- Antituberculars: increased risk of ventricular arrhythmias when parenteral erythromycin given with atamoxetine
- Calcium-channel Blockers: erythromycin possibly inhibits metabolism of felodipine (increased plasma concentration); avoidance of erythromycin advised by manufacturer of lercanidipine; clarithromycin and erythromycin possibly inhibit metabolism of verapamil (increased risk of toxicity)
- Cardiac Glycosides: macrolides increase plasma concentration of digoxin (increased risk of toxicity)

Macrolides (continued)
- Ciclosporin: macrolides possibly inhibit metabolism of ciclosporin (increased plasma concentration); clarithromycin and erythromycin inhibit metabolism of ciclosporin (increased plasma concentration)
- Cilostazol: erythromycin increases plasma concentration of cilostazol (also plasma concentration of erythromycin reduced)—avoid concomitant use
- Colchicine: clarithromycin or erythromycin increase risk of colchicine toxicity
- Corticosteroids: erythromycin possibly inhibits metabolism of corticosteroids; clarithromycin possibly increases plasma concentration of methylprednisolone; erythromycin inhibits the metabolism of methylprednisolone
- Cytoxotics: avoidance of clarithromycin advised by manufacturer of olotinib; in vitro studies suggest a possible interaction between erythromycin and docetaxel (consult docetaxel product literature); erythromycin increases toxicity of vinblastine—avoid concomitant use
- Diuretics: clarithromycin increases plasma concentration of bumetanide—avoid concomitant use; erythromycin increases plasma concentration of eplerenone (reduce dose of eplerenone)
- Dopaminergics: macrolides possibly increase plasma concentration of bromocriptine and cabergoline (increased risk of toxicity); erythromycin increases plasma concentration of bromocriptine and cabergoline (increased risk of toxicity)
- Ergot Alkaloids: increased risk of ergotism when macrolides given with ergotamine and methysergide—avoid concomitant use
- 5HT Agonists: clarithromycin and erythromycin increase plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use
- Ibravatricum: clarithromycin possibly increases plasma concentration of ivabradine—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ivabradine—avoid concomitant use
- Leukotriene Antagonists: erythromycin reduces plasma concentration of zafirlukast
- Lipid-regulating Drugs: clarithromycin increases plasma concentration of atorvastatin and pravastatin; possible increased risk of myopathy when erythromycin given with atorvastatin; erythromycin increases plasma concentration of pravastatin; erythromycin reduces plasma concentration of rosuvastatin; increased risk of myopathy when clarithromycin or erythromycin given with simvastatin (avoid concomitant use)
- Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
- Parasymphathomimetics: erythromycin increases plasma concentration of galantamine
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when parenteral erythromycin given with pentamidine isetionate
- Sildenafil: clarithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil; clarithromycin increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Sirolimus: clarithromycin increases plasma concentration of sirolimus—avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with sirolimus
- Tacrolimus: clarithromycin and erythromycin increase plasma concentration of tacrolimus
- Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of tadalafil
- Theophylline: azithromycin possibly increases plasma concentration of theophylline; clarithromycin inhibits metabolism of theophylline (increased plasma concentration); erythromycin inhibits metabolism of theophylline (increased plasma concentration), if erythromycin given by mouth, also decreased plasma-erythromycin concentration

Appendix 1: Interactions
Appendix 1: Interactions

**Macrolides (continued)**

Ulcer-healing Drugs: plasma concentration of erythromycin is increased by metronidazole (risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with omeprazole

Vaccines: antibiotics inactivate oral typhoid vaccine—see p. 679

Vardenafil: erythromycin increases plasma concentration of vardenafil (reduce dose of vardenafil)

**Magnesium (parenteral)**

- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and nifedipine in pre-ecclampsia

Muscle Relaxants: parenteral magnesium enhances effects of non-depolarising muscle relaxants and stopping magnesium and vincristine

**Magnesium Salts (oral)** see Antacids

**MAOIs**

Note For interactions of reversible MAO-A inhibitors (RIMA)s see Moclobemide, and for interactions of MAO-B inhibitors see Rasagline and Selegiline; the antibacterial Linezolid is a reversible, non-selective MAO inhibitor

ACE Inhibitors: MAOIs possibly enhance hypotensive effect of ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with adrenergic neurone blockers

- Alcohol: MAOIs interact with tyramine found in some beverages containing alcohol and some decaffeinated beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect

Alpha -adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of apraclonidine and brimonidine

- Alpha-blockers:: avoidance of MAOIs advised by manufacturer of indoramin; enhanced hypotensive effect when MAOIs given with alpha-blockers

- Anaesthetics, General: Because of hazardous interactions between MAOIs and general anaesthetics, MAOIs should normally be stopped 2 weeks before surgery

- Analgesics: CNS excitation or depression (hypertension or hypotension) when MAOIs given with pethidine—avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of nefopam; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with opioid analgesics—avoid concomitant use and for 2 weeks after stopping MAOIs

Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypotensive effect of angiotensin-II receptor antagonists

- Antidepressants: increased risk of hypertension and CNS excitation when MAOIs given with venlafaxine (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs); after stopping MAOIs do not start nortriptyline or fluoxetine for 2 weeks, also MAOIs should not be started until at least 1 week after stopping clomipramine or venlafaxine; increased risk of hypertension and CNS excitation when MAOIs given with other MAOIs (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); MAOIs

- Antidepressants (continued) after stopping MAOIs do not start moclobemide for at least 1 week; MAOIs increase CNS effects of SSRIs (risk of serious toxicity); after stopping MAOIs do not start tricyclic-related antidepressants for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with tricyclics, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); CNS excitation and confusion when MAOIs given with tryptophan (reduce dose of tryptophan)

Antidiabetics: MAOIs possibly enhance hypoglycaemic effect of antidiabetics; MAOIs enhance hypoglycaemic effect of insulin, metformin and sulphonylureas

- Antiepileptics: MAOIs possibly antagonise anti-convulsant effect of antiepileptics (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of carbamazepine, also antagonism of anticonvulsant effect

Antihistamines: increased antimuscarinic and sedative effect when MAOIs given with antihistamines

- Antimalarials: avoidance of antidepressants advised by manufacturer of artemether/lumefantrine

Antimuscarinics: increased risk of antimuscarinic side-effects when MAOIs given with antimuscarinics

- Antipsychotics: CNS effects of MAOIs possibly increased by doxapram

Anxiolytics and Hypnotics: avoidance of MAOIs advised by manufacturer of buspirone

- Atomoxetine: after stopping MAOIs do not start atomoxetine for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with atomoxetine

Barbiturates: MAOIs possibly antagonise anti-convulsant effect of barbiturates (convulsive threshold lowered)

Beta-blockers: enhanced hypotensive effect when MAOIs given with beta-blockers

- Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of bupropion

Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when MAOIs given with clonidine

Diazoxide: enhanced hypotensive effect when MAOIs given with diazoxide

Diuretics: enhanced hypotensive effect when MAOIs given with diuretics

- Dopaminergics: avoid concomitant use of non-selective MAOIs with entacapone; risk of hypertensive crisis when MAOIs given with levodopa, avoid levodopa for at least 2 weeks after stopping MAOIs; risk of hypertensive crisis when MAOIs given with rasagline, avoid MAOIs for at least 2 weeks after stopping rasagline; enhanced hypotensive effect when MAOIs given with selegiline; avoid concomitant use of MAOIs with tolcapone

Doxapram: MAOIs enhance effects of doxapram

5HT Agonists: risk of CNS toxicity when MAOIs given with zolmitriptan or sumatriptan (avoid zolmitriptan or sumatriptan for 2 weeks after MAOIs); increased risk of CNS toxicity when MAOIs given with sumatriptan

Methyldopa: avoidance of MAOIs advised by manufacturer of methyldopa
MAOIs (continued)
Moxonidine: enhanced hypotensive effect when MAOIs given with moxonidine
Muscle Relaxants: phenelzine enhances effects of saxethamethonium
Nicorandil: enhanced hypotensive effect when MAOIs given with nicorandil
Nitrates: enhanced hypotensive effect when MAOIs given with nitrates
Sibutramine: increased CNS toxicity when MAOIs given with sibutramine (manufacturer of sibutramine advises avoid concomitant use), also avoid sibutramine for 2 weeks after stopping MAOIs
Sympathomimetis: risk of hypertensive crisis when MAOIs given with dexmetetamine, dopamine, dopexamine, ephedrine, somethetepine, phenylephrine, phenylpropanolamine, pseudoephedrine or sympathomimetis; risk of hypertensive crisis when MAOIs given with methylnephenide, some manufacturers advise avoid methylphenidate for at least 2 weeks after stopping MAOIs
Tetrazenazine: risk of CNS excitation and hypertension when MAOIs given with tetrazenazine

Antidepressants: plasma concentration of maraviroc possibly increased by atazanavir, darunavir, indinavir, lopinavir and saquinavir (consider reducing dose of maraviroc); plasma concentration of maraviroc reduced by rifampicin—consider increasing dose of maraviroc
Antidepressants: plasma concentration of maraviroc possibly reduced by St John's wort—avoid concomitant use
Antifungals: plasma concentration of maraviroc increased by itaconazole (consider reducing dose of maraviroc)
Antivirals: plasma concentration of maraviroc increased by zanamivir, zidovudine, lamivudine (consider reducing dose of maraviroc); plasma concentration of maraviroc possibly reduced by efavirenz—consider increasing dose of maraviroc; plasma concentration of maraviroc possibly reduced by etravirine; plasma concentration of maraviroc possibly increased by nefilnavir (consider reducing dose of maraviroc)

Mebendazole
Ulcer-healing Drugs: metabolism of mebendazole possibly inhibited by cimetidine (increased plasma concentration)
Medroxyprogesterone see Progestogens
Mefenamic Acid see NSAIDs
Mefloquine (continued)
Beta-blockers: increased risk of bradycardia when mefloquine given with beta-blockers
Calcium-channel Blockers: possible increased risk of bradycardia when mefloquine given with calcium-channel blockers
Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with digoxin
Ivabradine: increased risk of ventricular arrhythmias when mefloquine given with ivabradine
Vaccines: antimalarials inactivate oral typhoid vaccine—see p. 679

Megestrol see Progestogens
Melatonin see Anxiolytics and Hypnotics
Meloxicam see NSAIDs
Melphalan
Antibacterials: increased risk of melphalan toxicity when given with nalidixic acid
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Ciclosporin: increased risk of nephrotoxicity when melphalan given with ciclosporin
Menantine
Anaesthetics, General: increased risk of CNS toxicity when memantine given with etometamine (manufacturer of memantine advises avoid concomitant use)
Analgesics: increased risk of CNS toxicity when memantine given with dextromethorphan (manufacturer of memantine advises avoid concomitant use)
Anticoagulants: memantine possibly enhances anti-coagulant effect of warfarin
Antiepileptics: memantine possibly reduces effects of pridimone
Antimuscarinics: memantine possibly enhances effects of antimuscarinics
Antipsychotics: memantine possibly reduces effects of antipsychotics
Barbiturates: memantine possibly reduces effects of barbiturates
Dopaminergics: memantine possibly enhances effects of dopaminergics and selegiline; increased risk of CNS toxicity when memantine given with amantadine (manufacturer of memantine advises avoid concomitant use)
Muscle Relaxants: memantine possibly modifies effects of baclofen and dantrolene
Mepacrine
Antimalarials: mepacrine increases plasma concentration of primaquine (increased risk of toxicity)
Meprobamate see Anxiolytics and Hypnotics
Meptazinol see Opioid Analgesics
Mecaptopurine
Allopurinol: enhanced effects and increased toxicity of mecaptopurine when given with allopurinol (reduce dose of mercaptopurine to one quarter of usual dose) Aminosaliclylates: possible increased risk of leukopenia when mercaptopurine given with aminosaliclylates
Antibacterials: increased risk of haematological toxicity when mercaptopurine given with
Allopurinol (as co-trimoxazole) increased risk of haematological toxicity when mercaptopurine given with trimethoprim (also with co-trimoxazole)
Anticoagulants: mercaptopurine possibly reduces anticoagulant effect of coumarins
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Appendix 1: Interactions

Meropenem
Antiepileptics: meropenem reduces plasma concentration of valproate
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
Probencid: excretion of meropenem reduced by probenecid (manufacturers of meropenem advise avoid concomitant use)
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Mesalazine see Aminosalicylates
Methotrexate see Oestrogens
Metaraminol see Sympathomimetics
Methformin see Antidiabetics
Methadone see Opioid Analgesics
Methyldopa
• Antibacterials: increased risk of crystalluria when methenamine given with sulphonamides
• Diuretics: effects of methenamide antagonised by acetazolamide
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
Potassium Salts: avoid concomitant use of methenamine with potassium citrate
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Methocarbamol see Muscle Relaxants
Methotrexate
• Anaesthetics, General: antifolate effect of methotrexate increased by nitrous oxide—avoid concomitant use
• Analgesics: excretion of methotrexate probably reduced by NSAIDs (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 568; excretion of methotrexate reduced by azapropazone (avoid concomitant use); excretion of methotrexate reduced by aspirin, diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 568
• Antibacterials: absorption of methotrexate possibly reduced by neomycin; excretion of methotrexate possibly reduced by ciprofloxacin (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with sulfa methoxazole (as co-trimoxazole); increased risk of methotrexate toxicity when given with doxycycline, sulphonamides or tetracycline; excretion of methotrexate reduced by penicillins (increased risk of toxicity); increased risk of haematological toxicity when methotrexate given with trimethoprim (also with co-trimoxazole)
Antiepileptics: antifolate effect of methotrexate increased by phenytoin; cytoxotics possibly reduce absorption of phenytoin
• Antimalarials: antifolate effect of methotrexate increased by pyrimethamine
• Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets
Ciclosporin: risk of toxicity when methotrexate given with ciclosporin
Corticosteroids: increased risk of haematological toxicity when methotrexate given with corticosteroids
Cytotoxics: increased pulmonary toxicity when methotrexate given with cisplatin
Probencid: excretion of methotrexate reduced by probenecid (increased risk of toxicity)
• Retinoids: plasma concentration of methotrexate increased by acitretin (also increased risk of hepatotoxicity)—avoid concomitant use
• Theophylline: methotrexate possibly increases plasma concentration of theophylline
Ulcer-healing Drugs: excretion of methotrexate possibly reduced by omeprazole (increased risk of toxicity)

Methoxamine see Sympathomimetics
Methyldopa
ACE Inhibitors: enhanced hypotensive effect when methyldopa given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when methyldopa given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when methyldopa given with alcohol
Aldesleukin: enhanced hypotensive effect when methyldopa given with aldesleukin
Alpha-blockers: enhanced hypotensive effect when methyldopa given with alpha-blockers
Anasthesics, General: enhanced hypotensive effect when methyldopa given with general anaesthetics
Analgesics: hypotensive effect of methyldopa antagonised by NSAIDs
Antigenos-II Receptor Antagonists: enhanced hypotensive effect when methyldopa given with angiotensin-II receptor antagonists
• Antidepressants: manufacturer of methyldopa advises avoid concomitant use with MAOIs
Antipsychotics: enhanced hypotensive effect when methyldopa given with antipsychotics (also increased risk of extrapyramidal effects)
Anxiolytics and Hypnotics: enhanced hypotensive effect when methyldopa given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when methyldopa given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when methyldopa given with calcium-channel blockers
Clonidine: enhanced hypotensive effect when methyldopa given with clonidine
Corticosteroids: hypotensive effect of methyldopa antagonised by corticosteroids
Diazoxide: enhanced hypotensive effect when methyldopa given with diazoxide
Diuretics: enhanced hypotensive effect when methyldopa given with diuretics
Dopaminergics: methyldopa antagonises anti-parkinsonian effect of dopaminergics; increased risk of extrapyramidal side-effects when methyldopa given with amantadine; effects of methyldopa possibly antagonised by entacapone; enhanced hypotensive effect when methyldopa given with levodopa
Iron: hypotensive effect of methyldopa antagonised by oral iron
• Lithium: neurotoxicity may occur when methyldopa given with lithium without increased plasma concentration of lithium
Moxisylyte (thymoxamine): enhanced hypotensive effect when methyldopa given with moxisylyte
Moxonidine: enhanced hypotensive effect when methyldopa given with moxonidine
Muscle Relaxants: enhanced hypotensive effect when methyldopa given with baclofen or tizanidine
Nitrates: enhanced hypotensive effect when methyldopa given with nitrates
Oestrogens: hypotensive effect of methyldopa antagonised by oestrogens
Prostaglandins: enhanced hypotensive effect when methyldopa given with alprostadil
• Sympathomimetics, Beta: acute hypotension reported when methyldopa given with infusion of adrenaline
• Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with hydralazine, minoxidil or sodium nitroprusside
Methylphenidate see Sympathomimetics
Methylprednisolone see Corticosteroids
Methysergide see Ergot Alkaloids
Metoprolol see Beta-blockers
Metoclopramide
• Analgesics: metoclopramide increases rate of absorption of aspirin (enhanced effect); effects of metoclopramide on gastro-intestinal activity antagonised by...
Appendix 1: Interactions

Metoclopramide
- Analgesics (continued)
  - opioid analgesics; metoclopramide increases rate of absorption of paracetamol
- Antimuscarinics: effects of metoclopramide on gastrointestinal activity antagonised by antimuscarinics
- Antipsychotics: increased risk of extrapyramidal side-effects when metoclopramide given with antipsychotics
- Atovaquone: metoclopramide reduces plasma concentration of atovaquone
  - Ciclosporin: metoclopramide increases plasma concentration of ciclosporin
- Dopaminergics: increased risk of extrapyramidal side-effects when metoclopramide given with amantadine;
  - metoclopramide antagonises antiparkinsonian effect of pergolide; avoidance of metoclopramide advised by manufacturer of ropinirole and rotigotine (antagonism of effect)
- Muscle Relaxants: metoclopramide enhances effects of suxamethonium
- Tetrabenazine: increased risk of extrapyramidal side-effects when metoclopramide given with tetrabenazine

Metololone see Diuretics

Metoprolol see Beta-blockers

Metronidazole
- Note Interactions do not apply to topical metronidazole preparations
- Alcohol: disulfiram-like reaction when metronidazole given with alcohol
  - Anticoagulants: metronidazole enhances anticoagulant effect of coumarins
  - Antiepileptics: metronidazole inhibits metabolism of phenytoin (increased plasma concentration);
  - metabolism of metronidazole accelerated by primidone (reduced plasma concentration)
  - Barbiruates: metabolism of metronidazole accelerated by barbiturates (reduced plasma concentration)
- Cytotoxics: metronidazole increases plasma concentration of busulfan (increased risk of toxicity);
  - metronidazole inhibits metabolism of fluorouracil (increased toxicity); metronidazole possibly reduces bioavailability of mycophenolate
- Disulfiram: psychotic reaction reported when metronidazole given with disulfiram
- Lithium: metronidazole increases risk of lithium toxicity
- Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
- Ulcer-healing Drugs: metabolism of metronidazole accelerated by primidone (reduced plasma concentration)
- Vaccines: antibacterials inactive oral typhoid vaccine—see p. 679

Mianserin see Antidepressants, Tricyclic (related)

Mifgitamin
- Antiluflurans: mifgitamin increases plasma concentration of itraconazole (consider reducing dose of itraconazole)
- Calcium-channel Blockers: mifgitamin increases plasma concentration of nifedipine
- Ciclosporin: mifgitamin possibly increases plasma concentration of ciclosporin
- Sirolimus: mifgitamin increases plasma concentration of sirolimus

Miconazole see Anxiolytics and Hypnotics

Mifepristone
- Corticosteroids: mifepristone may reduce effect of corticosteroids (including inhaled corticosteroids) for 3–4 days

Milorinone see Phosphodiesterase Inhibitors

Minacycline see Tetracyclines

Minoxidil see Vasodilator Antihypertensives

Mirtazapine
- Alcohol: increased sedative effect when mirtazapine given with alcohol
- Anticoagulants: mirtazapine enhances anticoagulant effect of warfarin
- Antidepressants: mirtazapine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine, after stopping mirtazapine do not use moclobemide for at least 1 week
- Antiepileptics: plasma concentration of mirtazapine reduced by carbamazepine and phenytoin
- Antifungals: plasma concentration of mirtazapine increased by ketoconazole
- Antimalarials: avoidance of antidepressants advised by manufacturer of arteether/lumefantrine
- Anxiolytics and Hypnotics: increased sedative effect when mirtazapine given with anxiolytics and hypnotics
- Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin
- Bupropion: avoid concomitant use of alcohol
- Dopaminergics: caution with mirtazapine advised by manufacturer of entacapone; increased risk of side-effects when moclobemide given with levodopa; avoid concomitant use of moclobemide with selegiline
- 5HT Agonists: risk of CNS toxicity when moclobemide given with nizatidine or sumatriptan (avoid
Moxonidine

- 5HT Agonists (continued)
  - rizatRIPTan or sumatriptan for 2 weeks after moxonidine; risk of CNS toxicity when moxonidine given with rizatryptan (reduce dose of rizatryptan)
  - Sibutramine: increased CNS toxicity when moxonidine given with sibutramine (manufacturer of sibutramine advises avoid concomitant use), also avoid sibutramine for 2 weeks after stopping moxonidine
  - Sympathomimetics: risk of hypertensive crisis when moxonidine given with sympathomimetics

- Beta-blockers: 
  - Moxisylyte (thymoxamine)
  - see Moxifloxacin
  - see Morphine
  - Montelukast 
  - see see
  - see Monobactams
  - Mometasone
  - see Moexipril

- Oestrogens:

- Ciclosporin:

- Modafinil

- Sympathomimetics:

- Ulcer-healing Drugs: plasma concentration of moxonidine increased by cimetidine (halve dose of moxonidine)

Modafinil

- Antiepileptics: modafinil possibly increases plasma concentration of phenytoin

- Ciclosporin: modafinil reduces plasma concentration of ciclosporin

- Oestrogests: modafinil accelerates metabolism of oestrogests (reduced contraceptive effect—see p. 439)

- Moexipril see ACE Inhibitors

- Mometasone see Corticosteroids

- Monobactams see Aztreonam

- Montelukast see Leukotriene Antagonists

- Morphine see Opioid Analgesics

- Morflexacin see Quinolones

- Moxisylyte (thymoxamine)

  - ACE inhibitors: enhanced hypotensive effect when moxisylyte given with ACE inhibitors
  - Adrenergic Neurone Blockers: enhanced hypotensive effect when moxisylyte given with adrenergic neurone blockers
  - Alpha-blockers: possible severe postural hypotension when moxisylyte given with alpha-blockers
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxisylyte given with angiotensin-II receptor antagonists
  - Beta-blockers: possible severe postural hypotension when moxisylyte given with beta-blockers
  - Calcium-channel Blockers: enhanced hypotensive effect when moxisylyte given with calcium-channel blockers
  - Clonidine: enhanced hypotensive effect when moxisylyte given with clonidine
  - Diazoxide: enhanced hypotensive effect when moxisylyte given with diazoxide
  - Diuretics: enhanced hypotensive effect when moxisylyte given with diuretics
  - Methylodopa: enhanced hypotensive effect when moxisylyte given with methylodopa
  - Moxonidine: enhanced hypotensive effect when moxisylyte given with moxonidine
  - Nitrates: enhanced hypotensive effect when moxisylyte given with nitrates
  - Vasodilator Antihypertensives: enhanced hypotensive effect when moxisylyte given with hydralazine, minoxidil or sodium nitroprusside

Moxonidine

- ACE inhibitors: enhanced hypotensive effect when moxonidine given with ACE inhibitors
  - Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with adrenergic neurone blockers
  - Alcohol: enhanced hypotensive effect when moxonidine given with alcohol
  - Aldesleukin: enhanced hypotensive effect when moxonidine given with aldesleukin
  - Alpha-blockers: enhanced hypotensive effect when moxonidine given with alpha-blockers

Moxonidine (continued)

Anaesthetics, General: enhanced hypotensive effect when moxonidine given with general anaesthetics

Analgesics: hypotensive effect of moxonidine antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with angiotensin-II receptor antagonists

Antidepressants: enhanced hypotensive effect when moxonidine given with MAOIs

Antipsychotics: enhanced hypotensive effect when moxonidine given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with anxiolytics and hypnotics; sedative effects possibly increased when moxonidine given with benzodiazepines

Beta-blockers: enhanced hypotensive effect when moxonidine given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when moxonidine given with clonidine

Corticosteroids: hypotensive effect of moxonidine antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when moxonidine given with diazoxide

Diuretics: enhanced hypotensive effect when moxonidine given with diuretics

Dopaminergics: enhanced hypotensive effect when moxonidine given with levodopa

Methylodopa: enhanced hypotensive effect when moxonidine given with methylodopa

Moxisylyte (thymoxamine): enhanced hypotensive effect when moxonidine given with moxisylyte

Muscle Relaxants

ACE inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with adrenergic neurone blockers

Antidepressants: General: increased risk of myocardial depression and bradycardia when suxamethonium given with propofol; effects of non-depolarising muscle relaxants and suxamethonium enhanced by volatile liquid general anaesthetics

Anaesthetics, Local: neuromuscular blockade enhanced and prolonged when suxamethonium given with propofol

Analgesics: excetration of baclofen possibly reduced by NSAIDs (increased risk of toxicity); excetration of baclofen reduced by ibuprofen (increased risk of toxicity)

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with angiotensin-II receptor antagonists

Anti-arrhythmics: neuromuscular blockade enhanced and prolonged when suxamethonium given with lidocaine (lignocaine)

Antibacterials: effects of non-depolarising muscle relaxants and suxamethonium enhanced by piperacillin; plasma concentration of tizanidine increased by ciprofloxacin (increased risk of toxicity)—avoid concomitant use; effects of non-depolarising muscle

Appendix 1: Interactions
Muscle Relaxants

Antibacterials (continued)
- relaxants and suxamethonium enhanced by
- vancomycin (antagonism of non-depolarising muscle relaxants and suxamethonium enhanced by clindamycin; effects of non-depolarising muscle relaxants and suxamethonium enhanced by polymyxins; effects of suxamethonium enhanced by vancomycin
- Antidepressants: plasma concentration of tizanidine increased by fluvoxamine (increased risk of toxicity)—avoid concomitant use; effects of suxamethonium enhanced by phenelzine; muscle relaxant effect of baclofen enhanced by tricyclics
- Antiepileptics: muscle relaxant effect of non-depolarising muscle relaxants antagonised by carbamazepine and phenytoin (accelerated recovery from neuromuscular blockade)
- Antimalarials: effects of suxamethonium possibly enhanced by quinine
- Antipsychotics: effects of suxamethonium possibly enhanced by promazine
- Anxiolytics and Hypnotics: increased sedative effect when baclofen or tizanidine given with anxiolytics and hypnotics
- Beta-blockers: enhanced hypotensive effect when baclofen given with beta-blockers; possible enhanced hypotensive effect and bradycardia when tizanidine given with beta-blockers; effects of muscle relaxants enhanced by propranolol
- Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with calcium-channel blockers; effects of non-depolarising muscle relaxants enhanced by nifedipine and verapamil; risk of arrhythmias when intravenous dantrolene given with diltiazem; hypotension, myocardial depression, and hyperkalaemia when intravenous dantrolene given with verapamil; effects of suxamethonium enhanced by verapamil
- Cardiac Glycosides: possible increased risk of bradycardia when tizanidine given with cardiac glycosides; risk of ventricular arrhythmias when suxamethonium given with cardiac glycosides
- Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with clonidine
- Corticosteroids: effects of pancuronium and vecuronium possibly modified by corticosteroids
- Cytotoxics: effects of suxamethonium enhanced by cyclophosphamide and thiotapec
- Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with diazoxide
- Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with diuretics
- Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with levodopa
- Lithium: effects of muscle relaxants enhanced by lithium; baclofen possibly aggravates hyperkinesis caused by lithium
- Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by parenteral magnesium
- Memantine: effects of baclofen and dantrolene possibly modified by memantine
- Methyldopa: enhanced hypotensive effect when baclofen or tizanidine given with methyldopa
- Metoclopramide: effects of suxamethonium enhanced by metoclopramide
- Naloxonidine: enhanced hypotensive effect when baclofen or tizanidine given with naloxonidine
- Nitrates: enhanced hypotensive effect when baclofen or tizanidine given with nitrates
- Oestrogens: plasma concentration of tizanidine possibly increased by oestrogens (increased risk of toxicity)
- Parasympathomimetics: effects of non-depolarising muscle relaxants possibly antagonised by donepezil; effects of suxamethonium possibly enhanced by donepezil; effects of non-depolarising muscle relaxants and suxamethonium enhanced by donepezil; plasma concentration of tizanidine possibly increased by progestogens (increased risk of toxicity)
- Sympathomimetics, Beta: effects of suxamethonium enhanced by bambuterol
- Vasodilator Antihypertensives: enhanced hypotensive effect when baclofen or tizanidine given with hydralazine; enhanced hypotensive effect when baclofen or tizanidine given with minoxidil; enhanced hypotensive effect when baclofen or tizanidine given with sodium nitroprusside
- Muscle Relaxants, depolarising see Muscle Relaxants

Muscle Relaxants, non-depolarising see Muscle Relaxants

MycoPhenolate
- Antacids: absorption of mycoPhenolate reduced by antacids
- Antibacterials: bioavailability of mycoPhenolate possibly reduced by metronidazole and norfloxacin; plasma concentration of active metabolite of mycoPhenolate reduced by rifampicin
- Antiepileptics: cytotoxics possibly reduced absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Antivirals: mycoPhenolate increases plasma concentration of aciclovir, also plasma concentration of inactive metabolite of mycoPhenolate increased; mycoPhenolate possibly increases plasma concentration of ganciclovir, also plasma concentration of inactive metabolite of mycoPhenolate possibly increased
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
- Iron: absorption of mycoPhenolate reduced by oral iron
- Lipid-regulating Drugs: absorption of mycoPhenolate reduced by colestatyramine
- Sevelamer: plasma concentration of mycoPhenolate possibly reduced by sevelamer
- MycoPhenolate Monotel see MycoPhenolate
- MycoPhenolate Sodium see MycoPhenolate
- MycoPhenolic Acid see MycoPhenolate

Nalbione
- Alcohol: increased sedative effect when nabilone given with alcohol
- Anxiolytics and Hypnotics: increased sedative effect when nabilone given with anxiolytics and hypnotics
- Nalbumeone see NSAIDs
- Nalodol see Beta-blockers
- Naldixidic Acid see Quinolones
- Nandrolone see Anabolic Steroids
- Naproxen see NSAIDs
- Naratriptan see 5HT Agonists
- Nateglinide see Antidiabetics
- Nebivolol see Beta-blockers
- Neofam
- Antidepressants: manufacturer of neofam advises avoid concomitant use with MAOIs; side-effects possibly increased when neofam given with tricyclics
- Antimuscarinics: increased risk of antimuscarinic side-effects when nefamopen given with antimuscarinics
- Nelfinavir
- Analgesics: nelfinavir reduces plasma concentration of methadone
- Anti-arrhythmics: increased risk of ventricular arrhythmias when nelfinavir given with amiodarone—avoid concomitant use
- Antibacterials: nelfinavir increases plasma concentration of rifabutin (halve dose of rifabutin); plasma concentration of nelfinavir significantly reduced by
Nelfinavir
- Antibacterials (continued)
  - rifampicin—avoid concomitant use; avoidance of concomitant nelfinavir in severe renal and hepatic impairment advised by manufacturer of telithromycin
- Anticoagulants: avoidance of nelfinavir advised by manufacturer of rivaroxaban
- Antidepressants: plasma concentration of nelfinavir reduced by St John's worth—avoid concomitant use
- Antiepileptics: plasma concentration of nelfinavir possibly reduced by carbamazepine and primidone; nelfinavir reduces plasma concentration of phenytoin
- Antimalariials: caution with nelfinavir advised by manufacturer of arteether/lumeferantrine
- Antimuscarinics: avoidance of nelfinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when nelfinavir given with fesoterodine—consult fesoterodine product literature; nelfinavir increases plasma concentration of solifenacin
- Antipsychotics: nelfinavir possibly inhibits metabolism of amisulpride (reduce dose of amisulpride); nelfinavir possibly increases plasma concentration of amitriptyline (increased risk of ventricular arrhythmias—avoid concomitant use); nelfinavir increases plasma concentration of aripiprazole (consider reducing dose of aripiprazole)
- Anxiolytics and Hypnotics: nelfinavir possibly increases plasma concentration of alprazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
- Barbiturates: plasma concentration of nelfinavir possibly reduced by barbiturates
- Ciclosporin: nelfinavir possibly increases plasma concentration of ciclosporin
- Clotidazole: nelfinavir possibly increases plasma concentration of clotidazole—avoid concomitant use
- Diuretics: nelfinavir increases plasma concentration of spironolactone—avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when nelfinavir given with ergotamine and methysergide—avoid concomitant use
- 5HT Agonists: nelfinavir increases plasma concentration of sumatriptan (risk of toxicity)—avoid concomitant use
- Iverabidine: nelfinavir possibly increases plasma concentration of iverabidine—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when nelfinavir given with atorvastatin; possible increased risk of myopathy when nelfinavir given with rosuvastatin—avoid concomitant use; increased risk of myopathy when nelfinavir given with simvastatin (avoid concomitant use)
- Oestrogens: nelfinavir accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 439)
- Progestogens: nelfinavir possibly reduces contraceptve effect
- Sildenafil: nelfinavir possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil
- Tacrolimus: nelfinavir possibly increases plasma concentration of tacrolimus
- Ulcer-healing Drugs: plasma concentration of nelfinavir reduced by eomeprazole—avoid concomitant use

Nevirapine
- Analgesics: nevirapine possibly reduces plasma concentration of methadone
- Antibacterials: nevirapine possibly increases plasma concentration of rifabutin; plasma concentration of nevirapine reduced by rifampicin—avoid concomitant use
- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of warfarin
- Antidepressants: plasma concentration of nevirapine reduced by St John's worth—avoid concomitant use
- Antifungals: nevirapine reduces plasma concentration of ketoconazole—avoid concomitant use; plasma concentration of nevirapine increased by fluconazole; nevirapine possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antipsychotics: nevirapine possibly reduces plasma concentration of aripiprazole—increase dose of aripiprazole
- Antivirals: nevirapine possibly reduces plasma concentration of etazanavir and etravirine—avoid concomitant use; nevirapine reduces plasma concentration of efavirenz and indinavir; nevirapine possibly reduces plasma concentration of fosamprenavir; nevirapine possibly reduces plasma concentration of olpanavir—consider increasing dose of olpanavir
- Oestrogens: nevirapine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 439)
- Progestogens: nevirapine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 439)

Nicardipine see Calcium-channel Blockers

Nicoardil
- Alcohol: hypotensive effect of nicoardil possibly enhanced by alcohol
- Antidepressants: enhanced hypotensive effect when nicoardil given with MAOIs; hypotensive effect of nicoardil possibly enhanced by tricyclics
- Sildenafil: hypotensive effect of nicoardil significantly enhanced by sildenafil (avoid concomitant use)
- Tadalafil: hypotensive effect of nicoardil significantly enhanced by tadalafil (avoid concomitant use)
- Vardenafil: possible increased hypotensive effect when nicoardil given with vardenafil—avoid concomitant use
- Vasodilator Antihypertensives: possible enhanced hypotensive effect when nicoardil given with hydralazine, minoxidil or sodium nitroprusside

Nitric Acid
- Note Interactions apply to lipid-regulating doses of nicotinic acid
- Lipid-regulating Drugs: increased risk of myopathy when atorvastatin with nicotinic acid given (applies to lipid regulating doses of nicotinic acid)

Nifedipine see Calcium-channel Blockers

Nilotinib
- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with clarithromycin, moxifloxacin and telithromycin
- Antiepileptics: coadministration of cytoxotyks possibly reduce absorption of phenytoin
- Antifungals: plasma concentration of nilotinib increased by ketoconazole—avoid concomitant use; manufacturer of nilotinib advises avoid concomitant use with itraconazole and voriconazole
- Antipsychotics: avoid concomitant use of cytoxotyks with nilotinib (increased risk of agranulocytosis)
- Antivirals: manufacturer of nilotinib advises avoid concomitant use with ritonavir
- Anxiolytics and Hypnotics: nilotinib increases plasma concentration of midazolam
- Cardiac Glycosides: cytotoxicity reduce absorption of digoxin
- Grapefruit Juice: manufacturer of nilotinib advises avoid concomitant use with grapefruit juice

Nimodipine see Calcium-channel Blockers
Nitrates

ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE inhibitors

Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with adrenergic neurone blockers

Alcohol: enhanced hypotensive effect when nitrates given with alcohol

Aldesleukin: enhanced hypotensive effect when nitrates given with aldesleukin

Alpha-blockers: enhanced hypotensive effect when nitrates given with alpha-blockers

Anaesthetics, General: enhanced hypotensive effect when nitrates given with general anaesthetics

Analgesics: hypotensive effect of nitrates antagonised by NSAIDs

Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with angiotensin-II receptor antagonists

Anti-arythmics: effects of sublingual tablets of nitrates reduced by disopyramide (failure to dissolve under tongue owing to dry mouth)

• Anticoagulants: infusion of glycyrin trinitrate reduces anticoagulant effect of heparins

Antidepressants: enhanced hypotensive effect when nitrates given with MAOIs; effects of sublingual tablets of nitrates possibly reduced by tricyclic related antidepressants (failure to dissolve under tongue owing to dry mouth); effects of sublingual tablets of nitrates reduced by tricyclics (failure to dissolve under tongue owing to dry mouth)

Antimuscarinics: effects of sublingual tablets of nitrates possibly reduced by antimuscarinics (failure to dissolve under tongue owing to dry mouth)

Antipsychotics: enhanced hypotensive effect when nitrates given with phenothiazines

Anxiolytics and Hypnotics: enhanced hypotensive effect when nitrates given with anxiolytics and hypnotics

Beta-blockers: enhanced hypotensive effect when nitrates given with beta-blockers

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when nitrates given with clonidine

Corticosteroids: hypotensive effect of nitrates antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide

Diuretics: enhanced hypotensive effect when nitrates given with diuretics

Dopaminergics: enhanced hypotensive effect when nitrates given with levodopa

Methyldopa: enhanced hypotensive effect when nitrates given with methyldopa

Moxisylyte (thymoxamine): enhanced hypotensive effect when nitrates given with moxisylyte

Moxonidine: enhanced hypotensive effect when nitrates given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when nitrates given with baclofen or tizanidine

Oestrogens: hypotensive effect of nitrates antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when nitrates given with alprostadil

• Sildenafil: hypotensive effect of nitrates significantly enhanced by sildenafil (avoid concomitant use)

• Tadalafil: hypotensive effect of nitrates significantly enhanced by tadalafil (avoid concomitant use)

• Vardenafil: possible increased hypotensive effect when nitrates given with vardenafil—avoid concomitant use

Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with hydralazine, minoxidil or sodium nitroprusside

Nitazepam see Anxiolytics and Hypnotics

Nitrofurantoin

Antacids: absorption of nitrofurantoin reduced by oral magnesium salts (as magnesium trisilicate)

Oestrogens: antibiotics that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)

Probencid: excretion of nitrofurantoin reduced by probencid (increased risk of side-effects)

Sulfinpyrazone: excretion of nitrofurantoin reduced by sulfinpyrazone (increased risk of toxicity)

Vaccines: antibacterial agents inactivate oral typhoid vaccine—see p. 879

Nitroimidazoles see Metronidazole and Tinidazole

Nitrous Oxide see Anaesthetics, General

Nizatidine see Histamine H1-antagonists

Noradrenaline (norepinephrine) see Sympathomimetics

Norapinephrine (noradrenaline) see Sympathomimetics

Norgesthromine see Progestogens

Norflaxacin see Quinolones

Norgestimate see Progestogens

Norgestrel see Progestogens

Nortriptyline see Antidepressants, Tricyclic

NSAIDs

Note See also Aspirin. Interactions do not generally apply to topical NSAIDs

ACE Inhibitors: increased risk of renal impairment when NSAIDs given with ACE inhibitors, also hypotensive effect antagonised

Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of adrenergic neurone blockers

Alpha-blockers: NSAIDs antagonise hypotensive effect of alpha-blockers

Analgesics: see Concomitant use of NSAIDs with

• Aspirin

Note

• NSAIDs or aspirin (increased side-effects)

Antidepressants: side-effects when NSAIDs given with MAOIs

Anticoagulants: anticoagulant effect of anticoagulants reduced by sulfinpyrazone (increased risk of toxicity)

Antihypertensives: hypotensive effect of antihypertensives antagonised by NSAIDs

Antimicrobials: inhibitors of bacterial growth may reduce effect of NSAIDs

Antipsychotics: enhanced hypotensive effect when nitrates given with phenothiazines

β-Blockers: enhanced hypotensive effect when nitrates given with β-blockers

Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with calcium-channel blockers

Clonidine: enhanced hypotensive effect when nitrates given with clonidine

Corticosteroids: hypotensive effect of nitrates antagonised by corticosteroids

Diazoxide: enhanced hypotensive effect when nitrates given with diazoxide

Diuretics: enhanced hypotensive effect when nitrates given with diuretics

Dopaminergics: enhanced hypotensive effect when nitrates given with levodopa

Methyldopa: enhanced hypotensive effect when nitrates given with methyldopa

Moxisylyte (thymoxamine): enhanced hypotensive effect when nitrates given with moxisylyte

Moxonidine: enhanced hypotensive effect when nitrates given with moxonidine

Muscle Relaxants: enhanced hypotensive effect when nitrates given with baclofen or tizanidine

Oestrogens: hypotensive effect of nitrates antagonised by oestrogens

Prostaglandins: enhanced hypotensive effect when nitrates given with alprostadil

• Sildenafil: hypotensive effect of nitrates significantly enhanced by sildenafil (avoid concomitant use)

• Tadalafil: hypotensive effect of nitrates significantly enhanced by tadalafil (avoid concomitant use)

• Vardenafil: possible increased hypotensive effect when nitrates given with vardenafil—avoid concomitant use

Vasodilator Antihypertensives: enhanced hypotensive effect when nitrates given with hydralazine, minoxidil or sodium nitroprusside

Nitrazepam see Anxiolytics and Hypnotics

Appendix 1: Interactions 763

BNF 57
NSAIDs
- Antiepileptics (continued)
  * Monitor use; NSAIDs possibly enhance effects of
    * Carbamazepine, oxcarbazepine, phenytoin,
      trimidone, Rufinamide and topiramate (reduced

Antifungals: plasma concentration of piroxicam increased by flucanazole (reduce dose of piroxicam); plasma concentration of celecoxib increased by flucanazole (halve dose of celecoxib)
- Antipsychotics: possible severe drowsiness when indometacin given with haloperidol; avoid concomitant use of azapropazone with ciclosporin (increased risk of agranulocytosis)
- Antivirals: plasma concentration of NSAIDs possibly increased by ritonavir; plasma concentration of piroxicam increased by ritonavir (risk of toxicity)—avoid concomitant use; increased risk of haematological toxicity when NSAIDs given with zidovudine
- Beta-blockers: NSAIDs antagonise hypotensive effect of beta-blockers
- Bisphosphonates: indometacin increases bioavailability of iludronic acid
- Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of calcium-channel blockers
- Cancer Glycosides: NSAIDs possibly increase plasma concentration of cardiac glycosides, also possible exacerbation of heart failure and reduction of renal function
- Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with ciclosporin; plasma concentration of ciclofenac increased by ciclosporin (halve dose of ciclofenac)
- Clonidine: NSAIDs antagonise hypotensive effect of clonidine
- Clopidogrel: increased risk of bleeding when NSAIDs given with clopidogrel
- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with corticosteroids
- Cytotoxics: NSAIDs probably reduce excretion of methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 568; azapropazone reduces excretion of methotrexate (avoid concomitant use); ciclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of methotrexate (increased risk of toxicity)—but for concomitant use in rheumatic disease see p. 568; increased risk of bleeding when NSAIDs given with etorolcine
- Desmopressin: indometacin enhances effects of desmopressin
- Diazoxide: NSAIDs antagonise hypotensive effect of diazoxide
- Dimethyl sulfoxide: avoid concomitant use of sulindac with dimethyl sulfoxide
- Diuretics: risk of nephrotoxicity of NSAIDs increased by diuretics, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of diuretics; NSAIDs possibly antagonise diuretic effect of potassium canrenoate; occasional reports of reduced renal function when indometacin given with triamterene—avoid concomitant use; increased risk of hyperkalaemia when indometacin given with potassium-sparing diuretics and aldosterone antagonists; possibly increased risk of hyperkalaemia when NSAIDs given with potassium-sparing diuretics and aldosterone antagonists
- Iloprost: increased risk of bleeding when NSAIDs given with iloprost
- Lipid-regulating Drugs: excretion of meloxicam increased by colestevaline
- Lithium: NSAIDs probably reduce excretion of lithium (increased risk of toxicity); ciclofenac, ibuprofen, indometacin, mephenamic acid, naproxen, piroxicam and piroxicam reduce excretion of lithium (increased risk of toxicity); ketorolac reduces excretion of lithium (increased risk of toxicity)—avoid concomitant use
- Methyldopa: NSAIDs antagonise hypotensive effect of methyldopa

NSAIDs (continued)
- Moxonidine: NSAIDs antagonise hypotensive effect of moxonidine
- Muscle Relaxants: ibuprofen reduces excretion of baclofen (increased risk of toxicity); NSAIDs possibly reduce excretion of baclofen (increased risk of toxicity)
- Nitrates: NSAIDs antagonise hypotensive effect of nitrates
- Oestrogens: etoricoxib increases plasma concentration of ethinylestradiol
- Penicillamine: increased risk of nephrotoxicity when NSAIDs given with penicillamine
- Pentoxifylline (opentifylline): increased possible risk of bleeding when NSAIDs given with pentoxifylline (opentifylline); increased risk of bleeding when ketoprofen given with pentoxifylline (opentifylline) (avoid concomitant use)
- Probencid: excretion of desketoprofen, indometacin, ketoprofen and naproxen reduced by probencid (increased plasma concentration); excretion of ketorolac reduced by probencid (increased plasma concentration)—avoid concomitant use
- Progestogens: risk of hyperkalaemia when NSAIDs given with drospirenone (monitor serum potassium during first cycle)
- Sibutramine: increased risk of bleeding when NSAIDs given with sibutramine
- Tacrolimus: possible increased risk of nephrotoxicity when NSAIDs given with tacrolimus; increased risk of nephrotoxicity when ibuprofen given with tacrolimus
- Ulcer-healing Drugs: plasma concentration of azapropazone possibly increased by cimetidine
- Vasodilator Antihypertensives: NSAIDs antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside

Oestrogens
- Anti-diabetics: oestradiol possibly reduces requirements for insulin, metformin, repaglinide and sulphonylureas
- Ciclosporin: oestradiol reduces plasma concentration of ciclosporin
- Dopaminergics: oestradiol increases plasma concentration of bromocriptine
- Ulcer-healing Drugs: oestradiol possibly delays absorption of cimetidine

Oestrogens
- Note: Interactions of combined oral contraceptives may also apply to combined contraceptive patches
- ACE inhibitors: oestrogens antagonise hypotensive effect of ACE inhibitors
- Adrenergic Neurone Blockers: oestrogens antagonise hypotensive effect of adrenergic neurone blockers
- Alpha-blockers: oestrogens antagonise hypotensive effect of alpha-blockers
- Analogues: plasma concentration of ethinylestradiol increased by etoricoxib
- Angiotensin-II Receptor Antagonists: oestrogens antagonise hypotensive effect of angiotensin-II receptor antagonists
- Antibacterials: contraceptive effect of oestrogens possibly reduced by antibacterials that do not induce liver enzymes (risk probably small, see p. 439); metabolism of oestrogens accelerated by rifampicins (reduced contraceptive effect—see p. 439)
- Anticoagulants: oestrogens may enhance or reduce anticoagulant effect of coumarins; oestrogens antagonise anticoagulant effect of warfarin
- Antibiotics: contraceptive effect of oestrogens reduced by St John’s wort (avoid concomitant use); oestrogens antagonise antidepressant effect of tricyclics (but side-effects of tricyclics possibly increased due to increased plasma concentration)
- Anti-diabetics: oestrogens antagonise hypoglycaemic effect of insulin
- Antiepileptics: metabolism of oestrogens accelerated by carbamazepine, oxcarbazepine, phenytoin, primidone, rufinamide and topiramate (reduced
Oestrogens

- Antiepileptics (continued) contraceptive effect—see p. 439; oestrogens reduce plasma concentration of modafinil.
- Antifungals: anecdotial reports of contraceptive failure when oestrogens given with fluconazole, imidazoles, itraconazole or ketoconazole; metabolism of oestrogens accelerated by griseofulvin (reduced contraceptive effect—see p. 439); occasional reports of breakthrough bleeding when oestrogens (used for contraception) given with terbinafine.
- Antivirals: plasma concentration of ethinylestradiol increased by azatasanavir—avoid concomitant use; contraceptive effect of oestrogens possibly reduced by efavirenz; plasma concentration of oestrogens increased by fosamprenavir, also plasma concentration of fosamprenavir reduced—alternative contraception recommended; metabolism of oestrogens possibly accelerated by nefilnavir, nevirapine and ritonavir (reduced contraceptive effect—see p. 439).
- Anxiolytics and Hypnotics: oestrogens increase plasma concentration of melatonin.
- Appreitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with appreitant (alternative contraception recommended).
- Barbiturates: metabolism of oestrogens accelerated by barbiturates (reduced contraceptive effect—see p. 439).
- Beta-blockers: oestrogens antagonise hypotensive effect of beta-blockers.
- Bile Acid-Ads: elimination of cholesterol in bile increased when oestrogens given with bile acids.
- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with bosentan (alternative contraception recommended).
- Calcium-channel Blockers: oestrogens antagonise hypotensive effect of calcium-channel blockers.
- Ciclosporin: oestrogens possibly increase plasma concentration of ciclosporin.
- Clonidine: oestrogens antagonise hypotensive effect of clonidine.
- Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of corticosteroids.
- Diazoxide: oestrogens antagonise hypotensive effect of diazoxide.
- Diuretics: oestrogens antagonise diuretic effect of diuretics.
- Dopaminergics: oestrogens increase plasma concentration of ropinirole; oestrogens increase plasma concentration of selegiline (increased risk of toxicity).
- Lipid-regulating Drugs: plasma concentration of ethinylestradiol increased by atorvastatin and rosuvastatin.
- Methyldopa: oestrogens antagonise hypotensive effect of methyldopa.
- Modafinil: metabolism of oestrogens accelerated by modafinil (reduced contraceptive effect—see p. 439).
- Moxonidine: oestrogens antagonise hypotensive effect of moxonidine.
- Muscle Relaxants: oestrogens possibly increase plasma concentration of tizanidine (increased risk of toxicity).
- Nitrates: oestrogens antagonise hypotensive effect of nitrates.
- Sitaxentan: plasma concentration of oestrogens increased by sitaxentan.
- Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of somatropin.
- Sugammadex: plasma concentration of oestrogens possibly reduced by sugammadex.
- Tacrolimus: metabolism of oestrogens possibly inhibited by tacrolimus; ethinylestradiol possibly increases plasma concentration of tacrolimus.

Oestrogens (continued)

- Theophylline: oestrogens reduce excretion of theophylline (reduced plasma concentration).
- Thyroid Hormones: oestrogens may increase requirements for thyroid hormones in hypothyroidism.
- Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of hydralazine, minoxidil and sodium nitroprusside.
- Oestrogens, conjugated see Oestrogens.
- Olfoxacin see Quinolones.
- Olanzapine see Antipsychotics.
- Olmesartan see Angiotensin-II Receptor Antagonists.
- Olsalazine see Aminosalicylates.
- Omeprazole see Proton Pump Inhibitors.
- Ondansetron see 5HT Antagonists.

Opioid Analgesics

- Alcohol: metabolism of hypnotic and sedative effects when opioid analgesics given with alcohol.
- Antibacterials: plasma concentration of alfenaltanal increased by erythromycin; avoidance of premedication with opioid analgesics advised by manufacturer of ciprofloxacin (reduced plasma concentration of ciprofloxacin when ciprofloxacin used for surgical prophylaxis; metabolism of methadone accelerated by rifampicin (reduced effect).  
- Anticoagulants: tramadol enhances coagulant effect of ecoutamars; dextropropoxyphene possibly enhances anticoagulant effect of ecoutamars.
- Antidepressants: plasma concentration of methadone possibly increased by fluvoxamine; possible increased serotonergic effects when pethidine or tramadol given with duxoloxine; possible CNS excitation or depression (hypothesis or hypotension) when opioid analgesics given with MAOIs—avoid concomitant use and for 2 weeks after stopping MAOIs; CNS excitation or depression (hypothesis or hypotension) when pethidine given with MAOIs—avoid concomitant use and for 2 weeks after stopping MAOIs; possible CNS excitation or depression (hypothesis or hypotension) when dextromethorphan or pethidine given with moclobemide; possible CNS excitation or depression (hypothesis or hypotension) when tranylcyromel and pethidine given with tricyclics; sedative effects possibly increased when opioid analgesics given with tricyclics.
- Antiepileptics: plasma concentration of methadone reduced by carbamazepine; dextropropoxyphene enhances effects of carbamazepine; effects of tramadol reduced by carbamazepine; metabolism of methadone accelerated by phenytoin (reduced effect and risk of withdrawal effects).
- Antifungals: metabolism of buprenorphine inhibited by ketonozazole (reduce dose of buprenorphine); metabolism of alfenaltanal inhibited by fluconazole (risk of prolonged or delayed respiratory depression); plasma concentration of fentanyl possibly increased by fluconazole and itraconazole; metabolism of alfenaltanal possibly inhibited by itraconazole; plasma concentration of alfenaltanal and methadone increased by voriconazole (consider reducing dose of alfenaltanal and methadone).
- Antihistamines: sedative effects possibly increased when opioid analgesics given with sedating antihistamines.
- Antipsychotics: enhanced hypnotic and sedative effects when opioid analgesics given with antipsychotics; increased risk of convulsions when tramadol given with antipsychotics.
- Antivirals: plasma concentration of methadone possibly reduced by abacavir and nevirapine; plasma concentration of methadone reduced by efavirenz, fosamprenavir, nelfinavir and ritonavir; plasma concentration of dextropropoxyphene increased by ritonavir (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by ritonavir; plasma concentration of...
Appendix 1: Interactions

Antimalarials:
- Antidepressants:
  - Oxcarbazepine
  - Oxazepam
  - see Oxandrolone
  - see Orciprenaline
  - see Sodium Oxybate
  - Memantine:
  - Atomoxetine:
  - Antivirals

Anticonvulsant effect of antiepileptics antagonised by:
- Antiepileptics:
  - Oxcarbazepine reduces plasma concentration of zidovudine
  - Anticoagulants:
    - Antimuscarinics
    - Antipsychotics (convulsive threshold lowered)
    - Barbiturates: oxcarbazepine increases plasma concentration of phenobarbital, also plasma concentration of an active metabolite of oxcarbazepine reduced
    - Clobazam: oxcarbazepine possibly reduces plasma concentration of clobazam
    - Cytotoxics: oxcarbazepine increases plasma concentration of omatinib—avoid concomitant use
    - Oestrogens: oxcarbazepine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 349)
    - Progestogens: oxcarbazepine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 349)

Oxprenolol see Beta-blockers
Oxybutynin see Antimuscarinics
Oxycodeone see Opioid Analgesics
Oxymetazoline see Sympathomimetics
Oxycodone see Lipid-regulating Drugs
Oxycycline see Tetracyclines
Oxycodone see Anxiolytics and Hypnotics
Oxcarbazepine (continued)
  - Antimarialarials (continued)
    - Antidepressants:
      - hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by
      - Antipsychotics: anticonvulsant effect of oxcarbazepine antagonised by
      - Barbiturates: oxcarbazepine increases plasma concentration of phenobarbital, also plasma concentration of an active metabolite of oxcarbazepine reduced
      - Clobazam: oxcarbazepine possibly reduces plasma concentration of clobazam
      - Cytotoxics: oxcarbazepine increases plasma concentration of omatinib—avoid concomitant use
      - Oestrogens: oxcarbazepine accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 349)
      - Progestogens: oxcarbazepine accelerates metabolism of progestogens (reduced contraceptive effect—see p. 349)
Parasymptomimetics

- Antibacterials (continued)
  - pyridostigmine antagonised by clindamycin; effects of neostigmine and pyridostigmine antagonised by polymyxins
- Antidepressants: plasma concentration of galantamine increased by paroxetine
- Antifungals: plasma concentration of galantamine increased by ketoconazole
- Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for chloroquine and hydroxychloroquine to increase symptoms of myasthenia gravis
- Antimuscarinics: effects of parasympathomimetics antagonised by antimuscarinics
- Beta-blockers: increased risk of arrhythmias when plicarpine given with beta-blockers; effects of neostigmine and pyridostigmine antagonised by propranolol
- Lithium: effects of neostigmine and pyridostigmine antagonised by lithium
- Muscle Relaxants: donepezil possibly enhances effects of suxamethonium; piperacillin, galantamine, neostigmine, pyridostigmine and rivastigmine enhance effects of suxamethonium; donepezil possibly antagonises effects of non-depolarising muscle relaxants; edrophonium, neostigmine, pyridostigmine and rivastigmine antagonise effects of non-depolarising muscle relaxants
- Paracetamol see NSAIDs
- Paroxetine see Vitamins
- Paroxetine see Antidepressants, SSRI
- Pegfilgrastim see Filgrastim
- Peginterferon Alfa see Interferons

Penicillamine

- Analgesics: possible increased risk of nephrotoxicity when penicillamine given with NSAIDs
- Antacids: absorption of penicillamine reduced by antacids
- Antipsychotics: avoid concomitant use of penicillamine with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: penicillamine possibly reduces plasma concentration of digoxin
- Gold: manufacturer of penicillamine advises avoid concomitant use with gold (increased risk of toxicity)
- Iron: absorption of penicillamine reduced by oral iron
- Zinc: penicillamine reduces absorption of zinc, also absorption of penicillamine reduced by zinc

Penicillins

- Allopurinol: increased risk of rash when amoxicillin or ampicillin given with allopurinol
- Antibacterials: absorption of phenoxymethylpenicillin reduced by neomycin
- Anticoagulants: common experience in anticoagulant clinics is that INR can be altered by a course of broad-spectrum penicillins such as ampicillin, although studies have failed to demonstrate an interaction with coumarins or phenindione
- Cytotoxics: penicillins reduce excretion of methotrexate (increased risk of toxicity)
- Muscle Relaxants: piperacillin enhances effects of non-depolarising muscle relaxants and suxamethonium
- Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
- Probencid: excretion of penicillins reduced by probenecid (increased plasma concentration)
- Sulfamethoxazole: fluoroquinoloxacin possibly reduces response to sulfamethoxazole
- Sulfapyrazine: excretion of penicillins reduced by sulfapyrazone
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Pentamidine Isethionate

- Anti-arrhythmics: increased risk of ventricular arrhythmias when pentamidine isethionate given with amiodarone—avoid concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when pentamidine isethionate given with parenteral erythromycin; increased risk of ventricular arrhythmias when pentamidine isethionate given with moxifloxacin—avoid concomitant use
- Antidepressants: increased risk of ventricular arrhythmias when pentamidine isethionate given with tricyclics
- Antifungals: possible increased risk of nephrotoxicity when pentamidine isethionate given with amphoterin
- Antipsychotics: increased risk of ventricular arrhythmias when pentamidine isethionate given with amisulpride—avoid concomitant use; increased risk of ventricular arrhythmias when pentamidine isethionate given with phenothiazines
- Ivalbridine: increased risk of ventricular arrhythmias when pentamidine isethionate given with ivermectin

Pentazocine see Opioid Analgesics

Pentoxifylline (oxpentifylline)

- Antiepileptics: cytoxotxically possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytoxotics reduce absorption of digoxin tablets
- Cytoxotics: increased toxicity when pentostatin given with high-dose cyclophosphamide—avoid concomitant use; increased pulmonary toxicity when pentostatin given with ifudarabine (unacceptably high incidence of fatalities)

Pentoxifylline (pentoxifylline)

- Analgesics: possible increased risk of bleeding when pentoxifylline (pentoxifylline) given with NSAIDs; increased risk of bleeding when pentoxifylline (pentoxifylline) given with ketorolac (avoid concomitant use)
- Theophylline: pentoxifylline (pentoxifylline) increases plasma concentration of theophylline

Pergolid

- Antipsychotics: effects of pergolide antagonised by antipsychotics
- Memantine: effects of dopaminergic possibly enhanced by memantine
- Metyldopa: antiparkinsonian effect of dopaminergic antagonised by metyldopa
- Metoclopramide: antiparkinsonian effect of pergolide antagonised by metoclopramide
- Pericyazine see Antipsychotics
- Perindopril see ACE Inhibitors
- Perphenazine see Antipsychotics
- Pethidine see Opioid Analgesics
- Phenozoene see Opioid Analgesics
- Phenerazine see MAOIs
- Phenindione
  - Note: Change in patient’s clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect anticoagulant control
  - Alcohol: anticoagulant control with phenindione may be affected by major changes in consumption of alcohol
  - Anabolic Steroids: anticoagulant effect of phenindione enhanced by anabolic steroids
- Phenindione
  - Analgesics: anticoagulant effect of phenindione possibly enhanced by NSAIDs; anticoagulant effect of phenindione enhanced by diclofenac, also increased risk of haemorrhage with intravenous diclofenac (avoid concomitant use); anticoagulant effect of phenindione enhanced by ketorolac (increased risk of haemorrhage—avoid concomitant use); increased risk of bleeding when phenindione given with aspirin (due to antiplatelet effect)
Antivirals: metabolism of phenytoin inhibited by omeprazole (increased plasma concentration of phenytoin); phenytoin reduces plasma concentration of omeprazole (increased plasma concentration of phenytoin); phenytoin reduces plasma concentration of omeprazole.

Antibacterials: metabolism of phenytoin inhibited by clarithromycin, ciprofloxacin, and metronidazole (increased plasma concentration of phenytoin); phenytoin reduces plasma concentration of clarithromycin (increased plasma concentration of phenytoin); phenytoin reduces plasma concentration of ciprofloxacin (increased plasma concentration of phenytoin); phenytoin reduces plasma concentration of metronidazole (increased plasma concentration of phenytoin).

Antifungals: metabolism of phenytoin inhibited by fluconazole (increased plasma concentration of phenytoin); phenytoin reduces plasma concentration of fluconazole (increased plasma concentration of phenytoin).

Antiepileptics: metabolism of phenytoin inhibited by phenobarbital, phenytoin, phenytoin, phenytoin.

Anticoagulants: plasma concentration of phenytoin increased by clopidogrel—avoid concomitant use; plasma concentration of phenytoin increases when given with dipyridamole; plasma concentration of phenytoin increases when given with dipyridamole—avoid concomitant use; plasma concentration of phenytoin increases when given with dipyridamole.

Alpha-blockers: metabolism of phenytoin inhibited by clonidine (increased plasma concentration of phenytoin); phenytoin reduces plasma concentration of clonidine (increased plasma concentration of phenytoin); phenytoin reduces plasma concentration of clonidine (increased plasma concentration of phenytoin).
Phenytoin
- **Antivirals** (continued)
  - centration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by zidovudine
- **Anxiolytics and Hypnotics**: phenytoin often reduces plasma concentration of clonazepam; plasma concentration of phenytoin increased or decreased by diazepam; plasma concentration of phenytoin possibly increased or decreased by benzodiazepines
- **Antiepileptics**: phenytoin possibly reduces plasma concentration of aminoglycosides; increased risk of ototoxicity when platinum compounds given with amphotericin or polymyxins; increased risk of ototoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin or polymyxins given with capreomycin; increased risk of nephrotoxicity and possibly of ototoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicoplanin; possibly of ototoxicity when platinum compounds given with capreomycin; increased risk of nephrotoxicity and oto-neurotoxicity when cisplatin given with vancomycin or teicopl
Appendix 1: Interactions

Polyoxymyxins (continued)

- Ciclosporin: increased risk of nephrotoxicity when polymyxins given with ciclosporin.
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when polymyxins given with platinum compounds.
- Diuretics: increased risk of ototoxicity when polymyxins given with loop diuretics.
- Muscle Relaxants: polymyxins enhance effects of non-depolarising muscle relaxants and aminoglycosides.
- Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439).
- Parasympathomimetics: polymyxins antagonise effects of oestrogens and mepiprostigmine.
- Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679.

Potassium Salts

- Potassium Citrate
- Potassium Chloride
- Potassium Aminobenzoate
- Potassium Canrenoate

Posaconazole

- Polystyrene Sulphonate Resins

Parasympathomimetics

- Diuretics

Ciclosporin:

(continued)

- Polymyxins
- Antimalarials:

- Avoidance of antimalarials inactivated by levofloxacin (thyroxine)

Potassium-sparing diuretics

- Antivirals:

- Antiallergics:

- Thyroid Hormones: polyxytene sulphonate resins reduce absorption of levothyroxine (thyroxine)

Posaconazole see Antifungals, Triazole

Potassium Canrenoate see Diuretics

Potassium Aminobenzoate

Antibacterials: potassium aminobenzoate inhibits effects of sulphonamides.

Potassium Bicarbonate see Potassium Salts

Potassium Chloride see Potassium Salts

Potassium Citrate see Potassium Salts

Potassium Salts

- Note: Includes salt substitutes.
- ACE Inhibitors: increased risk of severe hyperkalaemia when potassium salts given with ACE inhibitors.
- Aliskiren: increased risk of hyperkalaemia when potassium salts given with aliskiren.
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when potassium salts given with angiotensin-II receptor antagonists.
- Antibacterials: avoid concomitant use of potassium citrate with methenamine.
- Ciclosporin: increased risk of hyperkalaemia when potassium salts given with ciclosporin.
- Diuretics: increased risk of hyperkalaemia when potassium salts given with ciclosporin.
- Tacrolimus: increased risk of hyperkalaemia when potassium salts given with tacrolimus.

Pramipexole

- Antipsychotics: manufacturer of pramipexole advises avoidance concomitant use of antipsychotics (antagonism of effect).
- Memantine: effects of dopaminergics possibly enhanced by memantine.
- Metyldopa: antiparkinsonian effect of dopaminergics antagonised by metyldopa.
- Urease Inhibiting Drugs: excretion of pramipexole reduced by cimetidine (increased plasma concentration).

Prazastin see Statins

Prazosin see Alpha-blockers

Prednisolone see Corticosteroids

Pilocarpine

- Anti-arrhythmics: increased myocardial depression when pilocarpine given with anti-arrhythmics.
- Antibacterials: increased risk of methaemoglobinemia when pilocarpine given with sulphonamides.

Primadone

- Antibacterials: sometimes reduced (but concentration of an active metabolite of primadone often increased); primadone possibly reduces plasma concentration of etosuximide; primadone reduces plasma concentration of lamotrigine and tiagabine; plasma concentration of primadone possibly reduced by phenytoin (but concentration of an active metabolite increased); plasma concentration of phenytoin often reduced but may be increased; plasma concentration of primadone possibly increased by valproate (plasma concentration of active metabolite of primadone increased), also plasma concentration of valproate reduced; plasma concentration of primadone possibly reduced by vigabatrin.
- Antifungals: primadone possibly reduces plasma concentration of itraconazole; primadone possibly reduces plasma concentration of voriconazole—avoid concomitant use; primadone reduces absorption of griseofulvin (reduced effect).
- Antimarialis: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by antimalarial.
- Antipsychotics: anticonvulsant effect of primadone antagonised by antipsychotics (conversive threshold lowered); primadone antagonises mechanisms of haloperidol (reduced plasma concentration); primadone possibly reduces plasma concentration of aripiprazole—increase dose of aripiprazole.
- Antivirals: primadone possibly reduces plasma concentration of indinavir, efavirenz, nelfinavir and saquinavir.
- Antivirals and Hypnotics: primadone often reduces plasma concentration of carbamazepine.
- Barbiturates: increased sedative effect when primadone given with barbiturates.
- Calcium-channel Blockers: primadone reduces effects of felodipine and isradipine; primadone probably reduces effects of edhydropyridines, diltiazem and verapamil.
- Cardiac Glycosides: primadone accelerates metabolism of digoxin (reduced effect).
- Ciclosporin: primadone accelerates metabolism of ciclosporin (reduced effect).
- Corticosteroids: primadone accelerates metabolism of corticosteroids (reduced effect).
- Diuretics: plasma concentration of primadone possibly reduced by acetazolamide; increased risk of osteomalacia when primadone given with carbonic anhydrase inhibitors.
- Folates: plasma concentration of primadone possibly reduced by folates.
- Hormone Antagonists: primadone accelerates metabolism of gestrinone and toremifene (reduced plasma concentration).
Primidone (continued)
Leukotriene Antagonists: primidone reduces plasma concentration of montelukast
Memantine: effects of primidone possibly reduced by memantine
● Oestrogens: primidone accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 439)
● Progestogens: primidone accelerates metabolism of progestogens (reduced contraceptive effect—see p. 439)
Symptomatikism: plasma concentration of primidone possibly increased by methylphenidate
Thyroid Hormones: primidone accelerates metabolism of thyroxine (may increase requirements for thyroid hormones in hypothyroidism)
Tibolone: primidone accelerates metabolism of tibolone (reduced plasma concentration)
Vitamins: primidone possibly increases requirements for vitamin D
Probenecid
ACE Inhibitors: probenecid reduces excretion of captopril
Anaesthetics, General: probenecid possibly enhances effects of thiopental
● Analgesics: probenecid reduces excretion of
  ● dexketoprofen, indomethacin, ketoprofen and naproxen (increased plasma concentration); probenecid reduces excretion of ketorolac (increased plasma concentration)—avoid concomitant use; effects of probenecid antagonised by aspirin
Antibacterials: probenecid reduces excretion of doripenem and meropenem (manufacturers of doripenem and meropenem advise avoid concomitant use); probenecid reduces excretion of cephalosporins, ciprofloxacin, nalidixic acid, norfloxacin and penicillins (increased plasma concentration); probenecid reduces excretion of dapsone and nitrofurantoin (increased risk of side-effects); effects of probenecid antagonised by pyrazinamide
Antidiabetics: probenecid possibly enhances hypoglycaemic effect of chlorpropamide
● Antivirals: probenecid reduces excretion of aciclovir (increased plasma concentration); probenecid possibly reduces excretion of famiclovir (increased plasma concentration); probenecid reduces excretion of ganciclovir and acyclovir (increased plasma concentration and risk of toxicity)
Anxiolytics and Hypnotics: probenecid reduces excretion of lorazepam (increased plasma concentration); probenecid possibly reduces excretion of nitrazepam (increased plasma concentration)
● Cytotoxics: probenecid reduces excretion of mitoxantrone (increased risk of toxicity)
  Sodium Benzoate: probenecid possibly reduces excretion of conjugate formed by sodium benzoate
Sodium Phenylbutyrate: probenecid possibly reduces excretion of conjugate formed by sodium phenylbutyrate
Procarbazine
Alcohol: disulfiram-like reaction when procarbazine given with alcohol
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
● Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Prochlorperazine see Antipsychotics
Procyclidine see Antimuscarinics
Progesterone see Progestogens
Progestogens
Note Interactions of combined oral contraceptives may also apply to combined contraceptive patches
ACE Inhibitors: risk of hyperkalaemia when drospironone given with ACE inhibitors (monitor serum potassium during first cycle)
Analgesics: risk of hyperkalaemia when drospironone given with NSAIDs (monitor serum potassium during first cycle)
Angiotensin-II Receptor Antagonists: risk of hyperkalaemia when drospironone given with angiotensin-II receptor antagonists (monitor serum potassium during first cycle)
● Antibacterials: metabolism of progestogens accelerated by rifampicin (reduced contraceptive effect—see p. 439)
● Anticoagulants: progestogens may enhance or reduce anticoagulant effect of coumarins; progestogens antagonise anticoagulant effect of dexamethasone
● Antidepressants: metabolism of progestogens accelerated by St John’s Wort (avoid concomitant use)
Antidiabetics: progestogens antagonise hypoglycaemic effect of antidiabetics
● Antiepileptics: metabolism of progestogens accelerated by carbamazepine, oxcarbazepine, phenytoin, primidone, rufinamide and topiramate (reduced contraceptive effect—see p. 439); progestogens reduce plasma concentration of lamotrigine
● Antifungals: metabolism of progestogens accelerated by ketoconazole (reduced contraceptive effect—see p. 439); occasional reports of breakthrough bleeding when progestogens (used for contraception) given with terbinafine
● Antivirals: plasma concentration of progestogens increased by fosamprenavir, also plasma concentration of fosamprenavir reduced—alternative contraception recommended; contraceptive effect of progestogens possibly reduced by nelfinavir; metabolism of progestogens accelerated by nevirapine (reduced contraceptive effect—see p. 439)
● Aprepitant: possible contraceptive failure of hormonal contraceptives containing progestogens when given with aprepitant (alternative contraception recommended)
● Barbiturates: metabolism of progestogens accelerated by barbiturates (reduced contraceptive effect—see p. 439)
● Bosentan: possible contraceptive failure of hormonal contraceptives containing progestogens when given with bosentan (alternative contraception recommended)
● Ciclosporin: progestogens inhibit metabolism of ciclosporin (increased plasma concentration)
Diuretics: risk of hyperkalaemia when drospironone given with potassium-sparing diuretics and aldosterone antagonists (monitor serum potassium during first cycle)
Dopaminergic: progestogens increase plasma concentration of selegiline (increased risk of toxicity)
Lipid-regulating Drugs: plasma concentration of nor-ethisterone increased by atorvastatin; plasma concentration of norgestrel increased by rosuvastatin
Muscle Relaxants: progestogens possibly increase plasma concentration of tizanidine (increased risk of toxicity)
Sitaxentan: plasma concentration of progestogens increased by sitaxentan
Sugammadex: plasma concentration of progestogens possibly reduced by sugammadex
Tacrolimus: metabolism of progestogens possibly inhibited by tacrolimus
Progynova
Antacids: absorption of progynova reduced by oral magnesium salts (as magnesium trisilicate)
Anticoagulants: isolated reports that progynova may enhance anticoagulant effect of warfarin
Antivirals:
- Propranolol
- See Propiverine

Ulcer-healing Drugs:
- Beta-blockers
- Antihistamines
- Antibacterials
- Anti-arrhythmics
- Anticoagulants
- Antibacterials
- Antimalarials (continued)

Plasma concentration of propafenone possibly increased by time-related effects on plasma concentration of ciclosporin

Antidepressants:
- Anticoagulants: propafenone enhances anticoagulant effect of coumarins
- Antidepressants: metabolism of propafenone possibly inhibited by paroxetine

Anticoagulants:
- Increased risk of ventricular arrhythmias when propafenone given with nizoldipine—avoid concomitant use

Antipsychotics:
- Aconitum: plasma concentration of propafenone possibly increased by bosentan (increased risk of toxicity); plasma concentration of propafenone increased by itraconazole (increased risk of ventricular arrhythmias—avoid concomitant use)

Beta-blockers:
- Increased myocardial depression when anti-arrhythmics given with metoprolol and propranolol

Cardiac Glycosides:
- Increased myocardial depression when propafenone given with digoxin (halve dose of digoxin)

Ciclosporin: propafenone possibly increases plasma concentration of ciclosporin

5HT Antagonists: increased risk of ventricular arrhythmias when propafenone given with dolasetron—avoid concomitant use

Parasympathomimetics: propafenone possibly antagonises effects of neostigmine and pyridostigmine

Theophylline: propafenone increases plasma concentration of theophylline

Ulcer-healing Drugs: plasma concentration of propafenone increased by cimetidine

Propylthiouracil see Antimuscarnics

Propofol see Anaesthetics, General

Proparanol see Beta-blockers

Prostaglandins (continued)

Diuretics: enhanced hypotensive effect when alprostadil given with diuretics

Methyldopa: enhanced hypotensive effect when alprostadil given with methyldopa

Moxonidine: enhanced hypotensive effect when alprostadil given with moxonidine

Nitrates: enhanced hypotensive effect when alprostadil given with nitrates

Oxytocin: prostanoids potentiate uterine tonic effect of oxytocin

Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with hydralazine, minoxidil or sodium nitroprusside

Protein Kinase Inhibitors see Dasatinib, Erlotinib, Imatinib, Lapatinib, Nilotinib, Sorafenib, Sunitinib, and Temsirolimus

Proton Pump Inhibitors

Antacids: absorption of lansoprazole possibly reduced by antacids

Antibacterials: plasma concentration of both drugs increased when omeprazole given with clarithromycin

Anticoagulants: esomeprazole, omeprazole and pantoprazole possibly enhance anticoagulant effect of coumarins

Antidepressants: omeprazole increases plasma concentration of escitalopram; plasma concentration of lansoprazole possibly increased by fluvoxamine

Anti-inflammatory: esomeprazole enhances effects of phenytoin; omeprazole possibly enhances effects of phenytoin

Antifungals: proton pump inhibitors reduce absorption of itraconazole and ketoconazole; plasma concentration of esomeprazole possibly increased by voriconazole; plasma concentration of omeprazole increased by voriconazole (consider reducing dose of omeprazole)

Antipsychotics: omeprazole possibly reduces plasma concentration of clozapine

Antivirals: proton pump inhibitors reduce plasma concentration of azaferanavir; omeprazole reduces plasma concentration of melflufen—avoid concomitant use; proton pump inhibitors possibly increase plasma concentration of raltegravir—manufacturer of raltegravir advises avoid concomitant use; omeprazole increases plasma concentration of raltegravir—avoid concomitant use; omeprazole increases plasma concentration of saquinavir; plasma concentration of esomeprazole and omeprazole reduced by etipranavir

Anxiolytics and Hypnotics: esomeprazole and omeprazole possibly inhibit metabolism of diazepam (increased plasma concentration)

Cardiac Glycosides: proton pump inhibitors possibly slightly increase plasma concentration of digoxin

Ciclosporin: omeprazole possibly affects plasma concentration of ciclosporin

Cilostazol: omeprazole increases plasma concentration of cilostazol (risk of toxicity)—avoid concomitant use; lansoprazole possibly increases plasma concentration of cilostazol—avoid concomitant use; omeprazole increases plasma concentration of cilostazol (risk of toxicity); proton pump inhibitors possibly reduce absorption of lapatinib

Tacrolimus: omeprazole possibly increases plasma concentration of tacrolimus

Ulcer-healing Drugs: absorption of lansoprazole possibly reduced by omeprazole

Pseudoephedrine see Sympathomimetics

Pyrazinamide

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)

Probenecid: pyrazinamide antagonises effects of probenecid

Sulfonpyrazone: pyrazinamide antagonises effects of sulfonpyrazone
Antipsychotics:
- Increased antifolate effect when pyrimethamine given with quinoline; increased antifolate effect when pyrimethamine given with proguanil
- Increased antifolate effect when proguanil
- Increased antifolate effect when pyrimethamine given with zidovudine

Anticoagulants:
- Increased antifolate effect when pyrimethamine given with 
- Increased antifolate effect when pyrimethamine given with

Anti-arrhythmics:
- Increased antifolate effect when pyrimethamine given with
- Increased antifolate effect when quinoline given with pyridoxine
- Increased antifolate effect when quinoline given with pyridostigmine

Analgesics:
- Increased antifolate effect when pyrimethamine given with quinoline

Cardiac Glycosides:
- Increased antifolate effect when pyrimethamine given with quinidine

Antibacterials:
- Increased antifolate effect when pyrimethamine given with quinidine

Antimalarials:
- Increased antifolate effect when pyrimethamine given with quinidine

Cytotoxics:
- Increased antifolate effect when pyrimethamine given with quinidine

Antibacterials:
- Increased antifolate effect when pyrimethamine given with quinidine

Antiepileptics:
- Increased antifolate effect when pyrimethamine given with quinidine

Antipsychotics:
- Increased antifolate effect when pyrimethamine given with quinidine

Anticoagulants:
- Increased antifolate effect when pyrimethamine given with quinidine

Antihistamines:
- Increased antifolate effect when pyrimethamine given with quinidine

Vaccines:
- Increased antifolate effect when pyrimethamine given with quinidine

Ulcer-healing Drugs:
- Increased antifolate effect when pyrimethamine given with quinidine

Beta-blockers:
- Increased antifolate effect when pyrimethamine given with quinidine

Calcium Salts:
- Increased antifolate effect when pyrimethamine given with quinidine

Dairy Products:
- Increased antifolate effect when pyrimethamine given with quinidine

Oestrogens:
- Increased antifolate effect when pyrimethamine given with quinidine

Muscle Relaxants:
- Increased antifolate effect when pyrimethamine given with quinidine
Quinolones (continued)
Zinc: absorption of ciprofloxacin, levofloxacin, moxi-
foxacin, norfloxacin and ofloxacin reduced by zinc
Quinupristin with Dalfopristin
• Anti-arrhythmics: increased risk of ventricular arrhy-
thmias when quinupristin/dalfopristin given with
dipryamidine or lidocaine (lignocaine)—avoid concomitant use
Antibacterial: manufacturer: of quinupristin/dalfo-
pristin recommends monitoring liver function when
given with rifampicin
Antivirals: quinupristin/dalfopristin possibly increases
plasma concentration of saquinavir
• Anti-convulsants and Hypnotics: quinupristin/dalfopristin
inhibits metabolism of midazolam (increased
plasma concentration with increased sedation); quinupristin/dalfopristin inhibits the metabolism of
topoline
• Calcium-channel Blockers: quinupristin/dalfopristin
increases plasma concentration of nifedipine
• Ciclosporin: quinupristin/dalfopristin increases plasma
concentration of ciclosporin
• Ergot Alkaloids: manufacturer of quinupristin/dalfo-
pristin advises avoid concomitant use with ergot-
amine and methysergide
Oestrogens: antibacterials that do not induce liver
enzymes possibly reduce contraceptive effect of
Oestrogens (risk probably small, see p. 439)
• Tacroliumus: quinupristin/dalfopristin increases plasma
concentration of tacrolimus
Vaccines: antibacterials inactive oral typhoid
vaccine—see p. 679
Rabeprazole see Proton Pump Inhibitors
Rifaxifene
Anticoagulants: rifaxifene antagonises anticoagulant
effect of coumarins
Lipid-regulating Drugs: absorption of rifaxifene
reduced by colestyramine (manufacturer of rifaxifene
advises avoid concomitant administration)
Ralteglavir
• Antibacterials: plasma concentration of raltegravir
increased by enfuvirtide—consider increasing dose of
raltegravir
• Ulcer-healing Drugs: plasma concentration of rate-
gravir increased by omeprazole—avoid concomi-
tant use; plasma concentration of raltegravir possibly
increased by histamine H-antagonists and proton
pump inhibitors—manufacturer of raltegravir advises
avoid concomitant use
Ramipril see ACE Inhibitors
Ranitidine see Histamine H-antagonists
Rasagiline
Note Rasagiline is a MAO-B inhibitor
• Analgesics: avoid concomitant use of rasagiline with
dextromethorphan; risk of CNS toxicity when
rasagiline given with methadone (avoid methadone for 2
weeks after rasagiline)
• Antidepressants: after stopping rasagiline do not start
fluoxetine for 2 weeks, also rasagiline should not be
started until at least 5 weeks after stopping fluox-
etine; after stopping rasagiline do not start
fluvoxamine for 2 weeks; risk of hypertensive crisis
when rasagiline given with MAOs; avoid MAOs for
at least 2 weeks after stopping rasagiline; increased
risk of CNS toxicity when rasagiline given with
SSRIs or tricyclics
Dopaminergics: plasma concentration of rasagiline
possibly reduced by entacapone
Memantine: effects of dopaminergics possibly
enhanced by memantine
Methylodopa: antiparkinsonian effect of dopaminergics
antagonised by methylodopa
• Sympathomimetics: avoid concomitant use of rasagi-
line with sympathomimetics
Reboxetine
• Antibacterials: manufacturer of reboxetine advises
avoid concomitant use with macrolides
• Antidepressants: manufacturer of reboxetine advises
avoid concomitant use with fluvoxamine; increased
Reboxetine
• Antidepressants: manufacturer of reboxetine advises
avoid concomitant use with MAOs (MAOs should
not be started until 1 week after stopping
reboxetine, avoid reboxetine for 2 weeks after stopping
MAOs)
Antifungals: manufacturer of reboxetine advises avoid
concomitant use with imidazoles and triazoles
Antimalarials: avoidance of antidepressants advised by
manufacturer of recommends monitoring liver function when
given with reboxetine
Atomoxetine: possible increased risk of convulsions
when antidepressants given with atomoxetine
Diuretics: possible increased risk of hypokalaemia
when reboxetine given with loop diuretics or thia-
azes and related diuretics
Ergot Alkaloids: possible risk of hypertension when
reboxetine given with ergot alkaloids
Sibutramine: increased risk of CNS toxicity when
noradrenaline re-uptake inhibitors given with
sibutramine (manufacturer of sibutramine advises
avoid concomitant use)
Remifentanil see Opioid Analgesics
Repaglinide see Antidiabetics
Retinoids
• Alcohol: etretinate formed from acitretin in presence of
alcohol (increased risk of teratogenicity in women of
child-bearing potential)
Antibacterials: possible increased risk of benign
intracranial hypertension when retinoids given with
tetracyclines (avoid concomitant use)
Anticoagulants: acitretin possibly reduces anti-
coagulant effect of coumarins
Antiepileptics: isotretnoin possibly reduces plasma
concentration of carbamazepine
Antifungals: plasma concentration of alitretinoin
increased by ketoconazole
• Cytotoxics: acitretin increases plasma concentration of
methotrexate (also increased risk of hepatotoxic-
ity)—avoid concomitant use
• Lipid-regulating Drugs: alitretinoin reduces plasma
concentration of simvastatin
Vitamins: risk of hypervitaminosis A when retinoids
given with vitamin A
Ribavirin
• Antivirals: increased risk of side-effects when ribavirin
given with didanosine—avoid concomitant use; ribavirin possibly inhibits effects of etidronate; increased
risk of anaemia when ribavirin given with
zidovudine—avoid concomitant use
Ribafutin see Rifampicins
Rifampicin see Rifampicins
Rifamycins
ACE Inhibitors: rifampicin reduces plasma concentra-
tion of active metabolite of imidapril (reduced anti-
hypertensive effect)
Analgesics: rifampicin reduces plasma concentration of
ericorixib; rifampicin accelerates metabolism of
methadone (reduced effect)
Antacids: absorption of rifampicin reduced by antacids
Anti-arthrythmics: rifampicin accelerate metabolism of
clarithromycin (reduced plasma concentration); rif-
ampicin accelerates metabolism of clozapine
(reduced effect)
Antibacterials: rifampicin reduces plasma concentra-
tion of clarithromycin and dapsone; plasma concentra-
tion of rifabutin increased by clarithromycin
(1increased risk of uveitis—reduce rifabutin dose); rifampicin tolerates metabolism of chlorampheni-
ol (reduced plasma concentration); plasma concentra-
tion of rifabutin possibly increased by macrolides
(increased risk of uveitis—reduce rifabutin dose); monitoring of liver function with rifampicin recom-
manded by manufacturer of quinupristin/dalfopristin;
rifampicin reduces plasma concentration of
clarithromycin (avoid during and for 2 weeks after
rifampicin); rifampicin possibly reduces plasma concentra-
tion of trimethoprim
**Rifamycins (continued)**

- **Anticoagulants:** rifamycins accelerate metabolism of warfarin (increased anticoagulant effect); rifamycin reduces plasma concentration of warfarin.

- **Antidepressants:** rifamycin possibly reduces plasma concentration of tricyclics.

- **Antidiabetics:** rifamycins accelerate metabolism of tolbutamide, glibenclamide, and chlorpropamide (reduced effect); rifamycin reduces plasma concentration of glibenclamide and tolbutamide; rifamycin also reduces plasma concentration of acetohexamide (reduced effect).

- **Antiepileptics:** rifamycin reduces plasma concentration of phenytoin (reduced plasma concentration).

- **Antifungals:** rifamycin accelerates metabolism of itraconazole, voriconazole, and posaconazole (increased risk of hepatotoxicity).

- **Antipsychotics:** haloperidol (reduced plasma concentration) and also monitor for rifabutin toxicity; citalopram, escitalopram, and fluoxetine (increased metabolism by rifampicin); plasma concentration of citalopram possibly increased by concomitant use; rifampicin reduces plasma concentration of escitalopram and fluoxetine.

- **Antimalarials:** rifamycins affect metabolism of chloroquine (increased plasma concentration) and also monitor for rifabutin toxicity; rifampicin reduces plasma concentration of hydroxychloroquine.

- **Antivirals:** rifamycin reduces plasma concentration of lopinavir.

- **Calcium-channel Blockers:** rifampicin reduces plasma concentration of diltiazem, verapamil, felodipine, and isradipine; rifamycin possibly reduces plasma concentration of felodipine.

- **Ciclosporin:** rifamycins accelerate metabolism of ciclosporin; rifamycin possibly reduces plasma concentration of ciclosporin.

- **Corticosteroids:** rifamycins accelerate metabolism of cortisol.

- **Diuretics:** rifamycin reduces plasma concentration of spironolactone.

- **Hormone antagonists:** rifamycin reduces plasma concentration of exemestane; rifamycin accelerates metabolism of tamoxifen (reduced plasma concentration).

- **Hormone antagonists (continued):** rifamycin reduces plasma concentration of voriconazole; rifamycin reduces plasma concentration of voriconazole.

- **Lipid-regulating drugs:** atorvastatin and simvastatin (reduced effect) of atorvastatin and simvastatin.

- **Lipid-regulating drugs (continued):** fenofibrate reduces plasma concentration of atorvastatin and simvastatin (reduced effect) of atorvastatin and simvastatin.

- **Leflunomide:** rifamycin reduces plasma concentration of leflunomide.

- **Oestrogens:** rifamycins accelerate metabolism of oestrogens (reduced contraceptive effect—see p. 439); antibacterials that do not induce liver enzymes possibly reduces contraceptive effect of oestrogens (risk probably small, see p. 439).

**Rifamycins**

- **Antivirals (continued)**

- **Antiretrovirals:** rifabutin reduces plasma concentration of maraviroc; rifabutin reduces plasma concentration of raltegravir; rifabutin reduces plasma concentration of maraviroc and raltegravir; plasma concentration of rifabutin increased by nelfinavir (halve dose of rifabutin); plasma concentration of rifabutin possibly increased by nevirapine; plasma concentration of rifabutin increased by ritonavir (increased risk of toxicity); rifabutin reduces plasma concentration of saquinavir; rifamycin significantly reduces plasma concentration of saquinavir, also risk of hepatotoxicity—avoid concomitant use; rifampicin possibly reduces plasma concentration of elprapavir; rifampicin significantly reduces plasma concentration of atazanavir—avoid concomitant use.

- **Anxiolytics and Hypnotics:** rifamycin accelerates metabolism of diazepam (reduced plasma concentration); rifampicin possibly accelerates metabolism of benzodiazepines; rifamycin reduces plasma concentration of buspirone and zaleplon; rifampicin accelerates metabolism of zolpidem (reduced plasma concentration and reduced effect); rifampicin significantly reduces plasma concentration of zopiclone.

Barbiturates: plasma concentration of rifampicin possibly reduced by phenobarbital.

Betablockers: rifamycin accelerates metabolism of bisoprolol and propranolol (plasma concentration significantly reduced); rifampicin possibly reduces plasma concentration of carvedilol, celiprolol and metoprolol.

- **Beta-blockers:** rifamycin accelerates metabolism of metoprolol; plasma concentration of metoprolol increased by rifampicin; plasma concentration of atorvastatin and simvastatin (reduced effect) of atorvastatin and simvastatin.

- **Calcium-channel blockers:** rifamycin possibly accelerates metabolism of diltiazem and nicardipine (possible significantly reduced plasma concentration); rifamycin accelerates metabolism of felnidipine, nifedipine, nitrendipine and verapamil (plasma concentration significantly reduced).

Cardiac Glycosides: rifamycins accelerate metabolism of digoxin (reduced effect); rifampicin possibly reduces plasma concentration of digoxin.

- **Ciclosporin:** rifamycin accelerates metabolism of ciclosporin (reduced plasma concentration).

- **Corticosteroids:** rifamycins accelerate metabolism of corticosteroids (reduced effect).

- **Cytoxotics:** rifamycin reduces plasma concentration of active metabolite of mepacrine (reduced effect); rifamycin accelerates metabolism of ivermectin; rifamycin reduces plasma concentration of ivermectin.

- **Diuretics:** rifamycin reduces plasma concentration of spironolactone.

- **Hormone Antagonists:** rifamycin reduces plasma concentration of exemestane; rifamycin accelerates metabolism of tamoxifen (reduced plasma concentration).

- **Hormone Antagonists (continued):** rifamycin reduces plasma concentration of exemestane; rifamycin accelerates metabolism of tamoxifen (reduced plasma concentration).

- **Lipid-regulating drugs:** atorvastatin and simvastatin (reduced effect) of atorvastatin and simvastatin.

- **Lipid-regulating drugs (continued):** fenofibrate reduces plasma concentration of atorvastatin and simvastatin (reduced effect) of atorvastatin and simvastatin.

- **Leflunomide:** rifamycin reduces plasma concentration of leflunomide.

- **Oestrogens:** rifamycins accelerate metabolism of oestrogens (reduced contraceptive effect—see p. 439); antibacterials that do not induce liver enzymes possibly reduces contraceptive effect of oestrogens (risk probably small, see p. 439).
Anticoagulants: ritonavir possibly reduces plasma concentration of phenytoin—avoid concomitant use

Antiepileptics: ritonavir possibly reduces plasma concentration of phenytoin—avoid concomitant use

Antifungals: combination of ritonavir with itraconazole or ketoconazole may increase plasma concentration of either drug (or both); plasma concentration of ritonavir increased by fluconazole; ritonavir reduces plasma concentration of voriconazole—avoid concomitant use

Antihistamines: ritonavir possibly increases plasma concentration of non-sedating antihistamines

Antimaculins: avoidance of ritonavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when ritonavir given with fesoterodine consult fesoterodine product literature; ritonavir increases plasma concentration of solifenacin

Antipsychotics: ritonavir possibly increases plasma concentration of antipsychotics; ritonavir possibly inhibits metabolism of aripiprazole (reduce dose of aripiprazole); ritonavir increases plasma concentration of olanzapine (increased risk of toxicity)—avoid concomitant use; ritonavir reduces plasma concentration of olanzapine—consider increasing dose of olanzapine; ritonavir increases plasma concentration of epimozide and esertidolone (increased risk of ventricular arrhythmias—avoid concomitant use)

Antivirals: ritonavir increases toxicity of efavirenz, nevirapine (function tests); ritonavir increases plasma concentration of indinavir and saquinavir; combination of ritonavir with nelfinavir may increase plasma concentration of either drug (or both)

Anxiolytics and Hypnotics: ritonavir possibly increases plasma concentration of anxiolytics and hypnotics; ritonavir possibly increases plasma concentration of alprazolam, diazepam, flurazepam and zolpidem (risk of extreme sedation and respiratory depression—avoid concomitant use); ritonavir possibly increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam); ritonavir increases plasma concentration of bupropione (increased risk of toxicity)

Aprepitant: ritonavir possibly increases plasma concentration of aprepitant

Bosentan: ritonavir possibly increases plasma concentration of bosentan

Bupropion: ritonavir increases or decreases plasma concentration of bupropion

Calcium-channel Blockers: ritonavir possibly increases plasma concentration of calcium-channel blockers; avoidance of ritonavir advised by manufacturer of lercanidipine

Cardiac Glycosides: ritonavir possibly increases plasma concentration of digoxin

Ciclosporin: ritonavir possibly increases plasma concentration of ciclosporin

Cilostazol: ritonavir possibly increases plasma concentration of cilostazol—avoid concomitant use

Corticosteroids: ritonavir possibly increases plasma concentration of corticosteroids, dexamethasone and prednisolone; ritonavir increases plasma concentration of inhaled and intranasal budesonide and fluticasone

Cytochrome P450: avoidance of ritonavir advised by manufacturer of laptatinib and lolitnib; ritonavir increases plasma concentration of paxitaxel

Diuretics: ritonavir increases plasma concentration of spironolone—avoid concomitant use

Ergot Alkaloids: increased risk of ergotism when ritonavir given with ergotamine and methysergide—avoid concomitant use

5HT Agonists: ritonavir increases plasma concentration of eletriptan (risk of toxicity)—avoid concomitant use
Ritonavir (continued)
- Ivermectin: ritonavir possibly increases plasma concentration of ivermectin—avoid concomitant use
- Lipid-regulating Drugs: possible increased risk of myopathy when ritonavir given with atorvastatin; possible increased risk of myopathy when ritonavir given with rosuvastatin—avoid concomitant use; increased risk of myopathy when ritonavir given with simvastatin (avoid concomitant use)
- Oestrogens: ritonavir accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 439)
- Sildenafil: ritonavir significantly increases plasma concentration of sildenafil—avoid concomitant use
- Symptomimetics: ritonavir possibly increases plasma concentration of dexametidine
- Tacrolimus: ritonavir possibly increases plasma concentration of tacrolimus
- Tadalafil: ritonavir increases plasma concentration of tadalafil
- Theophylline: ritonavir accelerates metabolism of theophylline (reduced plasma concentration)
- Vardenafil: ritonavir possibly increases plasma concentration of vardenafil—avoid concomitant use

Rivaroxaban
- Antibacterials: plasma concentration of rivaroxaban reduced by rifampicin
- Antifungals: plasma concentration of rivaroxaban increased by ketoconazole—avoid concomitant use; manufacturer of rivaroxaban advises avoid concomitant use with itraconazole, posaconazole and voriconazole
- Antivirals: manufacturer of rivaroxaban advises avoid concomitant use with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, saquinavir and tipranavir; plasma concentration of rivaroxaban increased by ritonavir—manufacturer of rivaroxaban advises avoid concomitant use
- Sibutramine: increased risk of bleeding when anticoagulants given with sibutramine

Rivastigmine see Parasympathomimetics
Rizatriptan see 5HT Agonists
Rocuronium see Muscle Relaxants
Ropinirole
- Antibacterials: metabolism of ropinirole inhibited by ciprofloxacin (increased plasma concentration)
- Antipsychotics: manufacturer of ropinirole advises avoid concomitant use of antipsychotics (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Methylodopa: antiparkinsonian effect of dopaminergics antagonised by methylodopa
- Metoclopramide: manufacturer of ropinirole advises avoid concomitant use of metoclopramide (antagonism of effect)
- Oestrogens: plasma concentration of ropinirole increased by oestrogens

Ropivacaine
- Anti-arhythmic: increased myocardial depression when ropivacaine given with anti-arhythmics
- Antidepressants: metabolism of ropivacaine inhibited by fluvoxamine—avoid prolonged administration of ropivacaine
- Rosiglitazone see Antidiabetics
- Rosuvastatin see Statins

Rotigotine
- Antipsychotics: manufacturer of rotigotine advises avoid concomitant use of antipsychotics (antagonism of effect)
- Memantine: effects of dopaminergics possibly enhanced by memantine
- Methylodopa: antiparkinsonian effect of dopaminergics antagonised by methylodopa
- Metoclopramide: manufacturer of rotigotine advises avoid concomitant use of metoclopramide (antagonism of effect)

Rowachol®
- Anticoagulants: Rowachol possibly reduces anticoagulant effect of coumarins

Rufinamide
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by mefloquine
- Oestrogens: rufinamide accelerates metabolism of oestrogens (reduced contraceptive effect—see p. 439)
- Progestogens: rufinamide accelerates metabolism of progestogens (reduced contraceptive effect—see p. 439)

St John’s Wort
- Antibacterials: St John’s wort reduces plasma concentration of tetracycline (avoid during and for 2 weeks after St John’s wort)
- Anticoagulants: St John’s wort reduces plasma concentration of coumarins (avoid concomitant use)
- Antidepressants: possible increased serotonergic effects when St John’s wort given with duloxetine; St John’s wort reduces plasma concentration of amitriptyline; increased serotonergic effects when St John’s wort given with SSRIs—avoid concomitant use
- Antiepileptics: avoid concomitant use of St John’s wort with antiepileptics
- Antifungals: St John’s wort reduces plasma concentration of voriconazole—avoid concomitant use
- Antimalarials: avoidance of antiepileptics advised by manufacturer of etravirine; St John’s wort possibly reduces plasma concentration of maraviroc and tipranavir—avoid concomitant use
- Antioxidants and Hypnotics: St John’s wort possibly reduces plasma concentration of oral midazolam
- Aprepitant: avoidance of St John’s wort advised by manufacturer of aprepitant
- Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Barbiturates: avoid concomitant use of St John’s wort with phenobarbital
- Calcium-channel Blockers: manufacturer of amlodipine—avoid concomitant use; avoidance of St John’s wort advised by manufacturer of amlodipine
- Cardiac Glycosides: St John’s wort reduces plasma concentration of digoxin—avoid concomitant use
- Ciclosporin: St John’s wort reduces plasma concentration of ciclosporin—avoid concomitant use
- Cytoxotics: St John’s wort reduces plasma concentration of plerixafor—avoid concomitant use
- Diuretics: St John’s wort reduces plasma concentration of spironolactone—avoid concomitant use
- 5HT Agonists: increased serotonergic effects when St John’s wort given with 5HT agonists—avoid concomitant use
St John’s Wort (continued)

Ivabradine: St John’s wort reduces plasma concentration of ivabradine—avoid concomitant use
Lipid-regulating Drugs: St John’s wort reduces plasma concentration of simvastatin

• Oestrogens: St John’s wort reduces contraceptive effect of oestrogens (avoid concomitant use)
• Progestogens: St John’s wort reduces contraceptive effect of progestogens (avoid concomitant use)
• Tacrolimus: St John’s wort reduces plasma concentration of tacrolimus—avoid concomitant use
• Theophylline: St John’s wort reduces plasma concentration of theophylline—avoid concomitant use
Salbutamol see Sympathomimetics, Beta
Salmeterol see Sympathomimetics, Beta
Saquinavir

• Antibacterials: plasma concentration of saquinavir reduced by erafabutin; plasma concentration of saquinavir significantly reduced by imipenem, also risk of hepatotoxicity—avoid concomitant use; plasma concentration of saquinavir possibly increased by quinupristin/dalfopristin; avoidance of concomitant saquinavir in severe renal and hepatic impairment advised by manufacturer of telithromycin
Anticoagulants: saquinavir possibly enhances anti-coagulant effect of warfarin; avoidance of saquinavir advised by manufacturer of rivaroxaban
• Antidepressants: plasma concentration of saquinavir reduced by St John’s wort—avoid concomitant use
• Antiepileptics: plasma concentration of saquinavir possibly reduced by carbamazepine, phenytoin and primidone
Antifungals: plasma concentration of saquinavir increased by ketoconazole; plasma concentration of saquinavir possibly increased by imidazoles and triazoles
Antimalarials: caution with saquinavir advised by manufacturer of arteether/lumefantrine
Antimuscarnics: avoidance of saquinavir advised by manufacturer of darifenacin and tolterodine; manufacturer of fesoterodine advises dose reduction when saquinavir given with fesoterodine—consult fesoterodine manufacturer of darifenacin and tolterodine; manufacturer of entacapone if used concomitantly
• Antipsychotics: saquinavir possibly inhibits metabolism of earipiprazole (reduce dose of earipiprazole); saquinavir possibly increases plasma concentration of amitriptyline (increased risk of ventricular arrhythmias—avoid concomitant use); saquinavir increases plasma concentration of sertindole (increased risk of extrastriate arhythmias—avoid concomitant use)
• Antivirals: plasma concentration of saquinavir increased by atazanavir, indinavir, lopinavir and ritonavir; saquinavir reduces plasma concentration of darunavir; plasma concentration of saquinavir significantly reduced by elaviren; saquinavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); combination of saquinavir with nelfinavir may increase plasma concentration of either drug (or both); plasma concentration of saquinavir reduced by tipranavir
• Anxiolytics and Hypnotics: saquinavir increases plasma concentration of midazolam (risk of prolonged sedation—avoid concomitant use of oral midazolam)
Barbiturates: plasma concentration of saquinavir possibly reduced by barbiturates
Ciclosporin: plasma concentration of both drugs increased when saquinavir given with ciclosporin
Cilostazol: saquinavir possibly increases plasma concentration of cilostazol—avoid concomitant use
Corticosteroids: plasma concentration of saquinavir possibly reduced by dexamethasone
Cytotoxics: avoidance of saquinavir advised by manufacturer of lapaatinib
Diuretics: saquinavir increases plasma concentration of eplerenone (reduce dose of eplerenone)

Saquinavir (continued)

• Ergot Alkaloids: increased risk of ergotism when saquinavir given with ergotamine and methysergide
• Lipid-regulating Drugs: possible increased risk of myopathy when saquinavir given with atorvastatin; possible increased risk of myopathy when saquinavir given with rosuvastatin—avoid concomitant use; increased risk of myopathy when saquinavir given with simvastatin—even in concomitant use; Sildenafil: saquinavir possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil

Tacrolimus: saquinavir increases plasma concentration of tacrolimus (consider reducing dose of tacrolimus)
Tadalafil: saquinavir possibly increases plasma concentration of tadalafil—reduce initial dose of tadalafil
Ulcer-healing Drugs: plasma concentration of saquinavir increased by omeprazole
Vardenafil: saquinavir possibly increases plasma concentration of vardenafil—reduce initial dose of vardenafil

Secobarbital see Barbiturates
SelgeLINE

Note SelgeLINE is a MAO-B inhibitor

• Analgesics: hypoxepirexia and CNS toxicity reported when selegiline given with pethidine (avoid concomitant use); manufacturer of selegiline advises caution with tramadol
• Antidepressants: theoretical risk of serotonin syndrome if selegiline given with citalopram (especially if dose of selegiline 10 mg daily); caution with selegiline advised by manufacturer of escitalopram; increased risk of hypertension and CNS excitation when selegiline given with lithium (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with fluvoxamine or venlafaxine; avoid fluvoxamine or venlafaxine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with fluoxetine (selegiline should not be started until 2 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); enhanced hypnotic effect when selegiline given with MAOIs; avoid concomitant use of selegiline with moclobemide; CNS toxicity reported when selegiline given with tricyclics
Dopaminergics: max. dose of 10 mg selegiline advised by manufacturer of entacapone if used concomitantly; selegiline enhances effects and increases toxicity of levodopa (reduce dose of levodopa)
Mametane: effects of dopaminergics and selegiline possibly enhanced by memantine
Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Oestrogens: plasma concentration of selegiline increased by oestrogens (increased risk of toxicity)
Progestogens: plasma concentration of selegiline increased by progestogens (increased risk of toxicity)
• Sympathomimetics: risk of hypertensive crisis when selegiline given with dopamine
Selenium

Vitamins: absorption of selenium possibly reduced by ascorbic acid (give at least 4 hours apart)
Stertindole see Antipsychotics
Sertaline see Antidepressants, SSRIs
Sevelamer

Antibacterials: sevelamer reduces bioavailability of ciprofloxacin
Ciclosporin: sevelamer possibly reduces plasma concentration of ciclosporin
Cytotoxics: sevelamer possibly reduces plasma concentration of mycophenolate

778 Appendix 1: Interactions BNF 57
Antivirals: sevelamer possibly reduces plasma concentration of tacrolimus
Sevelamer see Anaesthetics, General
Sibutramine Analgesics: increased risk of bleeding when sibutramine given with NSAIDs or aspirin
Non-steroidal anti-inflammatory drugs: increased risk of bleeding when sibutramine given with anticoagulants
• Antidepressants: increased CNS toxicity when sibutramine given with MAOIs or moclobemide (manufacturer of sibutramine advises avoid concomitant use), also avoid sibutramine for 2 weeks after stopping MAOIs or moclobemide; increased risk of CNS toxicity when sibutramine given with SSRI-related antidepressants, SSRIs, nortriptyline, imipramine, amitriptyline, tricyclic-related antidepressants, tricycles or tricycop (manufacturer of sibutramine advises avoid concomitant use)
• Antipsychotics: increased risk of CNS toxicity when sibutramine given with antipsychotics (manufacturer of sibutramine advises avoid concomitant use)

Sildenafil
Alpha-blockers: enhanced hypotensive effect when sildenafil given with alpha-blockers (avoid alpha-blockers for 4 hours after sildenafil)
Antibacterials: plasma concentration of sildenafil possibly increased by clarithromycin and telithromycin—reduce initial dose of sildenafil; plasma concentration of sildenafil increased by erythromycin—reduce initial dose of sildenafil
Antifungals: plasma concentration of sildenafil increased by itraconazole and ketoconazole—reduce initial dose of sildenafil
Antivirals: side-effects of sildenafil possibly increased by stavudine, plasma concentration of sildenafil reduced by efavirenz; plasma concentration of sildenafil possibly increased by fosamprenavir, nelfinavir and saquinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil increased by indinavir—reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by ritonavir—avoid concomitant use
Boventan: plasma concentration of sildenafil reduced by bosentan
Calcium-channel Blockers: enhanced hypotensive effect when sildenafil given with amiodipine
Grapefruit Juice: plasma concentration of sildenafil significantly enhanced by grapefruit juice
Nicorandil: sildenafil significantly enhances anticoagulant effect of nicorandil (avoid concomitant use)
Nitrates: sildenafil significantly enhances hypotensive effect of nitrates (avoid concomitant use)
Ulcer-healing Drugs: plasma concentration of sildenafil increased by cimetidine (reduce initial dose of sildenafil)

Simovalstatin see Statins
Siroliimus (continued)
Ciclosporin: plasma concentration of sirolimus increased by ciclosporin
• Grapefruit Juice: plasma concentration of sirolimus increased by grapefruit juice—avoid concomitant use

Sitaxentan
• Anticoagulants: sitaxentan enhances anticoagulant effect of coumarins
• Ciclosporin: plasma concentration of sitaxentan increased by ciclosporin—avoid concomitant use
Oestrogens: sitaxentan increases plasma concentration of oestrogens
Progestogens: sitaxentan increases plasma concentration of progestogens

Sodium Aurothiomalate see Gold
Sodium Benzoate Antiepileptics: effects of sodium benzoate possibly reduced by valproate
Antipsychotics: effects of sodium benzoate possibly reduced by haloperidol
Corticosteroids: effects of sodium benzoate possibly reduced by corticosteroids
Probendil: excretion of conjugate formed by sodium benzoate possibly reduced by probendil
Sodium Bicarbonate see Antacids
Sodium Clodranate see Bisphosphonates
Sodium Nitroprusside see Vasodilator Antihypertensives
Sodium Oxybate Analgesics: effects of sodium oxybate enhanced by opioid analgesics (avoid concomitant use)
Antidepressants: increased risk of side-effects when sodium oxybate given with tricycles
Antipsychotics: effects of sodium oxybate possibly enhanced by antipsychotics
Anxiolytics and Hypnotics: effects of sodium oxybate enhanced by benzodiazepines (avoid concomitant use)
Barbiturates: effects of sodium oxybate enhanced by barbiturates (avoid concomitant use)

Sodium Phenylbutyrate
Antiepileptics: effects of sodium phenylbutyrate possibly reduced by valproate
Antipsychotics: effects of sodium phenylbutyrate possibly reduced by haloperidol
Corticosteroids: effects of sodium phenylbutyrate possibly reduced by corticosteroids
Probendil: excretion of conjugate formed by sodium phenylbutyrate possibly reduced by probendil
Sodium Valproate see Valproate
Solifenacin see Antimuscarinics
Somatropin Corticosteroids: growth-promoting effect of somatropin may be inhibited by corticosteroids
Oestrogens: increased doses of somatropin may be needed when given with oestrogens (when used as oral replacement therapy)

Sorafenib
Antibacterials: plasma concentration of sorafenib reduced by rifampicin
Anticoagulants: sorafenib possibly enhances anticoagulant effect of coumarins
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Cytotoxics: sorafenib possibly increases plasma concentration of doxorubicin and irinotecan; sorafenib increases plasma concentration of docetaxel
Sotalol see Beta-blockers
Spirinolactone see Diuretics
Statins Anticandies: absorption of rosuvastatin reduced by antacids
Anti-arrhythmics: increased risk of myopathy when simvastatin given with amiodarone
Statins (continued)

- Antibacterials: plasma concentration of atorvastatin and pravastatin increased by erlotinib; increased risk of myopathy when simvastatin given with clarithromycin, erythromycin, or telithromycin (avoid concomitant use); plasma concentration of rosuvastatin reduced by clarithromycin; possible increased risk of myopathy when atorvastatin given with erythromycin or fusidic acid; plasma concentration of pravastatin increased by erythromycin; plasma concentration of atorvastatin and simvastatin possibly reduced by rifampicin; metabolism of fluvastatin accelerated by rifampicin (reduced effect); increased risk of myopathy when statins given with dapotimycin (preferably avoid concomitant use); increased risk of myopathy when statins given with imatinib; increased risk of myopathy when atorvastatin given with telithromycin (avoid concomitant use)

- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of warfarin; rosuvastatin possibly enhances anticoagulant effect of coumarins and phenindione; fluvastatin and simvastatin enhance anticoagulant effect of coumarins

- Antidepressants: plasma concentration of simvastatin reduced by St John’s wort

- Antidiabetics: fluvastatin possibly increases plasma concentration of glibenclamide

- Antiepileptics: combination of fluvastatin with phenytoin may increase plasma concentration of either drug (or both)

- Antifungals: increased risk of myopathy when simvastatin given withitraconazole, ketoconazole or posaconazole (avoid concomitant use); possible increased risk of myopathy when simvastatin given with itraconazole—avoid concomitant use; plasma concentration of fluvastatin increased by fluconazole; increased risk of myopathy when atorvastatin given with itraconazole or posaconazole (avoid concomitant use); possible increased risk of myopathy when atorvastatin or simvastatin given with imidazoles; possible increased risk of myopathy when atorvastatin or simvastatin given with triazoles

- Antivirals: possible increased risk of myopathy when rosuvastatin given with atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir or tipranavir—avoid concomitant use; increased risk of myopathy when simvastatin given with atazanavir, indinavir, nelfinavir, ritonavir, or saquinavir (avoid concomitant use); possible increased risk of myopathy when atorvastatin given with atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir or saquinavir; plasma concentration of pravastatin possibly reduced by darunavir; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by elavirenz; plasma concentration of atorvastatin possibly reduced by etravirine; possible increased risk of myopathy when simvastatin given with fosamprenavir or lopinavir—avoid concomitant use

- Bosentan: plasma concentration of simvastatin reduced by bosentan

- Calcium-channel Blockers: plasma concentration of atorvastatin increased by diltiazem; possible increased risk of myopathy when simvastatin given with diltiazem; increased risk of myopathy when simvastatin given with verapamil

- Cardiac Glycosides: atorvastatin possibly increases plasma concentration of digoxin

- Ciclosporin: increased risk of myopathy when statins given with ciclosporin; increased risk of myopathy when rosuvastatin given with ciclosporin (avoid concomitant use)

- Colchicine: possible increased risk of myopathy when statins given with colchicine

- Cytotoxics: plasma concentration of simvastatin possibly increased by dasatinib; plasma concentration of simvastatin increased by imatinib

Statins (continued)

- Grapefruit juice: plasma concentration of atorvastatin possibly increased by grapefruit juice; plasma concentration of simvastatin increased by grapefruit juice—avoid concomitant use

- Hormone Antagonists: possible increased risk of myopathy when simvastatin given with danazol

- Lipid-regulating Drugs: increased risk of myopathy when statins given with gemfibrozil (preferably avoid concomitant use); increased risk of myopathy when statins given with fibrates; increased risk of myopathy when statins given with nicotinic acid (applies to lipid regulating doses of nicotinic acid)

- Oestrogens: atorvastatin and rosuvastatin increase plasma concentration of ethinylestradiol

- Progestogens: atorvastatin increases plasma concentration of norethisterone; rosuvastatin increases plasma concentration of norgestrel

- Retinoids: plasma concentration of simvastatin reduced by altretinoin

Stavudine

- Antivirals: increased risk of side-effects when stavudine given with didanosine; effects of stavudine possibly inhibited by abacavir; effects of stavudine possibly inhibited by efavirenz (manufacturers advise avoid concomitant use)

- Cytotoxics: effects of stavudine possibly inhibited by doxorubicin; increased risk of toxicity when stavudine given with hydroxyurea—avoid concomitant use

Streptomycin see Aminoglycosides

Strontium Ranelate

- Antibacterials: strontium ranelate reduces absorption of quinolones and tetracyclines (manufacturer of strontium ranelate advises avoid concomitant use)

Sucralfate

- Antibacterials: sucralfate reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin, ofloxacin and tetracyclines

- Anticoagulants: sucralfate possibly reduces absorption of coumarins (reduced anticoagulant effect)

- Antiepileptics: sucralfate reduces absorption of phenytoin

- Antifungals: sucralfate reduces absorption of ketoconazole

- Antipsychotics: sucralfate reduces absorption of sulpiride

- Cardiac Glycosides: sucralfate possibly reduces absorption of digitoxin

- Theophylline: sucralfate possibly reduces absorption of theophylline (give at least 2 hours apart)

- Thyroid Hormones: sucralfate reduces absorption of levothyroxine (thyroxine)

- Ulcer-healing Drugs: sucralfate possibly reduces absorption of lansoprazole

Sugammadex

- Antibacterials: response to sugammadex possibly reduced by fluoroquinolones and fusidic acid

- Hormone Antagonists: response to sugammadex possibly reduced by tamoxifen

- Oestrogens: sugammadex possibly reduces plasma concentration of oestrogens

- Progestogens: sugammadex possibly reduces plasma concentration of progestogens

Sulfadiazine see Sulphonamides

Sulfadoxine see Sulphonamides

Sulfamethoxazole see Sulphonamides

Sulfasalazine see Aminosalicylates

Sulfinpyrazone Antagonists: effects of sulfinpyrazone antagonised by aspirin

- Antibacterials: sulfinpyrazone reduces excretion of nitrofurantoin (increased risk of toxicity); sulfinpyrazone reduces excretion of penicillins; effects of sulfinpyrazone antagonised by pyrazinamide

- Anticoagulants: sulfinpyrazone enhances anti-coagulant effect of coumarins

- Antidiabetics: sulfinpyrazone enhances effects of sulphonylureas
Anticoagulants: sulfipyrazone increases plasma concentration of dicumarol.

Ciclosporin: increased risk of nephrotoxicity when sulphonamides given with dicumarol.

Ciclosporin: increased risk of haematological toxicity when sulphonamides given with methotrexate; sulfadiazine.

Anticoagulants: increased risk of hypotensive effect of sympathomimetics given with dicumarol.

Anticoagulants: increased risk of arrhythmias when sulphonamides given with prilocaine.

Ciclosporin: increased risk of ventricular arrhythmias when sulphonamides (as co-trimoxazole) given with amiodarone—avoid concomitant use of co-trimoxazole.

Antibacterials: increased risk of crystalluria when sulphonamides given with methenamine.

Anticoagulants: sulfipyrazone enhances anticoagulant effect of coumarins.

Anticoagulants: sulfipyrazone increases plasma concentration of phenytoin.

Anticoagulants: increased risk of methaemoglobinemia when sulphonamides given with propranolol.

Anticoagulants: increased antifolate effect when sulphonamides given with pyrimethamine (includes Fansidar).

Anticoagulants: increased risk of hypertension when vasoconstrictor sympathomimetics given with methylphenidate possibly increases plasma concentration of primidone.

Anticoagulants: increased risk of severe hypertension and bradycardia when adrenaline (epinephrine) given with non-cardioselective beta-blockers, also response to adrenaline (epinephrine) may be reduced; increased risk of severe hypertension and bradycardia when dobutamine given with non-cardioselective beta-blockers; possible increased risk of severe hypertension and bradycardia when noradrenaline (norepinephrine) given with non-cardioselective beta-blockers.

Clonidine: possible risk of hypertension when adrenaline (epinephrine) or noradrenaline (norepinephrine) given with clonidine; serious adverse events reported with concomitant use of methylphenidate and clonidine (causality not established).

Corticosteroids: ephedrine accelerates metabolism of dexamethasone.

Dopaminergics: risk of toxicity when isometheptene or phenylpropanolamine given with bromocriptine; effects of adrenaline (epinephrine), dobutamine, dopamine and noradrenaline (norepinephrine) possibly enhanced by entacapone; avoid concomitant use of sympathomimetics with rasagiline; risk of hypertensive crisis when dopamine given with selegiline.

Dopaminergics: increased risk of ergotism when sympathomimetics given with ergotamine and methysergide.

Oxytocin: risk of hypertension when vasoconstrictor sympathomimetics given with oxytocin (due to enhanced vasopressor effect).

Sympathomimetics: effects of adrenaline (epinephrine) possibly enhanced by parkalol; dopamine, possibly enhances effects of noradrenaline (norepinephrine).

Sympathomimetics: adrenaline (epinephrine) possibly increased by ritonavir; possible increased risk of hyper-tensive crisis when dopamine given with selegline.

Sympathomimetics: increased risk of hypertension when sympathomimetics given with doxapram.

Sympathomimetics: increased risk of hypertensive crisis when sympathomimetics given with high doses of beta sympathomimetics.

Beta-blockers: increased risk of arrhythmias when adrenaline (epinephrine) given with volatile liquid general anaesthetics; increased risk of hypertension when methyldenamine given with volatile liquid general anaesthetics.

Anticoagulants: methylphenidate possibly enhances anticoagulant effect of coumarins.
Appendix 1: Interactions

Potassium Salts: 
- Diuretics:
- Barbiturates:
- Antidepressants:
- Antibacterials:

Barbiturates: increased risk of nephrotoxicity when tacrolimus given with phenytoin; plasma concentration of phenytoin possibly increased.

Antifungals: manufacturer of telithromycin advises avoid concomitant use with ketoconazole in severe renal and hepatic impairment.

Antimuscarinics: manufacturer of fesoterodine advises dose reduction when telithromycin given with fesoterodine—consult fesoterodine product literature.

Antipsychotics: increased risk of ventricular arrhythmias; avoid concomitant use with telithromycin given with pimozide—avoid concomitant use.

Antivirals: manufacturer of telithromycin advises avoid concomitant use with ketoconazole in severe renal and hepatic impairment.

Alpha-blockers: enhanced hypotensive effect when tadalafil given with alpha-blockers—avoid concomitant use.

Antibacterials: plasma concentration of tadalafil possibly increased by clarithromycin and erythromycin; plasma concentration of tadalafil reduced by rifampicin.

Antifungals: plasma concentration of tadalafil increased by ketoconazole; plasma concentration of tadalafil possibly increased by itraconazole.

Antivirals: plasma concentration of tadalafil possibly increased by fosamprenavir and indinavir; plasma concentration of tadalafil given with ritonavir; plasma concentration of tadalafil possibly increased by saquinavir—reduce initial dose of tadalafil.

Grapefruit Juice: plasma concentration of tadalafil possibly increased by grapefruit juice.

Nicorandil: tadalafil significantly enhances hypotensive effect of nicorandil (avoid concomitant use).

Nitricates: tadalafil significantly enhances hypotensive effect of nitricates (avoid concomitant use).

Tamoxifen: Anticoagulants: tamoxifen enhances anticoagulant effect of coumarins.

Tamsulosin: see Alpha-blockers.

Taxanes: see Docetaxel and Paclitaxel.

Tegafur with uracil: see Fluorouracil.

Teicoplanin: Antifungals: increased risk of nephrotoxicity and otoxicity when teicoplanin given with aminoglycosides or colistin.

Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439).

Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 879.

Telmisartan: Interferons: increased risk of peripheral neuropathy when telmisartan given with interferon alpha.

Telithromycin: Antivirals: plasma concentration of telithromycin reduced by ritonavir, nelfinavir and ritonavir; plasma concentration of telithromycin increased by saquinavir (consider reducing dose of telithromycin).

Alpha-blockers—avoid concomitant use with telithromycin given with aciclovir or ganciclovir.

Antituberculosis: increased risk of nephrotoxicity when telithromycin given with aciclovir or ganciclovir; plasma concentration of telithromycin possibly increased by atazanavir, nelfinavir and ritonavir; plasma concentration of telithromycin increased by saquinavir (consider reducing dose of telithromycin).

Barbiturates: plasma concentration of telithromycin reduced by St John’s wort—avoid concomitant use.

Antiepileptics: plasma concentration of telithromycin reduced by phenytoin, also plasma concentration of phenytoin possibly increased.

Antifungals: plasma concentration of telithromycin increased by fluconazole, itraconazole, ketoconazole and voriconazole; increased risk of nephrotoxicity when telithromycin given with amphotericin; plasma concentration of telithromycin increased by posaconazole (reduce dose of telithromycin); plasma concentration of telithromycin reduced by caspofungin; plasma concentration of telithromycin possibly increased by imidazoles and triazoles.

Antivirals: possible increased risk of nephrotoxicity when telithromycin given with aciclovir or ganciclovir; plasma concentration of telithromycin possibly increased by atazanavir, nelfinavir and ritonavir; plasma concentration of telithromycin increased by saquinavir (consider reducing dose of telithromycin).

Calcium-channel Blockers: plasma concentration of telithromycin possibly increased by felodipine, nifedipine and verapamil; plasma concentration of telithromycin increased by ediltiazem and nefedipine.

Ciclosporin: telithromycin increases plasma concentration of ciclosporin (increased risk of nephrotoxicity)—avoid concomitant use.

Diuretics: increased risk of hyperkalaemia when telithromycin given with potassium-sparing diuretics and aldosterone antagonists.

Grapefruit Juice: plasma concentration of telithromycin increased by grapefruit juice.

Hormone Antagonists: plasma concentration of telithromycin possibly increased by danazol.

Oestrogens: telithromycin possibly inhibits metabolism of oestrogens; plasma concentration of telithromycin possibly increased by ethinylestradiol.

Potassium Salts: increased risk of hyperkalaemia when telithromycin given with potassium salts.

Progestogens: telithromycin possibly inhibits metabolism of progestogens.

Sevelamer: plasma concentration of telithromycin possibly reduced by sevelamer.

Tacrolimus: Ulcer-healing Drugs: plasma concentration of tacrolimus possibly increased by omeprazole.

Tadalafil: when telithromycin given with atazanavir, fosamprenavir, indinavir, lopinavir, nelfinavir, ritonavir, saquinavir and tipranavir in severe renal and hepatic impairment; telithromycin possibly increases plasma concentration of tipranavir (consider reducing dose of maraviroc).

Anxiolytics and Hypnotics: telithromycin inhibits metabolism of midazolam (increased plasma concentration with increased sedation).

Aprepitant: telithromycin possibly increases plasma concentration of aprepitant.

Barbiturates: plasma concentration of telithromycin reduced by phenobarbital (avoid during and for 2 weeks after phenobarbital).
Telithromycin (continued)
Cardiac Glycosides: telithromycin possibly increases plasma concentration of digoxin
● Ciclosporin: telithromycin possibly increases plasma concentration of ciclosporin
● Cytotoxics: avoidance of telithromycin advised by manufacturer of lapatinib and nilotinib
● Diuretics: telithromycin increases plasma concentration of spironolactone—avoid concomitant use
● Ergot Alkaloids: increased risk of ergotism when telithromycin given with ergotamine and methysergide—avoid concomitant use
● Ivabradine: telithromycin possibly increases plasma concentration of ivabradine—avoid concomitant use
● Lipid-regulating Drugs: increased risk of myopathy when telithromycin given with atorvastatin or simvastatin (avoid concomitant use)
Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439) Sildenafil: telithromycin possibly increases plasma concentration of sildenafil—reduce initial dose of sildenafil
● Sirolimus: telithromycin increases plasma concentration of sirolimus—avoid concomitant use
● Tacrolimus: telithromycin possibly increases plasma concentration of tacrolimus—avoid concomitant use
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679
Telmisartan see Angiotensin-II Receptor Antagonists Temazepam see Anxiolytics and Hypnotics Temocillin see Penicillins Temoperforin
● Cytotoxics: increased skin photosensitivity when temoperforin given with topical fluourouracil
Temozolomide
Antiepileptics: cytotoxics possibly reduce absorption of phenytoin; plasma concentration of temozolomide increased by valproate
● Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis) Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Tensirolimus
Note The main active metabolite of tensirolimus is sirolimus—see also interactions of sirolimus and consult product literature
● Antibacterials: plasma concentration of active metabolite of tensirolimus reduced by rifampicin—avoid concomitant use Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
● Antifungals: plasma concentration of active metabolite of tensirolimus increased by ketoconazole—avoid concomitant use
● Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis) Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets
Tenfovir
● Antivirals: manufacturer of tenofovir advises avoid concomitant use with adefovir; tenofovir reduces plasma concentration of atazanavir, also plasma concentration of tenofovir possibly increased; combination of tenofovir with cidofovir may increase plasma concentration of either drug (or both); tenofovir increases plasma concentration of didanosine (increased risk of toxicity)—avoid concomitant use; plasma concentration of tenofovir increased by lopinavir
Tenoxam see NSAIDs Terazosin see Alpha-blockers Terbinafine
Antibacterials: plasma concentration of terbinafine reduced by rifampicin Antidepressants: terbinafine possibly increases plasma concentration of imipramine and nortriptyline

Terbinafine (continued)
Oestrogens: occasional reports of breakthrough bleeding when terbinafine given with oestrogens (when used for contraception) Progestogens: occasional reports of breakthrough bleeding when terbinafine given with progestogens (when used for contraception) Ulcer-healing Drugs: plasma concentration of terbinafine increased by cimetidine
Terbutaline see Sympathomimetics, Beta-2 Agonists Terpene Mixture see Rowachol Testolactone
● Antiagoualants: testolactone enhances anticoagulant effect of ecarin and phenindione
Testosterone
● Antiagoualants: testosterone enhances anticoagulant effect of ecarin and phenindione Antidiabetics: testosterone possibly enhances hypoglycaemic effect of antidiabetics
Tetrabenazine
● Antidepressants: risk of CNS excitation and hypertension when tetrabenazine given with MAOIs Antipsychotics: increased risk of extrapyramidal side-effects when tetrabenazine given with antipsychotics Dopaminergics: increased risk of extrapyramidal side-effects when tetrabenazine given with amantadine Metoclopramide: increased risk of extrapyramidal side-effects when tetrabenazine given with metoclopramide
Tetracosactide see Corticosteroids Tetracycline see Tetracyclines Tetracyclines
ACE Inhibitors: absorption of tetracyclines reduced by quinapril tablets (quinapril tablets contain magnesium carbonate) Adsorbents: absorption of tetracyclines possibly reduced by kaolin Antacids: absorption of tetracyclines reduced by antacids
● Antiagoualants: tetracyclines possibly enhance anticoagulant effect of ecarin and phenindione Antiepileptics: metabolism of doxycycline accelerated by carbamazepine (reduced effect); metabolism of doxycycline accelerated by phenytoin and primidone (reduced plasma concentration) Atovaquone: tetracycline reduces plasma concentration of atovaquone Barbiturates: metabolism of doxycycline accelerated by barbiturates (reduced plasma concentration) Calcium Salts: absorption of tetracycline reduced by calcium salts
● Ciclosporin: doxycycline possibly increases plasma concentration of ciclosporin Cytotoxics: doxycycline or tetracycline increase risk of methotrexate toxicity Dairy Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by dairy products Diuretics: manufacturer of lymecycline advises avoid concomitant use with diuretics Ergot Alkaloids: increased risk of ergotism when tetracyclines given with ergotamine and methysergide Iron: absorption of tetracyclines reduced by oral iron, also absorption of oral iron reduced by tetracyclines Lipid-regulating Drugs: absorption of tetracycline possibly reduced by colestipol and colestyramine Oestrogens: antibacterials that do not induce liver enzymes possibly reduce contraceptive effect of oestrogens (risk probably small, see p. 439)
● Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with retinoids (avoid concomitant use) Strontium Ranelate: absorption of tetracyclines reduced by strontium ranelate (manufacturer of strontium ranelate advises avoid concomitant use) Ulcer-healing Drugs: absorption of tetracyclines reduced by sucralfate and tripotassium dicrato-bismuthate
Appendix 1: Interactions

**Theophylline** (continued)

**Theophylline**

- **Allopurinol**: plasma concentration of theophylline possibly increased by allopurinol
- **Anaesthetics, General**: increased risk of convulsions when theophylline given with ketamine; increased risk of arrhythmias when theophylline given with halothane

- **Antibacterials**: plasma concentration of theophylline possibly increased by azithromycin and isoniazid; metabolism of theophylline inhibited by clarithromycin (increased plasma concentration); metabolism of theophylline inhibited by erythromycin (increased plasma concentration), if erythromycin given by mouth, also decreased plasma-thymoxin concentration; plasma concentration of theophylline increased by ciprofloxacin and norfloxacin; metabolism of theophylline accelerated by rifampicin (reduced plasma concentration); possible increased risk of convulsions when theophylline given with quinolones

- **Antidepressants**: plasma concentration of theophylline increased by fluvoxamine (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline reduced by St John’s wort—avoid concomitant use

- **Antiepileptics**: metabolism of theophylline accelerated by carbamazepine and primidone (reduced effect); plasma concentration of both drugs reduced when theophylline given with phenytoin

- **Antifungals**: plasma concentration of theophylline possibly increased by fluconazole and itraconazole

- **Antivirals**: metabolism of theophylline accelerated by ritonavir (reduced plasma concentration)

- **Barbiturates**: metabolism of theophylline accelerated by barbiturates (reduced effect)

- **Calcium-channel Blockers**: plasma concentration of theophylline possibly increased by calcium-channel blockers (enhanced effect); plasma concentration of theophylline increased by diltiazem; plasma concentration of theophylline increased by verapamil (enhanced effect)

- **Corticosteroids**: increased risk of hypokalaemia when theophylline given with corticosteroids

- **Cytotoxics**: plasma concentration of theophylline possibly increased by methotrexate

- **Disulfiram**: metabolism of theophylline inhibited by disulfiram (increased risk of toxicity)

- **Diuretics**: increased risk of hypokalaemia when theophylline given with acetazolamide, loop diuretics or thiazide diuretics

- **Doxapram**: increased CNS stimulation when theophylline given with doxapram

- **Interferons**: metabolism of theophylline inhibited by interferon alfa (increased plasma concentration)

- **Leukotriene Antagonists**: plasma concentration of theophylline possibly increased by zafirlukast, also plasma concentration of zafirlukast reduced

- **Lithium**: theophylline increases excretion of lithium (reduced plasma concentration)

- **Oestrogens**: excretion of theophylline reduced by oestrogens (increased plasma concentration)

- **Pentoxifylline (oxpentifylline)**: plasma concentration of theophylline increased by pentoxifylline (oxpentifylline)

- **Sulfipyrazole**: plasma concentration of theophylline reduced by sulfipyrazole

Theophylline (continued)

**Symptomimetics**: manufacturer of theophylline advises concomitant use with ephedrine in children

**Symptomimetics, Beta**: increased risk of hypokalaemia when theophylline given with high doses of beta symptomimetics—for CSM advice (hypokalaemia) see p. 153

**Tobacco**: metabolism of theophylline increased by tobacco smoking (reduced plasma concentration)

**Ulceral-Healing Drugs**: metabolism of theophylline inhibited by cinemetine (increased plasma concentration); absorption of theophylline possibly reduced by sucralfate (give at least 2 hours apart)

**Vaccines**: plasma concentration of theophylline possibly increased by influenza vaccine

**Thiazolinediones** see Anti-diabetics

**Thiopental** see Anaesthetics, General

**Thiotepa**

- **Antiepileptics**: cytotoxics possibly reduce absorption of phenytoin

- **Antipsychotics**: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

- **Cardiac Glycosides**: cytotoxics reduce absorption of digoxin tablets

- **Muscle Relaxants**: thiopental enhances effects of suxamethonium

**Thioxanthines** see Antipsychotics

**Thyroid Hormones**

**Antacids**: absorption of levothyroxine (thyroxine) possibly reduced by antacids

**Anti-arthmetics**: for concomitant use of thyroid hormones and amiodarone see p. 82

**Antibacterials**: metabolism of levothyroxine (thyroxine) accelerated by rifampicin (may increase requirements for levothyroxine (thyroxine) in hypothyroidism), also plasma concentration of phenytoin possibly increased

**Barbiturates**: metabolism of thyroid hormones accelerated by barbiturates (may increase requirements for thyroid hormones in hypothyroidism) Beta-blockers: levothyroxine (thyroxine) accelerates metabolism of propranolol

**Calcium Salts**: absorption of levothyroxine (thyroxine) reduced by calcium salts

**Cytotoxics**: plasma concentration of levothyroxine (thyroxine) possibly reduced by imatinib

**Iron**: absorption of levothyroxine (thyroxine) reduced by oral iron (give at least 2 hours apart)

**Lipid-regulating Drugs**: absorption of thyroid hormones reduced by colestipol and colestyramine Oestrogens and related drugs for thyroid hormones in hypothyroidism may be increased by oestrogens Polyestre-Sulphonate Resins: absorption of levothyroxine (thyroxine) reduced by polysytrene sulphonate resins

**Ulcer-healing Drugs**: absorption of levothyroxine (thyroxine) reduced by cimetidine and sucralfate

**Tiagabine**

**Antidepressants**: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort

**Antiepileptics**: plasma concentration of tiagabine reduced by carbamazepine, phenytoin and primidone
Antivirals: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by mefloquine

Barbiturates: plasma concentration of tiagabine reduced by phenobarbital

Tipranavir reduces plasma concentration of tipranavir increased by:
- Abacavir, saquinavir, and ritonavir

Tipranavir increases plasma concentration of tipranavir possibly reduced by:
- Emtricitabine; tipranavir increases plasma concentration of emtricitabine

Antidepressants: metabolism of tetroxetine possibly reduced by antacids

Anticoagulants: possible increased risk of bleeding when tipranavir given with high doses of vitamin E

Tirofiban: increased risk of bleeding when tirofiban given with iloprost

Tizanidine: see Muscle Relaxants

Tobacco: smoking increases cinacalcet metabolism (reduced plasma concentration)

Cytotoxics: possibly reduced by antiepileptics

Theophylline: possibly reduced by antiepileptics

Tipranavir possibly reduced by:
- Abacavir, saquinavir, and ritonavir

Antiepileptics: increases plasma concentration of:
- Oxcarbazepine; tipranavir increases plasma concentration of oxcarbazepine

Antibacterials: reduces plasma concentration of:
- EtBr, didanosine, fosamprenavir, lopinavir, aminoglycosides, and doxorubicin; plasma concentration of tipranavir increased by atazanavir (also plasma concentration of atazanavir reduced); tipranavir reduces plasma concentration of etravirine, also

Tipranavir increases plasma concentration of tipranavir possibly antagonised by:
- Measles

Antivirals: tipranavir increases plasma concentration of:
- Abacavir, saquinavir, and ritonavir

Antibacterials: reduces plasma concentration of:
- EtBr, didanosine, fosamprenavir, lopinavir, aminoglycosides, and doxorubicin; plasma concentration of tipranavir increased by atazanavir (also plasma concentration of atazanavir reduced); tipranavir reduces plasma concentration of etravirine, also
Appendix 1: Interactions

Antidepressants:
- Tropicamide
- Tripotassium Dicitratobismuthate

Cytotoxics:
- Ciclosporin

Anti-arrhythmics:
- Trihexyphenidyl (benzhexol)
- Trifluoperazine
- Trienterine
- see Triclofos
- see Triamterene
- see Triamcinolone
- see Tretinoin
- Trazodone
- Tranylcypromine
- see Tramadol
- Travectedin

Increased risk of haematological toxicity
Increased antifolate effect when tri-trimethoprim increases plasma concentration of trimethoprim possibly enhances hypoglycaemic effect of repaglinide—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of sulphonylureas

Antipsychotics:
- Trihexyphenidyl (benzhexol) see Antimuscarinics

Anticoagulants:
- Clopidogrel
- see Clozapine
- see Captopril
- see Cerebrolysin
- see Cetuximab
- see Cetirizine
- see Ceftriaxone
- see Cefixime
- see Cefpodoxime
- see Cefuroxime
- see Cefazolin
- see Cefuroxime Axetil
- see Cefepime
- see Ceftriaxone
- see Cefepime
- see Cefoperazone
- see Cefuroxime Axetil
- see Cefuroxime
- see Ceftriaxone
- see Cefazolin
- see Cefuroxime
- see Ceftriaxone
- see Cefepime
- see Cefoperazone
- see Cefuroxime Axetil
- see Cefuroxime
- see Ceftriaxone
- see Cefepime
- see Cefoperazone
- see Cefuroxime Axetil
- see Cefuroxime
- see Ceftriaxone
- see Cefepime
- see Cefoperazone
- see Cefuroxime Axetil
- see Cefuroxime
- see Ceftriaxone

Antiepileptics:
- Toremifene (continued)
- Suggest medadex: toremifene possibly reduces response to sugammadex

Trabectedin

Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis)
- Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Tramadol see Opioid Analgesics

Trandolapril see ACE Inhibitors

Tranylcypromine see MAOIs

Trazodone see Antidepressants, Tricyclic (related)

Tretinoin

Trazodone

Triacylcylic Acid
Antacids: absorption of bile acids possibly reduced by antacids
- Ciclosporin: ursooaclylic acid increases absorption of ciclosporin

Lipid-regulating Drugs: absorption of bile acids possibly reduced by cholestipol and colestyramine
- Oestrogens: elimination of cholesterol in bile increased when bile acids with oestrogens

Vaccines
Note For a general warning on live vaccines and high doses of corticosteroids or other immunosuppressive drugs, see p. 660; for advice on live vaccines and immunoglobulins, see under Normal Immunoglobulin, p. 681
- Abatacept: avoid concomitant use of live vaccines with abatacept (see p. 660)
- Adalimumab: avoid concomitant use of live vaccines with adalimumab (see p. 660)
- Anakinra: avoid concomitant use of live vaccines with anakinra (see p. 660)
- Antibacterials: oral typhoid vaccine inactivated by Antibacterials—see p. 679
- Anticoagulants: influenza vaccine enhances effects of anticoagulant effect of warfarin
- Antiepileptics: influenza vaccine enhances effects of phenytoin
- Antimalarials: oral typhoid vaccine inactivated by antimalarials—see p. 679

Corticosteroids: immune response to vaccines impaired by high doses of corticosteroids, avoid concomitant use with live vaccines (see p. 660)
- Eflazolumab: live or live-attenuated vaccines should be given 2 weeks before eflazolumab or withheld until 8 weeks after discontinuation
- Etanercept: avoid concomitant use of live vaccines with etanercept (see p. 660)
- Infliximab: avoid concomitant use of live vaccines with infliximab (see p. 660)
- Interferons: avoid of vaccines advised by manufacturer of interferon gamma
- Leflunomide: avoid concomitant use of live vaccines with leflunomide (see p. 660)
- Theophylline: influenza vaccine possibly increases plasma concentration of theophylline

Valaciclovir see Aciclovir

Ganciclovir see Ganciclovir

Valproate
Analgesics: effects of valproate enhanced by aspirin
Antibacterials: plasma concentration of valproate possibly reduced by doripenem and ertapenem; plasma concentration of valproate reduced by metronidazole; metabolism of valproate possibly inhibited by erythromycin (increased plasma concentration)
- Anticoagulants: valproate possibly enhances anticoagulant effect of coumarins
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold
Valproate
- Antidepressants (continued) lowered); avoid concomitant use of antiepileptics with St. John’s wort
- Antiepileptics: plasma concentration of valproate reduced by carbamazepine, also plasma concentration of active metabolite of carbamazepine increased; valproate possibly increases plasma concentration of ethosuximide; valproate increases plasma concentration of lamotrigine; valproate sometimes reduces plasma concentration of an active metabolite of oxcarbazepine; valproate increases or possibly decreases plasma concentration of phenytoin, also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of primidone (plasma concentration of active metabolite of primidone increased), also plasma concentration of valproate reduced; valproate possibly increases plasma concentration of rufinamide (reduced dose of rufinamide)
- Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by nefluprine
- Antipsychotics: anticonvulsant effect of valproate antagonised by antipsychotics (convulsive threshold lowered); increased risk of neutropenia when valproate given with olanzapine

Antivirals: valproate possibly increases plasma concentration of zidovudine (increased risk of toxicity) Anxiolytics and Hypnotics: plasma concentration of valproate possibly increased by clobazam; increased risk of side-effects when valproate given with clonazepam; valproate possibly increases plasma concentration of diazepam and lorazepam

Barbiturates: valproate increases plasma concentration of phenobarbital (also plasma concentration of valproate reduced) Bupropion: valproate inhibits the metabolism of bupropion
Cytotoxics: valproate increases plasma concentration of temozolomide
Lipid-regulating Drugs: absorption of valproate possibly reduced by colestyramine
Sodium Benzoate: valproate possibly reduces effects of sodium benzoate
Sodium Phenylbutyrate: valproate possibly reduces effects of sodium phenylbutyrate
- Ulcer-healing Drugs: metabolism of valproate inhibited by omeprazole (increased plasma concentration) Valsartan see Angiotensin-II Receptor Antagonists

Valproate

Vancomycin (continued)
Vaccines: antibacterials inactivate oral typhoid vaccine—see p. 679

Vancomycin
- Alpha-blockers: enhanced hypotensive effect when vardenafil given with alpha-blockers (excludes tamsulosin)—avoid vardenafil for 6 hours after alpha-blockers
Antibacterials: plasma concentration of vardenafil increased by erythromycin (reduce dose of vardenafil)
- Antifungals: plasma concentration of vardenafil increased by ketoconazole—avoid concomitant use; plasma concentration of vardenafil possibly increased by itraconazole—avoid concomitant use
- Antivirals: plasma concentration of vardenafil possibly increased by fosamprenavir; plasma concentration of vardenafil increased by indinavir—avoid concomitant use; plasma concentration of vardenafil possibly increased by nelfinavir—avoid concomitant use; plasma concentration of vardenafil possibly increased by saquinavir—reduce initial dose of vardenafil
Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with nifedipine
- Grapefruit juice: plasma concentration of vardenafil possibly increased by grapefruit juice—avoid concomitant use
- Nicorandil: possible increased hypotensive effect when vardenafil given with nicorandil—avoid concomitant use
- Nitrates: possible increased hypotensive effect when vardenafil given with nitrates—avoid concomitant use

Vasodilator Antihypertensives
ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ACE inhibitors
Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with adrenergic neurone blockers
Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given after alcohol
Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with aldesleukin
Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with alpha-blockers
Anasthetic, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with general anaesthetics
Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by NSAIDs
Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with angiotensin-II receptor antagonists
Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MAOIs; enhanced hypotensive effect when hydralazine or sodium nitroprusside given with tricyclic-related antidepressants
Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with phenothiazines
Anxiolytics and Hypnotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with anxiolytics and hypnotics
Beta-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with beta-blockers
Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with calcium-channel blockers
Appendix 1: Interactions

Verapamil
- see Dopaminergics: Antipsychotics; Antidepressants:
- Anticoagulants:
- Analgesics:
- Venlafaxine
- Vecuronium

Anticoagulants:
- increased risk of bleeding when venlafaxine given with warfarin

Antidepressants:
- increased risk of bleeding when high doses of vitamin E given with tizanidine

Vasodilator Antihypertensives:
- Clonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with clonidine
- Corticosteroids: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by corticosteroids
- Diazoxide: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with diazoxide
- Diuretics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with diuretics
- Dopaminergic:
- Antipsychotics:
- Antidepressants:
- Anticoagulants:
- Analgesics:
- Venlafaxine
- Vecuronium

Anticoagulants:
- increased risk of bleeding when venlafaxine given with warfarin

Antidepressants:
- increased risk of bleeding when venlafaxine given with MAOIs and cyclic-related antidepressants (convulsive threshold lowered); avoid concomitant use of antidepressants with St John’s wort
- Antimalarias: possible increased risk of convulsions when antidepressants given with clozapine and haloperidol
- Antipsychotics: possible increased risk of bleeding when antidepressants given with clozapine and haloperidol

Barbiturates: venlafaxine possibly reduces plasma concentration of primidone

Vilaglaptin see Antiabetic

Vinblastine
- Antibacterials: toxicity of vinblastine increased by eritromycin—avoid concomitant use
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: metabolism of vinblastine possibly inhibited by posaconazole (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Calcium-channel Blockers: metabolism of vinblastine possibly inhibited by nifedipine

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Vincristine
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antifungals: metabolism of vincristine possibly inhibited by itraconazole and posaconazole (increased risk of neurotoxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)
- Calcium-channel Blockers: metabolism of vincristine possibly inhibited by nifedipine

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Vinorelbine
- Antiepileptics: cytotoxics possibly reduce absorption of phenytoin
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis)

Cardiac Glycosides: cytotoxics reduce absorption of digoxin tablets

Vitamin A see Vitamins

Vitamin D see Vitamins

Vitamin E see Vitamins

Vitamin K (Phytomenadione) see Vitamins

Vitamins
- Antibacterials: absorption of vitamin A possibly reduced by neomycin
- Anticoagulants: vitamin K antagonises anticoagulant effect of warfarin and aspirin
- Antidepressants: possibly increased serotoninergic effects when venlafaxine given with duloxetine; enhanced CNS effects and toxicity when venlafaxine given with MAOIs (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start moclobemide for at least 1 week
- Antimalarias: avoidance of antidepressants advised by manufacturer of arteether/lumefantrine
- Antipsychotics: venlafaxine increases plasma concentration of clozapine and haloperidol
- Atorvastatin: possible increased risk of convulsions when antidepressants given with atorvastatin
- Dopaminergic: caution with venlafaxine advised by manufacturer of entacapone; increased risk of hypertension and CNS excitation when venlafaxine given with selegiline (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline)
- Lithium: possible increased serotonergic effects when venlafaxine given with lithium
- Sibutramine: increased risk of CNS toxicity when SSRIs-related antidepressants given with sibutramine (manufacturer of sibutramine advises avoid concomitant use)

Verapamil see Calcium-channel Blockers

Vigabatrin
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and cyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and etrics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort
- Antimalearias: possible increased risk of convulsions when antidepressants given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by mefloquine

Barbiturates: vigabatrin possibly reduces plasma concentration of phenobarbital

Vildagliptin see Antiabetic

Xipamide see Diuretics
Xylometazoline see Sympathomimetics
Zafirlukast see Leukotriene Antagonists
Zaleplon see Anxiolytics and Hypnotics
Zidovudine

Note Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature

Analgesics: increased risk of haematological toxicity when zidovudine given with NSAIDs; plasma concentration of zidovudine possibly increased by methadone

Antibacterials: absorption of zidovudine reduced by clarithromycin tablets (give at least 2 hours apart); manufacturer of zidovudine advises avoid concomitant use with rifampicin

Antiepileptics: zidovudine increases or decreases plasma concentration of phenytoin; plasma concentration of zidovudine possibly increased by valproate (increased risk of toxicity)

● Antifungals: plasma concentration of zidovudine increased by fluconazole (increased risk of toxicity)

Antimalarials: increased antifolate effect when zidovudine given with pyrimethamine

Antivirals: profound myelosuppression when zidovudine given with ganciclovir (if possible avoid concomitant administration, particularly during initial ganciclovir therapy); increased risk of anaemia when zidovudine given with stavudine—avoid concomitant use; zidovudine possibly inhibits effects of atazanavir (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by tipranavir

Atovaquone: metabolism of zidovudine possibly inhibited by atovaquone (increased plasma concentration)

● Probenecid: excretion of zidovudine reduced by probenecid (increased plasma concentration and risk of toxicity)

Zinc

Antibacterials: zinc reduces absorption of ciprofloxacin, levofloxacin, moxifloxacin, norfloxacin and ofloxacin; zinc reduces absorption of tetracyclines, also absorption of zinc reduced by tetracyclines

Calcium Salts: absorption of zinc reduced by calcium salts

Iron: absorption of zinc reduced by oral iron, also absorption of oral iron reduced by zinc

Penicillamine: absorption of zinc reduced by penicillamine, also absorption of penicillamine reduced by zinc

Trientine: absorption of zinc reduced by trientine, also absorption of trientine reduced by zinc

Zoledronic Acid see Bisphosphonates
Zolmitriptan see 5HT Agonists
Zolpidem see Anxiolytics and Hypnotics
Zonisamide

● Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered); avoid concomitant use of antiepileptics with St John’s wort

Antiepileptics: plasma concentration of zonisamide reduced by carbamazepine and phenytoin

● Antimalarials: possible increased risk of convulsions when antiepileptics given with chloroquine and hydroxychloroquine; anticonvulsant effect of antiepileptics antagonised by mefloquine

Barbiturates: plasma concentration of zonisamide reduced by phenobarbital

Zopiclone see Anxiolytics and Hypnotics
Zotepine see Antipsychotics
Zuclopenthixol see Antipsychotics
Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

**Impaired drug metabolism** Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired.

A few drugs, e.g. rifampicin and fusidic acid, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

**Hypoproteinaemia** The hypoalbuminemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin and prednisolone.

**Reduced clotting** Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the sensitivity to oral anti-coagulants such as warfarin and phenindione.

**Hepatic encephalopathy** In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

**Fluid overload** Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention, e.g. NSAIDs and corticosteroids.

**Hepatotoxic drugs** Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease.

### Table of drugs to be avoided or used with caution in liver disease

The list of drugs given below is not comprehensive and is based on current information concerning the use of prescribed drugs in therapeutic dosage. Products introduced or amended since publication of BNF No. 56 (September 2008) are underlined.

Renal impairment

The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Principles of dose adjustment in renal impairment

The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity.

For many drugs with only minor or no dose-related side-effects very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient.

For more toxic drugs with a small safety margin or patients at extremes of weight, dose regimens based on creatinine clearance (see Use of Dosage Table for details) should be used. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration.

Renal function declines with age; many elderly patients have renal impairment but, because of reduced muscle mass, this may not be indicated by a raised serum creatinine. It is wise to assume at least mild impairment of renal function when prescribing for the elderly.

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same size as the initial dose for a patient with normal renal function.

Nephrotoxic drugs should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced.

Use of dosage table

Dose recommendations are based on the severity of renal impairment.

Renal function is measured either in terms of estimated glomerular filtration rate (eGFR) calculated from a formula derived from the Modification of Diet in Renal Disease study (‘MDRD formula’ that uses serum creatinine, age, sex, and race (for Afro-Caribbean patients)) or it can be expressed as creatinine clearance (best derived from a 24-hour urine collection but often calculated from the Cockcroft and Gault formula (CG) or a nomogram that uses serum creatinine, weight, sex, and age).

Cockcroft and Gault formula

Estimated Creatinine Clearance in mL/minute = \frac{(140 – Age) \times Weight \times Constant}{Serum creatinine}\n
Age in years  
Weight in kilograms; use ideal body-weight  
Serum creatinine in micromol/litre  
Constant = 1.23 for men; 1.04 for women

The serum-creatinine concentration is sometimes used instead as a measure of renal function but it is only a rough guide to drug dosing.

Important

The information on dosage adjustment in the BNF is based on creatinine clearance. This is because published information on the effects of renal impairment on drug elimination is usually given in terms of creatinine clearance as a surrogate for glomerular filtration rate (GFR).

Special care is required when interpreting advice on dosage adjustment based on creatinine clearance (e.g. calculated from the Cockcroft and Gault formula) because renal function in adults is increasingly being reported on the basis of estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m and derived from the MDRD (Modification of Diet in Renal Disease) formula. Although, the two measures of renal function are not interchangeable, in practice, for most drugs and for most patients (over 18 years) of average build and height, eGFR (MDRD) can be used to determine dosage adjustments in place of creatinine clearance. An individual’s absolute glomerular filtration rate can be calculated from the eGFR as follows:

\[ \text{GFR} = \text{eGFR} \times \left( \frac{\text{individual’s body surface area}}{1.73} \right) \]

Toxic drugs For potentially toxic drugs with a small safety margin, creatinine clearance (calculated from the Cockcroft and Gault formula or a nomogram) should be used to adjust drug dosages in addition to plasma-drug concentration and clinical response.

Patients at extremes of weight In patients at both extremes of weight (BMI of less than 18.5 kg/m or greater than 30 kg/m) the absolute glomerular filtration rate or creatinine clearance (calculated from the Cockcroft and Gault formula or a nomogram) should be used to adjust drug dosages.
In the BNF, values for creatinine clearance or another measure of renal function are included where possible. However, where such values are not available, the BNF reflects the terms used in the published information. 

Chronic kidney disease in adults: UK guidelines for identification, management and referral (March 2006) define renal function as follows:

<table>
<thead>
<tr>
<th>Degree of impairment</th>
<th>eGFR mL/minute/1.73 m</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal - Stage 1</td>
<td>More than 90 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Mild - Stage 2</td>
<td>60–89 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Moderate - Stage 3</td>
<td>30–59</td>
</tr>
<tr>
<td>Severe - Stage 4</td>
<td>15–29</td>
</tr>
<tr>
<td>Established renal failure - Stage 5</td>
<td>Less than 15</td>
</tr>
</tbody>
</table>

1. NICE clinical guideline 73 (September 2008)—Chronic kidney disease: Stage 3A eGFR 45–59, Stage 3B eGFR 30–44

Dialysis

For prescribing in patients on continuous ambulatory peritoneal dialysis (CAPD) or haemodialysis, consult specialist literature.

The following table can be used as a guide to drugs which require a reduction in dose in renal impairment, and to those which are potentially harmful or are ineffective. Drug prescribing should be kept to the minimum in all patients with severe renal disease.

If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification.

Absence of a drug from the table does not imply safety. For adjusting drug doses in renal impairment, see Important on p. 801.

Table of drugs to be avoided or used with caution in renal impairment

The list of drugs given below may not be comprehensive and is based on current information concerning the use of prescribed drugs in therapeutic dosage.

Products introduced or amended since publication of BNF No. 56 (September 2008) are underlined.

## Appendix 3: Renal impairment

### Drug | Comment
---|---
Dalteparin | Risk of bleeding may be increased—dose reduction, and monitoring of anti-Factor Xa, may be required; use of unfractionated heparin may be preferable
Danaparoid | Caution if creatinine clearance 10–20 mL/minute; increased risk of bleeding (monitor anti-Factor Xa activity); avoid if creatinine clearance less than 10 mL/minute unless patient has heparin-induced thrombocytopenia and no alternative
Daptomycin | Monitor renal function if creatinine clearance less than 80 mL/minute; for complicated skin and soft-tissue infections without bacteremia use 4 mg/kg every 48 hours if creatinine clearance less than 30 mL/minute; for other indications, consult product literature if creatinine clearance less than 50 mL/minute
Daunorubicin | Reduce dose by 25% if serum creatinine 105–265 micromol/litre and by 50% if serum creatinine greater than 265 micromol/litre
Deferasirox | Reduce dose by 10 mg/kg if creatinine clearance 60–90 mL/minute and if serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction; avoid if creatinine clearance less than 60 mL/minute
Deferiprone | Manufacturer advises caution—no information available
Demeclocycline | Avoid
Desflurane | Reduce dose if creatinine clearance less than 20 mL/minute
Desloratadine | Manufacturer advises caution in severe renal insufficiency
Desmopressin | Antidiuretic effect may be reduced
Dexibuprofen | see NSAIDs; reduce initial dose; avoid if glomerular filtration rate less than 30 mL/minute
Dexketoprofen | see NSAIDs; reduce initial dose to 50 mg daily if creatinine clearance 20–50 mL/minute; avoid if creatinine clearance less than 20 mL/minute
Dexrazoxane | Manufacturer of Cardioxane® advises reduce dose by 50% if creatinine clearance less than 40 mL/minute
Dextromethorphan | see Opioid Analgesics
Diamorphine | see Opioid Analgesics
 Diazepam | see Anxiolytics and Hypnotics
 Diazoxide | Dose reduction may be required
 Diclofenac | see NSAIDs; avoid if creatinine clearance less than 10 mL/minute; avoid Dyloject® if creatinine clearance less than 30 mL/minute
 Didanosine | Reduce dose if creatinine clearance less than 60 mL/minute; consult product literature
 Digoxin | Reduce dose; toxicity increased by electrolyte disturbances
 Dihydrocodeine | see Opioid Analgesics
 Diltilazem | Start with smaller dose
 Dinoprostone | Manufacturers advise avoid
 Diphenoxylate | see Opioid Analgesics
 Dipipanone | see Opioid Analgesics
 Disodium etidronate | Reduce dose if creatinine clearance 20–50 mL/minute; avoid if creatinine clearance less than 20 mL/minute
 Disodium pamidronate | Max. infusion rate 20 mg/hour; except in life-threatening hypercalcaemia, manufacturer advises avoid if creatinine clearance less than 30 mL/minute; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value
 Doripenem | 250 mg every 8 hours if creatinine clearance 30–50 mL/minute; 250 mg every 12 hours if creatinine clearance less than 30 mL/minute
 Dorzolamide | Manufacturer advises avoid if creatinine clearance less than 30 mL/minute
 Doxycycline | Use with caution (avoid excessive doses)
 Drospirenone | see Angelique®, Yasmin®, and Yaz®
 Duloxetine | Avoid if creatinine clearance less than 30 mL/minute
 Efavirenz | Manufacturer advises caution in severe renal failure—no information available; see also Atripla®
 Eletriptan | Reduce initial dose to 20 mg; max. 40 mg in 24 hours; avoid if creatinine clearance less than 30 mL/minute
 Emtricitabine | Reduce dose if creatinine clearance less than 50 mL/minute; consult product literature; see also Atripla® and Truvada®

For adjusting drug doses in renal impairment, see Important on p. 801.

Drug Comment
Fondaparinux Increased risk of bleeding; for treatment of acute coronary syndromes avoid if creatinine clearance less than 20 mL/minute; for treatment of venous thromboembolism use with caution if creatinine clearance 30–50 mL/minute, avoid if creatinine clearance less than 30 mL/minute; for prophylaxis of venous thromboembolism reduce dose to 1.5 mg daily if creatinine clearance 20–50 mL/minute, avoid if less than 20 mL/minute
Foscarnet Reduce dose; consult product literature
Fosinopril see ACE inhibitors
Fosphenytoin Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus)

For adjusting drug doses in renal impairment, see Important on p. 801.

Frusemide see Furosemide
Furosemide (frusemide) May need high doses; deafness may follow rapid i/v injection
Fydogel Mebeverine® Contains 2.5 mmol potassium per sachet
Gabapentin Reduce dose if creatinine clearance less than 80 mL/minute; consult product literature
Galantamine Avoid if creatinine clearance less than 9 mL/minute
Ganciclovir Reduce dose if creatinine clearance less than 70 mL/minute; consult product literature
Ganirelix Avoid if creatinine clearance less than 20 mL/minute
Gemcitabine Manufacturer advises caution
Gemeprost Manufacturer advises avoid
Gemfibrozil Initially 900 mg daily if creatinine clearance 30–80 mL/minute; avoid if creatinine clearance less than 30 mL/minute
Gentamicin see Aminoglycosides
Gestrinone Avoid if creatinine clearance less than 10 mL/minute
Glatiramer No information available—manufacturer advises caution
Glibenclamide Avoid if creatinine clearance less than 10 mL/minute
Gliclazide Reduce initial dose and monitor closely; avoid if creatinine clearance less than 10 mL/minute
Glimepiride Avoid if creatinine clearance less than 10 mL/minute
Glipizide Increased risk of hypoglycaemia; avoid if creatinine clearance less than 10 mL/minute or if hepatic impairment also present
Glyceryl trinitrate see Nitrates

Drug Comment
Guanethidine Reduce dose if creatinine clearance less than 65 mL/minute, avoid if creatinine clearance less than 40 mL/minute
Haloperidol see Antipsychotics; manufacturer advises caution in renal impairment
Heparin Risk of bleeding increased if creatinine clearance less than 10 mL/minute—dose may need to be reduced
Hctastarch Avoid if creatinine clearance less than 10 mL/minute; excreted by kidney
Hydralazine Reduce dose if creatinine clearance less than 30 mL/minute
Hydrochlorothiazide see Thiazides and Related Diuretics
Hydroflumethiazide see Thiazides and Related Diuretics
Hydromorphone see Opioid Analgesics
Hydroxyzine Use half normal dose
Hyoscine hydrobromide Manufacturer advises caution
Hypnotics see Anxiolytics and Hypnotics
Ibandronic acid For repeated doses, if creatinine clearance less than 30 mL/minute, reduce intravenous dose to 2 mg every 3–4 weeks and in bone metastasis, change oral dose to 50 mg once weekly
Ibuprofen see NSAIDs
Iferon Reduce dose; avoid if creatinine clearance less than 10 mL/minute
Ifofamide Avoid if serum creatinine concentration greater than 120 micromol/litre
Imatinib Max. starting dose 400 mg daily if creatinine clearance less than 60 mL/minute
Imidapril see ACE inhibitors; max. initial dose 2.5 mg daily if creatinine clearance 30–80 mL/minute; avoid if creatinine clearance less than 30 mL/minute
Imipenem [ingredient] see Primaxin®
Indapamide see Thiazides and Related Diuretics
Indometacin see NSAIDs; avoid if creatinine clearance less than 10 mL/minute
Indoramin Manufacturer advises caution
Inosine pranobex Manufacturer advises caution; metabolised to uric acid
Insulin May need dose reduction; insulin requirements fall; compensatory response to hypoglycaemia is impaired

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy.

During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery.

Not all the damaging effects of intrauterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The following list includes drugs which:

- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The list is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading.

Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used.

Few drugs have been shown conclusively to be teratogenic in man, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of a drug from the list does not imply safety.

It should be noted that the BNF provides independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the National Teratology Information Service Telephone: (0191) 232 1525 (0191) 282 5944 (out of hours emergency only) www.nyrdc.nhs.uk/Services/teratology/teratology.html

### Table of drugs to be avoided or used with caution in pregnancy

Products introduced or amended since publication of BNF No. 56 (September 2008) are underlined.

</table>
Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that the small amount of drug present in breast milk can induce a hypersensitivity reaction.

A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity.

Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital) while others can affect lactation (e.g. bromocriptine).

The following table identifies drugs:

- that should be used with caution or are contraindicated in breast-feeding;
- which can be given to the mother during breast-feeding because they are present in milk in amounts which are too small to be harmful to the infant;
- which might be present in milk in significant amount but are not known to be harmful.

For many drugs insufficient evidence is available to provide guidance and it is advisable to use only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence from the table does not imply safety.

### Table of drugs present in breast milk

Products introduced or amended since publication of BNF No. 56 (September 2008) are underlined.

Intravenous additives policies

A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each Strategic Health Authority (or equivalent) and issued as a document to the members of staff concerned.

Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines

1. Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.

2. In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions (section 9.3).

3. Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.

4. Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).

5. The infusion container should be labelled with the patient’s name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer’s label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.

6. It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination

The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc.

However, when this is necessary strict aseptic procedure should be followed.

Incompatibility

Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities

Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘salting-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood

Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions

These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as Vitlipid N® (section 9.3) may be added to appropriate intravenous fat emulsions.

Other infusions

Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.
Appendix 6: Intravenous additives

**Potassium chloride** are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 mL.

**Method**

Ready-prepared infusions should be used whenever available. **Potassium chloride** is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. **Lidocaine hydrochloride** (lignocaine hydrochloride) is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. furosemide (frusemide) injection requires dilution in infusions of pH greater than 5.5).

When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to differences in density. **Potassium chloride** is particularly prone to this ‘layering’ effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. amphotericin, dacarbazine, and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24 to 48 mL) of sodium chloride intravenous infusion (0.9%).

**Use of table**

The table lists preparations given by three methods: continuous infusion, intermittent infusion, and addition via the drip tubing.

**Drugs for continuous infusion** must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by intermittent infusion in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and tetracyclines.

An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the ‘piggy-back’ technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

Addition via the drip tubing is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

**Table of drugs given by intravenous infusion**

Covers addition to Glucose intravenous infusion 5 and 10%, Sodium chloride intravenous infusion 0.9%, Compound sodium chloride intravenous infusion (Ringer’s solution), and Compound sodium lactate intravenous infusion (Hartmann’s solution). Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with Sodium chloride and glucose intravenous infusion. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information in the Table relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.
**Appendix 6: Intravenous additives**

**Abatacept (Orencia®)**
Intermittent in Sodium chloride 0.9%
Reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided. Dilute requisite dose in infusion fluid to 100 mL, (using the same silicone-free syringe), give over 30 minutes through a low protein-binding filter ( pore size 0.2–1.2 micron).

**Abciximab (ReoPro®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution with infusion fluid through a low-protein binding 0.2, 0.22, or 5 micron filter or upon administration through an in-line non-proteinogenic low protein-binding 0.2 or 0.22 micron filter.

**Acetylcysteine (Parvolex®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Glucose 5% is preferable—see Emergency Treatment of Poisoning.

**Aciclovir (as sodium salt) (Zovirax IV®, Aciclovir IV, Hospira; Aciclovir IV, Genus; Aciclovir Sodium, Zurich)**
Intermittent in Sodium chloride 0.9% or Sodium chloride and glucose or Compound sodium lactate For Zovirax IV®, Aciclovir IV (Genus) initially reconstitute to 25 mg/mL in water for injections or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid, to be given over 1 hour, alternatively, may be administered in a concentration of 25 mg/mL with a suitable infusion pump and given over 1 hour; for Aciclovir IV (Hospira) dilute to not more than 5 mg/mL with infusion fluid, give over 1 hour.

**Agalsidase alfa (Replagel®)**
Intermittent in Sodium chloride 0.9%
Dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

**Agalsidase beta (Fabrazyme®)**
Intermittent in Sodium chloride 0.9%
Reconstitute with water for injections (35 mg in 7.2 mL, 5 mg in 1.1 mL) to produce a solution containing 5 mg/mL, dilute with infusion fluid (for doses less than 35 mg dilute with at least 50 mL, doses 35–70 mg dilute with at least 100 mL, doses 70–100 mg dilute with at least 250 mL, doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

**Alemutzumab (MabCampath®)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Add requisite dose to 100 mL infusion fluid; infuse over 2 hours.

**Alfentanil (as hydrochloride) (Rapifen®)**
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate

**Algglucosidase alfa (Myozyme®)**
Intermittent in Sodium chloride 0.9%
Reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution, gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL, give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 1 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

**Alprostadil (Prostin VR®)**
Continuous in Glucose 5% or Sodium chloride 0.9%
Add directly to the infusion solution avoiding contact with the walls of plastic containers.

**Alteplase (Actilyse®)**
Continuous or intermittent in Sodium chloride 0.9%
Dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously, alternatively dilute the solution further in the infusion fluid to a concentration of not less than 200 micrograms/mL; not to be infused in glucose solution

**Amikacin sulphate (Amikin®)**
Intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate
To be given over 30 minutes.

**Aminophylline**
Continuous in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate

**Amiodarone hydrochloride (Cordarone®)**
Continuous or intermittent in Glucose 5%
Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; infusion in extreme emergency see section 2.7.3, should not be diluted to less than 600 micrograms/mL, incompatible with sodium chloride infusion, avoid equipment containing the plasticizer di-2-ethylhexylphthalate (DEHP).

**Amoxicillin (as sodium salt) (Amoxil®)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9%
Continuous infusion not usually recommended

**Amphotericin (colloidal) (Amphocil®)**
Intermittent in Glucose 5%
Initially reconstitute with water for injections (30 mg in 10 mL, 100 mg in 20 mL) shaking gently to dissolve (fluid may be opalescent) to produce a colloidal concentration of 1 mg/mL (1 volume of reconstituted solution with 7 volumes of infusion fluid); give at a rate of 1–2 mg/kg/hour or slower if not tolerated (initial test dose 2 mg of a 100 microgram/mL solution over 10 minutes), incompatible with sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line

**Amphotericin (lipid complex) (Abelcet®)**
Intermittent in Glucose 5%
Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20 mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used in fluid restriction and in children); preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used, do not use sodium chloride or other electrolyte solutions, flush existing intravenous line with glucose 5% or use separate line

**Amphotericin (as deoxycholate complex) (Fungizone®)**
Intermittent in Glucose 5%
Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL, withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL, infuse over 30–60 minutes (initial test dose 1 mg over 10 minutes); incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line.

**Amphotericin (as sodium deoxycholate complex) (AmBisome®)**
Intermittent in Glucose 5%
Reconstitute each vial with 10 mL water for injections and shake immediately to produce a 5 mg/mL colloidal solution, dilute further in infusion fluid to a concentration of 100 micrograms/mL, pH of the glucose must not be below 4.2 (check each container—consult product literature for details of buffer), infuse over 2–4 hours, or longer if not tolerated (initial test dose 1 mg over 20–30 minutes), begin infusion on a preferably after dilution and protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used

**Ampicillin sodium (Penbritin®)**
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstituted solutions diluted and given without delay, suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9% or Ringer's solution or Compound sodium lactate
Continuous infusion not usually recommended.
Appendix 6: Intravenous additives

Amsacrine (Arsidine®)
Intermittent in Glucose 5%
Reconstitute with diluent provided and dilute to suggested volume 500 mL; give over 60–90 minutes; use glass syringes; incompatible with sodium chloride infusion

Anidulafungin (Ecalta®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 100 mg with solvent provided, allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 360 micrograms/mL; give at a rate not exceeding 1.1 mg/minute

Antithymocyte immunoglobulin (Thymoglobulin®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution, give through an in-line filter (pore size 0.22 micron); not to be given with heparin and hydrocortisone in glucose infusion as precipitation reported

Arsenic trioxide (Trisenox®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose with 100–250 mL infusion fluid, infuse over 1–2 hours (up to 4 hours if vasomotor reactions observed)

Atenolol (Tenormin®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested infusion time 20 minutes

Atosiban (Tractocile® concentrate for intravenous infusion)
Continuous in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate
Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL

Atracurium besilate (Atracurium injection/infusion)
Continuous in Glucose 5% or Sodium chloride 0.9%
Intermittent in Sodium chloride 0.9%
Reconstitute each 250-mg vial with 5 mL water for injections; then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with sodium solutions

Azathioprine (as sodium salt) (Imuran®)
Intermittent in Sodium chloride 0.9% or Sodium chloride and glucose
Reconstitute 50 mg with 5–15 mL water for injections; dilute with 20–200 mL infusion fluid

Aztreonam (Azactam®)
Intermittent in Glucose 5% or Sodium chloride 0.9% or Ringer’s solution or Compound sodium lactate
Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes

Basiliximab (Simulect®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute 10 mg with 5 mL water for injections then dilute to at least 25 mL with infusion fluid, reconstitute 20 mg with 10 mL water for injections then dilute to at least 50 mL with infusion fluid, give over 20–30 minutes

Benzydamine (Crystapen®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested volume 100 mL given over 30–60 minutes

Betamethasone (as sodium phosphate) (Betnesol®)
Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Bevacizumab (Avastin®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in infusion fluid to 100 mL and give over 90 minutes, if initial dose well tolerated give second dose over 60 minutes; if second dose well tolerated give subsequent doses over 30 minutes, incompatible with glucose solutions

Bivalirudin (Angiox®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 5 mL and dilute to 50 mL with infusion fluid

Bleomycin sulphate
Intermittent in Sodium chloride 0.9%
To be given slowly, suggested volume 200 mL

Bumetanide (Burinex®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Suggested volume 500 mL given over 30–60 minutes

Busulfan (Busilve®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 500 micrograms/mL; give through a central venous catheter over 2 hours

Calcitonin (salmon)/Salgotatin (Miacalcic®)
Intermittent in Sodium chloride 0.9%
Diluted solution given without delay; dilute in 500 mL and give over at least 6 hours, glass or hard plastic containers should not be used; some loss of potency on dilution and administration

Calcium folinate (Calcium Leucovorin®, Refolin®)
Intermittent in Sodium chloride 0.9%
Calcium Leucovorin can also be infused in Glucose 5 and 10% or Compound sodium lactate
Protect from light

Calcium gluconate
Continuous in Glucose 5% or Sodium chloride 0.9%
Avoid bicarbonates, phosphates, or sulphates

Calcium levofolinate (Isovorin®)
Intermittent in Glucose 5 and 10% or Sodium chloride 0.9% or Compound sodium lactate
Final concentration as low as 500 micrograms/mL; give over 15–60 minutes

Caspofungin (Cancidas®)
Intermittent in Sodium chloride 0.9% or Compound sodium lactate
Allow vial to reach room temperature, initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with sodium solutions

Cefotaxime (as sodium salt)
Intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate or Water for injections
Suggested volume 40–100 mL given over 20–60 minutes; incompatible with sodium solutions

Cefadoline (Velocef®)
Continuous or intermittent in Glucose 5% and 10% or Sodium chloride 0.9% or Ringer’s solution or Compound sodium lactate
Reconstitute 500 mg with 5 mL water for injections or glucose 5% or sodium chloride 0.9% then dilute with infusion fluid

Ceftazidime (as pentahydrate) (Fortum®, Kefadim®)
Intermittent or via drip tubing in Glucose 5 and 10% or Sodium chloride 0.9% or Compound sodium lactate
Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid, for Fortum dilute further to a concentration of 40 mg/mL; for Kefadim dilute further to a concentration of 20 mg/mL, give over up to 30 minutes
Ceftriaxone (as sodium salt) (Rocephin<sup>®</sup>; Ceftriaxone Injection, Genus)  
**Intermittent or via drip tubing in Glucose 5% and 10% or Sodium chloride 0.9%**  
Reconstitute 2-g vial with 40 mL infusion fluid; give intermittent infusion over at least 30 minutes (60 minutes in neonates); not to be given with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines

Cefuroxime (as sodium salt) (Zinacef<sup>®</sup>)  
**Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate**  
Dissolve initially in water for injections (at least 2 mL for each 250 mg, 15 mL for 1.5 g); suggested volume 50–100 mL given over 30 minutes

Chloramphenicol (as sodium succinate) (Kemicetine<sup>®</sup>)  
**Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%**

Ciclosporin (Sandimmun<sup>®</sup>)  
**Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%**  
Dilute to a concentration of 0.1–2 mg/mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment

Cidofovir (Vistide<sup>®</sup>)  
**Intermittent in Sodium chloride 0.9%**  
Dilute requisite dose with 100 mL infusion fluid; infuse over 1 hour

Cisatracurium (Nimbex<sup>®</sup>, Nimbex Forte<sup>®</sup>)  
**Continuous in Glucose 5% or Sodium chloride 0.9%**  
Solutions of 2 mg/mL and 5 mg/mL may be infused undiluted; alternatively dilute with infusion fluid to a concentration of 10–30 mg/L

Cisplatin (Cisplatin, Pharmacia; Cisplatin injection solution, Hospira)  
**Intermittent in Sodium chloride 0.9% or Sodium chloride and glucose**  
Reconstitute initially with water for injections to produce 1 mg/mL then dilute in 2 litres infusion fluid; give over 6–8 hours

Cladribine (Leustar<sup>®</sup>)  
**Continuous in Sodium chloride 0.9%**  
Dilute with 100–500 mL; glucose solutions are unsuitable

Clarithromycin (Klacid<sup>®</sup> I.V.)  
**Intermittent in Glucose 5% or Sodium chloride 0.9% or Ringer’s solution or Compound sodium lactate**  
Dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes

Clindamycin (as phosphate) (Dalacin<sup>®</sup> C Phosphate)  
**Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%**  
Dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion)

Clolarabine (Evoltra<sup>®</sup>)  
**Intermittent in Sodium chloride 0.9%**  
Filter requisite dose through a 0.2 micron filter and dilute with infusion fluid; give over 2 hours

Clonazepam (Rivotril<sup>®</sup>)  
**Intermittent in Glucose 5% and 10% or Sodium chloride 0.9%**  
Suggested volume 250 mL

Co-amoxiclav (Augmentin<sup>®</sup>; Co-amoxiclav Injection, Wockhardt)  
**Intermittent in Sodium chloride 0.9% or Water for injections; see also package leaflet**  
Suggested volume 50–100 mL given over 30–40 minutes and completed within 4 hours of reconstitution  
**via drip tubing in Glucose 5% or Sodium chloride 0.9%**

Co-fluampicil (as sodium salts) (Magnapen<sup>®</sup>)  
**Intermittent in Glucose 5% or Sodium chloride 0.9%**  
Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes  
**via drip tubing in Glucose 5% or Sodium chloride 0.9% or Ringer’s solution or Compound sodium lactate**

Colistimethate sodium (Colomycin<sup>®</sup>)  
**Intermittent in Sodium chloride 0.9% or Water for injections**  
Dilute with 50 mL infusion fluid and give over 30 minutes

Co-trimoxazole (Septrin<sup>®</sup> for infusion)  
**Intermittent in Glucose 5% and 10% or Sodium chloride 0.9% or Ringer’s solution**  
Dilute contents of 1 ampoule (5 mL) to 125 mL; 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and infused over max. 60 minutes

Cyclophosphamide (Endoxana<sup>®</sup>)  
**via drip tubing in Glucose 5% or Sodium chloride 0.9%**  
Reconstitute with sodium chloride 0.9%

Cytarabine (Cytarabine injection solution, Pharmacia, Hospira)  
**Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%**  
For Cytarabine injection solution 100 mg/mL (Pharmacia) before use, vials should be warmed to 55 °C for 30 minutes, with adequate shaking, and allowed to cool to room temperature

Dacarbazine (Dacarbazine, Medac)  
**Intermittent in Glucose 5% or Sodium chloride 0.9%**  
Reconstitute initially with water for injections then dilute in 200–300 mL infusion fluid; give over 15–30 minutes; protect infusion from light

Dactinomycin (Cosmegen Lyovac<sup>®</sup>)  
**Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%**  
Reconstitute with water for injections

Danaparoid sodium (Orgaran<sup>®</sup>)  
**Continuous in Glucose 5% or Sodium chloride 0.9%**

Daptomycin (Cubicin<sup>®</sup>)  
**Intermittent in Sodium chloride 0.9%**  
Reconstitute with water for injections

Daunorubicin (as hydrochloride) (Cerubidin<sup>®</sup>)  
**via drip tubing in Sodium chloride 0.9%**  
Reconstitute vial with 4 mL water for injections to give 5 mg/mL solution; dilute requisite dose with infusion fluid to a concentration of 1 mg/mL; give over 20 minutes

Daunorubicin (liposomal) (Daunoxome<sup>®</sup>)  
**Intermittent in Glucose 5%**  
Dilute to a concentration of 0.2–1 mg/mL; give over 30–60 minutes; incompatible with sodium chloride solutions; in-line filter not recommended (if used, pore size should be no less than 5 micron)

Desferrioxamine mesilate (Desferal<sup>®</sup>)  
**Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%**  
Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid

Desmopressin (DDAVP<sup>®</sup>, Octim<sup>®</sup>)  
**Intermittent in Sodium chloride 0.9%**  
Dilute with 50 mL and give over 20 minutes
Appendix 6: Intravenous additives

### Disopyramide (as phosphate) (*Rythmodan*)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9% or Ringer’s solution or Compound sodium lactate
Max. rate by continuous infusion 20–30 mg/hour (or 400 micrograms/kg/hour)

### Dobutamine (as hydrochloride)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilate to a concentration of 0.5–1 mg/mL and give via a controlled infusion device; give higher concentration (max. 5 mg/mL) with infusion pump, incompatible with bicarbonate

### Docetaxel (*Taxotere*)
Continuous in Glucose 5% or Sodium chloride 0.9%
Stand docetaxel vials and diluent at room temperature for 5 minutes; add diluent to produce a concentrate containing 10 mg/mL and allow to stand for a further 5 minutes; dilute the requisite dose with at least 250 mL infusion fluid to a final concentration not exceeding 740 micrograms/mL; infuse over 1 hour

### Dolasetron mesilate (*Anzemet*)
Continuous in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate
Suggested volume 50 mL given over 30 seconds–15 minutes

### Dopamine hydrochloride
Continuous in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate
Dilute to max concentration of 3.2 mg/mL, incompatible with bicarbonate

### Dopexamine hydrochloride (*Dopacard*)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of 400 or 800 micrograms/mL; max. concentration via large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused via central vein; give via infusion pump or other device which provides accurate control of rate; contact with metal should be minimised; incompatible with bicarbonate

### Doripenem (*Doribax*)
Continuous in Glucose 5% or Sodium chloride 0.9%
Reconstitute 500 mg with 10 mL water for injections or sodium chloride 0.9% then dilute with 100 mL infusion fluid; give over 1 hour (for severe hospital-acquired pneumonia or hospital-acquired pneumonia caused by less sensitive organisms, may extend infusion time to 4 hours using sodium chloride 0.6% as the infusion fluid)

### Doxorubicin hydrochloride
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%
Reconstitute with water for injections or sodium chloride 0.9% (10 mg in 5 mL, 50 mg in 25 mL); give over 3–5 minutes; for continuous infusion over 24 hours (Doxorubicin, Medac and Dorubicin, Teva UK only), consult local protocol

### Doxorubicin hydrochloride (liposomal) (*Caelyx*)
via drip tubing in Glucose 5%
Dilute up to 90 mg in 250 mL infusion fluid and over 90 mg in 500 mL infusion fluid

### Eculizumab (*Soliris*)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur)

### Enoximone (*Perfar*)
Continuous or intermittent in Sodium chloride 0.9% or Water for injections
Dilute to a concentration of 2.5 mg/mL, incompatible with glucose solutions; use only plastic containers or syringes

### Appendix 6: Intravenous additives

- **Dexamethasone sodium phosphate** (*Dexamethasone, Hospira; Dexamethasone, Organon*)
  Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%
  Dexamethasone (Organon) can also be infused in Ringer’s solution or Compound sodium lactate

- **Deroxazole** (*Savene*®)
  Intermittent *in Savene*® diluent
  Reconstitute 500 mg with 25 mL of Water for Injections then dilute in 500 mL Savene® diluent; give over 1–2 hours into a large vein in an area other than the one affected

- **Diamorphine hydrochloride** (*Diamorphine Injection, Wockhardt*)
  Continuous in Glucose 5% or Sodium chloride 0.9%
  Glucose is preferred as infusion fluid

- **Diazepam** *(solution)* (*Diazepam, Wockhardt*)
  Continuous in Glucose 5% or Sodium chloride 0.9%
  Dilute to a concentration of not more than 10 mg in 200 mL; adsorbed to some extent by the plastics of bags and infusion sets

- **Diazepam (emulsion)** (*Diazemuls*®)
  Continuous in Glucose 5% and 10%
  May be diluted to a max. concentration of 200 mg in 500 mL, max. 6 hours between addition and completion of administration; adsorbed to some extent by the plastics of the infusion set via drip tubing in Glucose 5% and 10% or Sodium chloride 0.9%
  Adsorbed to some extent by the plastics of the infusion set

- **Diclofenac sodium** (*Voltarol*®)
  Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
  Dilute 75 mg with 100–500 mL infusion fluid (previously buffered with 0.5 mL sodium bicarbonate 8.4% solution or with 1 mL sodium bicarbonate 4.2% solution); for intermittent infusion give 25–50 mg over 15–60 minutes or 75 mg over 30–120 minutes; for continuous infusion give at a rate of 5 mg/hour

- **Digoxin** (*Lanoxin*®)
  Intermittent in Glucose 5% or Sodium chloride 0.9%
  Dilute to a concentration of not more than 62.5 micrograms/mL.
  To be given over at least 2 hours. Protect from light

- **Digoxin-specific antibody fragments** (*Digibind*®)
  Intermittent in Sodium chloride 0.9%
  Dissolve initially in water for injections (4 mL/vial) then dilute with the sodium chloride 0.9% and give through a 0.22 micron sterile, disposable filter over 30 minutes

- **Dinoprostone** (*Prostin E2*®)
  Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
  Protect from light
  Avoid bicarbonate containing infusions

- **Disodium folinate** (*Sodiofolin*®)
  Intermittent in Sodium chloride 0.9%
  Protect from light
  Avoid bicarbonate containing infusions

- **Disodium pamidronate** (*Aredia*®; *Disodium pamidronate, Britannia, Hospira, Medac*)
  Intermittent in Glucose 5% or Sodium chloride 0.9%
  For *Aredia* and *Pamidronate disodium* (Britannia), reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL); for *Aredia*, *Pamidronate disodium* (Britannia), *Disodium pamidronate* (Hospira), dilute with infusion fluid to a concentration of not more than 80 mg in 250 mL; for *Disodium pamidronate* (Medac) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium

- **Disopyramide (as phosphate)** (*Rythmodan*)
  Continuous or intermittent in Glucose 5% or Sodium chloride 0.9% or Ringer’s solution or Compound sodium lactate
  Max. rate by continuous infusion 20–30 mg/hour (or 400 micrograms/kg/hour)

- **Dobutamine (as hydrochloride)**
  Continuous in Glucose 5% or Sodium chloride 0.9%
  Dilute to a concentration of 0.5–1 mg/mL and give via a controlled infusion device; give higher concentration (max. 5 mg/mL) with infusion pump, incompatible with bicarbonate

- **Docetaxel** (*Taxotere*)
  Continuous in Glucose 5% or Sodium chloride 0.9%
  Stand docetaxel vials and diluent at room temperature for 5 minutes; add diluent to produce a concentrate containing 10 mg/mL and allow to stand for a further 5 minutes; dilute the requisite dose with at least 250 mL infusion fluid to a final concentration not exceeding 740 micrograms/mL; infuse over 1 hour

- **Dolasetron mesilate** (*Anzemet*)
  Continuous in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate
  Suggested volume 50 mL given over 30 seconds–15 minutes

- **Dopamine hydrochloride**
  Continuous in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate
  Dilute to max concentration of 3.2 mg/mL, incompatible with bicarbonate

- **Dopexamine hydrochloride** (*Dopacard*)
  Continuous in Glucose 5% or Sodium chloride 0.9%
  Dilute to a concentration of 400 or 800 micrograms/mL; max. concentration via large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused via central vein; give via infusion pump or other device which provides accurate control of rate; contact with metal should be minimised, incompatible with bicarbonate

- **Doripenem** (*Doribax*)
  Continuous in Glucose 5% or Sodium chloride 0.9%
  Reconstitute 500 mg with 10 mL water for injections or sodium chloride 0.9% then dilute with 100 mL infusion fluid; give over 1 hour (for severe hospital-acquired pneumonia or hospital-acquired pneumonia caused by less sensitive organisms, may extend infusion time to 4 hours using sodium chloride 0.6% as the infusion fluid)

- **Doxorubicin hydrochloride**
  Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%
  Reconstitute with water for injections or sodium chloride 0.9% (10 mg in 5 mL, 50 mg in 25 mL); give over 3–5 minutes; for continuous infusion over 24 hours (Doxorubicin, Medac and Dorubicin, Teva UK only), consult local protocol

- **Doxorubicin hydrochloride (liposomal)** (*Caelyx*)
  via drip tubing in Glucose 5%
  Dilute up to 90 mg in 250 mL infusion fluid and over 90 mg in 500 mL infusion fluid

- **Eculizumab** (*Soliris*)
  Intermittent in Glucose 5% or Sodium chloride 0.9%
  Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur)

- **Enoximone** (*Perfar*)
  Continuous or intermittent in Sodium chloride 0.9% or Water for injections
  Dilute to a concentration of 2.5 mg/mL, incompatible with glucose solutions; use only plastic containers or syringes
Fentanyl

Etoposide

Esomeprazole (as sodium salt)

Erythromycin (as lactobionate)

Ertapenem (Invanza®)

Epirubicin hydrochloride (Pharmorubicin® Rapid Dissolution, Pharmorubicin® Solution)

via drip tubing in Sodium chloride 0.9%

Reconstitute Pharmorubicin Rapid Dissolution with sodium chloride 0.9% or with water for injections (10 mg in 5 mL, 20 mg in 10 mL, 50 mg in 25 mL), give over 3–5 minutes

Epoprostenol (Flolan®)

Continuous in Sodium chloride 0.9% (but see also below)

Reconstitute using the filter and solvent (glycine buffer dihydant) provided to make a concentrate, may be diluted further (consult product literature), for pulmonary hypertension dilute further with glycine buffer dihydant only, for renal dialysis may be diluted further with sodium chloride 0.9%

Ertapenem (Invanza®)

Intermittent in Sodium chloride 0.9%

Reconstitute 1 g with 10 mL water for injections or sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions

Erythromycin (as lactobionate)

Continuous or intermittent in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%

Dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1 mg/mL for continuous infusion and 1–5 mg/mL for intermittent infusion, give intermittent infusion over 20–60 minutes

Esmolol hydrochloride (Brevisloc®)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of 10 mg/mL, for continuous infusion use a suitable infusion control device, incompatible with bicarbonate

Esomeprazole (as sodium salt) (Nexium®)

Intermittent in Sodium chloride 0.9%

Reconstitute 40 mg with 5 mL sodium chloride 0.9% then dilute with up to 100 mL infusion fluid, give requisite dose over 10–30 minutes

Ethanol

Continuous in Glucose 5% or Sodium chloride 0.9% or Ringer’s solution or Compound sodium lactate

Dilute to a concentration of 5–10%

Etoposide (Eposin®, Etoposide, TEVA UK and Hospira)

Intermittent in Sodium chloride 0.9%

For Etoposide (TEVA UK) dilute with either sodium chloride 0.9% or glucose 5% to a concentration of 200 micrograms/mL and give over 30–60 minutes; for Etoposide (Hospira) dilute with either sodium chloride 0.9% or glucose 5% to a concentration not more than 250 micrograms/mL and give over not less than 30 minutes; for Etoposide in either sodium chloride 0.9% or glucose 5% to a concentration of 200–400 micrograms/mL and give over at least 30 minutes; check container for haze or precipitate during infusion

Etoposide (as phosphate) (Etopophos®)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute with 5–10 mL of either water for injections or with infusion fluid then dilute further with infusion fluid to a concentration as low as 100 micrograms/mL and give over 5 minutes to 3.5 hours

Fentanyl (Sublimaze®)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Ferric carboxymaltose (Ferinject®)

Intermittent in Sodium chloride 0.9%

Dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes

Filgrastim (Neupogen®, Ratiogranstim®)

Continuous or intermittent in Glucose 5%

For a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human serum albumin) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution

Flecainide acetate (Tambocor®)

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate

Minimum volume in infusion fluids containing chlorides 500 mL

Flucloxacillin (as sodium salt) (Flxin®)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium chloride 0.9% or Ringer’s solution or Compound sodium lactate

Continuous infusion not usually recommended

Fludarabine phosphate (Fludara®)

Intermittent in Sodium chloride 0.9%

Reconstitute each 50 mg with 2 mL water for injections and dilute requisite dose in 100 mL, give over 30 minutes

Flumazenil (Anexate®)

Continuous in Glucose 5% or Sodium chloride 0.9%

Fluorouracil (as sodium salt)

Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Give intermittent infusion over 30–60 minutes or over 4 hours

Fondaparinux (Arixtra®)

Intermittent in Sodium chloride 0.9%

For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes

Fosaprepitant (Ivend®)

Intermittent in Sodium chloride 0.9%

Reconstitute each 115-mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 110 mL infusion fluid, give over 15 minutes

Foscarnet sodium (Foscavir®)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only); infuse over at least 1 hour

Fosphenytoin Sodium (Pro-Epanutin®)

Intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent)/mL

Furosemide (Lasix®)

Continuous in Sodium chloride 0.9% or Ringer’s solution

Infusion pH must be above 5.5 and rate should not exceed 4 mg/minute, glucose solutions are unsuitable

Fusidic acid (as sodium salt)

Continuous in Glucose 5% (but see below) or Sodium chloride 0.9%

Reconstitute with the buffer solution provided and dilute to 500 mL, give through central venous line over 2 hours (or over 6 hours if superficial vein used), incompatible in solution of pH less than 7.4

Galsulfase (Naglazyme®)

Intermittent in Sodium chloride 0.9%

Dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently, infuse through a 0.2 micron in-line filter, give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours, if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours
Appendix 6: Intravenous additives

Ganciclovir (as sodium salt) (Cymevene®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
or Ringer’s solution or Compound sodium lactate
Reconstitute initially in water for injections (500 mg/10 mL) then
dilute to not more than 10 mg/mL with infusion fluid (usually
100 mL), give over 1 hour

Gemcitabine (Gemzar®)
Intermittent in Sodium chloride 0.9%
Reconstitute initially with sodium chloride 0.9% (200 mg in at
least 5 mL, 1 g in at least 25 mL); may be diluted further with
infusion fluid; give over 30 minutes

Gentamicin (as sulphate) (Cidomycin®, Gentamicin
Paediatric Injection, Beacon; Gentamicin Injection,
Hospira)
Intermittent or via drip tubing in Glucose 5% or Sodium
chloride 0.9%
Suggested volume for intermittent infusion 50–100 mL given over
20–30 minutes

Glyceryl trinitrate (Nitrocin®, Nitronal®)
Continuous in Glucose 5% or Sodium chloride 0.9%
For Nitrocin suggested infusion concentration 100 micrograms/
ml incompatible with polyvinyl chloride infusion containers such
as Viaflex or Sterifeed; use glass or polyethylene containers or
give via a syringe pump

Granisetron (as hydrochloride) (Kytril®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
or Compound sodium lactate
Dilute 3 mL in 20–50 mL infusion fluid (up to 3 mL in 10–30 mL for
children); give over 5 minutes

Haem arginate (Normosang®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid in glass bottle and
give over at least 30 minutes via large antebellial vein, admin-
sters within 1 hour after dilution

Heparin sodium
Continuous in Glucose 5% or Sodium chloride 0.9%
Administration with a motorised pump advisable

Hydralazine hydrochloride (Apresoline®)
Continuous in Sodium chloride 0.9% or Ringer’s solution
Suggested infusion volume 500 mL

Hydrocortisone (as sodium phosphate) (Efcorbeso®)
Continuous or intermittent or via drip tubing in Glu-
cose 5% or Sodium chloride 0.9%

Hydrocortisone (as sodium succinate) (SoluCortef®)
Continuous or intermittent or via drip tubing in Glu-
cose 5% or Sodium chloride 0.9%

Ibandronic acid (Bondronat®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose in 500 mL infusion fluid and give over 1–2
hours

Idarubicin hydrochloride (Zavedos®)
via drip tubing in Sodium chloride 0.9%
Reconstitute with water for injections; give over 5–10 minutes

Idursulfase (Elaprase®)
Intermittent in Sodium chloride 0.9%
Dilute requisite dose in 100 mL infusion fluid and mix gently (do
not shake); give over 3 hours (gradually reduced to 1 hour if no
infusion-related reactions)

Ifosfamide (Mitoxana®)
Continuous or intermittent or via drip tubing in Glu-
cose 5% or Sodium chloride 0.9%
For continuous infusion, suggested volume 3 litres given over 24
hours; for intermittent infusion, give over 30–120 minutes

Imiglucerase (Cerezyme®)
Intermittent in Sodium chloride 0.9%
Initially reconstitute with water for injections (200 units in 5.1 mL,
400 units in 10.2 mL) to give 40 units/mL solution, dilute requisite
dose with infusion fluid to a final volume of 100–200 mL and give
over 1–2 hours or at a rate not exceeding 1 unit/kg/minute;
administer within 3 hours after reconstitution

Imipenem with cilastatin (as sodium salt) (Primaxin®)
Intermittent in Sodium chloride 0.9% or Sodium
chloride and Glucose
Dilute to a concentration of 5 mg (as imipenem)/mL, infuse 250–
500 mg (as imipenem) over 20–30 minutes, 1 g over 40–60 min-
utes
Continuous infusion not usually recommended

Infliximab (Remicade®)
Intermittent in Sodium chloride 0.9%
Reconstitute each 100-mg vial with 10 mL water for injections
using a 21-gauge or smaller needle; gently swirl vial without
shaking to dissolve, allow to stand for 5 minutes; dilute requisite
dose with infusion fluid to a final volume of 250 mL and give
through a low protein-binding filter (1.2 micron or less) over at
least 2 hours (patients being treated for rheumatoid arthritis who
have tolerated 3 initial 2-hour infusions may be given subsequent
infusions of up to 6 mg/kg over at least 1 hour); start infusion
within 3 hours of reconstitution

Insulin (soluble)
Continuous in Sodium chloride 0.9% or Compound sodium
lactate
Adsorbed to some extent by plastics of infusion set; see also
section 6.1.3, ensure insulin is not injected into ‘dead space’ of
injection port of the infusion bag

Insulin aspart
Continuous in Sodium chloride 0.9% or Glucose 5%
Dilute to 0.05–1 unit/mL with infusion fluid; adsorbed to some
extent by plastics of infusion set

Insulin lispro
Continuous in Sodium chloride 0.9% or Glucose 5%

Interferon alfa-2b (IntronA®)
Intermittent in Sodium chloride 0.9%
For IntronA solution, dilute requisite dose in 50 mL infusion fluid
and administer over 20 minutes; not to be diluted to less than
300 000 units/mL.
For IntronA powder, reconstitute with 1 mL water for injections;
dilute requisite dose in 100 mL infusion fluid and administer over
20 minutes; not to be diluted to less than 100 000 units/mL.

Irinotecan hydrochloride (Campto®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute requisite dose in 250 mL infusion fluid; give over 30–90
minutes

Iron dextran (Cosmofe®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute 100–200 mg in 100 mL infusion fluid, give 25 mg over 15
minutes as a test dose initially, then give at a rate not exceeding
6.67 mg/minute; total dose infusion diluted in 500 mL infusion fluid
and given over 4–6 hours (initial test dose 25 mg over 15 minutes)

Iron sucrose (Venofe®)
Intermittent in Sodium chloride 0.9%
Dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over 15
minutes as a test dose initially, then give at a rate not exceeding
3.33 mg/minute
Appendix 6: Intravenous additives

Isosorbide dinitrate (Isoket 0.05%, Isoket 0.1%) Continuous in Glucose 5% or Sodium chloride 0.9% Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump. Isoket 0.05% can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe.

Itraconazole (Sporanox®) Intermittent in Sodium chloride 0.9% Dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.

Ketamine (as hydrochloride) (Ketalar®) Continuous in Glucose 5% or Sodium chloride 0.9% Dilute to 1 mg/mL; microdroop infusion for maintenance of anaesthesia.

Labetalol hydrochloride (Trandate®) Intermittent in Glucose 5% or Sodium chloride and glucose Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette.

Lacosamide (Vimpat®) Intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate solution. May be administered undiluted.

Laronidase (Aldurazyme®) Intermittent in Sodium chloride 0.9% Body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through an in-line filter (0.22 micron) at an initial rate of 2 units/kg/hour then increasing gradually every 15 minutes to max. 43 units/kg/hour.

Lenograstim (Granocyte®) Intermittent in Sodium chloride 0.9% Initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with up to 50 mL infusion fluid for each vial of Granocyte-13 or up to 100 mL infusion fluid for Granocyte-34, give over 30 minutes.

Lepirudin (Refudan®) Continuous in Glucose 5% or Sodium chloride 0.9% Reconstitute initially with water for injections or sodium chloride 0.9% then dilute to a concentration of 2 mg/mL with infusion fluid.

Levetiracetam (Keppra®) Intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate DILUTE the requisite dose with at least 100 mL of infusion fluid; give over 15 minutes.

Magnesium sulphate Continuous in Glucose 5% or Sodium chloride 0.9% Suggested concentration up to 200 mg/mL; max. rate 150 mg/minute.

Melphalan (Alkeran®) Intermittent or via drip tubing in Sodium chloride 0.9% Reconstitute with the solvent provided then dilute with infusion fluid; max. 90 minutes between addition and completion of administration; incompatible with glucose infusion.

Meropenem (Meropen®) Intermittent in Glucose 5 and 10% or Sodium chloride 0.9% Dilute in 50–200 mL infusion fluid and give over 15–30 minutes.

Mesna (Uromitexan®) Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Metaraminol (as tartrate) (Aramine®) Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9% Suggested volume 500 mL.

Methotrexate (as sodium salt) (Methotrexate, Leaderle) Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate or Ringer’s solution Dilute in a large-volume infusion; max. 24 hours between addition and completion of administration.

Methylprednisolone (as sodium succinate) (Solu-Medrone®) Continuous or intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9% Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.

Metoclopramide hydrochloride (Maxolon High Dose®) Continuous or intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate Continuous infusion recommended; loading dose, dilute with 50–100 mL and give over 15–20 minutes; maintenance dose, dilute with 500 mL and give over 8–12 hours; for intermittent infusion dilute with at least 50 mL and give over at least 15 minutes.

Mepacurin (Mycamine®) Intermittent in Glucose 5% or Sodium chloride 0.9% Reconstitute each vial with 5 mL infusion fluid, gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration 0.5–2 mg/mL); protect from light; give over 60 minutes.

Midazolam (Hypnovel®) Continuous in Glucose 5% or Sodium chloride 0.9% For neonates and children under 15 kg dilute to a max. concentration of 1 mg/mL.

Milrinone (Primacor®) Continuous in Glucose 5% or Sodium chloride 0.9% Dilute to a suggested concentration of 200 micrograms/mL.

Mitoxantrone/Mitozantrone (as hydrochloride) (Ontkarene®) Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9% For administration via drip tubing suggested volume at least 50 mL; give over at least 3–5 minutes, for intermittent infusion, dilute with 50–100 mL and give over 15–30 minutes.

Mivacurium (as chloride) (Mivacron®) Continuous in Glucose 5% or Sodium chloride 0.9% Dilute to a concentration of 500 micrograms/mL; may also be given undiluted.

Mycophenolate mofetil (as hydrochloride) (CellCept®) Intermittent in Glucose 5% Reconstitute each 500-mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid, give over 2 hours.

Naloxone (Min-I-Jet® Naloxone Hydrochloride) Continuous in Glucose 5% or Sodium chloride 0.9% Reversal of opioid-induced respiratory depression, dilute to a concentration of 4 micrograms/mL; opioid overdose only; dilute 10 mg in 50 mL glucose 5%, see Emergency Treatment of Poisoning.
Appendix 6: Intravenous additives

**Natalizumab** *(Tysabri®)*

Intermittent in Sodium chloride 0.9%

Dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour

**Nimodipine** *( Nimotop®)*

via drip tubing in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate

Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light

**Nizatidine** *( Axid®)*

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate

For continuous infusion, dilute 300 mg in 150 mL and give at a rate of 10 mg/hour; for intermittent infusion, dilute 100 mg in 50 mL and give over 15 minutes

**Noradrenaline acid tartrate/Norepinephrine bitartrate**

Continuous in Glucose 5% or Sodium chloride and glucose

Give via controlled infusion device; for administration via syringe pump, dilute 4 mg noradrenaline acid tartrate (2 mL solution) with 48 mL; for administration via drip counter dilute 40 mg (20 mL solution) with 480 mL; give through a central venous catheter; incompatible with alkaline solution

**Omeprazole (as sodium salt)** *(Losec®)*

Intermittent or continuous in Glucose 5% or Sodium chloride 0.9%

Reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; give intermittent infusion over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%

**Ondansetron (as hydrochloride)** *(Zofran®)*

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9% or Ringer’s solution

For intermittent infusion, dilute 32 mg in 50–100 mL and give over at least 15 minutes

**Oxaliplatin** *( Eloxatin®)*

Continuous in Glucose 5%

Dilute requisite dose to a concentration of 220–700 micrograms/mL and give over 2–6 hours; incompatible with alkaline or chloride-containing fluids; avoid equipment containing aluminium

**Oxycodone hydrochloride** *(OxyNorm®)*

Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of 1 mg/mL

**Oxytocin** *( Syntocinon®)*

Continuous in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate or Ringer’s solution

Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for induction or enhancement of labour: dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL for treatment of postpartum uterine haemorrhage dilute 5–30 units in 500 mL, if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient’s fluid and electrolyte status essential

**Paclitaxel** *( Taxo®)*

Continuous in Glucose 5% or Sodium chloride 0.9%

Dilute to a concentration of 0.3–1.2 mg/mL and give through an in-line filter (0.22 micron or less) over 3 hours; not to be used with PVC equipment (short PVC inlet or outlet on filter may be acceptable)

**Panitumumab** *( Vectibix®)*

Intermittent in Sodium chloride 0.9%

Flush intravascular line with Sodium chloride 0.9% before and after infusion, dilute requisite dose with infusion fluid to 100 mL (final concentration not to exceed 10 mg/mL), gently invert to mix, do not shake; give via infusion pump through a low protein-binding in-line filter (0.2 or 0.22 micron) over 60 minutes, for doses higher than 1 g, dilute requisite dose with infusion fluid to 150 mL and give over 90 minutes

**Pantoprazole (as sodium sesquihydrate)** *(Protonix®)*

Intermittent in Glucose 5 and 10% or Sodium chloride 0.9%

Reconstitute 40 mg with 10 mL sodium chloride 0.9% and dilute to 100 mL with infusion fluid

**Paracetamol** *(Perfalgan®)*

Intermittent in Sodium chloride 0.9% or Glucose 5%

Dilute to a concentration of 1 mg/mL and use within 1 hour; may also be given undiluted

**Pemetrexed** *(Alimta®)*

Intermittent in Sodium chloride 0.9%

Reconstitute 500–mL vial with 20 mL sodium chloride 0.9% to produce a 25 mg/mL solution; dilute requisite dose with infusion fluid to 100 mL; give over 10 minutes

**Pentamidine isethionate** *(Pentacarinat®)*

Intermittent in Glucose 5% or Sodium chloride 0.9%

Dissolve initially in water for injections (300 mg in 3–5 mL) then dilute in 50–250 mL; give over at least 60 minutes

**Pentostatin** *(Nipen®)*

Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute initially with 5 mL water for infusions to produce a 2 mg/mL solution; dilute requisite dose in 25–50 mL infusion fluid (final concentration 180–330 micrograms/mL) and give over 20–30 minutes

**Phenoxymenzamine hydrochloride**

Intermittent in Sodium chloride 0.9%

Dilute in 200–500 mL infusion fluid, give over at least 2 hours, max. 4 hours between dilution and completion of administration

**Phenylephrine hydrochloride**

Intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute 10 mg in 500 mL infusion fluid

**Phenytin sodium** *(Epanutin®)*

Intermittent in Sodium chloride 0.9%

Flush intravascular line with Sodium chloride 0.9% before and after infusion, dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/mL) and give through an in-line filter (0.22–0.50 micron) at a rate not exceeding 50 mg/minute (neonates, give at a rate of 1–3 mg/kg/minute); complete administration within 1 hour of preparation

**Phytomenadione (in mixed micelles vehicle)** *(Konakion® MM)*

Intermittent in Glucose 5%

Dilute with 55 mL, may be injected into lower part of infusion apparatus

**Piperacillin with tazobactam (as sodium salts)** *(Tazocin®)*

Intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate or Water for infusions

Reconstitute initially with water for injections or sodium chloride 0.9% (2.25 g in 10 mL, 4.5 g in 20 mL), then dilute to 50–150 mL with infusion fluid (to max. 50 mL with water for injections); give over 20–30 minutes

Important Generic preparations of piperacillin with tazobactam may have different compatibilities to Tazocin — consult product literature
Potassium chloride
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute in a large-volume infusion; mix thoroughly to avoid 'layering', especially in non-rod infusion containers; use ready-prepared solutions when possible

Propofol (emulsion) (Diprivan®, Abbott; Baxter; Propofol-Lipuro®, Propofen®, Braun; Hospira; Fresenius Kabi; Zurich)
1% or 2% emulsion
via drip tubing in Glucose 5% or Sodium chloride 0.9%
To be administered via a Y-piece close to injection site; microbiological filter not recommended
1% emulsion only
Continuous in Glucose 5% (or Sodium chloride 0.9% for Propofol-Lipuro®, Propofen®, Braun, Fresenius Kabi, and Zurich brands only)
Dilute to a concentration not less than 2 mg/mL; microbiological filter not recommended; administer using suitable device to control infusion rate; use glass or PVC containers (if PVC bag used it should be full—withdraw volume of infusion fluid equal to that of propofol to be added); give within 6 hours of preparation; propofol may alternatively be infused undiluted using a suitable infusion pump.

Quinine dihydrochloride
Continuous in Glucose 5% or Sodium chloride 0.9%
To be given over 4 hours; see also section 5.4.1

Quinupristin with dalfopristin (Synercid®)
Intermittent in Glucose 5%
Reconstitute 500 mg with 5 mL water for injections or glucose 5%; gently swirl vial without shaking to dissolve; allow to stand for at least 2 minutes until foam disappears; dilute requisite dose in 100 mL infusion fluid and give over 60 minutes via central venous catheter (in an emergency, first dose may be diluted in 250 mL infusion fluid and given over 60 minutes via peripheral line); flush line with glucose 5% before and after infusion; incompatible with sodium chloride solutions

Raltitrexed (TomudeX®)
Intermittent in Glucose 5%
Reconstitute with water for injections; dilute requisite dose in 50–250 mL infusion fluid and give over 15 minutes

Ranitidine (as hydrochloride) (Zantac®)
Intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate

Rasburicase (Fasturect®)
Intermittent in Sodium chloride 0.9%
Reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes

Remifentanil (Ultiva®)
Continuous in Glucose 5% or Sodium chloride 0.9% or Water for injections
Reconstitute with infusion fluid to a concentration of 1 mg/mL; then dilute further to a concentration of 20–250 micrograms/mL. (50 micrograms/mL recommended for general anaesthesia, 20–25 micrograms/mL recommended for children 1–12 years; 20–50 micrograms/mL recommended when used with target controlled infusion (TCI) device)

Rifampicin (Rifadin®)
Intermittent in Glucose 5 and 10% or Sodium chloride 0.9% or Ringer’s solution
Reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours

Ritodrine hydrochloride (Yutopar®)
Continuous in Glucose 5%
Give via controlled infusion device, preferably a syringe pump; if syringe pump available dilute to a concentration of 3 mg/mL, if syringe pump not available dilute to a concentration of 300 micrograms/mL; close attention to patient’s fluid and electrolyte status essential

Rituximab (MabThera®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to 1–4 mg/mL and gently invert bag to avoid foaming

Rocuronium bromide (Esmeron®)
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Salbutamol (as sulphate) (Ventolin® For Intravenous Infusion)
Continuous in Glucose 5%
For bronchodilatation dilute to a concentration of 200 micrograms/mL with glucose 5%, sodium chloride 0.9%, or water for injections; for premature labour dilute with glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL, close attention to patient’s fluid and electrolyte status essential

Sodium calcium edetate (Ledclair®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of not more than 3%; suggested volume 250–500 mL given over at least 1 hour

Sodium clonidine (Bonefa® Concentrate)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute 100 mg in 500 mL and give over at least 2 hours or 1.5 g in 500 mL and give over at least 4 hours

Sodium valproate (Epilim®, Episenta®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute Epilim with solvent provided then dilute with infusion fluid

Sotalol hydrochloride (Sotacor®)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Dilute to a concentration of between 0.01–2 mg/mL

Streptokinase (Streptase®, Streptokinase, Braun)
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9%
Reconstitute Streptase with sodium chloride 0.9%, and Streptokinase (Braun) with either water for injections or sodium chloride 0.9% then dilute further with infusion fluid

Sulfadiazine sodium
Continuous in Sodium chloride 0.9%
Suggested volume 500 mL; ampoule solution has a pH of over 10

Suxamethonium chloride (Anectine®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute 300 mg in 500 mL and give over at least 2 hours or 1.5 g in 500 mL and give over at least 4 hours

Tacrolimus (Prograf®)
Continuous in Glucose 5% or Sodium chloride 0.9%
Dilute concentration in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours; incompatible with PVC

Teicoplanin (Targocid®)
Intermittent in Glucose 5% or Sodium chloride 0.9%
Or Compound sodium lactate
Reconstitute initially with water for injections provided; infuse over 30 minutes

Teicoplanin (Targocid®)
Continuous infusion not usually recommended

Temocillin
Continuous in Sodium chloride 0.9%
Dilute further to a concentration of 20–250 micrograms/mL; give over 30 minutes; compatible with PVC

Temsirolimus (Torisel®)
Intermittent in Sodium chloride 0.9%
Add 1.8 mL of the supplied diluent to the vial of concentrate to produce a concentration of 10 mg/mL; dilute requisite dose with 250 mL of sodium chloride 0.9%, give (preferably via infusion pump) through an in-line filter with a maximum pore size of 5 microns; avoid PVC equipment; protect from light and administer within 6 hours of dilution
Appendix 6: Intravenous additives

**Terbutaline sulphate** *(Bricanyl®)*
Continuous in Glucose 5%

For bronchodilatation dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours; for premature labour dilute in glucose 5% and give via controlled infusion device preferably a syringe pump, if syringe pump available dilute to a concentration of 10 micrograms/mL; if syringe pump not available dilute to a concentration of 10 micrograms/mL, close attention to patient's fluid and electrolyte status essential.

**Ticarcillin sodium with clavulanic acid** *(Timentin®)*
Intermittent in Glucose 5% or Water for injections

Suggested volume (depending on dose) glucose 5% 100–150 mL or water for injections 50–100 mL, given over 30–40 minutes.

**Tigecycline** *(Tygaci®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes

**Tirofiban** *(Aggrastat®)*
Continuous in Glucose 5% or Sodium chloride 0.9%

Withdraw 50 mL infusion fluid from 250-mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL.

**Tobramycin (as sulphate)** *(Tygacil®)*
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

For adult intermittent infusion suggested volume 50–100 mL (children proportionately smaller volume) given over 20–60 minutes.

**Topotecan (as hydrochloride)** *(Hycamit®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute 4 mg with 4 mL water for injections then dilute to a final concentration of 25–50 micrograms/mL, give over 30 minutes

**Tramadol hydrochloride** *(Zydo®)*
Continuous or intermittent in Glucose 5% or Sodium chloride 0.9% or Ringer's solution or Compound sodium lactate

**Tranexamic acid** *(Cyklokapron®)*
Continuous in Glucose 5% or Sodium chloride 0.9% or Ringer's solution

**Trastuzumab** *(Herceptin®)*
Intermittent in Sodium chloride 0.9%

Reconstitute each 150-mg vial with 7.2 mL water for injections to produce a 21 mg/mL solution, swirl vial gently to avoid excessive foaming and allow to stand for approximately 5 minutes; dilute requisite dose in 250 mL infusion fluid

**Tresolufan** *(Treosulfan®)*
Intermittent in Water for injections

Infusion suggested for doses above 5 g, dilute to a concentration of 5 g in 100 mL

**Urokinase** *(Syner-KINASE®)*
Continuous or intermittent in Sodium chloride 0.9%

**Vancomycin (as hydrochloride)** *(Vancocin®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%

Reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects), give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible

**Vasopressin, synthetic** *(Pitressin®)*
Intermittent in Glucose 5%

Suggested concentration 20 units/100 mL given over 15 minutes

**Vecuronium bromide** *(Norcuron®)*
Continuous or via drip tubing in Glucose 5% or Sodium chloride 0.9% or Ringer's solution

Reconstitute each vial with 5 mL water for injections to give 2 mg/mL solution, alternatively reconstitute with up to 10 mL glucose 5% or sodium chloride 0.9% or water for injections—unsuitable for further dilution if not reconstituted with water for injections. For continuous intravenous infusion, dilute to a concentration of not less than 40 micrograms/mL

**Verteporfin** *(Visudyne®)*
Intermittent in Glucose 5%

Reconstitute each 15 mg with 7 mL water for injections to produce a 2 mg/mL solution then dilute requisite dose with infusion fluid to a final volume of 30 mL and give over 10 minutes; protect from light and administer within 4 hours of reconstitution. Incompatible with sodium chloride infusion

**Vinblastine sulphate** *(Velbe®)*
via drip tubing in Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9%; give over approx. 1 minute

**Vincristine sulphate** *(Oncovin®)*
via drip tubing in Glucose 5% or Sodium chloride 0.9%

**Vindesine sulphate** *(Elldisine®)*
via drip tubing in Glucose 5% or Sodium chloride 0.9%

Reconstitute with sodium chloride 0.9%; give over 1–3 minutes

**Vinorelbine** *(Navelbine®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute in 125 mL infusion fluid, give over 20–30 minutes

**Vitamins B & C** *(Pabrinex® 1/1 High potency)*
Intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%

Amploue contents should be mixed, diluted, and administered without delay; give over 30 minutes (see MHRA/CHM advice, section 9.6.2)

**Vitamins, multiple** *(Cernovit®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%

Dissolve initially in 5 mL water for injections (or infusion fluid) *(Solivito N®)*

Intermittent in Glucose 5 and 10%

Suggested volume 500–1000 mL given over 2–3 hours; see also section 9.3

**Voriconazole** *(Vfend®)*
Intermittent in Glucose 5% or Sodium chloride 0.9% or Compound sodium lactate

Reconstitute each 200 mg with 19 mL water for injections to produce a 10 mg/mL solution, dilute dose in infusion fluid to concentration of 0.5–5 mg/mL, give at a rate not exceeding 3 mg/kg/hour

**Zidovudine** *(Retrovir®)*
Intermittent in Glucose 5%

Dilute to a concentration of 2 mg/mL or 4 mg/mL and give over 1 hour

**Zoledronic acid** *(Zometa®)*
Intermittent in Glucose 5% or Sodium chloride 0.9%

Dilute requisite dose with 100 mL infusion fluid, infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line, do not mix with calcium or other divalent cation-containing infusion solutions such as lactated Ringer's solution.
Borderline substances

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee’s advice and endorsed ‘ACBS’ will normally not be investigated.

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or when available WP10 (Wales)

Note These are food products which the ACBS has approved. The clinical condition for which the product has approval follows each entry.

Foods included in this Appendix may contain carogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Note Feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Enteral foods and supplements

Standard ACBS indications: short-bowel syndrome, intractable malabsorption, pre-operative preparation of undernourished patients, proven inflammatory bowel disease, following total gastrectomy, bowel fistulas, or disease-related malnutrition.

Alicalm (SHS)

Powder, protein (cows’ milk) 15 g, carbohydrate 58 g, fat 17.5 g, energy 1889 kJ (450 kcal)/100 g with vitamins, minerals and trace elements; standard dilution (30%) provides protein 4.5 g, carbohydrate 17.4 g, fat 5.3 g, energy 567 kJ (135 kcal)/100 mL. Residual lactose. Vanilla flavour. Net price 400 g = £16.20

A sole source of nutrition or nutritional supplement for dietary management of Crohn’s disease in adults and children over 5 years.

Calogen (Nutricia Clinical)

Emulsion, fat 50 g, energy 1850 kJ (450 kcal)/100 mL. Flavours: neutral, banana, and strawberry (banana- and strawberry-flavour contain sucrose approx. 4 g/100 mL), net price 200 mL = £3.80; 500 mL = £9.32.

A nutritional supplement for disease-related malnutrition, malabsorption states or other conditions requiring fortification with a high-fat supplement with or without fluid and electrolyte restrictions. Use with caution in children under 5 years; strawberry and banana flavours not suitable for children under 3 years.

Caloreen (Nestlé)

Powder, water-soluble dextrins, 390 g/100 g, with less than 1.8 mmol of Na+ and 0.3 mmol of K+/100 g. Gluten-, lactose-, and fructose-free. Net price 500 g = £3.42.

For disease-related malnutrition, malabsorption states or other conditions requiring fortification with a high or readily available carbohydrate supplement.

Calshake (Fresenius Kabi)

Powder, protein 4.9 g, carbohydrate 58 g, fat 20.4 g, energy 1809 kJ (432 kcal)/87 g. Gluten-free. Strawberry, vanilla, neutral, and banana flavours, net price 87-g sachet = £1.87; also available chocolate flavour (protein 4 g, carbohydrate 58 g, fat 20.4 g, fibre 1.6 g, energy 1809 kJ (432 kcal)/90 g = £1.87.

For disease-related malnutrition, malabsorption states or other conditions requiring fortification with a fat/carbohydrate supplement.

Clinutren 1.5 (Nestlé)

Liquid, protein 11 g, carbohydrate 42 g, fat 10 g, energy 1260 kJ (300 kcal)/200 mL with vitamins and minerals. Gluten-free; clinically lactose-free. Flavours: apricot, banana, chocolate, coffee, strawberry-raspberry or vanilla, net price 4 × 200-mL bottle = £9.59

For indications see Clinutren Fruit

Clinutren 1.5 Fibre (Nestlé)

Liquid, protein 5.7 g, carbohydrate 19 g, fat 5.9 g, fibre 2.6 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free; clinically lactose-free. Flavours: vanilla or plum, net price 4 × 200-mL pot = £6.59.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see above) and dysphagia. Not suitable for children under 3 years; not suitable as a sole source of nutrition for children 3–6 years.

Clinutren Dessert (Nestlé)

Semi-solid, protein 12 g, carbohydrate 19 g, fat 3.3 g, energy 650 kJ (150 kcal)/125 g with vitamins and minerals. Gluten-free. Flavours: caramel, chocolate, peach or vanilla, net price 4 × 125-g pot = £5.56.

Nutritional supplement for standard ACBS indications (see above) and dysphagia, continuous ambulatory peritoneal dialysis (CAPD), or haemodialysis. Not suitable for children under 3 years; maximum of 3 units daily for children 3–6 years.

Clinutren Fruit (Nestlé)

Liquid, protein 8 g, carbohydrate 54 g, fat less than 0.4 g, energy 1040 kJ (250 kcal)/200 mL with vitamins and minerals. Gluten-free. Low-lactose. Flavours: grapefruit, orange, pear-cherry, or raspberry-blackcurrant, net price 4 × 200-mL cup = £6.63.

Nutritional supplement for standard ACBS indications (see above) and dysphagia. Not suitable for children under 3 years; maximum of 3 units daily for children 3–6 years.

Clinutren Junior (Nestlé)

Powder, protein (whey) 13.9 g, carbohydrate 62.2 g, fat 18.3 g (of which MCT 20%), energy 1950 kJ (467 kcal)/100 g with vitamins, minerals and trace elements; standard dilution (22%) provides protein 2.9 g, carbohydrate 13.3 g, fat 3.9 g, energy 420 kJ (100 kcal)/100 mL. Gluten-free; residual lactose. Flavour: vanilla, net price 400 g = £9.72.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see above), growth failure, and dysphagia in children 1–10 years.

Complan Shake (Complan Foods)

Powder, protein (cows’ milk) 8.8 g, carbohydrate 34.9 g, fat 8.4 g, fibre 200 mg, energy 1055 kJ (251 kcal)/57 g; when reconstituted with whole milk, provides protein 15.6 g, carbohydrate 44.2 g, fat 16.4 g, fibre 200 mg, energy 1619 kJ (387 kcal)/servings with vitamins, minerals and trace elements. Contains lactose; gluten-free. Flavours: banana, vanilla, chocolate, strawberry, milk, net price 4 × 57-g sachet = £3.26.

Nutritional supplement for standard ACBS indications (see above) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–5 years.

Duobar (SHS)

Bar, carbohydrate 22.5 g, fat 22.5 g, energy 1211 kJ (292 kcal)/45 g. Milk protein-, gluten-, and lactose-free.
Appendix 7: Borderline substances

Strawberry, toffee, or neutral flavours. Net price 45-g bar = £1.87.

A nutritional supplement for disease-related malnutrition, malabsorption states or other conditions requiring fortification with fat/carbohydrate supplement

Duocal (SHS)  
**Liquid** (emulsion providing carbohydrate 23.4 g, fat 7.1 g (of which MCT 30%), energy 661 kJ (158 kcal)/100 mL; low- 
electrolyte, gluten-, lactose-, and protein-free. Net price 250 mL = £3.14; 1 litre = £10.37

**MCT Powder** (carbohydrate 74.6 g, fat 23.2 g (of which MCT 85%), energy 2042 kJ (486 kcal)/100 g; low electrolyte, 
gluten-, protein- and lactose-free. Net price 400 g = £16.84

**Super Soluble Powder** (carbohydrate 72.7 g, fat 22.3 g (of which MCT 35%), energy 2061 kJ (492 kcal)/100 g; low 
electrolyte, gluten-, and protein-lactose-free. Net price 400 g = £14.16

Nutritional supplements for disease-related malnutrition, malabsorption states or other conditions requiring fortification with fat/carbohydrate supplement

Elemental 028 Extra (SHS)  
**Liquid** (protein equivalent (essential and non-essential amino acids) 2.5 g, carbohydrate 11.3 g, fat 3.5 g (of which MCT 35%), energy 358 kJ (86 kcal)/100 mL, with vitamins, minerals, and trace elements. Flavours: grapefruit, orange and pineapple, summer fruits. Net price 250-mL carton = £2.88

**Powder** (protein equivalent (essential and non-essential amino acids) 12.5 g, carbohydrate 59.5 g, fat 17.4 g (of which MCT 35%), energy 1871 kJ (443 kcal)/100 g (unflavoured) with vitamins, minerals, and trace elements. Net price 100 g unflavoured (see also Modul FLavour System, p. 878) = £5.80; also available in banana, citrus, or orange flavour (carbohydrate 55 g, energy 1792 kJ (427 kcal)/100 g), 100 g = £5.60

A sole source of nutrition or nutritional supplement for: short-bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistulas. Not suitable for children under 1 year; use with caution in children 1–5 years

Emsogen (SHS)  
**Powder** (protein equivalent (essential and non-essential amino acids) 12.5 g, carbohydrate 60 g, fat 104 g (of which MCT 83%), energy 1839 kJ (438 kcal)/100 g, with vitamins, minerals, and trace elements; **standard dilution** (20%) unflavoured, provides protein 2.5 g, carbohydrate 12.5 g, fat 3.3 g, energy 368 kJ (86 kcal)/100 mL (see also Modul FLavour System, p. 878). Net price 100 g = £5.76; also available in orange-flavoured (carbohydrate 55 g, energy 1754 kJ (418 kcal)/100 g), 100 g = £5.76

A sole source of nutrition (when supplemented with alpha-linolenic acid) or nutritional supplement for short-bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistulas. Not suitable for children under 1 year; use with caution in children 1–5 years

 Emmix Plus Commence (Abbott)  
**Starte pack**, contains: *Ensure Plus milkshake-style* (4 flavours), yoghurt-style (2 flavours); *Ensure Plus Juce* (4 flavours) – see *Ensure Plus and Ensure Plus Juce* for product information, net price 1 pack (10 × 220 mL) = £17.14

Intended as an initial 5–10 day supply to establish patient preferences.

Ensure Plus Fibre (Abbott)  
**Liquid** protein 6.25 g, carbohydrate 20.2 g, fat 4.92 g, fibre 2.5 g, energy 623 kJ (152 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free, residual lactose. Vanilla, chocolate, fruits of the forest, raspberry, strawberry and banana flavours. Net price 200-mL bottle = £1.74

Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia, continuous ambulatory peritoneal dialysis (CAPD), or haemodialysis. Not suitable for children under 1 year; use with caution in children 1–5 years

Ensure Plus Juce (Abbott)  
**Liquid** protein 4.8 g, carbohydrate 32.7 g, energy 638 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Fat- and gluten-free; residual lactose. Flavours: apple, fruit punch, grapefruit, lemon and lime, orange, peach, pineapple, strawberry, or mushroom. Net price 220-mL bottle = £1.69

Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia or continuous ambulatory peritoneal dialysis (CAPD). Not suitable for children under 1 year; use with caution in children 1–5 years

Ensure Twocal (Abbott)  
**Liquid** protein 8.4 g, carbohydrate 21 g, fat 8.9 g, fibre 1 g, energy 838kJ (200 kcal)/100 mL with vitamins, minerals, and trace elements. Residual lactose; gluten-free. Flavours: banana, chocolate, strawberry, or vanilla. Net price 200-mL carton = £2.03

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865), haemodialysis, continuous ambulatory peritoneal dialysis (CAPD), and dysphagia. Not suitable for children under 1 year; use with caution in children 1–5 years

Foodlink Complete (Foodlink)  
**Powder** protein 12.5 g, carbohydrate 32.7 g, fat 7.6 g, energy 1048 kJ (249 kcal)/57-g serving (serving = 3 heaped des- sertspoonfuls recomposed with approximately half a pint water), with vitamins and minerals. Flavours: banana, chocolate,
natural, or strawberry; net price 450-g carton = £3.29; also available in blackcurrant, forest fruits, lemon, orange, strawberry, tropical, and chocolate flavour (protein 5 g, carbohydrate 19.3 g, fat 5 g, energy 670 kJ (160 kcal)/100 g with vitamins and minerals. Gluten-free. Vanilla, chocolate, banana, and forest fruit flavours, net price 4 × 125-g pot = £6.09. Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–5 years.

Forticare (Nutricia Clinical)

Forticare liquid, protein 9.5 g, carbohydrate 19.1 g, fat 5.3 g, fibre 2.1 g, energy 675 kJ (160 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and lactose-free. Flavours: cappuccino, orange and lemon, or peach and ginger. Net price 125-mL carton = £1.92. As a nutritional supplement for patients with lung cancer undergoing chemotherapy, or with pancreatic cancer.

FortiCreme Complete (Nutricia Clinical)

FortiCreme Complete liquid, protein 9.5 g, carbohydrate 19.3 g, fat 5 g, energy 670 kJ (160 kcal)/100 g with vitamins and minerals. Gluten-free. Vanilla, chocolate, banana, and forest fruit flavours, net price 4 × 125-g pot = £6.09. Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia, continuous ambulatory peritoneal dialysis (CAPD), and haemodialysis. Not suitable for children under 3 years; use with caution in children 3–5 years.

Fortijuice (Nutricia Clinical)

Fortijuice liquid, protein 4 g, carbohydrate 33.5 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Fat-free. Flavours: apple, apricot, blackcurrant, forest fruits, lemon, orange, strawberry, tropical, net price 200-mL carton = £1.80; 4 × 200 mL starter pack = £7.00. Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 3 years; use with caution in children 3–5 years.

Fortimel (Nutricia Clinical)

Fortimel liquid, protein 3.4 g, carbohydrate 18.8 g, fat 6.8 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and lactose-free. Flavours: strawberry or vanilla, net price 200-mL = £2.52. A sole source of nutrition or nutritional supplement for disease-related malnutrition, and growth failure. For children 1–6 years, or body-weight 8–30 kg.

Fortini (Nutricia Clinical)

Fortini liquid, protein 3.4 g, carbohydrate 18.8 g, fat 6.8 g, fibre 1.5 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and lactose-free. Flavours: strawberry or vanilla, net price 200-mL = £2.52. A sole source of nutrition or nutritional supplement for disease-related malnutrition, and growth failure. For children 1–6 years (8–20 kg body-weight).

Fortini Multifibre (Nutricia Clinical)

Fortini Multifibre liquid, protein 3.4 g, carbohydrate 18.8 g, fat 6.8 g, fibre 1.5 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and lactose-free. Flavours: banana, chocolate, strawberry, and vanilla, net price 200-mL = £2.65.

For indications see Fortini

Fortisip Bottle (Nutricia Clinical)

Fortisip Bottle liquid, protein 6 g, carbohydrate 18.4 g, fat 5.8 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten-free; clinically lactose-free. Vanilla, banana, chocolate, orange, strawberry, tomato, tomato, vanilla flavour; also available chocolate flavour (protein 5 g, carbohydrate 18.4 g, fat 6.5 g, fibre 2.2 g, energy 625 kJ (150 kcal)/100 mL, net price 200-mL = £1.85. As a sole source of nutrition or as a nutritional supplement prescribed on medical grounds for: short-bowel syndrome, intractable malabsorption, pre-operative preparation of under-nourished patients, proven inflammatory bowel disease, following total gastrectomy, dysphagia, disease-related malnutrition. Not suitable for children under 3 years; use with caution in children aged 3–5 years.

Fortisip Multi Fibre (Nutricia Clinical)

Fortisip Multi Fibre liquid, protein 6 g, carbohydrate 18.4 g, fat 5.8 g, fibre 2.3 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free, clinically lactose-free. Bananas, chocolate, orange, strawberry, tomato, vanilla flavour; also available chocolate flavour (protein 5 g, carbohydrate 18.4 g, fat 6.5 g, fibre 2.2 g, energy 625 kJ (150 kcal)/100 mL, net price 200-mL = £1.85. As a sole source of nutrition or as a nutritional supplement prescribed on medical grounds for: short-bowel syndrome, intractable malabsorption, pre-operative preparation of under-nourished patients, proven inflammatory bowel disease, following total gastrectomy, dysphagia, disease-related malnutrition. Not suitable for children under 3 years; use with caution in children aged 3–5 years.

Fortisip Range (Nutricia Clinical)

Fortisip Range Starter pack contains 4 × Fortisip Bottle, 4 × Fortijuce, 2 × Fortisip Yogurt Style, see separate entries for details, net price 1 pack (10 × 200 mL) = £17.46.

Fortisip Yogurt Style (Nutricia Clinical)

Fortisip Yogurt Style yoghurt, protein 6 g, carbohydrate 18.7 g, fat 5.8 g, fibre 0.2 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals, and trace elements. Gluten-free. Peach and orange, raspberry, vanilla and lemon flavours, net price 200-mL bottle = £1.80. A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 3 years; not suitable as a sole source of nutrition for children 3–6 years.

Frebini Energy (Fresenius Kabi)

Frebini Energy Sip feed, protein 3.75 g, carbohydrate 18.8 g, fat 6.65 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free; residual lactose. Flavours: banana or strawberry. Net price 200-mL bottle = £2.25. Tube feed, protein 3.75 g, carbohydrate 18.75 g, fat 6.7 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free; clinically lactose-free. Flavour: neutral, net price 500-mL EasyBag = £5.93. As a sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia in children 1–10 years, or body-weight 8–30 kg. Not suitable for children under 1 year.

Frebini Energy Fibre (Fresenius Kabi)

Frebini Energy Fibre Sip feed, protein 3.75 g, carbohydrate 18.8 g, fat 6.65 g, fibre 1.1 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free; residual lactose. Chocolate or vanilla flavour, net price 200-mL bottle = £2.30. Tube feed, protein 3.75 g, carbohydrate 18.75 g, fat 6.7 g, fibre 1.13 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free, clinically lactose-free. Flavour: neutral, net price 500-mL EasyBag = £6.34. For indications see Frebini Energy

Frebini Original (Fresenius Kabi)

Frebini Original tube feed, protein 2.5 g, carbohydrate 13.5 g, fat 4 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free; residual lactose. Flavour: neutral, net price 500-mL EasyBag = £4.73. For indications see Frebini Energy

Frebini Original Fibre (Fresenius Kabi)

Frebini Original Fibre tube feed, protein 2.5 g, carbohydrate 12.5 g, fat 4.4 g, fibre 750 mg, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free, residual lactose. Neutral flavour, net price 500-mL EasyBag = £5.25. For indications see Frebini Energy

Fresubin 1000 Complete (Fresenius Kabi)

Fresubin 1000 Complete tube feed, protein 5.5 g, carbohydrate 12.5 g, fat 3.1 g, fibre 2 g, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free, clinically lactose-free, net price 1-litre EasyBag = £8.20. For indications see Fresubin Energy
Appendix 7: Borderline substances

Fresubin 1200 Complete (Fresenius Kabi)

**Liquid**, tube feed, protein 6 g, carbohydrate 15 g, fat 4.1 g, fibre 2 g, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free, clinically lactose-free. Net price 1-litre EasyBag = £10.61.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865). Not suitable for children under 2 years; use with caution in children 2–5 years.

Fresubin 2250 Complete (Fresenius Kabi)

**Tube feed**, protein 5.6 g, carbohydrate 18.8 g, fat 5.8 g, fibre 2 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and lactose-free. Fruits of the forest or vanilla flavour, net price 200 mL = £1.69.

Nutritional supplement for standard ACBS indications (see p. 865), dysphagia, continuous ambulatory peritoneal dialysis (CAPD), and haemodialysis. Not suitable for children under 1 year; use with caution in children 1–5 years.

Fresubin 2kcal Drink (Fresenius Kabi)

**Liquid**, protein 10 g, carbohydrate 22.5 g, fat 7.8 g, energy 840 kJ (200 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and lactose-free. Chocolate flavour, net price 200 mL = £1.69.

Nutritional supplement for standard ACBS indications (see p. 865), dysphagia, continuous ambulatory peritoneal dialysis (CAPD), and haemodialysis. Not suitable for children under 1 year; use with caution in children 1–5 years.

Fresubin Energy (Fresenius Kabi)

**Liquid**, protein 5.65 g, carbohydrate 18.8 g, fat 5.83 g, energy 630 kJ (150 kcal)/100 mL, with vitamins and minerals. Flavours: vanilla, strawberry, blackcurrant, banana, cappuccino, tropical fruits, chocolate, lemon, and neutral, net price 200 mL bottle = £1.66, unflavoured, 500 mL EasyBag = £3.91; 1-litre EasyBag = £7.70; 1.5-litre EasyBag = £10.32.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–5 years.

Fresubin Fibre (Fresenius Kabi)

**Sip feed**, protein 5.65 g, carbohydrate 18.8 g, fat 5.83 g, fibre 2.5 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free; clinically lactose-free. Flavours: banana, caramel, chocolate, cherry, strawberry, vanilla. Net price 200-mL bottle = £1.74.

For indications see **Fresubin Energy**

Fresubin Energy Fibre (Fresenius Kabi)

**Tube feed**, protein 5.6 g, carbohydrate 18.8 g, fat 5.8 g, fibre 2 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free; clinically lactose-free. Unflavoured, net price 500-mL EasyBag = £4.30; 1-litre EasyBag = £8.20.

For indications see **Fresubin Energy**

Fresubin HP Energy (Fresenius Kabi)

**Liquid**, protein 7.5 g, carbohydrate 17 g, fat 6 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free and low lactose. Vanilla flavour. Net price 500 mL Flexible Pouch = £3.96; 1-litre flexible pouch = £6.36. Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia, continuous ambulatory peritoneal dialysis (CAPD), haemodialysis. Not suitable for children under 1 year; use with caution in children 1–5 years.

Fresubin Original (Fresenius Kabi)

**Liquid**, protein 3.8 g, carbohydrate 13.8 g, fat 3.4 g, fibre 2 g, energy 420 kJ (100 kcal)/100 mL, with vitamins and minerals. Flavour: neutral. Net price 500-mL EasyBag = £3.63; 1-litre EasyBag = £7.24; 1.5-litre EasyBag = £10.20.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 2 years; use with caution in children 2–5 years.

Fresubin Protein Energy Drink (Fresenius Kabi)

**Liquid**, protein 10 g, carbohydrate 12.4 g, fat 6.7 g, energy 630 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and lactose-free. Cappuccino, chocolate, strawberry, tropical fruits, and vanilla flavours, net price 200 mL bottle = £1.69.

Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia, continuous ambulatory peritoneal dialysis (CAPD), or haemodialysis. Not suitable for children under 1 year; use with caution in children 1–5 years.

Infatini (Nutricia Clinical)

**Liquid**, tube feed, protein 10.3 g, fat 5.4 g, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free. Net price 100-mL bottle = 96p, 200-mL carton = £1.91.

A sole source of nutrition or nutritional supplement for failure to thrive, disease-related malnutrition and malabsorption. Manufactured, advises suitable for infants up to 8 kg body-weight (0–12 months of age).

Isosource Energy (Nestlé)

**Liquid**, protein 5.7 g, carbohydrate 20 g, fat 6.2 g, energy 660 kJ (160 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free; clinically lactose-free. Net price 500-mL flexible pouch = £3.66, 1-litre flexible pouch = £7.31.

For indications see **Isosource Standard**

Isosource Energy Fibre (Nestlé)

**Liquid**, tube feed, protein 4.9 g, carbohydrate 20.2 g, fat 5.5 g, fibre 1.5 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free; clinically lactose-free. Net price 500-mL flexible pouch = £3.96, 1-litre flexible pouch = £7.93.

For indications see **Isosource Standard**

Isosource Fibre (Nestlé)

**Liquid**, protein 3.8 g, carbohydrate 13.6 g, fat 3.4 g, fibre 1.4 g, energy 422 kJ (100 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free; clinically lactose-free. Net price 500-mL flexible pouch = £3.39, 1-litre flexible pouch = £6.77.

For indications see **Isosource Standard**

Isosource Junior (Nestlé)

**Liquid**, protein 2.7 g, carbohydrate 17 g, fat 4.7 g, energy 513 kJ (123 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free; clinically lactose-free. Net price 500-mL flexible pouch = £3.96, 1-litre flexible pouch = £7.95.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865), dysphagia and growth failure in children 1 to 6 years or body-weight 8 to 20 kg.

Isosource Standard (Nestlé)

**Liquid**, protein 4 g, carbohydrate 13.6 g, fat 3.3 g, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free; clinically lactose-free. Net price 500-mL flexible pouch = £3.96, 1-litre flexible pouch = £7.95.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–5 years.

Jevity (Abbott)

**Liquid**, protein 4 g, fat 3.5 g, carbohydrate 14.1 g, fibre 1.8 g, energy 441 kJ (106 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-, lactose-, and sucrose-free. Net price 500-mL ready-to-hang = £3.85, 1-litre ready-to-hang = £7.23, 1.5-litre ready-to-hang = £10.89.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 2 years; use with caution in children 2–5 years.

Jevity 1.5 kcal (Abbott)

**Liquid**, tube feed, protein 6.38 g, carbohydrate 20.1 g, fat 4.9 g, fibre 2.2 g, energy 640 kJ (152 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and lactose-free. Flavour: neutral. Net price 500-mL EasyBag = £3.63; 1-litre EasyBag = £7.24; 1.5-litre EasyBag = £10.20. Not suitable for children under 2 years; use with caution in children 2–5 years.
free. Net price 500-mL ready-to-hang = £4.69, 1-litre ready-to-hang = £8.70, 1.5-litre ready-to-hang = £13.58.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 2 years, use with caution in children 2–10 years

**Jevity Plus** (Abbott)

**Liquid**, protein 5.6 g, carbohydrate 15.1 g, fat 3.9 g, dietary fibre 2.2 g, energy 504 kJ (120 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and lactose-free. Net price 500-mL ready-to-hang = £4.24, 1-litre ready-to-hang = £8.68, 1.5-litre ready-to-hang = £13.05.

For indications see under **Jevity**

**Jevity Promote** (Abbott)

**Liquid**, protein 5.55 g, carbohydrate 11.98 g, fat 3.32 g, fibre 1.7 g, energy 427 kJ (101 kcal)/100 mL, with vitamins, minerals, and trace elements. Gluten-free, clinically lactose-free. Net price 1-litre ready-to-hang = £8.49.

For indications see **Jevity** 1.5 kkal

**Maxi-Juila** (SHS)

**Liquid**, carbohydrate 50 g, sodium less than 23 mg, phosphorus less than 5 mg, potassium less than 4 mg, energy 859 kJ (200 kcal)/100 mL. Gluten-, lactose-, and fructose-free. Flavours: orange, and natural. Net price 200 mL = £1.28

**Super Soluble Powder**, carbohydrate (as glucose polymer) 95 g, sodium less than 20 mg, phosphorous less than 5 mg, potassium less than 5 mg, energy 1615 kJ (380 kcal)/100 g. Gluten- and lactose-, and fructose-free. Unflavoured. Net price 4 × 132-g sachet pack = £5.04, 200 g = £1.96, 2.5 kg = £17.94, 25 kg = £121.85

All for disease-related malnutrition; malabsorption states or other conditions requiring fortification with high or readily available carbohydrate supplement

**Modulen IBD** (Nestlé)

**Powder**, protein (casein) 18 g, carbohydrate 54 g, fat 23 g, energy 2040 kJ (500 kcal)/100 g with vitamins, minerals, and trace elements. Gluten-free; clinically lactose-free. Net price 500-mL drink bottle = £4.39, 500-mL flexible pouch = £4.52.

For indications see **Modulen IBD**

**Novasource GI Control** (Nestlé)

**Liquid**, protein 4.1 g, carbohydrate 14.2 g, fat 3.5 g, fibre 2.2 g, energy 440 kJ (100 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten-free; clinically lactose-free, net price 500-mL bottle = £4.39, 500-mL flexible pouch = £4.52.

For indications see **Novasource GI Control**

**Novasource GI Forte** (Nestlé)

**Liquid**, protein 6 g, carbohydrate 18.3 g, fat 5.9 g, fibre 2.2 g, energy 631 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten-free; low-lactose, net price 500-mL flexible pouch = £4.49, 1-litre flexible pouch = £8.98.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–5 years

**Nutrini** (Nestlé)

**Liquid**, protein 2.75 g, carbohydrate 12.3 g, fat 4.4 g, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten-free; clinically lactose-free. Net price 200-mL bottle = £2.12, 500-mL = £5.28.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia in children 1–6 years or 8–20 kg body-weight

**Nutrini Energy** (Nutricia Clinical)

**Liquid**, tube feed, protein 4.1 g, carbohydrate 18.5 g, fat 6.7 g, fibre 0.75 g, energy 830 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and lactose-free, net price 200-mL bottle = £2.74, 500-mL pack = £6.82.

For short-bowel syndrome, intractable malabsorption, pre-operative preparation of undernourished patients, total gastroctomy, dysphagia, disease-related malnutrition, and growth failure. For children 1–6 years or 8–20 kg body-weight

**Nutrini Low Energy Multi Fibre** (Nutricia Clinical)

**Liquid**, tube feed, protein 2.06 g, carbohydrate 9.3 g, fat 3.3 g, fibre 0.75 g, energy 315 kJ (75 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and lactose-free, net price 200-mL bottle = £2.05, 500-mL pack = £5.18

For indications see **Nutrini Energy Multi Fibre**

**Nutrini Multi Fibre** (Nutricia Clinical)

**Liquid**, protein 2.75 g, carbohydrate 12.3 g, fat 4.4 g, fibre 750 mg, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten-free, clinically lactose-free. Net price 200-mL bottle = £2.35, 500-mL pack = £5.87

A sole source of nutrition or nutritional supplement for short-bowel syndrome, intractable malabsorption, pre-operative preparation of undernourished patients, total gastroctomy, dysphagia, disease-related malnutrition and growth failure. For children 1–6 years or 8–20 kg body-weight

**Nutrini Peptisorb** (Nutricia Clinical)

**Liquid**, (formerly Nutrisorb), protein 2.9 g, carbohydrate 13.7 g, fat 3.9 g, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten-free. Net price 500-mL = £8.15

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865), growth failure, and dysphagia in children 1–6 years or 8–20 kg body-weight

**Nutriprem 2** (Cow & Gate)

**Liquid**, protein (cows’ milk) 2 g, carbohydrate 7.5 g, fat 4.1 g, fibre 0.4 g, energy 801 kJ (190 kcal)/100 mL (75 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose. Net price 200-mL carton = £1.54. Also available to hospitals-only as a sterilised prepared feed in 100-mL bottles

**Powder**, protein (cows’ milk) 1.9 g, carbohydrate 48.3 g, fat 26.7 g, fibre 5.2 g, energy 2030 kJ (485 kcal)/100 g with vitamins, minerals, and trace elements. Standard dilution (15.4%) provides protein 2 g, carbohydrate 7.4 g, fat 4.1 g, energy 310 kJ (75 kcal)/100 mL. Contains lactose. Net price 900 g = £10.28.

For catch-up growth in pre-term infants (less than 35 weeks at birth), and small-for-gestational-age infants, until 6 months corrected age

**Nutrison Energy** (Nutricia Clinical)

**Liquid**, protein 6 g, carbohydrate 18.5 g, fat 5.8 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and sucrose-free; clinically lactose-free. Net price 500-mL bottle = £4.25; 500-mL pack = £4.72; 1-litre pack = £8.50; 1.5-litre pack = £12.80.

Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–6 years

**Nutrison Energy Multi Fibre** (Nutricia Clinical)

**Liquid**, protein 4.1 g, carbohydrate 18.5 g, fat 6.7 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and fructose-free. Net price 200-mL bottle = £3.99, 500-mL pack = £5.23; 1-litre pack = £9.49; 1.5-litre pack = £15.20.

A sole source of nutrition or nutritional supplement for short-bowel syndrome, intractable malabsorption, pre-operative preparation of undernourished patients, proven inflammatory bowel disease, following total gastroctomy, dysphagia, disease-related malnutrition. Not suitable for children under 1 year; use with caution in children 1–6 years

**Nutrison MCT** (Nutricia Clinical)

**Liquid**, protein 5 g, carbohydrate 12.6 g, fat 3.3 g (of which MCT 61%), energy 420 kJ (100 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and fructose-free. Net price 1-litre pack = £7.73.

For indications see **Nutrition Energy**

**Nutrison Multi Fibre** (Nutricia Clinical)

**Liquid**, protein 4.1 g, carbohydrate 18.5 g, fat 6.7 g, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten- and sucrose-free, clinically lactose-
Appendix 7: Borderline substances

**Nutrition Protein Plus** (Nutricia Clinical)
- Liquid, protein 6.3 g, carbohydrate 14.2 g, fat 4.9 g, energy 525 kJ (125 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and lactose-free. Net price 1-litre pack = £7.95.

For use in the dietary management of disease-related malnutrition. Not suitable for children under 1 year; use with caution in children 1–6 years

**Nutrition ProPlus Multi Fibre** (Nutricia Clinical)
- Liquid, protein 6.3 g, carbohydrate 14.2 g, fat 4.9 g, fibre 1.5 g, energy 525 kJ (125 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and lactose-free. Net price 1-litre pack = £8.85.

For use in the dietary management of disease-related malnutrition. Not suitable for children under 1 year; use with caution in children 1–6 years

**Nutrition Soya Multi Fibre** (Nutricia Clinical)
- Liquid, protein 4 g, carbohydrate 12.3 g, fat 3.9 g, energy 420 kJ (100 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and sucrose-free; clinically lactose-free. Net price 500-mL bottle = £4.12; 1-litre pack = £8.24.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 885) and cow's milk protein and lactose intolerance. Not suitable for children under 1 year; use with caution in children 1–6 years

**Nutrition Soya** (Nutricia Clinical)
- Liquid, protein 4 g, carbohydrate 12.3 g, fat 3.9 g, energy 425 kJ (100 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and lactose-free. Net price 1-litre pack = £13.25.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 885), dysphagia, and cow's milk protein and lactose intolerance. Not suitable for children under 1 year; use with caution in children 1–6 years

**Nutrition Standard** (Nutricia Clinical)
- Liquid, protein 4 g, carbohydrate 12.3 g, fat 3.9 g, energy 425 kJ (100 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and lactose-free. Net price 1-litre pack = £10.65.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 885) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–6 years

**Nutrition 1000 Complete Multi Fibre** (Nutricia Clinical)
- Liquid, protein 5.5 g, carbohydrate 11.3 g, fat 3.7 g, fibre 2 g, energy 420 kJ (100 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and clinically lactose-free, net price 500-mL bottle = £8.75.

A sole source of nutrition or nutritional supplement for the dietary management of disease-related malnutrition in patients with low-energy and/or low fluid requirements. Not suitable for children under 1 year; use with caution in children 1–6 years

**Nutrition 1200 Complete Multi Fibre** (Nutricia Clinical)
- Liquid, protein 5.5 g, carbohydrate 15 g, fat 4.3 g, fibre 2 g, energy 505 kJ (120 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten- and clinically lactose-free, net price 500-mL bottle = £4.55; 1-litre pack = £9.10; 1.5-litre pack = £13.66.

A sole source of nutrition or nutritional supplement for short-bowel syndrome, intractable malabsorption, pre-operative preparation of undernourished patients, proven inflammatory bowel disease, following total gastrectomy, dysphagia, disease-related malnutrition. Not suitable for children under 1 year; use with caution in children 1–6 years

**Osmolite Plus** (Abbott)
- Liquid, protein 5.6 g, carbohydrate 15.8 g, fat 3.9 g, energy 508 kJ (121 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free and clinically lactose-free. Net price 500-mL ready-to-hang = £3.96, 1-litre ready-to-hang = £7.64, 1.5-litre ready-to-hang = £11.44.

For indications see Osmolite

**Paediasure Fibre** (Abbott)
- Liquid, protein 2.8 g, carbohydrate 11 g, fat 5 g, energy 422 kJ (101 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free, residual lactose. Flavours: vanilla (can, ready-to-hang and carton), strawberry, chocolate and banana (carton). Net price 250-mL can = £2.48, 500-mL ready-to-hang = £4.97, 200-mL carton = £1.99.

A sole source of nutrition or nutritional supplement for children aged 1–10 years, body-weight 8–30 kg, for short-bowel syndrome, intractable malabsorption, pre-operative preparation of undernourished patients, dysphagia, bowel fistulas, and disease-related malnutrition and/or growth failure. Not suitable for children under 1 year

**Peptamen Plus Fibre** (Abbott)
- Liquid, protein 4.2 g, carbohydrate 16.7 g, fat 7.5 g, energy 623 kJ (151 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free, residual lactose, net price 1-litre pack = £2.64, 200-mL carton = £2.19.

Flavours: vanilla (ready-to-hang and carton), banana (carton), strawberry (carton). Net price 500-mL ready-to-hang = £5.52, 200-mL carton = £2.19.

For indications see Peediaure

**Peptamen Plus** (Abbott)
- Liquid, protein 4.2 g, carbohydrate 16.4 g, fat 7.4 g, fibre 1.1 g, energy 626 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free, residual lactose, net price 200-mL carton = £2.43, 500-mL ready-to-hang = £6.23.

For indications see Peediaure

**Peptamen Junior** (Nestlé)
- Powder, 4.2 g, carbohydrate 12.7 g, fat 3.7 g (of which MCT 70%), energy 420 kJ (100 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free, residual lactose; dual lactose; gluten-free. Net price 500 mL = £5.97.

For indications see Peediaure

**Peptamen** (Nestlé)
- Powder, 4.2 g, carbohydrate 16.6 g, fat 7.4 g, fibre 1.1 g, energy 626 kJ (150 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free, residual lactose, net price 200 mL = £2.64, 200-mL carton = £2.19.

For indications see Peediaure

**Nestlé Nutrition Flavour Mix**
- For use with Peptamen Liquid 200-mL cup and Modulen IBD. Flavours: banana, chocolate, coffee, lemon and lime, strawberry. Net price 60 g = £6.48

**Nestlé Pediatric Liquid**
- For indications see Peptamen Liquid

**Osmolite** (Abbott)
- Liquid, protein 4 g, carbohydrate 13.5 g, fat 3.4 g, energy 424 kJ (100 kcal)/100 mL, with vitamins and minerals. Gluten- and lactose-free. Net price 250-mL can = £1.79, 500-mL bottle = £3.39, 1-litre bottle = £6.46, 1.5-litre bottle = £9.69.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–5 years
hydrate 13.8 g, fat 3.85 g, energy 420 kJ (100 kcal)/100 mL. Residual lactose; gluten-free. Vanilla flavour, net price 400-g can = £14.52.

A sole source of nutrition or nutritional supplement for short-bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistulas, in children 1–10 years

Peptisorb (Nutricia Clinical)

Liquid, protein 4 g, carbohydrate 17.6 g, fat 1.7 g, energy 425 kJ (100 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free. Net price 500-mL bottle = £5.50; 500-mL pack = £6.04; 1-litre pack = £10.92.

A sole source of nutrition or nutritional supplement prescribed on medical grounds for short-bowel syndrome, intractable malabsorption, proven inflammatory bowel disease, bowel fistulas. Not suitable for children under 1 year; use with caution in children 1–5 years

Pevital (Abbott)

Powder, glucose, maltose, and polysaccharides, providing 1630 kJ (384 kcal)/100 g. Net price 400 g = £3.55.

Liquid, glucose polymers providing carbohydrate 61.9 g/100 mL. Low-electrolyte, protein-free. Flavours: orange or neutral. Net price 200 mL = £1.42.

Nutritional supplement for disease-related malnutrition, malabsorption states or other conditions requiring fortification with a high or readily available carbohydrate supplement

Polycal (Nutricia Clinical)

Powder, carbohydrate 17.7 g, fat 3.7 g, energy 552 kJ (131 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free, unflavoured. Net price 500-mL ready-to-hang = £5.52; 1-litre ready-to-hang = £11.04.

Nutritional supplement for standard ACBS indications (see p. 865). Not suitable for children under 5 years

Polarcal (Nutricia Clinical)

Powder, protein 6.7 g, carbohydrate 17.7 g, fat 3.7 g, energy 552 kJ (131 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free. Vanilla or banana flavour, net price, 240-mL carton = £4.17.

Nutritional supplement for catch-up growth in pre-term infants (less than 35 weeks at birth), and small-for-gestational-age infants, until 6 months post-natal age

Pro-Cal (Vitalfa)

Powder, protein 13.5 g, carbohydrate 26.8 g, fat 56.2 g, energy 2788 kJ (687 kcal)/100 g. Net price 25 × 15-g sachets = £12.83; 510 g = £24.21; 12.5 kg = £172.13; 25 kg = £265.25.

Nutritional supplement for disease-related malnutrition, malabsorption states or other conditions requiring fortification with a fat/carbohydrate supplement. Not suitable for children under 1 year, use with caution in children 1–5 years

Pro-Cal Shot (Vitalfa)

Liquid, protein 6.7 g, carbohydrate 13.4 g, fat 28.2 g, energy 1586 kJ (374 kcal)/100 mL, neutral or strawberry flavour; net price 6 × 250-mL bottle = £25.80.

Nutritional supplement for disease-related malnutrition, malabsorption states, or other conditions requiring fortification with a fat/carbohydrate supplement. Not suitable for children under 1 year, use with caution in children 1–5 years

ProSure (Abbott)

Liquid, protein 6.65 g, carbohydrate 19.4 g, fat 2.56 g, fibre 97 mg. Gluten-free. Net price 500 mL (125 kcal)/100 mL, with vitamins, minerals, and trace elements. Gluten-free, clinically lactose-free. Vanilla or banana flavour, net price, 240-mL carton = £2.70.

Nutritional supplement for patients with pancreatic cancer and patients with lung cancer undergoing chemotherapy. Not suitable for children under 1 year; use with caution in children 1–4 years

Provide Xtra (Fresenius Kabi)

Liquid, protein 3.75 g, carbohydrate 27.5 g, energy 525 kJ (125 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free. Apple, blackcurrant, carrot-apple, cherry, citrus cola, lemon & lime, melon, orange & pineapple, or tomato flavour. Net price 200-mL carton = £1.63.

Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–5 years

QuickCal (Vitalfa)

Powder, protein (cows' milk) 600 mg, carbohydrate (lactose) 2.2 g, fat 10 g, Na+ 13 mg (0.6 mmol), energy 418 kJ (100 kcal)/13 g, net price 25 × 13-g sachets = £11.54.

For disease-related malnutrition, malabsorption states or other conditions requiring fortification with a fat/carbohydrate supplement. Not suitable for children under 1 year, use with caution in children 1–5 years

Renilin 7.5 (Nutricia Clinical)

Liquid, protein 7.5 g, carbohydrate 20 g, fat 10 g, energy 840 kJ (200 kcal)/100 mL, with vitamins, minerals and trace elements. Gluten-free. Apricot or caramel flavour, net price 125-mL carton = £1.79.

Nutritional supplement for standard ACBS indications (see p. 865). Not suitable for children under 3 years, use with caution in children 3–4 years

Resource Benefiber (Nestlé)

Powder, fibre (hydrolysed guar gum, soluble) 78 g, carbohydrate 19 g, energy 323 kJ (76 kcal)/100 g with vitamins, minerals and trace elements. Gluten-free, low lactose. Flavours: caramel, chocolate, or vanilla, net price 125-g cup = £1.39.

Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia, continuous ambulatory peritoneal dialysis (CAPD), or haemodialysis. Not suitable for children under 1 year, use with caution in children 1–5 years

Resource Dessert Energy (Nestlé)

Semi-solid, protein 4.8 g, carbohydrate 21.2 g, fat 6.24 g, energy 671 kJ (160 kcal)/100 g with vitamins, minerals, and trace elements. Gluten-free; low lactose. Flavours: caramel, chocolate, or vanilla, net price 125-g cup = £1.39.

Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia and conditions requiring a high energy and low volume diet. Not suitable for children under 6 years, use with caution in children 6–10 years

Resource Fruit Flavour Drink (Nestlé)

Liquid, protein 4 g, carbohydrate 33.5 g, energy 638 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Fat- and gluten-free; low lactose. Flavours: apple, orange, or pineapple, net price 200-mL carton = £1.53.

Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 3 years, use with caution in children 3–5 years

Resource Junior (Nestlé)

Liquid, protein 2.8 g, carbohydrate 20.6 g, fat 6.2 g, energy 631 kJ (150 kcal)/100 mL with vitamins, minerals, and trace elements. Gluten-free; clinically lactose-free. Flavours: chocolate, strawberry, or vanilla, net price 200-mL carton = £1.74.

A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 1 year

Resource Protein (Nestlé)

Liquid, protein 9 g, carbohydrate 21.4 g, fat 8.7 g, fibre 2.5 g, energy 836 kJ (200 kcal)/100 mL, with vitamins, minerals, and trace elements. Gluten-free; low lactose. Flavours: summer fruits, strawberry, vanilla, coffee, apricot, or neutral. Net price 200 mL carton = £1.70.

Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia and conditions requiring a high energy and low volume diet. Not suitable for children under 6 years, use with caution in children 6–10 years

Appendix 7: Borderline substances
Appendix 7: Borderline substances

colate, forest fruits, strawberry, or vanilla. Net price 200-mL bottle = £1.37.

For indications see Resource: Fruit Flavour Drink.

Resource Shade (Nestlé)

| Liquid | protein 5.1 g, carbohydrate 22.6 g, fat 7 g, energy 731 kJ (174 kcal)/100 mL with vitamins, minerals and trace elements. Gluten-free; low lactose. Flavours: banana, chocolate, lemon, strawberry, summer fruits, toffee, or vanilla. Net price 175-mL carton = £1.50. Nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 1 year; use with caution in children 1–5 years |

Scandishake Mix (Nutricia Clinical)

| Powder | protein 11.7 g, carbohydrate 66.8 g, fat 30.4 g, energy 2457 kJ (588 kcal)/unflavoured serving (serving = 1 sachet reconstituted with 240 mL whole milk; protein, carbohydrate and energy values vary with flavour). Flavours: banana, caramel, chocolate, strawberry, vanilla, and unflavoured. Net price 85-g sachet = £2.02. Nutritional support for disease-related malnutrition, malabsorption states or other conditions requiring fortification with a fat/carbohydrate supplement |

SMA High Energy (SMA Nutrition)

| Liquid, Powder | protein 4.5 g, carbohydrate 15.6 g, fat 2.6 g, energy 420 kJ (100 kcal)/100 mL, with vitamins, minerals, and trace elements. Gluten-free, and low lactose. Net price 500-mL EasyBag = £5.34. A sole source of nutrition or nutritional supplement for disease-related malnutrition, malabsorption, and growth failure in children up to 18 months |

Surived OPD (Fresenius Kabi)

| Liquid, Powder | protein 3.3 g, carbohydrate 12.3 g, fat 4.2 g, energy 420 kJ (100 kcal)/100 mL with vitamins, minerals and trace elements. Residual lactose; gluten-free. Unflavoured, net price 500-mL bottle or pack = £4.66. A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865), dysphagia, and growth failure. Not suitable for children under 1 year; use with caution in children 1–6 years, body-weight under 21 kg. Suitable for children 7–12 years, body-weight 21–45 kg |

Tentri (Nutricia Clinical)

| Liquid, Tube Feed | protein 3.3 g, carbohydrate 12.3 g, fat 4.2 g, energy 420 kJ (100 kcal)/100 mL, with vitamins, minerals and trace elements. Residual lactose; gluten-free. Unflavoured, net price 500-mL bottle or pack = £5.76. For indications see Tentri |

Tentri Energy Multi Fibre (Nutricia Clinical)

| Liquid, Tube Feed | protein 4.9 g, carbohydrate 18.5 g, fat 6.3 g, energy 630 kJ (150 kcal)/100 mL with vitamins, minerals and trace elements. Residual lactose; gluten-free. Unflavoured, net price 500-mL bottle or pack = £6.35. For indications see Tentri |

Tentri Multi Fibre (Nutricia Clinical)

| Liquid, Tube Feed | protein 3.3 g, carbohydrate 12.3 g, fat 4.2 g, fibre 1.12 g, energy 420 kJ (100 kcal)/100 mL, with vitamins, minerals and trace elements. Residual lactose; gluten-free. Unflavoured, net price 500-mL bottle or pack = £5.12. A sole source of nutrition for short-bowel syndrome, intractable malabsorption, pre-operative preparation of undernourished patients, inflammatory bowel disease, total gastrectomy, dysphagia, disease-related malnutrition, and growth failure. Not suitable for children under 1 year; use with caution in children 1–6 years or body-weight less than 21 kg. Suitable for children 7–12 years, body-weight 21–45 kg |

TwoCal HN (Abbott)

| Liquid | protein 8.4 g, carbohydrate 21.6 g, fat 8.0 g, fibre 840 mg, energy 850 kJ (202 kcal)/100 mL, with vitamins, minerals, and trace elements. Gluten- and lactose-free. Vanilla flavour, net price 237-mL can = £2.40. A sole source of nutrition or nutritional supplement for standard ACBS indications (see p. 865) and dysphagia. Not suitable for children under 6 years; use with caution in children 6–10 years |

Vegenat -med (Vegenat)

| Powder-high protein varieties, average nutritional content: protein 24.6 g, carbohydrate 59.2 g, fat 16.3 g, fibre 6 g, energy 2020 kJ (480 kcal)/110 g, with vitamins, minerals, and trace elements. Gluten-free, low lactose. Flavours: chicken, fish, veal, ham, winter vegetables, fish and vegetable, lentil, vegetable, and chickpea, net price 12 × 110-g sachets = £47.44; curry chicken, 12 × 110-g sachets = £45.75; Lemon, or rice with lemon flavours, 12 × 110-g sachets = £45.07; rice with apple, 24 × 55-g sachets = £43.46 Powder-balanced protein varieties, average nutritional content: protein 18.4 g, carbohydrate 63.9 g, fat 15 g, fibre 6 g, energy 1970 kJ (470 kcal)/110 g, with vitamins, minerals, and trace elements. Gluten-free, low lactose. Flavours: apple, chocolate, honey, or orange, net price 12 × 110-g sachets = £33.89. Nutritional supplement for short-bowel syndrome, intractable malabsorption, pre-operative preparation of undernourished patients, proven inflammatory bowel disease, following total gastrectomy, dysphagia, disease-related malnutrition. Not suitable for children under 12 years; use with caution in children 12–16 years |

Vitajoule (Vitaffio)

| Powder, Resource Thickened Drink | protein 12 g, carbohydrate 24 g, fat 54 g, energy 2610 kJ (630 kcal)/100 g. Net price 500 g = £3.48, 2.5 kg = £17.35, 25 kg = £101.97. For disease-related malnutrition; malabsorption states or other conditions requiring fortification with a high or readily available carbohydrate supplement |

Vitasavoury (Vitaffio)

| Powder, Resource ThickenUp | protein 12 g, carbohydrate 24 g, fat 54 g, energy 2610 kJ (630 kcal)/100 g. Net price 10 × 50-g sachets = £15.52, 24 × 33-g ready cups = £25.76. Flavours: chicken, leek and potato, mushroom, vegetable. Nutritional supplement for disease-related malnutrition, malabsorption states or other conditions requiring fortification with a fat/carbohydrate supplement. Not suitable for children under 1 year; use with caution in children 1–5 years |

Feed thickeners and pre-thickened foods

Carobel, Instant (Cow & Gate)

| Powder, Carobel ThickenUp | rice flour, net price 153 g = £2.81. For thickening feeds in the treatment of vomiting |

Enfamil AR (Mead Johnson)

| Powder, Resource Thickened Drink | protein 12.5 g, carbohydrate 56 g, fat 26 g, energy 2093 kJ (500 kcal)/100 g with vitamins, minerals, and trace elements; standard dilution (15%) provides protein 1.7 g, fat 3.5 g, carbohydrate 7.6 g, energy 285 kJ (68 kcal)/100 mL. Contains lactose; gluten-free. Net price 400 g = £2.90. For significant gastro-oesophageal reflux. For use not in excess of a 6-month period. Not to be used in conjunction with any other thickener or antacid product |

Nutilis (Nutricia Clinical)

| Powder, Nutilis ThickenUp | modified maize starch, gluten- and lactose-free, net price 20 × 9-g sachets = £5.71, 225 g = £4.38. For thickening of foods in dysphagia. Not suitable for children under 3 years |

Resource Thickened Drink (Nestlé)

| Liquid | carbohydrate 22 g, energy: orange 383 kJ (89 kcal); apple 375 kJ (89 kcal)/100 mL syrup and custard consistencies. Gluten-free; clinically lactose free, net price 12 × 114-mL cups = £7.08. For dysphagia. Not suitable for children under 1 year |

Resource ThickenUp (Nestlé)

| Powder, Resource Thickened Drink | modified maize starch, gluten- and lactose-free, net price 227 g = £4.11, 75 × 4.5-g sachet = £15.75. For thickening of foods in dysphagia. Not suitable for children under 1 year |

BNF 57
SLO Drinks (SLO Drinks)
Powder; carbohydrate content varies with flavour and chosen consistency (3 consistencies available), see product literature. Flavours: black currant, lemon, orange, or peach, net price 25-cups = £7.50.

For patient hydration in the dietary management of dysphagia. Not suitable as a sole source of nutrition. Not suitable for children under 3 years

SMA Staydown (SMA Nutrition)
Powder; protein (casein, whey) 12.4 g, fat 28 g, carbohydrate 54.3 g, energy 2166 kJ (518 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (12.9%) provides protein 1.6 g, carbohydrate 7 g, fat 3.6 g, energy 279 kJ (67 kcal)/100 mL. Contains lactose. Net price 900 g = £6.48.

For significant gastro-oesophageal reflux. Not to be used for more than 6 months or in conjunction with any other thickener or antacid product

Thick and Easy (Fresenius Kabi)
Modified maize starch, net price 225-g can = £4.15; 100 x 2.5-g sachets = £26.35; 4.54 kg = £70.53.

Thickened juices, liquid, modified food starch. Flavours: apple or orange, net price 118-mL pot = £54; 1.42-litre bottle = £3.61.

For thickening of foods in dysphagia. Not suitable for children under 1 year except in cases of failure to thrive

Vitapro (Vitaful)
Powder; skim milk proteins, containing all essential amino acids, 75%. Net price 250 g = £7.10, 2 kg = £55.73.

For biochemically proven hypoproteinaemia

Foods and supplements for special diets

Alcoholic Beverages
see under Rectified Spirit

Alembicol D (Alembic Products)
Fractionated coconut oil. Net price 5 kg = £115.55.

For steatohepatia associated with cystic fibrosis of the pancreas, intestinal lymphangiectasia, surgery of the intestine, chronic liver disease, liver cirrhosis, other proven malabsorption syndromes; in a ketogenic diet in the management of epilepsy, type I hyperlipoproteinaemia

Caprilon (SHS)
Powder; cows' milk 5.1 g, fat 28.3 g (of which MCT 75%) and 1494 kJ (357 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (12.7%) provides protein 1.5 g, carbohydrate 7 g, fat 3.6 g, energy 277 kJ (66 kcal)/100 mL. Net price 420 g = £14.28.

A sole source of nutrition or nutritional supplement for children with disorders for which a high intake of MCT is beneficial

Corn flour and corn starch
For hypoglycaemia associated with glycogen-storage disease

Energivit (SHS)
Powder, protein-free, carbohydrate 66.7 g, fat 25 g, energy 2059 kJ (492 kcal)/100 g with vitamins, minerals and trace elements, net price 400 g = £17.23.

Nutritional supplement for children requiring additional energy vitamins, minerals, and trace elements, following a protein-restricted diet

General Plus (SHS)
Powder; protein equivalent (whey, with added branched chain amino acids 33%) 76 g, carbohydrate 5 g, fat 5.5 g, energy 1596 kJ (374 kcal)/100 g with minerals. Net price 200 g (unflavoured) = £23.97. See also Modjul Flavour System, p. 878.

Nutritional supplement for patients with chronic liver disease and/or porto-hepatic encephalopathy, may be used for children over 6 months

Generalid (SHS)
Powder; protein equivalent (whey, with added branched chain amino acids 32%, and other essential amino acids) 11 g, energy 1494 kJ (357 kcal)/100 g with vitamins, minerals (low sodium), and trace elements; standard dilution (22%) provides protein equivalent 2.4 g, carbohydrate 13.6 g, fat 4.2 g, energy 428 kJ (102 kcal)/100 mL. Net price 400 g = £17.15. See also Modjul Flavour System, p. 878

A sole source of nutrition or nutritional supplement for children over 1 year with hepatic disorders

KetoCal (SHS)
Powder; protein 3.1 g, carbohydrate 600 mg, fat 14.6 g, energy 602 kJ (146 kcal)/100 mL serving (serving = 20 g powder reconstituted with water up to final volume of 100 mL, with vitamins, minerals, and trace elements. Vanilla or unflavoured, net price 300-g can = £23.87.

For use as part of the ketogenic diet in the management of epilepsy resistant to drug therapy. Only to be prescribed on the advice of a secondary care physician with experience of the ketogenic diet; not suitable for children under 1 year

Kindergen (SHS)
Powder; protein 7.5 g, carbohydrate 60.5 g, fat 26.1 g, energy 2060 kJ (492 kcal)/100 g with vitamins and minerals. Net price 400 g = £15.18.

For complete nutritional support or supplementary feeding for infants and children with chronic renal failure who are receiving peritoneal rapid overnight dialysis

Appendix 7: Borderline substances

and mineral content. Residual lactose; gluten-free. Net price 20-g sachet = £2.32.

Nutritional supplement for hypoproteinaemia and patients undergoing dialysis. Not suitable for children under 1 year

BNF 57
Appendix 7: Borderline substances

**Liquigen** (SHS)
- Emulsion, medium chain triglycerides 52%. Net price 250 mL = £7.26, 1 litre = £28.25.
- For steatorrhea associated with cystic fibrosis of the pancreas; intestinal lymphangiectasia, surgery of the intestine; chronic liver disease and liver cirrhosis; other proven malabsorption syndromes; ketogenic diet in the management of epilepsy; type I hyperlipoproteinaemia.

**MCT Oil**
- Triglycerides from medium chain fatty acids. For steatorrhoea associated with cystic fibrosis of the pancreas; intestinal lymphangiectasia; surgery of the intestine; chronic liver disease and liver cirrhosis; other proven malabsorption syndromes; in a ketogenic diet in the management of epilepsy; type I hyperlipoproteinaemia.

**MCT Pepdite** (SHS)
- Powder, protein equivalent (non-milk, low molecular-weight peptides and essential amino acids) 13.8 g, carbohydrate 59 g, fat (of which MCT 75%) 18 g, energy 1903 kJ (453 kcal)/100 g/ with vitamins, minerals, and trace elements. Unflavoured (see also Modju Flavour System, p. 878).
- MCT Pepdite. Standard dilution (15%) provides protein equivalent 2 g, carbohydrate 8.8 g, fat 2.7 g, energy 286 kJ (68 kcal)/100 mL. For use from birth, net price 400 g = £16.01.
- MCT Pepdite 1+. Standard dilution (20%) provides protein equivalent 2.8 g, carbohydrate 11.8 g, fat 3.6 g, energy 381 kJ (91 kcal)/100 mL. Available from SHS (net price 500 mL = £11.50).

**Metabolic Mineral Mixture** (SHS)
- Powder, essential mineral salts. Net price 100 g = £9.94.
- For mineral supplementation in synthetic diets.

**Monogen** (SHS)
- Powder, protein (whey) 11.4 g, carbohydrate 68 g, fat 11.8 g (of which MCT 90%), energy 1786 kJ (424 kcal)/100 g/ with vitamins, minerals and trace elements; standard dilution (17.5%) provides protein 2 g, carbohydrate 12 g, fat 2.1 g, energy 313 kJ (74 kcal)/100 mL. Net price 400 g = £15.91.
- A sole source of nutrition or nutritional supplement for disorders in which a high intake of medium chain triglyceride is beneficial.

**Nepro** (Abbot)
- Liquid, protein 7 g, carbohydrate 20.6 g, fat 9.6 g, fibre 1.56 g, energy 840 kJ (200 kcal)/100 ml with vitamins and minerals. Gluten- and lactose-free. Net price 500-ml ready-to-hang = £4.95 (vanilla); 200-mL carton = £2.28 (strawberry or vanilla).
- For patients with chronic renal failure who are on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), or patients with cirrhosis or other conditions requiring a high energy, low fluid, low electrolyte diet.

**Paediatric Seravit** (SHS)
- Powder, vitamins, minerals, low sodium and potassium, and trace elements. Net price 200 g (unflavoured) = £14.03; pineapple flavour, 250 g = £14.94.
- For vitamin and mineral supplementation in restrictive therapeutic diets in infants and children.

**Rectified Spirit**
- Where the therapeutic qualities of alcohol are required rectified spirit (suitably flavoured and diluted) should be prescribed.

**Renamil** (KoRa)
- Powder, protein (cows’ milk) 4.6 g, carbohydrate 7.08 g, fat 19.3 g, energy 2003 kJ (477 kcal)/100 g/ with vitamins (except vitamins A and D), minerals (low potassium, low phosphophate), and trace elements. Contains lactose; gluten-free. Net price 10 x 100 g = £25.40.
- A sole source of nutrition or nutritional supplement for use in chronic renal failure. Not suitable for children under 1 year.

**Suplepa** (Abbot)
- Liquid, protein 3 g, carbohydrate 25.5 g, fat 9.6 g, energy 841 kJ (201 kcal)/100 mL. Flavour: vanilla. Net price 237-mL can = £2.34.
- For patients with chronic or acute renal failure who are not undergoing dialysis; chronic or acute liver disease with fluid restriction; other conditions requiring a high-energy, low-protein, low-electrolyte, low-volume enteral feed.

**Special foods for conditions of intolerance**

**Colief** (Britannia)
- Liquid, lactase 50 000 units/g, net price 7-mL dropper bottle = £7.00.
- For the relief of symptoms associated with lactose intolerance in infants, provided that lactose intolerance is confirmed by the presence of reducing substances and/or excessive acid in stools, a low confirmed corresponding to the hydrolysis of the intestinal biopsy or by breath hydrogen test or lactose intolerance test. For dosage and administration details, consult product literature.

**Cow & Gate Pepti** (Cow & Gate)
- Powder, protein (whey, hydrolysed) 11.6 g, energy 52 g, fat 25.6 g, fibre 5.9 g, energy 2025 kJ (484 kcal)/100 g/ with vitamins, minerals, and trace elements; standard dilution (13.6%) provides protein 1.6 g, carbohydrate 7.1 g, fat 3.5 g, energy 800 mg, energy 275 kJ (66 kcal)/100 mL. Contains lactose. Net price 900 g = £19.39.
- A sole source of nutrition or nutritional supplement for established cows’ milk protein intolerance with or without proven secondary lactose intolerance.

**Cow & Gate Pepti-Junior** (Cow & Gate)
- Powder, protein (whey, hydrolysed) 14 g, energy 53.4 g, fat 27.3 g, energy 2155 kJ (515 kcal)/100 g/ with vitamins, minerals, and trace elements; standard dilution (12.8%) provides protein 1.8 g, carbohydrate 6.8 g, fat 3.5 g, energy 275 kJ (66 kcal)/100 mL. Residual lactose. Net price 450 g = £10.68.
- A sole source of nutrition or nutritional supplement for disorders and or whole protein intolerance or where amino acids and peptides are indicated in conjunction with medium chain triglycerides.

**Enfamil O-Lac** (Mead Johnson)
- Powder, protein (cows’ milk) 10.9 g, energy 55 g, fat 28 g, energy 2200 kJ (530 kcal)/100 g/ with vitamins, minerals, and trace elements; standard dilution provides protein 1.4 g, carbohydrate 7.2 g, fat 3.7 g, energy 280 kJ (68 kcal)/100 mL. Residual lactose. Net price 400 g = £3.86.
- A sole source of nutrition or nutritional supplement for proven lactose intolerance.

**Farley’s Soya Formula** (Heinz)
- Powder, protein 2%, carbohydrate 7%, fat 3.8% with vitamins and minerals when reconstituted. Gluten-, sucrose-, and milk-free. Net price 900 g = £6.17.
- For proven lactose and associated sucrose intolerance in preschool children, galactokienase deficiency, galactosaemia, and cow’s milk protein intolerance.

**Fructose** (Laevulose)
- For proven glucose/galactose intolerance.

**Galactamin 17 (SHS)**
- Powder, protein equivalent (cows’ milk) 12.3 g, energy 55.3 g, fat 27.2 g, energy 2155 kJ (515 kcal)/100 g/ with vitamins, minerals, and trace elements; standard dilution (13%) provides protein equivalent 1.7 g, carbohydrate 7.5 g, fat 3.7 g, energy 295 kJ (70 kcal)/100 mL. Residual lactose. Net price 400 g = £13.16.
- A sole source of nutrition or a nutritional supplement for proven lactose intolerance in preschool children, galactosaemia and galactokinase deficiency.

**Galactamin 19 (SHS)**
- Powder, protein equivalent (cows’ milk) 14.6 g, carbohydrate (fructose) 9 g, fat 30.8 g, energy 2233 kJ (534 kcal)/100 g/ with vitamins, minerals, and trace elements; standard dilution (12.9%) provides protein equivalent 1.9 g, carbohydrate 6.4 g.

Appendix 7: Borderline substances

875
(15%) provides protein 2 g, carbohydrate 8.6 g, fat 3.6 g, energy 315 kJ (75 kcal)/100 mL. Gluten- and lactose-free. Net price 400 g = £10.12. A sole source of nutrition or a nutritional supplement for diarrhoea and/or whole protein intolerance where additional medium chain triglyceride is not indicated

**SMA LF** *(SMA Nutrition)*

**Powder**; protein (casein, whey) 12 g, carbohydrate 55.6 g, fat 28 g. energy 2185 kJ (522 kcal)/100 g with vitamins, minerals and trace elements; **standard dilution (13%)** provides protein 1.48 g, carbohydrate 8.7 g, fat 3.6 g, energy 282 kJ (67 kcal)/100 mL. Residual lactose. Net price 430 g = £4.57. A sole source of nutrition or a nutritional supplement for proven lactose intolerance

**Wysoy** *(Wyeth)*

**Protein** (soya) 14 g, carbohydrate 54 g, fat 27 g, energy 2155 kJ (515 kcal)/100 g with vitamins, minerals and trace elements; **standard dilution (13.2%)** provides protein 1.8 g, carbohydrate 6.9 g, fat 3.6 g, energy 280 kJ (67 kcal)/100 mL. Lactose-free. Net price 430 g = £4.44; 860 g = £8.41. A sole source of nutrition or a nutritional supplement for proven lactose and associated sucrose intolerance in preschool children, galactokinase deficiency, galactosaemia and proven whole cows' milk sensitivity

**Gluten-sensitive enteropathies**

**Freebake** *(Freebake)*

**Gluten-free**. Bread mix, net price 2.4 kg = £12.15, cake mix, 2.4 kg = £11.90; pasta mix, 2.4 kg = £12.00; flour (plain), 2.4 kg = £11.50.

**Gadsby’s**

**Gluten-free**. White bread flour, net price 1 kg = £4.99. White bread rolls, 4 × 75 g = £2.00

**Glutafin** *(Nutrition Point)*

**Gluten-free**. Bread loaf, fibre or white (sliced or unleashed), 400 g = £3.25; rolls, fibre or white, 4 = £3.25. Biscuits, savoury, 125 g = £1.80; savoury shorts, 150 g = £2.47. Biscuits, digestives, sweet or tea, 150 g = £1.80. Biscuits, 200 g = £3.51. Fibre rolls, 100 g = £1.49. Mixes, fibre or white, 500 g = £5.65, cake, 500 g = £5.31. Crackers, 200 g = £2.93. High fibre crackers, 200 g = £2.46. Pasta (penne, shells, spirals, spaghetti), 500 g = £5.69; lasagne, tagliatelle, 250 g = £2.98. Pizza bases, 2 × 150 g = £7.40.

**Select Gluten-Free**

**Fibre loaf** (sliced or unleashed), 400 g = £2.89; paper-baked, 500 g = £3.25. Fresh bread, white or brown loaf, (sliced), 400 g = £3.03. Seeded loaf, 400 g = £3.15. White loaf (sliced or unleashed), 400 g = £2.89; part-baked, 400 g = £3.25. Fibre rolls, 4 = £3.25, part-baked, 4 = £3.25; long (part-baked), 2 = £3.25. White rolls, 4 = £3.25, part-baked 4 = £3.25; long (part-baked), 2 = £3.25. Mixes (bread, cake, fibre, fibre bread, pastry, and white), 500 g = £5.63

**Gluten-free** *(Gluten Free Foods Ltd)*

**Gluten-free**. Bread mix, organic (standard or fibre), net price 500 g = £4.12

**Il Pane di Anna** *(Gluten Free Foods Ltd)*

**Gluten-free**. Bread mix, white, net price 500 g = £5.25, cake mix, white 500 g = £5.25

**Juvela** *(Juvela)*

**Gluten-free**. Harvest mix, fibre mix, and flour mix, net price 500 g = £6.06. Bread (white or sliced), 400-g loaf = £2.92; part-baked loaf (with or without fibre), 400g = £3.13; fresh sliced loaf (white) 400 g = £0.34, (fibre) 400 g = £2.92. Bread (fibre unleashed), 400-g loaf = £2.92. Bread rolls, 5 × 85 g = £3.94, fibre bread rolls, 5 × 85 g = £3.94, part-baked rolls (with or without fibre), 5 × 75 g = £4.07. Crispbread, 210 g = £3.82. Pasta (Fibre Linguine, fibre Penne, fusilli, macaroni, spaghetti), 500 g = £5.94; lasagne, 250 g = £3.03; tagliatelle, 250 g = £2.96. Pasta bases, 2 × 180 g = £7.24. Digestive biscuits, 150 g = £2.51. Savoury biscuits, 150 g = £3.15. Sweet biscuits, 150 g = £2.38. Tea biscuits, 150 g = £2.51

**Gluten-free** *(Gluten Free Foods Ltd)*

**Gluten-free**. Bread, sliced (brown), net price 225 g = £2.25, (white), 200 g = £2.25; baguette (white) 250 g = £2.50; rolls (white), 4 = £2.50

**Lifestyle** *(Ultraplarm)*

**Gluten-free**. Brown bread (sliced and unleashed), net price 400 g = £2.82. White bread (sliced and unleashed), 400 g = £2.82. High fibre bread (sliced and unleashed), 400 g = £2.82. Bread rolls, (brown, white, or high-fibre) 400 g = £2.82

**Liwwell** *(Liwwell)*

**Gluten-free**. Bread, sliced, (brown), net price 225 g = £2.25, (white), 200 g = £2.25; baguette (white) 250 g = £2.50; rolls (white), 4 = £2.50

**Orange** *(Community)*

**Gluten-free**. Pasta: lasagne (corn, rice and maize), 150 g = £2.89; macaroni (rice and maize), 250 g = £2.25; shells (split pea and soya), 200 g = £2.25; spaghetti (corn, rice, and rice and maize), 250 g = £2.25; spirals (buckwheat, corn, rice, rice and millet, rice and maize), 250 g = £2.25, spirals (organic brown rice), 250 g = £2.90. Crispbread (corn or rice), 200 g = £2.56. Pizza and pastry mix, 375 g = £3.33. Flour, self-raising, 500 g = £2.89. Bread mix, 450 g = £3.10

**Pleniday** *(TOI)*

**Gluten-free**. Bread: loaf (sliced) net price 350 g = £1.18; country loaf (sliced), 500 g = £2.85; rustic loaf (sliced), 400 g = £2.09; petit pain (part baked), 2 × 150 g = £0.22. Pasta (penne), 250 g = £1.27; rigate, 250 g = £1.50

**Polial** *(Ultraplarm)*

**Gluten-free**. Biscuits. Net price 200-g pack = £2.85

**Procelli** *(Generpharm)*

**Gluten-free**. Bread, (white, sliced), net price 165 g = £2.24. Baguettes, sliced bread, 155 g = £1.18. Baguettes (part-baked), 2 × 125 g = £1.96; bread buns, 4 × 50 g = £1.25. Dinner rolls (white, part-baked), 4 × 35 g = £1.91. Flat bread (part-baked), 3 × 40 g = £3.99. Hotdog rolls (white, part-baked) 3 × 35 g = £1.95. Long rolls (white, part-baked), 3 × 83 g = £2.81. Lunch rolls (white), 6 × 45 g = £3.22. Flour (white), 1 kg = £6.88. Pasta (macaroni, small macaroni, penne, short spaghetti, spirals), 250 g = £2.99. Pizza bases, 3 × 125 g = £5.99. Rice
Gluten-sensitive enteropathies with coexisting established wheat sensitivity

ACBS indications: established gluten enteropathy with coexisting established wheat sensitivity only.

Ener-G (General Dietary)
Gluten-free, wheat-free. Pizza bases, 372 g = £3.75. Six flour bread loaf, 576 g = £3.60. Seattle brown rolls (round or long), 4 x 119 g = £1.00

Glutafin (Nutricia Dietary)
Gluten-free, wheat-free. Crisp bread, 2 x 125 g = £3.82. Mixes (fibre bread, bread), 500 g = £5.63; cake or pastry mix, 250 g = £5.63.

Heron Foods (Gluten Free Foods Ltd)
Gluten-free, wheat-free. Bread mix, organic (fibre), net price 500 g = £4.12; bread and cake mix, organic, 500 g = £4.12

Low protein

Protein (Ultrapharm)
Low protein. Low Na+ and K+. Benefits, net price 180 g (36) = £2.88; bread mix 250 g = £2.17; cake mix 300 g = £2.10; crispbread 260 g = £4.06; pasta (anellini, ditalini, rigatini, spaghetti) 500 g = £4.06; tagliatelle 250 g = £2.16.

Ener-G (General Dietary)
Low protein. Egg replacer, carbohydrate 94 g, energy 1574 kj (376 kcal)/100 g. Egg, gluten- and lactose-free, net price 454 g = £4.05. Rice bread, 600 g = £4.39.

Fate (Fat)
Low protein. All-purpose mix, net price 500 g = £6.35; Cake mix, 2 x 250 g = £6.35. Chocolate-flavour cake mix, 2 x 250 g = £6.35.

Hariffen (Ultrapharm)
Low protein. Cracker toast, net price 200 g = £2.75. Cookies, white chip, 200 g = £2.25.

Juelva (SHS)
Low Protein. Mix, net price 500 g = £6.66. Bread (sliced), 400-g loaf = £3.12. Bread rolls, 5 x 70 g = £3.87. Biscuits, orange and cinnamon flavour, 125 g = £5.61; chocolate chip, 130 g = £6.51. Pizza base, 2 x = £7.37.

Loprofin (SHS)
Low protein. Sweet biscuits, net price 150 g = £2.08; chocolate cream-filled biscuits, 125 g = £2.08; cookies (chocolate chip or cinnamon), 100 g = £5.51; crunch bar, 8 x 41 g = £11.09; wafers (orange, vanilla, or chocolate), 100 g = £0.22. Breakfast cereal, 375 g = £6.23. Egg replacer, 500 g = £12.14. Egg-white replacer, 100 g = £0.71. Bread (sliced), 400-g loaf = £3.12. Bread rolls (white) 4 x £2.91, (part-baked) 4 x 65 g = £3.28. Mix, 500 g = £6.61. Cake mix (chocolate or lemon), 500 g = £6.99. Dessert mix (chocolate, strawberry, vanilla), 150 g = £3.82. Crispbread, 150 g = £2.84. Herb crackers, 150 g = £2.84. Pasta (fusilli, penne, spaghetti), 500 g = £6.91. Pasta (macaroni, puntoni, tagliatelle) 250 g = £3.32. Pasta (conchiglie, gnocchi sardi) 500 g = £6.66. Pasta (lasagne), 250 g = £3.36. Pasta (vermicelli), 250 g = £3.44. Pasta (animal shapes) 500 g = £6.64. Snack Pot (curry or tomato and basil), 47 g = £3.67, Rice, 500 g = £6.71.

Low protein drink (Milupa)
Powder, whey protein 500 mg, carbohydrate 6 g, fat 3 g, energy 220 kJ (53 kcal)/10 g, with vitamins, minerals, and trace elements. Net price 400 g = £7.23.

For inherited disorders of amino acid metabolism in children over 1 year

Note Termed Milupa lpd by manufacturer

PK Foods (Gluten Free Foods Ltd)
Low-protein. Bread (white sliced) net price 500 g = £4.00. Crispbread, 75 g = £2.00. Pasta (spiral) 250 g = £2.00.

Aminex biscuits 150 g = £4.25; cookies, 200 g = £4.25; rusks, 200 g = £4.25

See also Phenylketonuria, p. 880

Promin (Firstplay Dietary)
Low protein. Burger mix, 2 x 62 g = £5.60, (lamb and mint), 4 x 72 g = £5.50. Sausage mix (apple and sage, tomato and basil, or original), 4 x 30 g = £6.30. Cous Cous, 500 g = £6.35. Pasta (alphabets, macaroni, shells, shortcut spaghetti, spirals); Pasta tricolour (alphabets, shells, spirals), net price 500 g = £6.35; Lasagne sheets, 200 g = £2.70. Pasta shells in tomato, pepper and herb sauce, 4 x 72 g-sachets = £7.32. Pasta elbows in cheese and broccoli sauce, 4 x 66-g sachets = £7.32. Pasta spirals in Moroccan sauce, 4 x 72 g = £7.32. Pasta spirals in tomato sauce, 4 x 72 g-sachets = £6.50. Pasta imitation rice, 500 g = £8.35. Rice puddling imitation (apple, banana, strawberry, and original flavours), 4 x 69-g sachets = £5.60. Dessert (chocolate and banana, strawberry and vanilla, custard, or caramel) 6 x 365 g = £5.60. Hot breakfast (apple and cinnamon, banana, chocolate, original) 6 x 57 g = £7.14. Spread, chocolate and hazelnut, 230 g = £6.80

Rite-Diet Low-protein (SHS)
Low protein. Baking mix. Net price 500 g = £6.61. Flour mix, 400 g = £5.68.
**Appendix 7: Borderline substances**

**1. Analog products are generally intended for use in children up to 1 year**

**2. Maxamaid products are generally intended for use in children 1–8 years, see also Modjul Flavour System, above**

**3. Maxamaid products are generally intended for use in children over 8 years**

---

**Homocystinuria or hypermethioninaemia**

**HCU cooler (Vitafo)**

Liquid, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7.8 g, fat trace, energy 386 kJ (92 kcal)/130 mL, with vitamins, minerals and trace elements. Orange flavour, net price 30 × 130-mL pouch = £258.30

A methionine-free protein substitute for use as a nutritional supplement in patients over 3 years of age with homocystinuria

**HCU Express (Vitafo)**

Protein, essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.3 kcal)/25 g with vitamins, minerals and trace elements. Unflavoured (see also FlavourPac, above), net price 30 × 25-g sachets = £253.24

A methionine-free protein substitute for use as a nutritional supplement in patients over 8 years of age with homocystinuria

**HCU gel (Vitafo)**

Protein, essential and non-essential amino acids except methionine) 8.4 g, carbohydrate 8.6 g, fat 30 mg, energy 286 kJ (68 kcal)/20 g with vitamins, minerals and trace elements. Unflavoured (see also FlavourPac, above), net price 30 × 20-g sachets = £141.51

A methionine-free protein substitute for use as a nutritional supplement in children 12 months–10 years with homocystinuria

**HCU LV (Vitafo)**

Powder, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 2.5 g, fat 190 mg, energy 390 kJ (92 kcal)/27.8-g sachet, with vitamins, minerals and trace elements. Unflavoured (formulation varies slightly), net price 30 × 27.8-g sachets = £86.17

A nutritional supplement for hypermethioninaemia or vitamin B non-responsive homocystinuria in patients over 8 years.

**1. XMET Analog (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine) 15 g, carbohydrate 54 g, fat 23 g, energy 1900 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, see also Modjul Flavour System, above, net price 400 g = £28.22.

For hypermethioninaemia or homocystinuria

**2. XMET Homidion (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1386 kJ (326 kcal)/100 g. Net price 500 g = £145.76.

For hypermethioninaemia or homocystinuria

**3. XMET Maxamaid (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, see also Modjul Flavour System, above. Net price 500 g = £123.34.

For hypermethioninaemia or homocystinuria

**4. XMET Maxumam (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 34 g, fat less than 0.5%, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, see also Modjul Flavour System, above. Net price 500 g = £123.34.

For hypermethioninaemia or homocystinuria

**Hyperlysinaemia**

**1. XLYS Analog (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except lysine) 39 g, carbohydrate 34 g, fat less than 0.5%, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, see also Modjul Flavour System, above. Net price 400 g = £28.22.

For hyperlysinaemia

**2. XLYS Maxamaid (SHS)**

Powder, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, see also Modjul Flavour System, above. Net price 400 g = £28.22.

For hyperlysinaemia

---

**Sno-Pro (SHS)**

Low-protein, Drink, protein 220 mg (phenylalanine 12.5 mg), carbohydrate 8 g, fat 3.8 g, energy 280 kJ (67 kcal)/100 mL. Net price 200 mL = £9.8p.

For phenylketonuria, chronic renal failure, and other inborn errors of metabolism

**Taranis (Firstplay Dietary)**

Low protein, Cake bars (lemon), net price 6 × 40g = £5.10

**Ultra (Ultrapharm)**

Low protein, PKU bread, 400 g = £2.25. PKU flour, 500 g = £3.07. PKU biscuits, 200 g = £2.21. PKU cookies, 250 g = £2.31. PKU pizza base, 400 g = £2.35. PKU savoy biscuits, 150 g = £2.06.

**Vita Bite (Vitafo)**

Low-protein, Bar, protein 30 mg (less than 2.5 mg phenylalanine), carbohydrate 15.35 g, fat 8.4 g, energy 572 kJ (137 kcal)/25 g. Chocolate flavoured, net price 25 g = £9.6p.

Not recommended for children under 1 year

### Metabolic Diseases

**Glutaric aciduria (type 1)**

**GA Gel (Vitafo)**

Gel, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 8.4 g, carbohydrate 8.6 g, fat trace, energy 286 kJ (68 kcal)/20 g, with vitamins, minerals, and trace elements. Net price 30 × 20-g sachets = £141.51.

**Modjul Flavour System (SHS)**

Powder, flavours: blackcurrant, lemon, orange, pineapple, 100 g = £9.54. Cherry-vanilla, grapefruit, lemon-lime, 20 × 5-g sachets = £9.54.

For use with unflavoured SHS products based on peptides or amino acids

**Flavour preparations**

**FlavourPac (Vitafo)**

Powder, flavours: blackcurrant, lemon, orange, tropical or raspberry, net price 4 × 30 × 4-g sachets = £43.84.

For use with Vitafo’s range of unflavoured protein substitutes for metabolic diseases

**Modjul Flavour System (SHS)**

Powder, flavours: blackcurrant, orange, pineapple, 100 g = £9.54. Cherry-vanilla, grapefruit, lemon-lime, 20 × 5-g sachets = £9.54.

For use with unflavoured SHS products based on peptides or amino acids

---

1. Analog products are generally intended for use in children up to 1 year

2. Maxamaid products are generally intended for use in children 1–8 years, see also Modjul Flavour System, above, for use with unflavoured amino acid and peptide products from SHS

3. Maxamaid products are generally intended for use in children over 8 years
than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, net price 500 g = £76.94.

For hyperlysinaemia

Isovaleric acidemia

1. XLEU Analog (SHS)
   Powder, protein equivalent (essential and non-essential amino acids except leucine) 15 g, carbohydrate 54 g, fat 23 g (of which MCT 4.5%), energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements. Glutên-, lactose-, fructose-free. Net price 400 g = £28.22.

For isovaleric acidemia

Ingredients: include arachis oil (peanut oil)

XLEU Faladon (SHS)
Powder, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, net price 500 g = £76.94.

For isovaleric acidemia

2. XLEU Maxamaid (SHS)
   Powder, protein equivalent (essential and non-essential amino acids except leucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, net price 500 g = £76.94.

For isovaleric acidemia

Maple syrup urine disease

Isoleucine Amino Acid Supplement (Vitaflo)
Powder, isoleucine 0.05 g, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £42.23.

For in use conjunction with a protein supplement for maple syrup urine disease in children over 1 year

Mapleflex (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 11 g, fat 3.9 g, energy 474 kJ (113 kcal)/29 g, with vitamins, minerals, and trace elements. Unflavoured.

Net price 30 x 29-g sachets = £162.82.

For maple syrup urine disease in children 1–10 years

MSUD Aid III (SHS)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 77 g, carbohydrate 4.5 g, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Net price 500 g = £145.76.

For maple syrup urine disease and related conditions where it is necessary to limit the intake of branched chain amino acids

1. MSUD Analog (SHS)
   Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 13 g, carbohydrate 54 g, fat 23 g (of which MCT 4.5%), energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements. Net price 400 g = £28.22.

For maple syrup urine disease

MSUD express (Vitaflo)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 15 g, carbohydrate 3.8 g, fat less than 100 mg, energy 315 kJ (75 kcal)/25 g with vitamins, minerals, and trace elements. Unflavoured (see FlavourPac sachets, p. 878), net price 30 x 25-g sachets = £253.24.

For maple syrup urine disease in children over 8 years and adults

MSUD express cooler (Vitaflo)
Liquid, protein equivalent 15 g (essential and non-essential amino acids except isoleucine, leucine, and valine), carbohydrate 7.8 g, fat trace, energy 380 kJ (92 kcal)/130-mL.

1. Analog products are generally intended for use in children up to 1 year.

2. Maxamaid products are generally intended for use in children 1–8 years, see also Modjul Flavour System, p. 878, for use with unflavoured amino acid and peptide products from SHS

pouch, with vitamins, minerals, and trace elements. Orange flavour, net price 30 x 150-mL = £258.30.

For maple syrup urine disease in children over 3 years and adults

MSUD Gel (Vitaflo)
Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 8.4 g, carbohydrate 8.6 g, fat less than 100 mg, energy 286 kJ (68 kcal)/20 g with vitamins, minerals, and trace elements. Unflavoured (see FlavourPac sachets, p. 878), net price 30 x 20-g sachets = £141.51.

For maple syrup urine disease in children 1–10 years

2. MSUD Maxamaid (SHS)
   Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 39 g, carbohydrate 54 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (see Modjul Flavour System, p. 878). Net price 500 g = £123.34.

For maple syrup urine disease

3. MSUD Maxamum (SHS)
   Powder, protein equivalent (essential and non-essential amino acids except isoleucine, leucine, and valine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured, net price 500 g = £76.94.

For maple syrup urine disease

Valine Amino Acid Supplement (Vitaflo)
Powder, valine 0.05 g, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £42.23.

For use in conjunction with a protein supplement for maple syrup urine disease in children over 1 year

Methylnalonic or propionic acidemia

1. XMVTI Analog (SHS)
   Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 12 g, carbohydrate 54 g, fat 23 g (of which MCT 4.5%), energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements. Net price 500 g = £123.34.

For methylnalonic or propionic acidemia

XMVTI Asadon (SHS)
Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 77 g, carbohydrate 4.5 g, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Net price 500 g = £145.76.

For methylnalonic or propionic acidemia

XMVTI Maxamaid (SHS)
Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Net price 500 g = £76.94.

For methylnalonic or propionic acidemia

XMVTI Maxamum (SHS)
Powder, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 12 g, carbohydrate 54 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (see also Modjul Flavour System, p. 878). Net price 500 g = £123.34.

For methylnalonic or propionic acidemia

Other errors of protein metabolism

Cystine Amino Acid Supplement (Vitaflo)
Powder, cystine 0.5 g, carbohydrate 3.4 g, fat nil, energy 63 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £42.23.

For dietary management of inborn errors of protein metabolism

EAA Supplement (Vitaflo)
Powder, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with trace elements.

3. Maxamaid products are generally intended for use in children over 8 years
Appendix 7: Borderline substances

Phenylketonuria

Add-Ins (SHS)

Powder, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/sachet, with vitamins, minerals, and trace elements. Unflavoured (see Modju Flavour System, p. 878), net price 60 x 18.2-g sachets = £294.00.

For the dietary management of proven phenylketonuria. Not suitable for children under 4 years

Lophlex LQ 10 (SHS)

Liquid, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 170 mg, energy 245 kJ (58 kcal)/62.5 mL with vitamins, minerals, and trace elements. Berry flavour, net price 60 x 62.5 mL = £243.00.

For the dietary management of phenylketonuria in children over 8 years and adults including pregnant women

Phenylketonuria

Appendix 7: Borderline substances

vitals, minerals, and trace elements. Tropical flavour, net price 50 x 12.5-g sachets = £165.67

For dietary management of disorders of protein metabolism including urea cycle disorders. Not suitable for children under 3 years

Leucine Amino Acid Supplement (Vitaflo)

Powder, leucine 0.1 g, carbohydrate 4 g, fat nil, energy 64 kJ (15 kcal)/4 g, net price 30 x 4-g sachets = £42.23

For the dietary management of inborn errors of protein metabolism

Capsules, protein equivalent (essential and non-essential amino acids except phenylalanine) 416 mg/capsule. Net price 200-cap pack = £33.23

Tablets, protein equivalent (essential and non-essential amino acids except phenylalanine) 1 g tablet. Net price 75-tab pack = £21.59

For use as a vitamin and mineral component of restricted therapeutic diets in children 11 years and over and adults with phenylketonuria and similar amino acid abnormalities

Tablets, vitamins, minerals, and trace elements, net price 180-tab pack = £68.69.

For the dietary management of phenylketonuria. Not suitable for children under 8 years

PK Aid-4 (SHS)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 75 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g, with vitamins, minerals, and trace elements. Net price 500 g = £112.04. For phenylketonuria

PK Foods (Gluten Free Foods Ltd)

Cookies (chocolate chip, orange, or cinnamon). 150 g = £4.25. Egg replacer, 350 g = £4.25. Flour mix, 750 g = £9.60. Jelly (orange or cherry flavour), 4 x 80 g = £6.76. For phenylketonuria. See also Low-protein foods, p. 877.

PKU 2 (Milupa)

Granules, protein equivalent (essential and non-essential amino acids except phenylalanine) 66.8 g, carbohydrate 8.2 g, fat nil, energy 1274 kJ (300 kcal)/100 g with vitamins, minerals, and trace elements. Flavour: vanilla. Net price 500 g = £44.75. For phenylketonuria

PKU cooler10 (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 68 g, carbohydrate 3.9 g, fat nil, energy 1222 kJ (288 kcal)/100 g, with vitamins, minerals, and trace elements. Flavour: vanilla. Net price 500 g = £44.75. For phenylketonuria, not recommended for children under 8 years

PKU cooler15 (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 5.1 g, energy 250 kJ (62 kcal)/87-mL pouch, with vitamins, minerals, and trace elements. Orange or purple option. Net price 30 x 87 mL = £105.00. For the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU cooler20 (Vitaflo)

Liquid, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174 mL pouch, with vitamins, minerals, and trace elements. Orange or purple option. Net price 30 x 174 mL = £210.00. For the dietary management of phenylketonuria. Not recommended for children under 3 years

PKU express (Vitaflo)

Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 72 g, carbohydrate 15.1 g, energy 1260 kJ (301.5 kcal)/100 g with vitamins, minerals,
and trace elements. Lemon, orange, tropical or unflavoured, net price 30 x 25 g sachets = £15.53.

For phenylketonuria, not recommended for children under 3 years

PKU gel (Vitaflo)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.4 g, carbohydrate 8.6 g, fat 0.03 g, energy 285.5 kJ (68 kcal)/20 g with vitamins, minerals and trace elements. Orange or unflavoured, net price 30 x 20-g sachets = £88.51.

For use as part of the low-protein dietary management of phenylketonuria in children 1–10 years

PKU Start (Vitaflo)
Liquid, ready-to-feed formula, phenylalanine-free containing essential and non-essential amino acids, carbohydrate, fat, vitamins, minerals, and trace elements. Includes long-chain polyunsaturated fatty acids. Net price 500-mL bottle = £5.30.

For the dietary management of phenylketonuria in children under 1 year

L-Tyrosine (SHS)
Powder, net price 100 g = £12.53.

For use as a supplement in maternal phenylketonurics who have low plasma tyrosine concentrations

Tyrosine Amino Acid Supplement (Vitaflo)
Powder, tyrosine 1 g, carbohydrate 2.9 g, energy 62 kJ (15 kcal)/4-g sachet, net price 30 x 4-g sachets = £37.80.

For the dietary management of phenylketonuria. Not suitable as a sole source of nutrition.

XP Analog (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 13 g, carbohydrate 54 g, fat 23 g (of which MCT 4.5%), energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements. Net price 400 g = £22.54.

For phenylketonuria

XP Analog LCP (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements. Gluten- and lactose-free. Net price 400 g = £25.64.

For phenylketonuria in children under 2 years

XP Maxamaid (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 25 g, carbohydrate 51 g, fat less than 0.5 g, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements. Net price 400 g = £22.54.

For phenylketonuria

XP Maxamum (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 39 g, carbohydrate 34 g, fat less than 0.5 g, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Flavours: orange, unflavoured (see Modiflavour System, p. 878). Net price 30 x 50-g sachets = £21.14, 500 g = £70.39.

For phenylketonuria.

Tyrosinaemia

TYR express (Vitaflo)
Powder, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 3.8 g, fat less than 0.1 g, energy 315 kJ (76 kcal)/25 g, with vitamins, minerals, and trace elements. Unflavoured (see Flavourpacs, p. 878), net price 30 x 25-g sachets = £25.24.

A tyrosine- and phenylalanine-free protein substitute for use in the dietary management of tyrosinaemia. Not recommended for children under 8 years

TYR Gel (Vitaflo)
Gel, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 8 g, carbohydrate 6.6 g, fat 0.03 g, energy 285.5 kJ (68 kcal)/20 g, with vitamins, minerals and trace elements. Unflavoured (see Flavourpacs, p. 878) net price 30 x 20-g sachets = £141.51.

A tyrosine- and phenylalanine-free protein substitute for use in the dietary management of tyrosinaemia in children 1–10 years

XPHEN TYR Analog (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (for child over 6 months, Modiflavour System, can be used, see p. 878). Net price 400 g = £28.22.

For tyrosinaemia

XPHEN TYR Maxamaid (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 25 g, carbohydrate 51 g, fat less than 0.5 mg, energy 1311 kJ (309 kcal)/100 g with vitamins, minerals, and trace elements. Unflavoured. Net price 500 g = £76.94.

For tyrosinaemia

XPHEN TYR Tyrosidon (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 77 g, carbohydrate 4.3 g, fat nil, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (for child over 6 months, Modiflavour System can be used, see p. 878). Net price 500 g = £145.76.

For tyrosinaemia where plasma methionine concentrations are normal

XPTM Analog (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, tyrosine, and methionine) 13 g, carbohydrate 54 g, fat 23 g, energy 1990 kJ (475 kcal)/100 g, with vitamins, minerals, and trace elements. Modiflavour System can be used, see p. 878). Net price 400 g = £28.22.

For tyrosinaemia

XPTM Tyrosidon (SHS)
Powder, protein equivalent (essential and non-essential amino acids except phenylalanine, tyrosine, and methionine) 77 g, carbohydrate 4.3 g, fat nil, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals, and trace elements. Unflavoured (for child over 6 months, Modiflavour System can be used, see p. 878). Net price 500 g = £145.76.

For tyrosinaemia type 1 where plasma concentrations are above normal

Urea cycle disorders (other than arginase deficiency)

L-Arginine (SHS)
Powder, net price 100 g = £10.64.

For use as a supplement in urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, argininosuccinic aciduria, and deficiency of N-acetyl glutamate synthetase
Conditions for which toilet preparations may be prescribed on FP10, GP10 (Scotland), WP10 (Wales)

Note This is a list of clinical conditions for which the ACBS has approved toilet preparations. For details of the preparations see Chapter 13.

Birthmarks  See Disfiguring skin lesions, below

Dermatitis  Aveeno Bath Oil; Aveeno Cream; Aveeno Colloidal; Aveeno Lotion; E45 Emollient Bath Oil; E45 Emollient Wash Cream; E45 Lotion

Dermatitis herpetiformis  See also Gluten-sensitive enteropathies, p. 876

Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)  Covermark classic foundation and finishing powder; Dermacolor Camouflage cream and fixing powder; Keromask masking cream and finishing powder; Veil Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded)

Disinfectants (antiseptics)  May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygenic purposes.

Eczema  See Dermatitis, above

Photodermatoses (skin protection in)  Delph Sun Lotion SPF 30; E45 Sun SPF 50; Spectran Ultra; Sunsense Ultra; Uvistat Lipscreen SPF 50, Uvistat Suncream SPF 30 and 50.

Pruritus  See Dermatitis, above
A8 Wound management products and elastic hosiery

A8.1 Wound dressings

A8.1.1 Alginate dressings
A8.1.2 Foam dressings
A8.1.3 Hydrogel dressings
A8.1.4 Hydrocolloid dressings
A8.1.5 Vapour-permeable films and membranes
A8.1.6 Low adherence dressing and wound contact materials
A8.1.7 Odour absorbent dressings
A8.1.8 Dressing packs
A8.1.9 Surgical absorbents
A8.1.10 Capillary dressings
A8.1.11 Other dressings
A8.2 Bandages and adhesives

An overview of the management of chronic wounds (including venous ulcers and pressure sores) and the role of different dressings is given below, as is the NICE guidance on difficult-to-heal surgical wounds; the notes do not deal with the management of clean surgical wounds which usually heal very rapidly. The correct dressing for wound management depends not only on the type of wound but also on the stage of the healing process. The principal stages of healing are:

1. Cleansing, removal of debris;
2. Granulation, vascularisation;
3. Epithelialisation.

Greater understanding of the requirements of a wound dressing, including recognition of the benefits of maintaining a moist environment for wound healing, has improved the management of chronic wounds.

The ideal dressing needs to ensure that the wound remains:

1. Moist with exudate, but not macerated;
2. Free of clinical infection and excessive slough;
3. Free of toxic chemicals, particles or fibres;
4. At the optimum temperature for healing;
5. Undisturbed by the need for frequent changes;
6. At the optimum pH value.

As wound healing passes through its different stages, variations in dressing type may be required to satisfy better one or other of these requirements. The type of dressing depends on the type of wound or the stage of the healing process.

### Functions of dressings

Alginates, foam, hydrogel and hydrocolloid dressings are designed to absorb wound exudate and thus to control the state of hydration of a wound. There have been few clinical trials able to establish a clear advan-
Dressings impregnated with an antiseptic, such as iodine, can be used to treat clinically infected wounds. Dressings containing silver should be used when clinical signs or symptoms of infection are present, or when infection has been confirmed by microbiological investigation.

Medical grade honey has antimicrobial properties; it may improve healing time in mild to moderate superficial and partial thickness burns.

Protease modulating matrix dressings (section A8.1.3) alter the activity of proteolytic enzymes in chronic wounds; the clinical significance of this approach is yet to be demonstrated.

Practices such as the use of irritant cleansers may be harmful and are largely obsolete; removal of debris and dressing remnants should need minimal irrigation with physiological saline.

A8.1.1 Alginate dressings

The gelling characteristics of alginate dressings vary according to the product used. Some products only gel to a limited extent to form a partially gelled sheet that can be lifted off; others form an amorphous gel that can be rinsed off with water or physiological saline. A secondary covering is needed. They are highly absorptive and are therefore suitable for moderately or heavily exuding wounds, but not for eschars or for dry wounds.

Dressings containing silver should be used when infection is suspected as a result of clinical signs or symptoms, or when infection has been confirmed by microbiological investigation.

Acticoat Absorbent (S&N Hlth.)
Calcium alginate dressing with a silver coated antimicrobial barrier, 5 cm × 5 cm = £4.91, 10 cm × 10 cm = £11.78; cavity dressing, 2 cm × 30 cm = £1.45
Uses antimicrobial dressing for moderately to heavily exuding wounds

ActiHeal (MedLogic)
ActiveHeal Alginate, calcium sodium alginate dressing, 5 cm × 5 cm = 57p, 10 cm × 10 cm = £1.11, 10 cm × 20 cm = £2.73; cavity dressing, 2 cm × 30 cm = £0.05
ActiveHeal Aquafiber, non-woven, calcium sodium alginate dressing, 5 cm × 5 cm = 73p, 10 cm × 10 cm = £1.74, 15 cm × 15 cm = £3.28; cavity dressing, 2 cm × 42 cm = £1.75
Uses moderately to heavily exuding wounds

Algisite (S&N Hlth.)
Algisite Ag, calcium alginate dressing, with silver, 5 cm × 5 cm = £1.53, 10 cm × 10 cm = £3.85, 10 cm × 20 cm = £7.04; cavity dressing 2 g, 30 cm = £5.28
Uses antimicrobial dressing for moderately to heavily exuding wounds

Algisite M, calcium alginate fibre, non-woven dressing, 5 cm × 5 cm = 85p, 10 cm × 10 cm = £1.75, 15 cm × 20 cm = £4.71; cavity dressing, 2 cm × 30 cm = £3.18
Uses moderately to heavily exuding wounds

Algosteril (S&N Hlth.)
Calcium alginate dressing, 5 cm × 5 cm = £3.25; cavity dressing, 2 g, 30 cm = £3.47
Uses moderately to heavily exuding wounds

Curasorb (Covidien)
Curasorb Alginate dressing, 5 cm × 5 cm = 69p, 10 cm × 10 cm = £1.46, 10 cm × 14 cm = £2.36, 10 cm × 20 cm = £2.87, 15 cm × 25 cm = £5.05, 30 cm × 61 cm = £26.50
(Other sizes £)
Curasorb Plus, calcium alginate dressing, 10 cm × 10 cm = £2.00
Curasorb Rope, calcium alginate cavity dressing, 30 cm = £2.78, 61 cm = £4.88, 91 cm = £5.25
Curasorb Zn, calcium alginate and zinc dressing, 5 cm × 5 cm = 78p, 10 cm × 10 cm = £1.65, 10 cm × 20 cm = £3.24
(Other sizes £)

Flaminal (Ark Therapeutics)
Forte gel, alginate with glucose oxidase and lactoperoxidase, 15 g = £7.13
Uses moderately to heavily exuding wounds

Hydro gel, alginate with glucose oxidase and lactoperoxidase, 15 g = £7.13
Uses lightly to moderately exuding wounds

Kaltostat (Convatec)
(Alginate Dressing, BP 1993, type C) Calcium alginate fibre, non-woven, 5 cm × 5 cm, = £87p, 7.5 cm × 12 cm = £1.91, 10 cm × 20 cm = £3.77, 15 cm × 25 cm = £6.48, (other sizes £)
Calcium alginate dressing, 5 cm × 5 cm = £1.53, 10 cm × 10 cm = £3.85, 10 cm × 20 cm = £7.04
Uses moderately to heavily exuding wounds

Melgisorb (Mölnlycke)
Calcium sodium alginate fibre, highly absorbent, gelling dressing, non-woven, 5 cm × 5 cm = 84p, 10 cm × 10 cm = £1.64, 10 cm × 20 cm = £3.08; cavity dressing, 32 cm × 2.2 cm, (2 g) = £3.30
Uses moderately to heavily exuding wounds including leg ulcers, dermal lesions and traumatic wounds

SeaSorb (Coloplast)
SeaSorb Soft, alginate containing hydrocolloid dressing, highly absorbent, gelling dressing, 5 cm × 5 cm = 90p, 10 cm × 10 cm = £2.14, 15 cm × 15 cm = £4.05
Uses heavily exuding wounds

SeaSorb Soft Filler, calcium sodium alginate fibre, highly absorbent, gelling filler, 44 cm = £2.52
Uses moderately to heavily exuding cavity wounds

Sorbalgon (Hartmann)
Calcium alginate dressing, 5 cm × 5 cm = £7.4p, 10 cm × 10 cm = £1.55; cavity dressing, net price 2 g, 32 cm = £3.17
Uses for moderately to heavily exuding wounds

Sorbsan (Unomedical)
Sorbsan Flat, calcium alginate fibre, highly absorbent, flat non-woven pads, 5 cm × 5 cm = 78p, 10 cm × 10 cm = £1.64, 10 cm × 20 cm = £3.08; with silver, 5 cm × 5 cm = £1.50, 10 cm × 10 cm = £3.80, 10 cm × 20 cm = £6.94
Uses moderately to heavily exuding wounds; with silver, antimicrobial dressing for moderately to heavily exuding wounds

Sorbsan Plus, alginate dressing bonded to a secondary absorbent viscose pad, 7.5 cm × 10 cm = £1.66, 10 cm × 15 cm = £2.93, 10 cm × 20 cm = £3.74, 15 cm × 20 cm = £5.20
Uses moderately to heavily exuding shallow wounds and ulcers

Sorbsan Plus SA, alginate dressing with adhesive border and absorbent backing, 11.5 cm × 14 cm = £2.89, 14 cm ×
Foam dressings vary from products that are suitable for lightly exuding wounds to highly absorbent structures for heavily exuding wounds. They may also be used as secondary dressings. In hypergranulating (or overgranulating) tissue (which may arise from the use of occlusive dressings such as hydrocolloids), changing to a more permeable product such as a foam dressing may be beneficial.

Dressings containing silver should be used when infection is suspected as a result of clinical signs or symptoms, or when infection has been confirmed by microbiological investigation.

**Polyurethane Foam Dressing, BP 1993**
Absorbent foam dressing of low adherence

- **Lyfoam**, 7.5 cm x 7.5 cm = £1.02; 10 cm x 10 cm = £1.17, 10 cm x 17.5 cm = £1.88, 15 cm x 20 cm = £2.54, other sizes (\(\geq 10\) cm) 10 cm x 25 cm = £4.79 (hospital only), 25 cm x 30 cm = £11.35 (Medlock)

**Uses**
- Treatment of burns, decubitus ulcers, donor sites, granulating wounds

### For lightly to non-exuding wounds

**Polyurethane Foam Dressing with Adhesive Border**

- **Avazorb Border**, 6 cm x 10 cm = £1.10, 8 cm x 12 cm = £1.90 (Advancis)
- **PolyMem**, 5 cm x 5 cm = 48p (Unomedical)
- **Tielle Lite**, 11 cm x 11 cm = £2.24; 7 cm x 9 cm = £1.19; 8 cm x 15 cm = £2.76; 8 cm x 20 cm = £2.91 (J&J)

### For lightly to moderately exuding wounds

**Polyurethane Foam Dressing with Adhesive Border**

- **Lyfoam Extra Adhesive**, 9 cm x 9 cm = £1.27, 15 cm x 15 cm = £2.39, 22 cm x 22 cm = £4.70; sacral, 15 cm x 13 cm = £1.95; (Medlock)
- **Suprasorb P**, 7.5 cm x 7.5 cm = £1.16, 10 cm x 10 cm = £1.25, 15 cm x 15 cm = £2.24 (Synergy Healthcare)
- **Tielle**, 11 cm x 11 cm = £2.53; 15 cm x 15 cm = £3.81; 18 cm x 18 cm = £4.85; 7 cm x 9 cm = £1.25; 15 cm x 20 cm = £4.77; **Tielle Sacrum** 18 cm x 18 cm = £3.53 (J&J)
- **Trufoam**, 7 cm x 9 cm = £1.13; 11 cm x 11 cm = £2.16 (Unomedical)

### For moderately to heavily exuding wounds

**Polyurethane Foam Dressing without Adhesive Border**

- **Allevyn Lite**, 5 cm x 5 cm = £1.04; 10 cm x 10 cm = £1.88; 10 cm x 20 cm = £3.22; 15 cm x 20 cm = £4.02 (S&N Hlth.)
- **Allevyn Thin** (adhesive), net price 5 cm x 6 cm = 98p, 10 cm x 10 cm = £1.98, 15 cm x 15 cm = £3.26, 15 cm x 20 cm = £3.96 (S&N Hlth.)
- **Flexipore** (adhesive), 6 cm x 7 cm = 93p; 10 cm x 10 cm = £1.73, 15 cm x 20 cm = £3.70; 20 cm x 20 cm = £5.06; 10 cm x 30 cm = £3.60 (MedLogic)
- **Lyfoam Extra**, 10 cm x 10 cm = £2.02; 17.5 cm x 10 cm = £3.43; 20 cm x 15 cm = £4.44 (Medlock)
- **Suprasorb M**, 10 cm x 10 cm = £1.72, 10 cm x 20 cm = £3.03, 20 cm x 20 cm = £5.05 (Synergy Healthcare)
- **Suprasorb P**, 5 cm x 5 cm = 90p, 7.5 cm x 7.5 cm = 96p, 10 cm x 10 cm = £1.13, 15 cm x 15 cm = £3.01 (Synergy Healthcare)
- **Transorbert** (adhesive), 5 cm x 7 cm = £1.00; 10 cm x 10 cm = £1.89; 15 cm x 15 cm = £3.47; 20 cm x 20 cm = £5.55 (Unomedical)

### For moderately to heavily exuding wounds

**Polyurethane Foam Dressing with Adhesive Border**

- **ActivHeal Foam Island**, 10 cm x 10 cm = £1.57, 12.5 cm x 12.5 cm = £1.50, 15 cm x 15 cm = £1.92, 20 cm x 20 cm = £4.34 (MedLogic)
- **Allevyn Plus Adhesive**, 12.5 cm x 12.5 cm = £3.08; 17.5 cm x 17.5 cm = £5.93; 22.5 cm x 22.5 cm = £5.45; (sacral) 17 cm x 17 cm = £4.48, 22 cm x 22 cm = £6.49 (S&N Hlth.)
- **Biatain Adhesive**, 10 cm x 10 cm = £1.62; 12 cm x 12 cm = £2.38, 18 cm x 18 cm = £4.77, 20 cm x 20 cm = £7.06; 23 cm x 23 cm (sacral) = £4.08, 19 cm x 20 cm (heel) = £4.76, 17 cm diameter (contour) = £4.59 (Coloplast)
- **Copa Island**, 10 cm x 10 cm = £1.51, 15 cm x 15 cm = £2.84, 20 cm x 20 cm = £5.36 (Covidien)

**Appendix 8: Wound management**

**A8.1.2 Foam dressings**

- **Suprasorb A** (Synergy Healthcare)
  - Calcium alginate dressing, 5 cm x 5 cm = £1.10; cavity dressing, 2 g x 30 cm = £2.04
  - Uses: moderately to heavily exuding wounds

- **Tegaderm Alginate** (3M)
  - 5 cm x 5 cm = 76p, 10 cm x 10 cm = £1.61; cavity dressing, 2 g x 30 cm = £2.68
  - Uses: moderately to heavily exuding wounds

- **Tielle Packing** (J&J)
  - Tielle Packing, 9.5 cm x 9.5 cm = £2.08

- **Urgosorb** (Urgo)
  - Alginate containing hydrocolloid dressing without adhesive border, 5 cm x 5 cm = 81p, 10 cm x 10 cm = £1.93, 10 cm x 20 cm = £3.55; cavity dressing, 30 cm = £2.58
  - Uses: moderately to heavily exuding wounds

- **Urgosorb Silver** (Urgo)
  - Alginate containing hydrocolloid dressing, impregnated with silver, 5 cm x 5 cm = £1.42, 10 cm x 10 cm = £3.39, 10 cm x 20 cm = £6.39; cavity dressing, 2.5 cm x 10 cm = £3.41
  - Uses: antifungal dressing for heavily exuding wounds

- **Algivon** (Advancis)
  - Absorbent, non-adherent calcium alginate dressing impregnated with medical grade manuka honey, 5 cm x 5 cm = £2.09, 10 cm x 10 cm = £3.53
  - Uses: lightly to heavily exuding wounds; use with suitable secondary dressing

- **Medihoney** (Medihoney)
  - Gel sheet, sodium alginate dressing impregnated with medical grade honey, 5 cm x 5 cm = £1.75, 10 cm x 10 cm = £4.20
  - Uses: lightly to moderately exuding wounds

**Cavi-Care** (S&N Hlth.)

Soft, conforming cavity wound dressing prepared by mixing thoroughly for 15 seconds immediately before use and allowing to expand its volume within the cavity. 20 g = £18.12

**Silver-containing foam film dressings**

**Acticoat Moisture Control** (S&N Hlth.)

Three layer polyurethane dressing consisting of a silver coated layer, a foam layer, and a waterproof layer, 5 cm × 5 cm = £8.58, 10 cm × 10 cm = £15.39, 15 cm × 20 cm = £29.99

**Uses** antimicrobial dressing for lightly to moderately exuding wounds

**Allevyn Ag** (S&N Hlth.)

Silver sulfadiazine impregnated polyurethane foam film dressing with adhesive border, 7.5 cm × 7.5 cm = £3.15, 10 cm × 10 cm = £4.96, 12.5 cm × 12.5 cm = £6.25, 17.5 cm × 17.5 cm = £12.54, 17 cm × 17 cm (sacral) = £9.79, 22 cm × 22 cm (sacral) = £13.12; without adhesive border, 5 cm × 5 cm = £2.94, 10 cm × 10 cm = £5.54, 15 cm × 15 cm = £10.50, 20 cm × 20 cm = £15.38, 10.5 cm × 13.5 cm (heel) = £9.90

**Uses** antimicrobial dressing for moderately to heavily exuding wounds

**Avance** (Medlock)

Silver impregnated polyurethane foam dressing, without adhesive border, 10 cm × 10 cm = £2.75, 15 cm × 17.5 cm = £4.38, 15 cm × 20 cm = £6.05; with adhesive border, 9 cm × 9 cm = £2.31, 12 cm × 12 cm = £3.83, 15 cm × 15 cm = £4.69, 16.5 cm × 13 cm (sacral) = £4.45

**Uses** antimicrobial dressing for lightly to moderately exuding wounds

**Blatiain Ag** (Coloplast)

(S formerly Contrexx Foam) Silver impregnated polyurethane foam dressing with adhesive border, 12.5 cm × 12.5 cm = £8.55, 18 cm × 18 cm = £17.14, 19 cm × 20 cm (heel) = £16.91, 23 cm × 23 cm (sacral) = £17.97; without adhesive border, 10 cm × 10 cm = £7.47, 5 cm × 7 cm = £3.07, 10 cm × 20 cm = £13.73, 15 cm × 15 cm = £15.00, 20 cm × 20 cm = £21.15, cavity dressing 5 cm × 8 cm = £3.72

**Uses** antimicrobial dressing for moderately to heavily exuding wounds

**PolyMem** (Unomedical)

Silver impregnated polyurethane foam film dressing, with adhesive border, 5 cm × 7.6 cm (oval) = £2.15, 12.7 cm × 8.8 cm (oval) = £5.30; without adhesive border, 10.8 cm × 10.8 cm = £8.20, 17 cm × 19 cm = £16.80

**Uses** antimicrobial dressing for moderately to heavily exuding wounds

**Vacuum assisted closure products**

**Exsu-Fast** (Synergy Healthcare)

**Dressing kit**, Kit 1 (small wound, low exudate) = £28.04; Kit 2 (large wound, heavy exudate) = £35.83; Kit 3 (large wound, medium to low exudate) = £25.83; Kit 4 (small wound, heavy exudate) = £28.04

**V.A.C. Granufoam** (KCI Medical)

**Dressing kit**, polyurethane foam dressing (with adhesive drapes and pad connector), 10 cm × 7.5 cm × 3.3 cm (small) = £21.41, 18 cm × 12.5 cm × 3.3 cm (medium) = £25.49, 26 cm × 15 cm × 3.3 cm (large) = £29.57

**Venturi** (Talley)

**Wound sealing kit**, flat drain, standard = £15.00, large = £17.50; channel drain = £15.00

**VISTA** (S&N Hlth.)

**Dressing kit**, flat drain, small = £16.52, medium = £20.70, large = £26.28; round drain, small = £16.52, large = £26.28; channel drain, medium = £20.70

**WoundASSIST** (Huntleigh)

**Wound pack**, small-medium = £20.50, medium-large = £23.50
Appendix 8: Wound management

**Wound drainage collection devices**
- **V.A.C Freedom** , canister (with gel), 300 mL = £26.51 (KCI Medical)
- **Venturi** , canister kit (with solidifier) = £12.50 (Tailley)
- **V1STA** , canister kit, 250 mL (with solidifier) = £18.63, 800 mL (with solidifier) = £20.70 (S&N Hlth.)
- **WoundASSIST** , canister, 500 mL = £20.00 (Huntleigh)

**A8.1.3 Hydrogel dressings**

Hydrogel dressings are most commonly supplied as an amorphous, cohesive material that can take up the shape of a wound. A secondary covering is needed. These dressings are generally used to donate liquid to dry sloughy wounds and facilitate autolytic debridement but they may also have the ability to absorb limited amounts of exudate. Hydrogel sheets are also available which have a fixed structure; such products have limited fluid handling capacity. Hydrogel sheets are best avoided in the presence of infection. Hydrogel products that do not contain propylene glycol should be used if the wound is to be treated with larval therapy.

- **ActiFormCool** (Activa)
  - Hydrogel dressing, 5 cm × 6.5 cm = £1.65, 10 cm × 10 cm = £2.43, 15 cm × 15 cm = £3.49
  - Uses: exuding or necrotic wounds; with compression bandaging for moderately to heavily exuding wounds

- **ActivHeal Hydrogel** (MedLogic)
  - Hydrogel containing guar gum and propylene glycol, 15 g = £1.36
  - Uses: dry or lightly exuding sloughy or necrotic wounds

- **Aquaform** (Unomedical)
  - Hydrogel containing modified starch copolymer, 8 g = £1.57, 15 g = £1.91
  - Uses: for dry, sloughy or necrotic wounds, lightly exuding wounds, granulating wounds

- **Aquaflo** (Coviden)
  - Hydrogel dressing, 7.5 cm diameter = £2.50, 12 cm = £5.16

- **Askin Gel** (Braun)
  - Hydrogel containing modified starch and glycerol, 15 g = £1.89
  - Uses: exuding, sloughy, or necrotic wounds

- **Citrugel** (Advancis)
  - Hydrogel containing polysaccharides, 15 g = £1.35
  - Uses: sloughy or necrotic wounds, lightly exuding wounds

- **Coolie** (Zeroderma)
  - Hydrogel dressing with lint backing, 7 cm diameter = £1.96
  - Uses: for sloughy or necrotic wounds, lightly exuding wounds, granulating wounds

- **Curageel** (Coviden)
  - Hydrogel dressing, without adhesive border, 5 cm × 7.5 cm = £1.74, 10 cm × 10 cm = £2.71; with adhesive border, 7.5 cm × 10 cm = £2.47, 12.5 cm × 12.5 cm = £3.58

- **Cutimed** (BSN Medical)
  - **Hydrogel**, 8 g = £1.56, 15 g = £1.90, 25 g = £2.80

- **Cutinova Hydro** (S&N Hlth.)
  - Polyurethane gel sheet with waterproof polyurethane film, 5 cm × 6 cm = £1.16, 10 cm × 10 cm = £2.33, 15 cm × 20 cm = £4.94
  - Uses: lightly to moderately exuding wounds

- **Flexigran** (A1 Pharmaceuticals)
  - Hydrogel containing starch polymer and glycerol, 15 g = £1.90

**Gel FX** (Synergy Healthcare)
- Hydrogel dressing (without adhesive border) 10 cm × 10 cm = £1.60, 10 cm × 15 cm = £2.20, 15 cm × 15 cm = £3.20

**Geliperm** (Geistlich)
- Hydrogel sheets, 10 cm × 10 cm = £2.27, 12 cm × 26 cm = £9.31
  - Uses: wound and ulcer dressing, burns, donor sites

**GranuGel** (ConvacTec)
- Hydrogel containing carboxymethylcellulose, pectin, and propylene glycol, 15 g = £2.13
  - Uses: dry, sloughy or necrotic wounds, lightly exuding wounds, granulating wounds

**Hydrosorb** (Hartmann)
- Absorbent, transparent, hydrogel sheets containing polyurethane polymers covered with a semi-permeable film
  - **Hydrosorb 5**, 5 cm × 7.5 cm = £1.43; 10 cm × 10 cm = £2.04; 20 cm × 20 cm = £6.12
  - **Hydrosorb comfort** (with adhesive border, waterproof), 4.5 cm × 6.5 cm = £1.69; 7.5 cm × 10 cm = £2.24; 12.5 cm × 12.5 cm = £3.26
  - Uses: second degree burns, donor sites; chronic wounds where granulation is unsatisfactory, including leg ulcers, pressure sores

**Intrasite Conformable** (S&N Hlth.)
- Soft non-woven dressing impregnated with Intrasite gel, 10 cm × 10 cm = £1.66; 10 cm × 20 cm = £2.23; 10 cm × 40 cm = £3.99
  - Uses: for dry, sloughy or necrotic wounds, lightly exuding wounds; granulating wounds

**Intrasite Gel** (S&N Hlth.)
- Hydrogel containing modified carmelllose polymer and propylene glycol, 8-g sachet = £1.66, 15-g sachet = £2.25, 25-g sachet = £3.29
  - Uses: for dry, sloughy or necrotic wounds, lightly exuding wounds; granulating wounds

**Mesitran** (Unomedical)
- Absorbent, semi-permeable dressings impregnated with medical grade honey, 10 cm × 10 cm = £2.51, 10 cm × 15 cm = £4.52, 15 cm × 15 cm = £5.22; with adhesive border, 10 cm × 10 cm = £2.61, 15 cm × 13 cm (sacral) = £4.42, 15 cm × 15 cm = £4.62
  - Uses: pressure ulcers, diabetic ulcers, fungating wounds, donor sites, surgical wounds, abrasions, and first and second degree burns

**Mesitran Mesh**
- Non-adherent wound contact layer, without adhesive border, 10 cm × 10 cm = £2.41
  - Uses: pressure ulcers, diabetic ulcers, donor sites, abrasions, trauma wounds, post-operative wounds, and first and second degree burns

**Novogel** (Ford)
- Glycerol hydrogel sheets, 10 × 10 cm = £3.01; 30 cm × 30 cm, standard = £12.74, thin = £12.03, 5 cm × 7.5 cm = £1.91; 10 cm × 20 cm = £5.74; 20 cm × 40 cm = £10.94; 7.5 cm diameter = £2.73
  - Uses: diabetic wounds, burns, leg ulcers, decubitus ulcers, donor sites

**Nu-Gel** (IBI)
- Hydrogel containing alginates and propylene glycol, 15 g = £2.05
  - Uses: dry, sloughy or necrotic, lightly exuding or granulating wounds

**Prontosan Wound Gel** (Braun)
- Hydrogel containing betaine surfactant and polyhexanide, 30 mL = £5.97

**Purilon Gel** (Coloplast)
- Hydrogel containing carboxymethylcellulose and calcium alginate, 8 g = £1.61, 15 g = £2.10
  - Uses: for dry, sloughy or necrotic wounds, lightly exuding wounds; granulating wounds

**Suprasorb G** (Synergy Healthcare)
- Hydrogel dressing containing carboxymethylcellulose and propylene glycol (without adhesive border) 5 cm × 7.5 cm = £1.73, 10 cm × 10 cm = £2.22, 20 cm × 20 cm = £6.71; (amorphous gel) 6 g = £1.10, 20 g = £1.80
Appendix 8: Wound management

A8.1.4 Hydrocolloid dressings

**Vacuette** (Proex)
Non-adherent, hydrogel coated polyester net dressing, 10 cm × 10 cm = £1.93, 10 cm × 15 cm = £2.86
*Uses* lacerations, abrasions, pressure ulcers, burns, surgical and malignant wounds.

**With iodine**

**Iodoflex** (S&N Hlth.)
*Paste*, iodine 0.9% as cadexomer–iodine in a paste basis with gauze backing, 5-g unit = £7.46; 17 g = £11.81
*Uses* for treatment of chronic exuding wounds, such as leg ulcers, apply to wound surface, remove gauze backing and cover; renew when saturated (usually 2–3 times weekly, daily for heavily exuding wounds); max. single application 50 g, max. weekly application 150 g; max. duration up to 3 months in any single course of treatment
*Cautions* iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder
*Contra-indications* children; pregnancy and breast-feeding

**Iodosorb** (S&N Hlth.)
*Ointment*, iodine 0.9% as cadexomer–iodine in an ointment basis, 10 g = £4.04; 20 g = £8.24
*Powder*, iodine 0.9% as cadexomer–iodine microbeads, 3-g sachet = £1.76
*Uses* for treatment of chronic exuding wounds, such as leg ulcers, apply to wound surface to depth of approx. 3 mm and cover; renew when saturated (usually 2–3 times weekly, daily for heavily exuding wounds); max. single application 50 g, max. weekly application 150 g, max. duration up to 3 months in any single course of treatment
*Cautions* iodine may be absorbed, particularly from large wounds or during prolonged use; severe renal impairment; history of thyroid disorder
*Contra-indications* children; patients receiving lithium, thyroid disorders; pregnancy and breast-feeding

**Iodozyme** (Insense)
*Hydrogel* (two-component dressing containing glucose oxidase and iodide ions), 10 cm × 10 cm = £12.50
*Uses* antimicrobial dressing for lightly to moderately exuding wounds
*Contra-indications* children; pregnancy and breast-feeding

**Oxyzyme** (Insense)
*Hydrogel* (two-component dressing containing glucose oxidase and iodide ions), 10 cm × 10 cm = £10.00
*Uses* non-infected, dry to moderately exuding wounds
*Cautions* children; pregnancy and breast-feeding

**Protease modulating matrix**
Protease modulating matrix dressings alter the activity of proteolytic enzymes in chronic wounds; the clinical significance of this approach is yet to be demonstrated.

**Cadesorb** (S&N Hlth.)
*Ointment*, starch-based, 10 g = £4.96, 20 g = £8.46
*Uses* chronic wounds free of necrotic tissue and infection

**Promogran** (J&J)
Collagen and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm (hexagonal) = £5.09, 123 cm (hexagonal) = £15.32
*Uses* chronic wounds free of necrotic tissue and infection

**Promogran Prisma Matrix** (J&J)
Collagen, silver and oxidised regenerated cellulose matrix, applied directly to wound and covered with suitable dressing, 28 cm (hexagonal) = £6.19, 123 cm (hexagonal) = £17.63
*Uses* chronic wounds free of necrotic tissue

**Sorbin S** (H&R)
Absorbent polymers in cellulose matrix, hypoallergenic fleece envelope, 7.5 cm × 7.5 cm = £1.74, 10 cm × 10 cm = £2.20, 20 cm × 20 cm = £6.85, 20 cm × 10 cm = £3.63, 30 cm × 10 cm = £5.25, 30 cm × 20 cm = £9.85, 12 cm × 5 cm = £1.85
*Uses* moderately to heavily exuding chronic wounds

**Suprasorb C** (Synergy Healthcare)
Collagen, 4 cm × 6 cm = £2.55, 6 cm × 8 cm = £3.90, 8 cm × 12 cm = £7.65
*Uses* lightly to moderately exuding chronic uninfected wounds

**Tegaderm Matrix** (3M)
Cellulose acetate matrix, impregnated with polyhydrated ionogens ointment in polyethylene glycol basis, 5 cm × 6 cm = £4.75, 8 cm × 10 cm = £9.75
*Uses* chronic uninfected wounds

---

**A8.1.4 Hydrocolloid dressings**

Hydrocolloid dressings are usually presented as a hydrocolloid layer on a vapour-permeable film or foam. Because of their impermeable nature, hydrocolloid dressings facilitate rehydration and autolytic debridement of dry, sloughy, or necrotic wounds; they are also suitable for promoting granulation. Fibrous dressings made from modified carmellose fibres resemble alginate dressings (e.g. *Aquace®*, *Aquacell®*); these are not occlusive.

Dressings containing *silver* should be used when infection is suspected as a result of clinical signs or symptoms, or when infection has been confirmed by microbiological investigation.

**ActivHeal**

**Hydrocolloid** (MedLogic)
Semi-permeable polyurethane film backing, hydrocolloid wound contact layer, 5 cm × 7.5 cm = 75p, 10 cm × 10 cm = £1.52, 15 cm × 15 cm = £3.31, 15 cm × 18 cm (sacral) = £3.84; with polyurethane foam layer, 5 cm × 7.5 cm = 94p, 10 cm × 10 cm = £1.49, 15 cm × 15 cm = £2.81, 15 cm × 18 cm (sacral) = £3.24
*Uses* lightly to moderately exuding wounds

**Aline** (Coloplast)
Semi-permeable hydrocolloid dressing with adhesive border, 10 cm × 10 cm = £2.96, 12.5 cm × 12.5 cm = £4.07, 12 cm × 20 cm = £5.34, 15 cm × 15 cm = £5.14, 20 cm × 20 cm = £7.68; without adhesive border 10 cm × 10 cm = £2.96, 12.5 cm × 12.5 cm = £4.07, 12 cm × 20 cm = £5.34, 15 cm × 15 cm = £5.14, 20 cm × 20 cm = £7.68
*Uses* chronic and exuding wounds

**Aquadex** (Convatec)
Soft non-woven pad containing hydrocolloid fibres, 4 cm × 10 cm = £1.38, 4 cm × 20 cm = £2.04, 4 cm × 30 cm = £3.05, 5 cm × 5 cm = £1.07, 10 cm × 10 cm = £2.54, 15 cm × 15 cm = £4.78
*Uses* moderately to heavily exuding wounds

**Aquadex Ag** (silver impregnated), 4 cm × 10 cm = £2.65, 4 cm × 20 cm = £3.46, 4 cm × 30 cm = £5.17, 5 cm × 5 cm = £1.81, 10 cm × 10 cm = £4.32, 15 cm × 15 cm = £8.13, 20 cm × 30 cm = £20.17
*Uses* antimicrobial dressing for moderately to heavily exuding wounds

**Aquadex Ag Ribbon** (silver impregnated), 2 cm × 45 cm = £4.34
*Uses* antimicrobial dressing for moderately to heavily exuding cavity wounds

**Aquadex Ribbon** (silver impregnated), 2 cm × 45 cm = £2.59
*Uses* moderately to heavily exuding cavity wounds
Askina Biofilm Transparent (Braun)  
Semi-permeable, polyurethane film dressing with hydrocolloid adhesive, 10 cm × 10 cm = £1.02, 15 cm × 15 cm = £2.31, 20 cm × 20 cm = £3.02  
Biofilm S (Braun)  
Hydrocolloid dressing with polyurethane-polyester backing; also in powder form for direct application into wound, 10 cm × 10 cm = £1.65, 20 cm × 20 cm = £5.70  
Biofilm powder, 1 sachet = £1.82  
Comfeel Plus (ConvaTec)  
Hydrocolloid dressing with polyurethane-polyester backing; also in powder form for direct application into wound, 10 cm × 10 cm = £1.65, 20 cm × 20 cm = £5.70  
Comfeel powder, 1 sachet = £1.82  
Combiderm (Convatec)  
Semi-permeable, hydrocolloid dressing with carmellose sodium and colloid adhesive, 5 cm = £0.66, 10 cm = £1.27, 15 cm = £1.88, 20 cm = £2.49; without adhesive border (in powder form) 10 cm × 10 cm = £1.05, 15 cm × 15 cm = £2.36  
Uses lightly to moderately exuding wounds  
Hydrocolloid dressing with adhesive border and absorbent wound contact pad, 10 cm × 10 cm = £1.53, 14 cm × 14 cm = £2.13, 15 cm × 18 cm (triangular) = £3.66, 20 cm × 20 cm = £4.08, 20 cm × 23 cm (triangular) = £4.92  
Uses lightly to moderately exuding wounds  
Comfeel (Coloplast)  
Soft elastic, latex-free dressing consisting of carmellose sodium particles embedded in adhesive mass; smooth outer layer and polyurethane film backing; available as sheets, powder in plastic blister units and paste for direct application into the wound: ulcer dressing, 10 cm × 10 cm = £2.41, 15 cm × 15 cm = £4.83, 20 cm × 20 cm = £7.39; other sizes (\( \text{mm} \) × 6 cm × 6 cm = £1.19; powder 6 g = £4.04; paste 12-g sachet = £1.61; 50 g = £6.33  
Uses lightly to moderately exuding wounds  
Comfeel Plus (Coloplast)  
Hydrocolloid dressings containing carmellose sodium and calcium alginate. Contour dressing, 6 cm × 6 cm = £0.24, 9 cm × 11 cm = £3.54; Ulcer Dressing, 4 cm × 6 cm = £8.80, 10 cm × 10 cm = £2.25, 15 cm × 15 cm = £4.82, 16 cm × 20 cm (triangular) = £5.25, 20 cm × 20 cm = £8.94; Trans- 
parent Dressing, 5 cm × 7 cm = £1.61, 5 cm × 15 cm = £1.46, 5 cm × 25 cm = £2.37, 9 cm × 14 cm = £2.24, 9 cm × 25 cm = £3.18, 10 cm × 10 cm = £1.17, 15 cm × 15 cm = £3.06, 15 cm × 20 cm = £3.11, 17 cm × 17 cm (sacral) = £3.44, 20 cm × 20 cm = £3.15; Pressure Relieving Dressing:  
Diameter = £4.26, 15 cm × 15 cm = £6.62  
Uses light to moderately exuding wounds  
Comfeel Hydrocolloid (Coloplast)  
Semi-permeable, antimicrobial barrier dressing with ionic silver (silver sodium thiosulphate). 10 cm × 10 cm = £2.13, 15 cm × 15 cm = £3.12, 20 cm × 20 cm = £6.94; Concave dressing, 8 cm × 10 cm = £1.90, 12 cm × 12 cm (heel) = £3.12, 15 cm × 18 cm (sacral) = £4.37; without adhesive border, thin, 10 cm × 10 cm = £1.04  
Uses lightly to moderately exuding wounds  
Suprasorb H (Synergy Healthcare)  
Semi-permeable hydrocolloid dressing with adhesive border, 10 cm × 10 cm = £1.65, 15 cm × 15 cm = £3.30; without adhesive border, thin 5 cm × 10 cm = £1.15, 10 cm × 10 cm = £1.00, 20 cm × 20 cm = £7.53, 11 cm × 11 cm = £4.06  
Uses antimicrobial dressing for moderate to heavily exuding wounds  
Versiva (Convatec)  
Semi-permeable hydrocolloid dressing with hydrocolloid and alginate dressing impregnated with silver, 2.5 cm × 3.5 cm = £4.37, 5 cm × 5 cm = £1.64, 10 cm × 20 cm = £6.73; Sacral dressing, 15 cm × 18 cm = £4.32  
Uses lightly to moderately exuding wounds  
Silvercel (J&J)  
Hydrocolloid and alginate dressing impregnated with silver, 9 cm = £3.89, 14 cm = £2.24, 9 cm = £2.44, 11 cm = £2.25, 10 cm × 10 cm = £2.39, 15 cm × 15 cm = £4.42  
Uses chronic wounds such as leg ulcers and pressure sores  
Tegaderm Hydrocolloid Thin (3M)  
Hydrocolloid dressing with adhesive border, 10 cm × 12 cm (oval) = £2.42, 13 cm × 15 cm (oval) = £4.19, 17.1 cm × 16.1 cm (sacral) = £4.68; without adhesive border, 10 cm × 10 cm = £2.29, 15 cm × 15 cm = £4.42  
Uses chronic wounds such as leg ulcers and pressure sores  
Tegaderm Hydrocolloid Thin, semi-permeable, clear film dressing with hydrocolloid and adhesive border, 10 cm × 12 cm (oval) = £1.49, 13 cm × 15 cm (oval) = £2.79; without adhesive border, 10 cm × 10 cm = £1.50  
Uses lightly to moderately exuding wounds  
Ultec Pro (Covidien)  
Semi-permeable hydrocolloid dressing with adhesive border, 10 cm × 10 cm = £1.39, 14 cm × 14 cm = £2.24, 21 cm × 21 cm = £4.94, 15 cm × 10 cm (sacral) = £3.17, 19.5 cm × 23 cm (sacral) = £4.88; without adhesive border 10 cm × 20 cm = £2.19, 15 cm × 15 cm = £4.27, 20 cm × 20 cm = £6.43  
Uses lightly to moderately exuding wounds  
Versiva XC (Convatec)  
Semi-permeable hydrocolloid dressing with fibre layer and polyurethane foam backing with adhesive border, 9 cm × 9 cm = £2.44, 11 cm × 19 cm (oval) = £2.42, 14 cm × 14 cm = £4.55, 19 cm × 19 cm = £7.08, 19 cm × 24 cm = £8.56, 18 cm × 17.7 cm (oval) = £5.99, 21 cm × 25 cm (capsule) = £8.56, 19.5 cm × 18.5 cm (heel) = £7.27  
Uses chronic and acute exuding wounds  
Versiva, hydrocolloid gelling foam dressing, with adhesive border, 10 cm × 10 cm = £2.30, 14 cm × 14 cm = £3.10, 19 cm × 19 cm = £4.95, 22 cm × 22 cm = £5.50, 18.5 cm × 17.7 cm (oval) = £5.99; without adhesive border, 7.5 cm × 7.5 cm = £1.35, 11 cm × 11 cm = £2.25, 15 cm × 15 cm = £4.15, 20 cm × 20 cm = £6.20  
Uses lightly to moderately exuding wounds  
Hydrocolloid (Hartmann)  
Hydrocolloid dressing with adhesive border and absorbent wound contact pad, 5 cm × 5 cm = £0.92, 7.5 cm × 7.5 cm = £1.51, 10 cm × 10 cm = £2.20, 15 cm × 15 cm = £4.13; Concave dressing, 8 cm × 12 cm = £1.93; Sacral dressing, 12 cm × 18 cm = £3.29; Basic dressing without adhesive border, 10 cm × 10 cm = £2.23, Thin film dressing, 7.5 cm × 7.5 cm = £3.63, 10 cm × 10 cm = £1.01, 15 cm × 15 cm = £2.36  
Uses lightly to moderately exuding wounds  
Nu Derm (J&J)  
Semi-permeable hydrocolloid dressing without adhesive border, 5 cm = £0.63, 10 cm × 10 cm = £1.53, 15 cm × 15 cm = £3.12, 20 cm × 20 cm = £6.24, 8 cm × 12 cm (heel/ 
elbow) = £3.12, 15 cm × 18 cm (sacral) = £4.37; without adhesive border, thin, 10 cm × 10 cm = £1.04  
Replicare Ultra (S&N Hlth.)  
Adhesive hydrocolloid dressing with outer semi-permeable polyurethane film backing, 10 cm × 10 cm = £2.29, 15 cm × 15 cm = £4.56, 20 cm × 20 cm = £6.73; Sacral dressing, 15 cm × 18 cm = £4.32  
Uses lightly to moderately exuding wounds  
Bio-cellulose dressings  
Suprasorb X (Synergy Healthcare)  
Biosynthetic cellulose fibre dressing, 5 cm × 5 cm = £1.87, 9 cm × 9 cm = £3.89, 14 cm × 20 cm = £7.71, 2 cm × 21 cm (rape) = £5.99  
Uses lightly to moderately exuding wounds  
Appendix 8: Wound management
Appendix 8: Wound management

**Vapour-permeable films and membranes**

Vapour-permeable films and membranes allow the passage of water vapour and oxygen but not of water or micro-organisms, and are suitable for mildly exuding wounds. They are highly conformable, convenient to use, provide a moist healing environment, and some may permit constant observation of the wound. However, water vapour loss may occur at a slower rate than exudate is generated, so that fluid accumulates under the dressing, which can lead to tissue maceration and to wrinkling at the adhesive contact site (with risk of bacterial entry). Newer versions have increased moisture vapour permeability, some also contain water-soluble antimicrobials. Despite these advances vapour-permeable films and membranes remain less suitable for large heavily exuding wounds and are probably not suitable for chronic leg ulcers. They are most commonly used as secondary dressings over alginate or gel; they are also sometimes used to protect fragile skin of patients at risk of developing minor skin damage.

**Vapour-permeable Adhesive Film Dressing, BP 1993**
(Semi-permeable Adhesive Dressing)

Extendable, waterproof, water-vapour-permeable polyurethane film coated with synthetic adhesive mass; transparent. Supplied in single-use pieces.

**Advise! Conform** (Advancis)

Self-adhesive silicone gel sheet with polyurethane backing, 10 cm × 10 cm = £5.20, 10 cm × 15 cm = £9.17

**Cica-Care** (S&B Hith.)

Soft, self-adhesive, semi-occlusive silicone gel sheet with backing, 6 cm × 12 cm = £13.42; 15 cm × 12 cm = £26.16

**Clitech** (Su-Med)

Silicone gel sheet, 10 cm × 10 cm = £7.50, 15 cm × 15 cm = £14.00, 10 cm × 20 cm = £12.50

Silicone gel, 15 g = £17.50, 60 g = £50.00

**Dermatix**

(Decompression)

(ConvaTec)

Siligel (Mölnlycke)

Sage of water vapour and oxygen but not of water or insulation

**Advasil Conform** (Advancis)

Dermatix

Clitech

Ciltech

Cica-Care

Advasil Conform

(Advancis)

890 A8.1.5 Vapour-permeable films and membranes

BNF 57

Keloid dressings

Silicone gel and gel sheets are used to reduce or prevent hypertrophic and keloid scarring. They should not be used on open wounds. Application times should be increased gradually. Silicone sheets can be washed and reused.

**Hyaluronic acid**

**Hyalo-lift** (ConvaTec)

Hyalofill R, flat, non-woven, absorbent fibrous fleece of Hyaff (an ester of hyaluronic acid), 5 cm × 5 cm = £9.98, 10 cm × 10 cm = £27.68

**Hyalofill-F** (Mölnlycke)

Uses for treatment of chronic or acute wounds, place on surface inside cavity and cover with sterile dressing, renew daily or when saturated (at least every 2–3 days)

**Hyalofill-R** (Mölnlycke)

absorbent fibrous rope of Hyaff (an ester of hyaluronic acid), 500 mg = £27.68

**Uses** for treatment of chronic or acute wounds, position gently inside cavity and cover with sterile dressing, renew daily or when saturated (at least every 2–3 days)

**Hyaluronic acid**

**Hyalo-lift** (ConvaTec)

Hyalofill R, flat, non-woven, absorbent fibrous fleece of Hyaff (an ester of hyaluronic acid), 5 cm × 5 cm = £9.98, 10 cm × 10 cm = £27.68

**Uses** for treatment of chronic or acute wounds, place on surface of lesion and cover with sterile dressing, renew daily or when saturated (at least every 2–3 days)

**Hyalo-lift** (ConvaTec)

(ConvaTec)

Hyalofill R, flat, non-woven, absorbent fibrous fleece of Hyaff (an ester of hyaluronic acid), 5 cm × 5 cm = £9.98, 10 cm × 10 cm = £27.68

**Uses** for treatment of chronic or acute wounds, place on surface inside cavity and cover with sterile dressing, renew daily or when saturated (at least every 2–3 days)
Omiderm (Chemical Search)

Water-vapour permeable polyurethane film (plain and meshed versions). 5 cm × 7 cm = £2.00; 8 cm × 10 cm = £3.50, meshed = £4.75; 18 cm × 10 cm = £6.40, meshed = £9.50; 60 cm × 10 cm = £23.50; 21 cm × 31 cm = £24.00, meshed = £32.00; 23 cm × 39 cm = £48.75

Uses: ulcers; donor sites; superficial and partial thickness burns; meshed: donor sites, skin grafts

For intravenous and subcutaneous catheter sites

Central Gad (Unomedical)

16 cm × 7 cm (central venous catheter) = 92p, 16 cm × 8.8 cm (central venous catheter) = £1.01.

IV3000 (S&N Hlth.)

5 cm × 6 cm (1-hand) = 39p, 6 cm × 7 cm (non-winged peripheral catheter) = 51p, 7 cm × 9 cm (ported peripheral catheter) = 67p, 9 cm × 12 cm (PICC line) = £1.54, 10 cm × 12 cm (central venous catheter) = £1.28.

Mepore IV (Möllycse)

5 cm × 5.5 cm = 29p, 8 cm × 9 cm = 37p, 10 cm × 11 cm = 97p.

Niko Fix (Unomedical)

7 cm × 8.5 cm (intra-venous ported peripheral catheter) = 38p.

PharmaPre-PU IV (Wallace Cameron)

8.5 cm × 7 cm = 7p, 6 cm × 7 cm (ported peripheral cannula) = 8p, 7 cm × 9 cm (peripheral cannula, hand) = 17p.

Tegaderm IV (3M)

7 cm × 8.5 cm (peripheral catheter) = 57p, 8.5 cm × 10.5 cm (central venous catheter) = £1.11, 10 cm × 15.5 cm (peripherally inserted central venous catheter) = £1.60.

A8.1.6 Low adherence dressing and wound contact materials

Low adherence dressings and wound contact materials are used as interface layers under secondary absorbent dressings.

Tulle dressings are manufactured from cotton or viscose fibres which are impregnated with white or yellow soft paraffin to prevent the fibres from sticking, but this is only partly successful and it may be necessary to change the dressings frequently. The paraffin reduces the problems of adherence but they are suitable for heavily exuding wounds; they are not appropriate for leg ulcers or for other lesions that produce large quantities of viscous exudate.

Absorbent dressings should be used when infection is suspected as a result of clinical signs or symptoms, or when infection has been confirmed by microbiological investigation.

Absorbent Cellulose Dressing with Fluid Repellent Backing

Eclipse, 15 cm × 15 cm = £1.52; 20 cm × 30 cm = £2.14; 60 cm × 30 cm = £8.15; Eclipse Adherent with silicone wound contact layer, 10 cm × 10 cm = £2.99; 10 cm × 20 cm = £3.75, 15 cm × 15 cm = £4.99; 20 cm × 30 cm = £9.99 (Advancis)

Uses: primary or secondary dressing for medium to heavily exuding wounds.

Exu-Dry, 10 cm × 15 cm = £1.03, 15 cm × 23 cm = £2.11, 23 cm × 38 cm = £4.90 (S&N Hlth.)

Uses: primary or secondary dressing for medium to heavily exuding wounds.

Mesorol cellulose wadding pad with gauze wound contact layer and non-woven repellent backing, 10 cm × 10 cm = 58p, 10 cm × 15 cm = 75p, 10 cm × 20 cm = 93p, 15 cm × 20 cm = £1.32. 15 cm × 25 cm = £2.08, 20 cm × 30 cm = £2.36 (Möllycse)

Uses: post-operative use for heavily exuding wounds.

Telfa Max, 15 cm × 22.8 cm = £1.96, 22.8 cm × 38 cm = £4.53, 38 cm × 45.7 cm = £5.50, 38 cm × 60.9 cm = £8.00 (Covidien)

Uses: primary or secondary dressing for medium to heavily exuding wounds.

Zetuvit, non-sterile, 10 cm × 10 cm = 6p, 10 cm × 20 cm = 8p, 20 cm × 20 cm = 13p, 20 cm × 40 cm = 25p; sterile, 10 cm × 10 cm = £1.19, 10 cm × 20 cm = 22p, 20 cm × 20 cm = 35p, 20 cm × 40 cm = 98p (Hartmann)

Uses: primary or secondary dressing for medium to heavily exuding wounds.

Absorbent Perforated Dressing with Adhesive Border

Low adherence dressing consisting of viscose and rayon absorbent pad with adhesive border.

Cosmopore E, 5 cm × 7.2 cm = 7p, 6 cm × 10 cm = 14p, 8 cm × 10 cm = 16p, 6 cm × 15 cm = 18p, 8 cm × 15 cm = 25p, 8 cm × 20 cm = 34p, 10 cm × 20 cm = 41p, 10 cm × 25 cm = 59p, 10 cm × 35 cm = 71p (Hartmann)

Medipore + Pad, 5 cm × 7.2 cm = 7p, 10 cm × 10 cm = 15p, 10 cm × 15 cm = 24p, 10 cm × 20 cm = 36p, 10 cm × 25 cm = 45p, 10 cm × 35 cm = 62p (3M)

Medisafe, 6 cm × 8 cm = 8p, 8 cm × 10 cm = 13p, 8 cm × 12 cm = 23p, 9 cm × 15 cm = 29p, 9 cm × 20 cm = 34p, 9 cm × 25 cm = 36p (Neomeric)

Mepore, 7 cm × 8 cm = 10p, 10 cm × 11 cm = 20p, 11 cm × 15 cm = 34p, 9 cm × 20 cm = 41p, 9 cm × 25 cm = 57p, 9 cm × 30 cm = 65p, 9 cm × 35 cm = 71p (Möllycse)

Primapore, 6 cm × 8.3 cm = 16p, 8 cm × 10 cm = 18p, 8 cm × 15 cm = 30p, 10 cm × 20 cm = 40p, 10 cm × 25 cm = 46p, 10 cm × 30 cm = 57p, 10 cm × 35 cm = 85p (S&N Hlth.)

Softpore, 6 cm × 7 cm = 6p, 10 cm × 10 cm = 13p, 10 cm × 15 cm = 20p, 10 cm × 20 cm = 35p, 10 cm × 25 cm = 40p, 10 cm × 30 cm = 59p, 10 cm × 35 cm = 85p (Richardson)

Sterifix, 5 cm × 7 cm = 16p, 7 cm × 10 cm = 30p, 10 cm × 14 cm = 53p (Hartmann)

Telfa Island, 5 cm × 10 cm = 8p, 10 cm × 12.5 cm = 26p, 10 cm × 20 cm = 34p, 10 cm × 25 cm = 45p, 10 cm × 35 cm = 60p; Telfa AMD Island (with polyhexamethylene biguanide—antimicrobial), 10 cm × 12.5 cm = 57p, 10 cm × 20 cm = 83p, 10 cm × 25 cm = 94p, 10 cm × 35 cm = £1.17 (Covidien)

Uses: lightly exuding and post-operative wounds.
Appendix 8: Wound management

Absorbent Perforated Plastic Film Faced Dressing

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10%, 5 cm × 5 cm = 32p, 9.5 cm × 9.5 cm = 62p (J&J)

Uses wound contact layer for abrasions and superficial burns

Contraindications iodoine may be absorbed particularly if large wounds treated, children under 6 months, thyroid disease

Para-indications severe renal impairment, pregnancy, breastfeeding

Acticoat (S&N Hlth.)

Three layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver coated high density polyethylene mesh, 5 cm × 5 cm = £3.22, 10 cm × 10 cm = £7.85, 10 cm × 20 cm = £12.28, 20 cm × 40 cm = £42.01

Acticoat 7 five layer antimicrobial barrier dressing consisting of a polyester core between low adherent silver coated high density polyethylene mesh, 5 cm × 5 cm = £5.59, 10 cm × 12.5 cm = £16.65, 15 cm × 15 cm = £29.93

Uses pressure ulcers, venous ulcers, diabetic ulcers, burns, donor and recipient graft sites; with silver, antimicrobial dressing for exuding wounds

Allevyn Gentle (S&N Hlth.)

Soft gel wound contact dressing, with polyurethane foam film backing, 5 cm × 5 cm = £1.21, 10 cm × 10 cm = £2.38, 10 cm × 20 cm = £3.83, 15 cm × 15 cm = £4.31, 20 cm × 20 cm = £6.39

Allevyn Gentle Border, silicone gel wound contact dressing, with polyurethane foam film backing, 7.5 cm × 7.5 cm = £1.40, 10 cm × 10 cm = £2.39, 12.5 cm × 12.5 cm = £3.08, 17.5 cm × 17.5 cm = £5.99

Atrauman (Hartmann)

Non-adherent knitted polyester primary dressing impregnated with neutral triglycerides, 5 cm × 5 cm = 26p, 7.5 cm × 10 cm = 25p, 10 cm × 20 cm = 57p, 20 cm × 30 cm = £1.57

Uses abrasions, burns, and other injuries of skin, and ulcerative conditions; postoperatively for granulating wounds

Atrauman Ag, non-adherent polyamide fabric impregnated with silver and neutral triglycerides, 5 cm × 5 cm = 47p, 7 cm × 7 cm = £1.14, 10 cm × 20 cm = £2.23

Uses antimicrobial dressing for burns, acute or chronic wounds, donor graft sites, diabetic ulcers

Cutimed Sorbact (BSN Medical)

Low adherence acetate tissue impregnated with dialkylcarbamoyl chloride, (dressing pad) 7 cm × 9 cm = £3.70, 20 cm × 20 cm = £7.80; (swabs) 4 cm × 6 cm = £1.50, 7 cm × 9 cm = £2.50, (round swabs) 3 cm, 5 pad pack = £3.00; (cavity dressing, cotton) 2 cm × 5 cm = £5.74, 3 cm × 200 cm = £7.37

Use wound contact dressing with polyurethane foam film backing, 7.5 cm × 7.5 cm = £1.19, 10 cm × 10 cm = £2.16, 10 cm × 20 cm = £2.90, 10 cm × 30 cm = £4.25, 15 cm × 15 cm = £3.15, 15 cm × 20 cm = £4.10

KerraMax (Ark Therapeutics)

Super absorbent polyacrylate primary dressing, 10 cm × 22 cm = £1.02, 20 cm × 22 cm = £1.80

Uses moderate to heavily exuding wounds

Mepilex (Mölnlycke)

Absorbent soft silicone dressing with polyurethane foam film backing, 10 cm × 11 cm = £2.53, 11 cm × 20 cm = £4.16, 15 cm × 20 cm = £4.59, 20 cm × 21 cm = £6.93, 20 cm × 50 cm = £27.24

Mepilex Border, with soft silicone adhesive border, 7 cm × 7.5 cm = £1.31, 10 cm × 12.5 cm = £2.59, 10 cm × 20 cm = £3.47, 10 cm × 30 cm = £5.21, 15 cm × 17.5 cm = £4.46, 17 cm × 20 cm = £5.78

Mepilex Border Lite, thin absorbent soft silicone dressing with adhesive border, 4 cm × 5 cm = £8.66, 7.5 cm × 7.5 cm = £1.33, 10 cm × 20 cm = £1.92, 10 cm × 10 cm = £2.42, 15 cm × 15 cm = £3.95

Mepilex Border Sacrum, soft silicone dressing with adhesive border, 18 cm × 18 cm = £4.56, 23 cm × 23 cm = £7.44

Mepilex Heel, soft silicone adhesive dressing, 13 cm × 20 cm = £5.15

Mepilex Lite, thin absorbent soft silicone dressing, 6 cm × 8.5 cm = £1.69, 10 cm × 10 cm = £2.02, 15 cm × 15 cm = £3.92, 20 cm × 50 cm = £24.77

Mepilex Transfer, soft silicone exudate transfer dressing, 7.5 cm × 8.5 cm = £2.10, 10 cm × 12 cm = £3.30, 15 cm × 20 cm = £9.89, 20 cm × 50 cm = £25.27

Mepilex Ag, soft silicone wound contact dressing with polyurethane foam film backing, with silver, 10 cm × 10 cm = £5.80, 10 cm × 20 cm = £9.57, 15 cm × 15 cm = £10.77, 20 cm × 20 cm = £15.96

Chlorhexidine Gauze Dressing, BP 1993

Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with povidone–iodine ointment 10%, 5 cm × 5 cm = £1.78, 10 cm × 10 cm = £3.01 (Advancis)

Uses leg ulcers, pressure sores

Actilite (B&G), impregnated with medical grade manuka honey 10% (normal loading); S&N Hlth.—Paratex, soft silicone adhesive dressing, 13 cm × 20 cm = £5.15

Uses moderate to heavily exuding wounds

Cutisorb LA, 5 cm × 5 cm = 8p, 10 cm × 10 cm = 14p, 10 cm × 20 cm = 29p (BSN Medical)

Interpose, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 15p, 10 cm × 20 cm = 32p (Frontier)

Melolin, 5 cm × 5 cm = 16p, 10 cm × 10 cm = 25p, 20 cm × 10 cm = 49p (S&N Hlth.)

Release, 5 cm × 5 cm = 14p, 10 cm × 10 cm = 23p, 20 cm × 10 cm = 43p (J&J)

Skinfact, 5 cm × 5 cm = 10p, 10 cm × 10 cm = 17p, 20 cm × 10 cm = 34p (Robinson)

Solvaline N, 5 cm × 5 cm = 9p, 10 cm × 10 cm = 16p, 20 cm × 10 cm = 32p (Synergy Healthcare)

Paragauze, yellow soft paraffin, 10 cm × 10 cm = £3.22, 10 cm × 20 cm = £3.47, 10 cm × 30 cm = £5.00

Uses leg ulcers, pressure sores, and other granulating wounds with superimposed absorbent pad

Antiseptic/infectious

Melolin, 5 cm × 5 cm = £3.22, 10 cm × 10 cm = £5.00

Uses severe renal impairment; pregnancy; breast-feeding

Paraffin Gauze Dressing, BP 1993

(Tulle Gras). Fabric of leno weave, weft and warp threads of cotton and/or viscose yarn, impregnated with white or yellow soft paraffin, 10 cm × 10 cm, (light loading) = 25p; (normal loading) = 37p (most suppliers including Synergy Healthcare—Paragon; BSN Medical—Cuticell Classic (normal loading); S&N Hlth.—Jelonet (normal loading); Neomedic—Netullle (normal loading); C D Medical—Paragauze (normal loading))

Povidone–iodine Fabric Dressing

(Drug Tariff specification 43). Knitted viscose primary dressing impregnated with povidone–iodine ointment 10%, 5 cm × 5 cm = 32p, 9.5 cm × 9.5 cm = 47p (J&J—Intodine )

Uses wound contact layer for abrasions and superficial burns

Contraindications iodoine may be absorbed particularly if large wounds treated, children under 6 months, thyroid disease

Uses wound contact dressing of low adherent dressing and wound contact materials BNF 57

Appendix 8: Wound management

892 A8.1.6 Low adherence dressing and wound contact materials BNF 57
Mepitel (Mölnlycke)
Soft silicone wound contact dressing, 5 cm × 7 cm = £1.52, 8 cm × 10 cm = £3.05, 12 cm × 15 cm = £6.17, 20 cm × 30 cm = £16.61
Uses leg ulcers, decubitus ulcers, burns, fixation of skin grafts; should be covered with simple absorbent secondary dressing

Physiostulle (Coloplast)
Non-adherent soft polyurethane wound contact dressing, 10 cm × 10 cm = £2.09, 15 cm × 20 cm = £6.37
Uses leg ulcers, pressure sores, burns, postoperative wounds, donor sites, skin abrasions

Physiostulle Ag (Coloplast)
Non-adherent polyester fabric with hydrocolloid and silver sulphadiazine, 10 cm × 10 cm = £2.10
Uses antimicrobial dressing for leg ulcers, diabetic ulcers, pressure sores, burns, postoperative wounds, donor sites, skin abrasions

Proguide (S&N Hith.)
Non-adherent polyurethane wound contact layer, 10 cm × 10 cm = £2.00

Silon-TSR (Job skin)
Soft silicone wound polymer wound contact dressing, 13 cm × 13 cm = £3.52, 13 cm × 25 cm = £5.47, 28 cm × 30 cm = £7.37
Uses non-exuding to heavily exuding wounds; use suitable secondary dressing

Siltex (Advancis)
Soft silicone-coated polyurethane wound contact dressing, 5 cm × 7 cm = £1.25, 8 cm × 10 cm = £2.55, 12 cm × 15 cm = £5.15, 20 cm × 30 cm = £13.25
Uses non-exuding to heavily exuding wounds; use suitable secondary dressing

SURGIPAD (3M)
Except in Sterile Dressing Pack with Non-woven Pads

Tegaderm Contact (3M)
Non-adherent soft polyurethane wound contact dressing, 7.5 cm × 10 cm = £2.13, 7.5 cm × 20 cm = £4.17, 20 cm × 25 cm = £10.16

UrgoCell (Urgo)
Non-adherent soft polyurethane wound contact dressing with polyurethane foam film backing, 10 cm × 12 cm = £4.44, 15 cm × 20 cm = £9.00; with adhesive border 13 cm × 13 cm = £4.44, 15 cm × 20 cm = £9.00; with silver, 6 cm × 6 cm = £4.00, 10 cm × 10 cm = £5.50, 15 cm × 20 cm = £9.90
Uses moderately to heavily exuding wounds; with silver, antimicrobial dressing for moderately to heavily exuding wounds

UrgoCell Start (Urgo), soft polymer wound contact dressing with polyurethane foam backing, 6 cm × 6 cm = £4.30, 10 cm × 10 cm = £9.95, 15 cm × 20 cm = £10.70

Urgotul (Urgo)
Non-adherent soft polyurethane wound contact dressing, 11 cm × 11 cm = £2.98, 10 cm × 40 cm = £9.69, 16 cm × 21 cm = £8.43; with silver, 10 cm × 12 cm = £3.52, 15 cm × 20 cm = £9.03
Uses dry or lightly exuding wounds; with silver, antimicrobial dressing for dry or lightly exuding wounds

Urgotul Duo, non-adherent, soft polymer wound contact dressing, 5 cm × 10 cm = £2.39, 10 cm × 12 cm = £3.54, 15 cm × 20 cm = £8.22; with silver, 5 cm × 7 cm = £1.94, 11 cm × 11 cm = £3.85, 15 cm × 20 cm = £9.28
Uses dry or lightly exuding wounds; with silver, antimicrobial dressing for dry or lightly exuding wounds

Urgotul Duo Border, soft polymer wound contact dressing with absorbent pad and adhesive polyurethane film backing, 8 cm × 8 cm = £2.24, 10 cm × 12 cm = £3.47, 15 cm × 20 cm = £8.05

Urgotul 500, with silver sulphadiazine, 11 cm × 11 cm = £2.95, 16 cm × 21 cm = £8.35
Uses antimicrobial dressing for dry or lightly exuding wounds

A8.1.7 Odour absorbent dressings

Dressings containing activated charcoal are used to absorb odour from wounds. Wound odour is most effectively reduced by debridement of slough, reduction in bacterial levels, and frequent dressing changes.

Actisorb Silver 220 (J&J)
Knitted fabric of activated charcoal, with one-way stretch, with antimicrobial silver, within spun-bonded nylon sleeve. 6.5 cm × 9.5 cm = £1.61, 10.5 cm × 10.5 cm = £2.53, 15.5 cm × 19 cm = £4.60

Askina Carbosorb (Braun)
Activated charcoal absorbent dressing, 10 cm × 10 cm = £2.72, 10 cm × 20 cm = £5.25

CarboFLEX (Convatec)
Dressing in 5 layers: wound-facing absorbent layer containing alginate and hydrocolloid; water-resistant second layer; third layer containing activated charcoal; non-woven absorbent fourth layer; water-resistant backing layer. 10 cm × 10 cm = £2.95, 8 cm × 15 cm = £3.55, 15 cm × 20 cm = £6.72

Carbonet (S&N Hith.)
Activated charcoal dressing, 10 cm × 10 cm = £3.13, 10 cm × 20 cm = £6.10

Carbopad VC (Synergy Healthcare)
Activated charcoal non-absorbent dressing, 10 cm × 10 cm = £1.59, 10 cm × 20 cm = £2.15

CliniSorb Odour Control Dressings (CliniMed)
Layer of activated charcoal cloth between viscose rayon with outer polyamide coating. 10 cm × 10 cm = £1.75, 10 cm × 20 cm = £2.33, 15 cm × 25 cm = £3.75

Lyfoam C (Medipal)
Lyfoam sheet with layer of activated charcoal cloth and additional outer envelope of polyurethane foam. 10 cm × 10 cm = £2.85, 15 cm × 20 cm = £6.47

Sorbpan Plus Carbon (Unomedical)
Alginite dressing with activated carbon, 7.5 cm × 10 cm = £2.42, 10 cm × 10 cm = £4.70, 10 cm × 20 cm = £5.62, 15 cm × 20 cm = £6.47

A8.1.8 Dressing packs

The role of dressing packs is very limited. They are used to provide a clean or sterile working surface; packs shown below include cotton wool balls, but they are not recommended for use on wounds.

Non-Drug Tariff Specification Sterile Dressing Pack
Dressit contains vilutex gloves, large apron, disposable bag, paper towel, softswabs, absorbent pad, sterile field = 60p (Richardson)

Polyfield Nitrile Patient Pack contains powder-free nitrile gloves, laminate sheet, non-woven swabs, towel, polythene disposable bag, apron = 52p (Shermond)

Polyfield Soft Vinyl Patient Pack contains powder-free soft vinyl gloves, polythene sheet, non-woven swabs, towel, polythene disposable bag, apron = 52p (Shermond)

Propax SDP contains paper towel, disposable bag, gauze swabs, dressing pad, sterile field = 45p (BSN Medical)

Sterile Dressing Pack
(Drug Tariff specification 10). Contains gauze and cotton tissue pads, gauze swabs, absorbent cotton wool balls, absorbent paper towel, water repellent inner wrapper. 1 pack = 49p (Synergy Healthcare—Vernad )
Appendix 8: Wound management

**A8.1.9 Surgical absorbents**

Surgical absorbents, applied directly to the wound, have many disadvantages, since they adhere to the wound, shed fibres into it, and dehydrate it; they also permit leakage of exudate (‘strike through’) with an associated risk of infection. Surgical absorbents may be used as secondary absorbent layers in the management of heavily exuding wounds.

**Absorbent Cotton, BP**

Carded cotton fibres of not less than 10 mm average staple length, available in rolls and balls, 2.5 g = 69p; 100 g = £1.58; 500 g = £5.31. 25-g pack to be supplied when weight not stated. Uses general purpose cleansing and swabbing, pre-operative skin preparation, application of medications; supplementary absorbent pad to absorb excess wound exudate.

**Absorbent Cotton Gauze, BP 1988**

Cotton fabric of plain weave, in rolls and as swabs (see below), usually Type 13 light, sterile, 90 cm (all) × 1 m = £1.04; 3 m = £2.17; 5 m = £3.38; 10 m = £6.47. 1-m packet supplied when no size stated. Uses pre-operative preparation, for cleansing and swabbing; absorbs more quickly than gauze.

**Absorbent Cotton Ribbon Gauze, BP 1993**

Woven fabric in ribbon form with fast selvedge edges. Uses post-surgery cavity packing for sinus, dental, throat cavities etc. See also below.

**Absorbent Cotton and Viscose Ribbon Gauze, BP 1993**

Consists of absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2. 500 g = £6.74. Uses absorbent and protective pad, as burns dressing on non-adherent layer.

**Absorbent Cotton and Viscose Ribbon Gauze, BP 1993**

Woven fabric in ribbon form with fast selvedge edges, warp threads of cotton, weft threads of viscose or combined cotton and viscose yarn, sterile. 5 m (both) × 1.25 cm = 78p; 2.5 cm = 86p. Uses post-surgery cavity packing for sinus, dental, throat cavities etc.

**Gauze and Cotton Tissue, BP 1988**

Consists of absorbent cotton enclosed in absorbent cotton gauze type 12 or absorbent cotton and viscose gauze type 2. 500 g = £6.74. Uses absorbent and protective pad, as burns dressing on non-adherent layer.

**Gauze and Cotton Tissue**

(Drug Tariff specification 14). Similar to above. 500 g = £4.92. Uses absorbent and protective pad, as burns dressing on non-adherent layer.

**Absorbent Lint, BPC**

Cotton cloth of plain weave with nap raised on one side from warp yarns. 25 g = 66p; 100 g = £2.63; 500 g = £11.07. 25-g pack supplied where no quantity stated. Note Not recommended for wound management.

**Absorbent Muslin, BP 1988**

Fabric of plain weave, warp threads of cotton, weft threads of cotton and/or viscose. Uses wet dressing, soaked in 0.9% sterile sodium chloride solution.

**Gauze Swab, BP 1988**

Consists of absorbent cotton gauze type 13 light or absorbent cotton and viscose gauze type 1 folded into squares or rectangles of 8-ply with no cut edges exposed, sterile, 7.5 cm × 7.5 cm 5-pad packet = 88p; non-sterile, 10 cm × 10 cm 100-pad packet = £1.31 (most suppliers).

**Filmed Gauze Swab, BP 1988**

As for Gauze Swab, but with thin layer of Absorbent Cotton enclosed within, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.52 (Synergy Healthcare—Cofide).

**Non-woven Fabric Swab**

(Drug Tariff specification 28). Consists of non-woven fabric folded 4-ply; alternative to gauze swabs, type 13 light, sterile, 7.5 cm × 7.5 cm, 5-pad packet = 24p; non-sterile, 10 cm × 10 cm, 100-pad packet = 76p. Uses general purpose swabbing and cleansing.

**Filmed Non-woven Fabric Swab**

(Drug Tariff specification 29). Film of viscose fibres enclosed within non-woven viscose fabric folded 8-ply, non-sterile, 10 cm × 10 cm, 100-pad packet = £3.52 (J & J—Regal). Uses general purpose swabbing and cleansing.

**A8.1.10 Capillary dressings**

Capillary dressings consist of an absorbent core of hydrophilic fibres sandwiched between two low-adherent wound-contact layers. Wound exudate is taken up by the dressing and retained within the highly absorbent central layer. The dressing may be applied intact to relatively superficial areas, but for deeper wounds or cavities it may be cut to shape to ensure good contact with the wound base. Multiple layers may be applied to heavily exuding wounds to further increase the fluid-absorbing capacity of the dressing.

Capillary dressings can be applied to a variety of wounds but they are contra-indicated for heavily bleeding wounds or arterial bleeding.

**Advadraw**

Non-adherent dressing consisting of a soft viscose and polyester absorbent pad with central wicking layer between two perforated permeable wound contact layers. 5 cm × 7.5 cm = 56p, 10 cm × 10 cm = 87p, 10 cm × 15 cm = £1.17, 15 cm × 15 cm = £1.54.

**Advadraw Spiral**

0.5 cm × 40 cm = 81p.

**Cerdak Basic**

Non-adhesive wound contact sachet containing ceramic spheres. 5 cm × 5 cm = 70p, 10 cm × 10 cm = £1.56, 10 cm × 15 cm = £2.08; cavity dressing 10 cm × 10 cm = £2.10, 10 cm × 15 cm = £2.63.

**Cerdak Aerocloth**

Non-adhesive wound contact sachet containing ceramic spheres, with non-woven fabric adhesive backing. 5 cm × 5 cm = £1.37, 5 cm × 10 cm = £1.94.

**Cerdak Aerofilm**

Non-adhesive wound contact sachet containing ceramic spheres, with waterproof transparent adhesive film backing. 5 cm × 5 cm = £1.51, 5 cm × 10 cm = £2.07.

**Sumar**

Lite. For light to moderately exuding wounds and cavities, 10 cm × 10 cm = £1.59, 10 cm × 15 cm = £2.12.

**Sumar Max**

For heavily exuding wounds, 10 cm × 10 cm = £1.61, 10 cm × 15 cm = £2.15.
A8.1.11 Other dressings

Honey-based topical application
Medical grade honey is applied directly to the wound and covered with a primary low adherence wound dressing; an additional secondary dressing may be required for exuding wounds. Honey has an osmotic effect that may help to deslough wounds and maintain required for exuding wounds. Honey has an osmotic effect that may help to deslough wounds and maintain

Antibacterial Medical Honey
Manuka honey, (medical grade), 25-g tube = £1.99
Medihoney
Antibacterial Medical Honey, honey (medical grade, Lep- tosparsum sp), 20-g tube = £3.96
Antibacterial Wound Gel, honey (medical grade, Leptosper- sum sp), 80% in natural waxes and oils, 10-g tube = £2.69, 20-g tube = £4.02
Note Antibacterial Wound Gel is not recommended for use in deep wounds or body cavities where removal of waxes may be difficult
Melladerm
Honey (medical grade; S. African, Fynbos) 45% in basis containing polyethylene glycol, 50-g tube = £7.50
Melladerm Plus, honey (medical grade; Bulgarian, moun- tain flower) 45% in basis containing polyethylene glycol, 20-g tube = £4.49, 50-g tube = £8.50
Mesitran
Ointment, honey (medical grade) 47%, 15-g tube = £3.47, 50-g tube = £9.55
Ointment S, honey (medical grade) 40%, 15-g tube = £3.46
Excipients include lanolin

A8.2 Bandages and adhesives

According to their structure and performance bandages are used for dressing retention, for support, and for compression.

A8.2.1 Non-extensible bandages
Bandages made from non-extensible woven fabrics have generally been replaced by more conformable products, therefore their role is now extremely limited. Triangular calico bandage has a role as a sling.

Domette Bandage, BP 1988
Fabric, plain weave, cotton warp and wool weft (hospital quality also available, all cotton). 5 m (all), 5 m = 54p; 7.5 cm × 5 cm = 81p; 10 cm = £1.08; 15 cm = £1.61 (Seraid)
Uses protection and support where warmth required

Multiple Pack Dressing No. 1
(Drug Tariff). Contains absorbent cotton, absorbent cotton gauge type 13 light (sterile), open-wove bandages (banded). 1 pack = £3.93
Appendix 8: Wound management

Elasticated Tubular Bandage, BP 1993

...Venous leg ulcers and should be considered after wound healing.

Compression hosiery (section A8.3.1) reduces the recurrence of venous leg ulcers and should be considered after wound healing.

Elasticated Surgical Tubular Stockinette, Foam packed

(Drug Tariff specification 25). Fabric as for Elasticated Tubular Bandage with polyurethane foam lining. ...Series: Synergy—Comfigrip; Easigrip—Easigrip; Sallis—Easiband; Sigma—Sigma ETB; S&N Hilton—Tenosigrip, JLB—Textex; Medlock—Tubigrip. Where no size stated by prescriber the 50 cm length should be supplied and width endorsed.

Elasticated Surgical Stockinette

(Drug Tariff specification 46). Lightweight plain-knit elasticated tubular bandage.

Acti-Fast .3.5 cm red line (small limb), length 1 m = 62p; 5 cm green line (medium limb), length 1 m = 65p, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = £3.15, 5 cm = £4.89, 9 cm = £6.50; 10.75 cm beige line (adult trunks), length 1 m = £2.15 (Activa).

CliniFast .3.5 cm red line (small limb), length 1 m = 56p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.81; 7.5 cm blue line (large limb), length 1 m = 71p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £4.10, 5 m = £7.10; 17.5 cm beige line (adult trunk), length 1 m = £2.15 (Activa).

Uses: retention of dressings on limbs, abdomen, trunk.

Elasticated Viscose Stockinette

(Drug Tariff specification 100). Light support bandages, which include the various forms of crepe bandage, are used in the prevention of oedema; they are also used to provide support for mild sprains and joints but their effectiveness has not been proven for this purpose. Since they have limited extensibility, they are able to provide light support without

their use as the only means of applying pressure to an oedematous limb or to a varicose ulcer is not appropriate, since the pressure they exert is inadequate. Compression hosiery (section A8.3.1) reduces the recurrence of venous leg ulcers and should be considered after wound healing.

Cotton Stockinette, Bleached, BP 1988

Knitted fabric, cotton yarn, tubular, 1 m × 2.5 cm = 33p; 5 cm = 51p; 7.5 cm = 62p; 6 m × 10 cm = £4.23 (J&J, Medlock)

Uses: 1 lengths, basis (with wadding) for Plaster of Paris bandages etc.; 6 m length, compression bandage.

Elasticated Tubular Bandage, BP 1993

(formerly Elasticated Surgical Tubular Stockinette). Knitted fabric, elasticated threads of rubber-cored polyamide or polyester yarns and viscose or cotton yarns; tubular. Lengths 50 cm and 1 m, widths 6.25 cm, 6.75 cm, 7.5 cm, 8.75 cm, 10 cm, 12 cm (other sizes); Synergy—Comfigrip; Easigrip—Easigrip; Sallis—Easiband; Sigma—Sigma ETB; S&N Hilton—Tenosigrip, JLB—Textex; Medlock—Tubigrip. Where no size stated by prescriber the 50 cm length should be supplied and width endorsed.

Elasticated Viscose Stockinette

(Drug Tariff specification 46). Lightweight plain-knit elasticated tubular bandage.

Acti-Fast .3.5 cm red line (small limb), length 1 m = 62p; 5 cm green line (medium limb), length 1 m = 65p, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = £3.15, 5 cm = £4.89, 9 cm = £6.50; 10.75 cm beige line (adult trunks), length 1 m = £2.15 (Activa).

CliniFast .3.5 cm red line (small limb), length 1 m = 56p; 5 cm green line (medium limb), length 1 m = 58p, 3 m = £1.62, 5 m = £2.81; 7.5 cm blue line (large limb), length 1 m = 71p, 3 m = £2.13, 5 m = £3.74; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £4.10, 5 m = £7.10; 17.5 cm beige line (adult trunk), length 1 m = £2.15 (Activa).

Uses: retention of dressings on limbs, abdomen, trunk.

Elasticated Viscose Stockinette

(Drug Tariff specification 46). Lightweight plain-knit elasticated tubular bandage.

Acti-Fast .3.5 cm red line (small limb), length 1 m = 62p; 5 cm green line (medium limb), length 1 m = 65p, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = 90p, 3 m = £2.50, 5 m = £4.40; 10.75 cm yellow line (child trunk), length 1 m = £1.45, 3 m = £4.10, 5 m = £7.10; 17.5 cm beige line (adult trunk), length 1 m = £2.15 (Activa).

Uses: retention of dressings on limbs, abdomen, trunk.

Elasticated Viscose Stockinette

(Drug Tariff specification 46). Lightweight plain-knit elasticated tubular bandage.

Acti-Fast .3.5 cm red line (small limb), length 1 m = 62p; 5 cm green line (medium limb), length 1 m = 65p, 3 m = £1.90, 5 m = £3.30; 7.5 cm blue line (large limb), length 1 m = £3.15, 5 cm = £4.89, 9 cm = £6.50; 10.75 cm beige line (adult trunks), length 1 m = £2.15;...
exerting undue pressure. For a warning against injudicious compression see section A8.2.5.

**Crepe Bandage, BP 1988**
Fabric, plain weave, warp of wool threads and crepe-twisted cotton threads, weft of cotton threads; stretch bandage. 4.5 m stretched (all): 5 cm = 90p; 7.5 cm = £1.20; 10 cm = £1.85; 15 cm = £2.39 (most suppliers)

**Uses** light support system for strains, sprains, compression over paste bandages for varicose veins

**Cotton Crepe Bandage**
Light support bandage, 4.5 m stretched (all): 5 cm = 48p; 7.5 cm = 67p; 10 cm = 87p; 15 cm = £1.27 (Steraid—Hospiacrepe 239)

**Cotton Crepe Bandage, BP 1988**
Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton and/or viscose threads; stretch bandage. 4.5 m stretched (both): 7.5 cm = £2.81; 10 cm = £3.62; other sizes (most suppliers)

**Uses** light support system for strains, sprains, compression over paste bandages for varicose ulcers

**Cotton, Polyamide and Elastane Bandage**
Fabric, cotton, polyamide, and elastane; light support bandage (Type 2). 4.5 m stretched (all): 5 cm = 54p; 7.5 cm = £73p; 10 cm = 91p; 15 cm = £1.12 (Neomedic—Neoprot); 5 cm = 64p; 7.5 cm = 91p; 10 cm = £1.16; 15 cm = £1.67 (BSN Medical—Jiffipore); 10 cm = £1.10 (Medlock—Setocrepe); 10 cm = £1.24, latex-free = £1.31 (S&N Hlth.—Profore #2)

**Uses** light support for sprains and strains; retention of dressings

**Cotton Stretch Bandage, BP 1988**
Fabric, plain weave, warp of crepe-twisted cotton threads, weft of cotton threads; stretch bandage, lighter than cotton crepe. 4.5 m stretched (all): Hospipore 233, 5 cm = 52p; 7.5 cm = 72p; 10 cm = 96p; 15 cm = £1.36 (Steraid)

**PremierBand** 6, 5 cm = 45p; 7.5 cm = 63p; 10 cm = 79p; 15 cm = £1.18 (Shermond)

**Uses** light support system for strains, sprains, compression over paste bandages for varicose ulcers

**Cotton Suspensory Bandage**
(Drug Tariff). Type 1: cotton net bag with draw tapes and webbing waistband; small, medium, and large (all) = £1.55, extra large = £1.65. Type 2: cotton net bag with elastic edge and webbing waistband; small = £1.77, large = £1.83, extra large = £1.91. Type 3: cotton net bag with elastic edge and webbing waistband with elastic insertion; small, medium, and large (all) = £1.86; extra large = £1.92. Type supplied to be endorsed

**Uses** support of scrotum

**Knitted Elastomer and Viscose Bandage**
Knitted fabric, viscose and elastomer yarn. **Type 2** (light support bandage)
Clinilite, 4.5 m (all), 5 cm = 44p; 7.5 cm = 61p; 10 cm = 80p; 15 cm = £1.16 (Clinisupplies)

**K-Lite** 4.5 m stretched, 5 cm = 51p; 7 cm = 71p; 10 cm = 93p; 15 cm = £1.34; 5.2 m stretched, 10 cm = £1.06 (Urgo)

**Knit-Firm** 4.5 m stretched, 5 cm = 36p; 7 cm = 51p; 10 cm = 66p; 15 cm = 96p (Steraid)

**Uses** light support for sprains and strains

**Type 3a (light compression bandage):**
CliniPlus, all 5 cm = £1.80 (Clinisupplies)

**Elset** 6 m stretched, 10 cm = £2.39; 15 cm = £2.59; 8 m stretched, 10 cm = £3.06; 12 m stretched, 15 cm = £5.13 (Medlock)

**K-Plus** 8.7 m stretched, 10 cm = £2.08; 10.25 m stretched, 10 cm = £2.36 (Urgo)

**K-Plus Long** 10.25 m stretched, 10 cm = £2.41 (Urgo)

**Profore #3** 8.7 m stretched, 10 cm = £3.60, latex-free = £3.91 (S&N Hlth.)

**High compression bandages**

**PEC High Compression Bandage**
Polyamide, elastane, and cotton compression (high) extensible bandage, 3 m (unstretched) (all): 7.5 cm = £2.52; 10 cm = £3.25 (Medlock—Setocrepe)

**VEC High Compression Bandage**
Viscose, elastane, and cotton compression (high) extensible bandage, 3 m unstretched (both): 7.5 cm = £2.52; 10 cm = £3.25; 15 cm = £3.95 (S&N—Tensopress)

**High Compression Bandage**
Cotton, viscose, nylon, and Lycra extensible bandage, 3 m (unstretched), 10 cm (red) = £3.33 (ConvaTec—SurePres); 3 m (unstretched), 10 cm = £2.64 (Urgo—K-ThreeC); 3.5 m (unstretched), 10 cm = £1.82 (Advancis—Adva-Co)

**ProGuide #2** (S&N Hlth.)
Woven, elastomer, cohesive, extensible, compression bandage, 3 m (unstretched), 10 cm (red) = £5.37, 10 cm (yellow) = £5.85, 10 cm (green) = £6.34

**Short stretch compression bandage**
Short stretch bandages help to reduce oedema and promote healing of venous leg ulcers. They are also used to reduce swelling associated with lymphoedema. They are applied at full stretch over padding (see Sub-compression Wadding Bandage below) which protects areas of high pressure and sites at high risk of pressure damage.

**Actiban** (Activa)
All 5 m, 8 cm = £3.08; 10 cm = £3.31; 12 cm = £4.02

**Actico** (Activa)
Cohesive, all 6 m, 4 cm = £2.19, 6 cm = £2.57, 8 cm = £2.95, 10 cm = £3.07, 12 cm = £3.91

**Comprilan** (BSN Medical)
All 5 m, 6 cm = £2.52; 8 cm = £2.96; 10 cm = £3.18; 12 cm = £3.87

**Rosidal K** (Synergy Healthcare)
All 5 m, 4 cm = £1.70, 6 cm = £2.37, 8 cm = £2.83, 10 cm = £3.09, 12 cm = £3.75; 10 m x 10 cm = £5.38

**Silkolan** (Urgo)
All 5 m, 8 cm = £3.00; 10 cm = £3.39

**Sub-compression wadding bandage**
Advasoft (Advancis)
3.5 m unstretched, 10 cm = 37p

**Cellona Undercast Padding** (Synergy Healthcare)
2.75 m unstretched (all): 5 cm = 26p, 7.5 cm = 34p; 10 cm = 42p; 15 cm = 54p

**Flexi-Ban** (Activa)
Padding, 3.5 m unstretched, 10 cm = 46p
Multi-layer compression bandaging systems are an alternative to High Compression Bandages (section A8.2.5) for the treatment of venous leg ulcers. Compression is achieved by the combined effects of two or three extensible bandages applied over a layer of orthopaedic wadding and a wound contact dressing.

### Four layer systems

**K-Four** (Urgo)  
K-Four Wound Dressing (Paratex — see Knitted Viscose Primary Dressing, p. 892); K-Four #1 (K-Soft — see Sub-compression Wadding Bandage, above); K-Four #2 (K-Lite — see Knitted Elastomer and Viscose Bandage, p. 897); K-Four #3 (K-Plus — see Knitted Elastomer and Viscose Bandage, p. 897); K-Three C — see High compression bandages, p. 897; K-Four #4 (K-Flex ), 6 m (stretched), 10 cm = £2.76; 7.6 (stretched), 10 cm = £3.16

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £6.93, 18–25 cm = £6.51, 25–30 cm = £6.64, above 30 cm = £9.05, reduced compression, 18 cm+ = £4.43

**Profore** (S&N Hlth.)  
Profore wound contact layer (see Knitted Viscose Primary Dressing, p. 892); Profore #1 (see Sub-compression Wadding Bandage, above); Profore #2 (see Cotton, Polyamide and Elastane Bandage, p. 897); Profore #3 (see Knitted Elastomer and Viscose Bandage, p. 897); Profore #4 (see Cohesive bandages, p. 899); Profore Plus 3 m (unstretched), 10 cm = £3.37, latex-free = £3.60

Multi-layer compression bandaging kit, four layer system, for ankle circumference up to 18 cm = £9.32, 18–25 cm = £6.69, 25–30 cm = £7.21, above 30 cm = £10.79, latex-free, 18–25 cm = £9.28, Profore Lite above 18 cm = £5.01, latex-free = £5.45

**System 4** (Mölnlycke)  
System 4 wound contact layer (Setoprime — see Knitted Viscose Primary Dressing, p. 892); System 4 #1 (Softex — see Sub-compression Wadding Bandage, above); System 4 #2 (Strocrepe — see Cotton, Polyamide and Elastane Bandage, p. 897); System 4 #3 (Ellet — see Knitted Elastomer and Viscose Bandage, p. 897); System 4 #4 (Coban — see Cohesive Bandages, p. 899)

### Two layer systems

**Coban** (3M)  
Multi-layer compression bandaging kit, two layer system (latex-free, foam bandage and cohesive compression bandage), one size = £8.08

**K-Two** (Urgo)  
K-Tech (see Sub-compression Wadding Bandages, above); K-Press (see Cohesive Bandages, p. 899)

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–25 cm (short) = £6.50, ankle circumference 18–25 cm = £7.70, ankle circumference 25–32 cm = £8.35

**ProGuide** (S&N Hlth.)  
ProGuide wound contact layer (see Low Adherence Dressing and Wound Contact Materials, p. 893); ProGuide #1 (see Sub-compression Wadding Bandage, above); ProGuide #2 (see High Compression Bandages, p. 897)

Multi-layer compression bandaging kit, two layer system, for ankle circumference 18–22 cm (red) = £8.98, 22–28 cm (yellow) = £9.48, 28–32 cm (green) = £9.96

### Adhesive bandages

Elastic adhesive bandages are used to provide compression in the treatment of varicose veins and for the support of injured joints; they should no longer be used for the support of fractured ribs and clavicles. They have also been used with zinc paste bandage in the treatment of venous ulcers, but they can cause skin reactions in susceptible patients and may not produce sufficient pressures for healing (significantly lower than those provided by other compression bandages).

**Elastic Adhesive Bandage, BP 1993**  
Woven fabric, elastic in warp (crepe-twisted cotton threads), weft of cotton and/or viscose threads spread with adhesive mass containing zinc oxide. 4.5 m stretched (all): 5 cm = £3.51; 7.5 cm = £4.80; 10 cm = £6.36 (Robinsons—Flexoplast); S&N Hlth.—Elastoplast Bandage. 7.5 cm width supplied when size not stated

**Uses** compression for chronic leg ulcers, compression and support for swollen or sprained joints

### Cohesive bandages

Cohesive bandages adhere to themselves, but not to the skin, and are useful for providing support for sports use where ordinary stretch bandages might become displaced and adhesive bandages are inappropriate. Care is needed in their application, however, since the loss of ability for movement between turns of the bandage to equalise local areas of high tension carries the potential for creating a tourniquet effect. They should not be used if arterial disease is suspected.
Cohesive extensible bandages

These elastic bandages adhere to themselves and not to skin; this prevents slipping during use.

**Uses**: support of sprained joints; outer layer of multi-layer compression bandaging

**Coban** (3M)

6 m (stretched), 10 cm = £2.76; other sizes £4.5 m stretched (all): 2.5 cm = £1.29; 5 cm = £1.81; 7.5 cm = £2.74; 10 cm = £3.61; 15 cm = £5.33

**K-Press** (Urgo)

6.5 m × 10 cm (0, short) = £2.76, 7.5 m × 10 cm (18–25 cm ankle circumference) = £3.22, 10.5 m × 10 cm (25–32 cm ankle circumference) = £3.50

**Profore #4** (S&N Hlth.)

2.5 m (unstretched) = £2.97, latex-free = £3.23

Ultra Fast (Robinsons)

6.3 m (stretched), 10 cm = £2.59

A8.2.9 Medicated bandages

**Zinc Paste Bandage** has been used with compression bandaging for the treatment of venous leg ulcers. However, paste bandages are associated with hypersensitivity reactions and should be used with caution.

Zinc paste bandages are also used with coal tar or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions.

**Zinc Paste Bandage, BP 1993**

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide; requires additional bandaging, 6 m × 7.5 cm = £3.23 (Medlock—Zincaband 15%), excipients: include hydroxybenzoates; £3.55 (S&N Hlth.—Viscopaste PB7 (10%), excipients: include cetostearyl alcohol, hydroxybenzoates)

**Zinc Paste and Calamine Bandage** (Drug Tariff specification 5). Cotton fabric, plain weave, impregnated with suitable paste containing calamine and zinc oxide; requires additional bandaging. 6 m × 7.5 cm = £3.33 (Medlock—Caloband).

**Zinc Paste and Ichthammol Bandage, BP 1993**

Cotton fabric, plain weave, impregnated with suitable paste containing zinc oxide and ichthammol; requires additional bandaging, 6 m × 7.5 cm = £3.31 (Medlock—Icthaband 15%/25%), excipients: include hydroxybenzoates; £3.55 (S&N Hlth.—Icthopaste 6%/2%, excipients: include cetostearyl alcohol

**Uses** see section 13.5

**Steripaste** (Medlock)

Cotton fabric, selvedge weave impregnated with paste containing zinc oxide (requires additional bandaging), 6 m × 7.5 cm = £3.24

**Excipients** include polysorbate 80

**Medicated stocking**

**Ziploc** (S&N Hlth.)

Sterile rayon stocking impregnated with ointment containing zinc oxide 20%. 4-pouch carton = £12.52; 10-pouch carton = £31.30

**Uses** chronic leg ulcers; can be used under appropriate compression bandages or hosiery in chronic venous insufficiency.

A8.2.10 Surgical adhesive tapes

Adhesive tapes are useful for retaining dressings on joints or awkward body parts. These tapes, particularly those containing rubber, can cause irritant and allergic reactions in susceptible patients; synthetic adhesives have been developed to overcome this problem, but they, too, may sometimes be associated with reactions. Adhesive tapes that are occlusive may cause skin maceration. Care is needed not to apply these tapes under tension, to avoid creating a tourniquet effect. If applied over joints they need to be orientated so that the area of maximum extensibility of the fabric is in the direction of movement of the limb.

### Permeable adhesive tapes

**Elastic Adhesive Tape, BP 1988**

(Elastic Adhesive Plaster). Woven fabric, elastic in warp (crepe-twisted cotton threads), web of cotton and/or viscose threads, spread with adhesive mass containing zinc oxide. 4.5 m stretched × 2.5 cm = £1.64 (Robinsons—Flexoplast; S&N—Elastoplast).

**Uses** securing dressings.

For 5 cm width, see Elastic Adhesive Bandage

**Permeable, Apertured Non-Woven Synthetic Adhesive Tape, BP 1988**

Non-woven fabric with a polyacrylate adhesive.

**Hyfaja** (all) 2.5 cm = £1.56, 5 cm = £2.48, 10 cm = £4.33, 15 cm = £6.42, 20 cm = £8.51, 30 cm = £12.31 (BSN Medical).

**Mefix** 2.5 cm = 95p, 5 cm = £1.68, 10 cm = £2.69, 15 cm = £3.66, 20 cm = £4.69, 30 cm = £6.72 (Molnlycke).

**Omnifix** 2.5 cm = £1.79, 10 cm = £3.69, 15 cm = £5.44 (Hartmann).

**Uses** securing dressings.

**Permeable Non-woven Synthetic Adhesive Tape, BP 1988**

Backing of paper-based or non-woven textile material spread with a polymeric adhesive mass:

**Clinipore** 5 m (all) 1.25 cm = 35p, 2.5 cm = 59p, 5 cm = 99p; 2.5 cm × 10 m = 73p (Clinisupplies).

**Leukofix** 5 m (all) 1.25 cm = 52p, 2.5 cm × 83p, 5 cm = £1.45 (BSN Medical).

**Leukopore** 5 m (all) 1.25 cm = 46p, 2.5 cm = 72p, 5 cm = £1.26 (BSN Medical).

**Mediplast** 5 m (all) 1.25 cm = 30p, 2.5 cm = 50p (Neomedic).

**Microprop** 5 m (all) 1.25 cm = 60p, 2.5 cm = 89p, 5 cm = £1.57 (3M).

**Scanpor** 5 m (all) 1.25 cm = 40p, 2.5 cm = 64p, 5 cm = £1.11, 10 cm (all) 1.25 cm = 52p, 2.5 cm = 86p, 5 cm = £1.64, 7.5 cm = £2.40 (BioDiagnosics).

Where no brand stated by prescriber, net price of tape supplied not to exceed 35p (1.25 cm), 59p (2.5 cm), 99p (5 cm).

**Uses** securing dressings; skin closures for small incisions for patients with skin reactions to other plasters and strapping, which require use for long periods.

**Permeable Woven Synthetic Adhesive Tape, BP 1988**

Non-extendible closely woven fabric, spread with a polymeric adhesive. 5 m (all): 1.25 cm = 77p, 2.5 cm = £1.12, 5 cm = £1.95 (Beiersdorf—Leukosilk).

**Uses** securing dressings for patients with skin reactions to other plasters and strapping, which require use for long periods.

**Silicone adhesive tape**

Soft silicone, water-resistant, knitted fabric, polyurethane film adhesive tape.

**Insil** 2 cm × 3 m = £5.60, 4 cm × 1.5 m = £6.60 (Insight).

**Mepitac** 2 cm × 3 m = £6.39, 4 cm × 1.5 m = £6.39 (Molnlycke).

**Uses** securing dressings and appliances, skin protection under devices.

**Zinc Oxide Adhesive Tape, BP 1988**

(Zinc Oxide Plaster). Fabric, plain weave, warp and weft of cotton and/or viscose, spread with an adhesive containing...
Appendix 8: Wound management

Vapour permeable adhesive dressings

Vapour-permeable Waterproof Plastic Wound Dressing, BP 1993
(former Drug Tariff title: Semipermeable Waterproof Plastic Wound Dressing). Consists of absorbent pad, may be dyed and impregnated with suitable antiseptic (see under Elastic Adhesive Dressing), attached to a piece of permeable plastic surgical adhesive tape, to leave a suitable adhesive margin; both pad and margin covered with suitable protector (most suppliers)

Use general purpose waterproof dressing, permeable to air and water vapour

Occlusive adhesive tapes

Impermeable Plastic Wound Dressing, BP 1993

Consists of absorbent pad, may be dyed and impregnated with suitable antiseptic (see under Elastic Adhesive Dressing), attached to piece of impermeable plastic surgical adhesive tape, to leave suitable adhesive margin; both pad and margin covered with suitable protector (most suppliers)

Uses protective covering for wounds requiring an occlusive dressing

A8.2.11 Adhesive dressings

A8.2.12 Skin closure dressings

Skin closure strips are used as an alternative to sutures for minor cuts and lacerations.

Skin closure strips, sterile

Leukostrip, 6.4 mm × 76 mm, 3 strips per envelope. 10 envelopes = £5.79 (S&N Hlth.)

Steri-strip, 6 mm × 75 mm, 3 strips per envelope. 12 envelopes = £8.52; 5.5 mm × 75 mm, 12 envelopes = £8.32; 12 mm × 100 mm, 12 envelopes = £8.52 (3M)

Drug Tariff specifies that these are specifically for personal administration by the prescriber

A8.3 Elastic hosiery

Before elastic hosiery can be dispensed, the quantity (single or pair), article (including accessories), and compression class must be specified by the prescriber. There are different compression values for graduated compression hosiery and lymphoedema garments (see table below). All dispensed elastic hosiery articles must state on the packaging that they conform with Drug Tariff technical specification No. 40, for further details see Drug Tariff.

Note Graduated compression tights are

A8.3.1 Graduated compression hosiery

Class 1 Light Support

Hosiery, compression at ankle 14–17 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £7.44, below knee = £6.80, (made-to-measure), thigh length = £36.95, below knee = £23.12, lightweight elastic net (made-to-measure), thigh length = £19.93, below knee = £15.55

Uses superficial or early varices, varicosis during pregnancy

Class 2 Medium Support

Hosiery, compression at ankle 18–24 mmHg, thigh length or below knee with knitted in heel. 1 pair, circular knit (standard), thigh length = £11.06, below knee = £9.94, (made-to-
measure), thigh length = £36.95, below knee = £23.12; net
(made-to-measure), thigh length = £19.93, below knee = £15.55; flat bed (made-to-measure, only with closed heel and open toe), thigh length = £36.95, below knee = £23.12
Uses varices of medium severity, ulcer treatment and prophylaxis, mild oedema, varicosis during pregnancy

Class 3 Strong Support
Hosiery, compression at ankle 25–35 mmHg, thigh length or below knee with open or knitted in heel. 1 pair, circular knit (standard), thigh length = £13.11, below knee = £11.27, (made-to-measure) thigh length = £36.95, below knee = £23.12
Uses gross varices, post thrombotic venous insufficiency, gross oedema, ulcer treatment and prophylaxis

A8.3.2 Accessories
Suspenders
Suspenders, for thigh stockings = 65p, belt (specification 13), = £4.96, fitted (additional price) = 62p

A8.3.3 Anklets
Class 2 Medium Support
Anklets, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.51; flat bed (standard and made-to-measure) = £11.33; net (made-to-measure) = £12.80
Uses soft tissue support

Class 3 Strong Support
Anklets, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £9.09; flat bed (standard) = £9.09, (made-to-measure) = £13.53
Uses soft tissue support

A8.3.4 Knee caps
Class 2 Medium Support
Kneecaps, compression 18–24 mmHg, circular knit (standard and made-to-measure), 1 pair = £6.51; flat bed (standard and made-to-measure) = £12.80
Uses soft tissue support

Class 3 Strong Support
Kneecaps, compression 25–35 mmHg, circular knit (standard and made-to-measure), 1 pair = £8.68; flat bed (standard) = £8.68, (made-to-measure) = £13.53
Uses soft tissue support

A8.3.5 Lymphoedema garments
In addition to the products listed below, made-to-measure garments up to compression 90 mmHg and accessories also available; see Drug Tariff for details. There are different compression values for lymphoedema garments and graduated compression hosiery, see table, p. 900

Low Compression
Armsleeves (with grip top), compression 12–16 mmHg, small, medium, and large sizes all available short or long, 1 pair = £16.70

Class 1 Light support
Hosiery and armsleeves, compression 18–21 mmHg, small, medium, and large sizes all available short or long, 1 pair = £16.70

Class 2 Medium support
Hosiery and armsleeves, compression 23–32 mmHg, small, medium, large, and extra large sizes all available standard length (some available petite), 1 pair below knee closed or open toe (no top band) = £25.50, thigh closed or open toe (with top band) = £49.00; 1 piece armsleeve (no top band) = £14.50, armsleeve (with top band) = £19.00, combined armsleeve (no top band) = £25.50, combined armsleeve (with top band) = £30.00

Class 3 Strong support
Hosiery, compression 34–46 mmHg, small, medium, large, and extra large sizes all available standard length (some available petite), 1 pair below knee open toe (no top band) = £28.00, thigh open toe (with top band) = £51.00
Appendix 9: Cautionary and advisory labels for dispensed medicines

Numbers following the preparation entries in the BNF correspond to the code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient. The pharmacist should ensure that the patient understands how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on driving or work, any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin by a medicine should also be mentioned.

For some preparations there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this is indicated where necessary.

Original packs Most preparations are now dispensed in unbroken original packs (see Patient Packs, p. x) that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value in unbroken original packs (see Patient Packs, p. x) that include further advice for the patient in the form of patient information leaflets. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under ‘Dose’ should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed ‘NCL’ (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include ‘Shake the bottle’, ‘For external use only’, and ‘Store in a cool place’, as well as ‘Discard . . . days after opening’ and ‘Do not use after . . . ,’ which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF these labels should continue to be used when appropriate; indeed, ‘For external use only’ is a legal requirement on external liquid preparations, while ‘Keep out of the reach of children’ is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquid and for this reason no separate label has been recommended.

The label wordings recommended by the BNF apply to medicines dispensed against a prescription. Patients should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The Executive Editor will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

Wordings which can be given as separate warnings are labels 1–19 and labels 29–33. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

1 Warning. May cause drowsiness

To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning. May cause drowsiness. If affected do not drive or operate machinery. Avoid alcoholic drink

To be used on preparations for adults that can cause drowsiness, thereby affecting the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.
Some of these preparations only cause drowsiness in the first few days of treatment and some only cause drowsiness in higher doses. In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness. Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient's doctor.

Side-effects unrelated to drowsiness that may affect a patient's ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been recommended to cover these cases but the patient should be suitably counselled.

3 Warning. May cause drowsiness. If affected do not drive or operate machinery
To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and dealcoholised (low alcohol) drink is covered by the patient information leaflet. Also to be used as for label 2 but where alcohol is not an issue.

4 Warning. Avoid alcoholic drink
To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole and chlorpropamide). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

5 Do not take indigestion remedies at the same time of day as this medicine
To be used with label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.
Label 5 also applies to drugs such as ketoconazole where the absorption is significantly affected by antacids; the usual period of avoidance recommended is 2 to 4 hours.

6 Do not take indigestion remedies or medicines containing iron or zinc at the same time of day as this medicine
To be used on preparations containing oflixacin and some other quinolones, doxycycline, lymecycline, minocycline, and penicillamine. These drugs chelate calcium, iron and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. These incompatible preparations should be taken 2 to 3 hours apart.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc at the same time of day as this medicine
To be used on preparations containing ciprofloxacin, norfloxacin or tetracyclines that chelate calcium, iron, magnesium, and zinc and are thus less available for absorption; these incompatible preparations should be taken 2 to 3 hours apart. Doxycycline, lymecycline and minocycline are less liable to form chelates and therefore only require label 6 (see above).

8 Do not stop taking this medicine except on your doctor's advice
To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. anti-tuberculous drugs).
Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Take at regular intervals. Complete the prescribed course unless otherwise directed
To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment. The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning. Follow the printed instructions you have been given with this medicine
To be used particularly on preparations containing anticoagulants, lithium and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanation given. This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Avoid exposure of skin to direct sunlight or sun lamps
To be used on preparations that may cause phototoxic or photoallergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 9 (e.g. phenothiazines and sulphonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sun-beds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine
To be used on preparations containing probenecid and sulfinpyrazone whose activity is reduced by aspirin.
Label 12 should not be used for anticoagulants since label 10 is more appropriate.

13 Dissolve or mix with water before taking
To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders, granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour the urine
To be used on preparations that may cause the patient's urine to turn an unusual colour. These include phenolphthalein (alkaline urine pink), triamterene (blue under some lights), levodopa (dark red dish), and rifampicin (red).

15 Caution flammable: keep away from fire or flames
To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Allow to dissolve under the tongue. Do not transfer from this container. Keep tightly closed. Discard eight weeks after opening
To be used on glyceryl trinitrate tablets to remind the patient not to transfer the tablets to plastic or less suitable containers.

17 Do not take more than . . . in 24 hours
To be used on preparations for the treatment of acute migraine except those containing ergotamine, for which label 18 is used. The dose form should be specified, e.g. tablets or capsules. It may also be used on preparations for which no dose has been specified by the prescriber.

18 Do not take more than . . . in 24 hours or . . . in any one week
To be used on preparations containing ergotamine. The dose form should be specified, e.g. tablets or suspensions.

19 Warning. Causes drowsiness which may continue the next day. If affected do not drive or operate machinery. Avoid alcoholic drink
To be used on preparations containing hypnotics (or some other drugs with sedative effects) prescribed to be taken at night. On the rare occasions (e.g. nitrazepam in epilepsy) when hypnotics are prescribed for...
daytime administration this label would clearly not be appropriate. Also to be used as an alternative to the label 2 wording (the choice being at the discretion of the pharmacist) for anxiolytics prescribed to be taken at night.

It is hoped that this wording will convey adequately the problem of residual morning sedation after taking ‘sleeping tablets’. A

21 . . . with or after food
To be used on preparations that are liable to cause gastric irritation, or those that are better absorbed with food. Patients should be advised that a small amount of food is sufficient.

22 . . . half to one hour before food
To be used on some preparations whose absorption is thereby improved. Most oral antibacterials require label 23 instead (see below).

23 . . . an hour before food or on an empty stomach
To be used on oral preparations whose absorption may be reduced by the presence of food and acid in the stomach.

24 . . . sucked or chewed
To be used on preparations that should be sucked or chewed. The pharmacist should use discretion as to which of these words is appropriate.

25 . . . swallowed whole, not chewed
To be used on preparations that are enteric-coated or designed for modified-release. Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole.

26 . . . dissolved under the tongue
To be used on preparations designed for sublingual use. Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 . . . with plenty of water
To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulphonamides), or where water is required to aid the action (e.g. methylcellulose). The patient should be advised that ‘plenty’ means at least 150 mL (about a tumblerful). In most cases fruit juice, tea, or coffee may be used.

28 To be spread thinly . . .
To be used on external preparations that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
To be used on containers of dispensed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an ‘as required’ basis. The dose form should be specified, e.g. tablets or capsules. This label has been introduced because of the serious consequences of overdose with paracetamol.

30 Do not take with any other paracetamol products
To be used on all containers of dispensed preparations containing paracetamol.

31 Contains aspirin and paracetamol. Do not take with any other paracetamol products
To be used on all containers of dispensed preparations containing aspirin and paracetamol.

32 Contains aspirin
To be used on containers of dispensed preparations containing aspirin when the name on the label does not include the word ‘aspirin’.

33 Contains an aspirin-like medicine
To be used on containers of dispensed preparations containing aspirin derivatives.

### Products and their labels

Products introduced or amended since publication of BNF No. 56 (September 2008) are underlined. Proprietary names are in italic.

List of Dental Preparations

The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales).

Sugar-free versions, where available, are preferred.

- Aciclovir Cream, BP
- Aciclovir Oral Suspension, BP, 200 mg/5 mL
- Aciclovir Tablets, BP, 200 mg
- Aciclovir Tablets, BP, 800 mg
- Amoxicillin Capsules, BP
- Amoxicillin Oral Powder, DPF
- Amoxicillin Oral Suspension, BP
- Amphotericin Lozenges, BP
- Ampicillin Capsules, BP
- Ampicillin Oral Suspension, BP
- Artificial Saliva, DPF
- Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS):
  - AS Saliva Orthana®
  - Glandosane®
  - BioXtra®
  - Saliveze®
  - Salivix®
- Aspirin Tablets, Dispersible, BP
- Azithromycin Oral Suspension, 200 mg/5 mL, DPF
- Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as:
  - Clenil Modulite®
- Benzylamine Mouthwash, BP, 0.15%
- Benzylamine Oromucosal Spray, BP, 0.15%
- Betamethasone Soluble Tablets, 500 micrograms, DPF
- Carbamazepine Tablets, BP
- Carmellose Gelatin Paste, DPF
- Cefalexin Capsules, BP
- Cefalexin Oral Suspension, BP
- Cefalexin Tablets, BP
- Cefadroxil Capsules, BP
- Cefadroxil Oral Solution, DPF
- Cefazolin Hydrochloride Tablets, 10 mg, DPF
- Chlorhexidine Gluconate 1% Gel, DPF
- Chlorhexidine Mouthwash, BP
- Chlorhexidine Oral Spray, DPF
- Chlorphenamine Oral Solution, BP
- Chlorphenamine Tablets, BP
- Choline Salicylate Dental Gel, BP
- Clindamycin Capsules, BP
- Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
- Diazepam Oral Solution, BP, 2 mg/5 mL
- Diazepam Tablets, BP
- Diclofenac Sodium Tablets, BP
- Dihydrocodeine Tablets, BP, 30 mg
- Doxycycline Capsules, BP, 100 mg
- Doxycycline Tablets, BP, 20 mg, DPF
- Ephedrine Nasal Drops, BP
- Erythromycin Ethyl Succinate Oral Suspension, BP
- Erythromycin Ethyl Succinate Tablets, BP
- Erythromycin Stearate Tablets, BP
- Erythromycin Tablets, BP
- Fluconazole Capsules, 50 mg, DPF
- Fluconazole Oral Suspension, 50 mg/5 mL, DPF
- Hydrocortisone Cream, BP, 1%
- Hydrocortisone Oromucosal Tablets, BP
- Hydrogen Peroxide Mouthwash, BP
- Ibuprofen Oral Suspension, BP, sugar-free
- Ibuprofen Tablets, BP
- Lansoprazole Capsules, DPF
- Lidocaine 5% Ointment, DPF
- Lidocaine Spray 10%, DPF
- Loratadine Tablets, 10 mg, DPF
- Menthol and Eucalyptus Inhalation, BP 1980
- Metronidazole Oral Suspension, BP
- Metronidazole Tablets, BP
- Miconazole Cream, BP
- Miconazole Oromucosal Gel, BP
- Miconazole and Hydrocortisone Cream, BP
- Miconazole and Hydrocortisone Ointment, BP
- Mouthwash Solution-tablets, BP
- Nitrazepam Tablets, BP
- Nystatin Oral Suspension, BP
- Gastro-resistant Omeprazole Capsules, BP
- Oxytetracycline Tablets, BP
- Paracetamol Oral Suspension, BP
- Paracetamol Tablets, BP
- Paracetamol Tablets, Soluble, BP
- Phenoxymethylpenicillin Cream, DPF
- Phenoxymethylpenicillin Oral Solution, BP
- Phenoxymethylpenicillin Tablets, BP
- Promethazine Hydrochloride Tablets, BP
- Promethazine Oral Solution, BP
- Saliva Stimulating Tablets, DPF
- Sodium Chloride Mouthwash, Compound, BP
- Sodium Fluoride Mouthwash, BP
- Sodium Fluoride Oral Drops, BP
- Sodium Fluoride Tablets, BP
- Sodium Fluoride Toothpaste 0.619%, DPF
- Sodium Fluoride Toothpaste 1.1%, DPF

1. Amoxicillin Dispersible Tablets are no longer available
2. Supplies may be difficult to obtain
3. Indications approved by the ACBS are: patients suffering from dry mouth as a result of having (or having undergone) radiotherapy or sicca syndrome
4. The BP directs that when soluble aspirin tablets are prescribed, dispersible aspirin tablets should be dispensed
5. This preparation does not appear in subsequent editions of the BP
6. The BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed and no strength stated Paracetamol Oral Suspension 120 mg/5 mL should be dispensed
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP
Triamcinolone Dental Paste, BP

Preparations in this list which are not included in the BP or BPC are described under Details of DPF preparations, below

Details of DPF preparations

Preparations on the List of Dental Preparations which are specified as DPF are described as follows in the DPF. Although brand names have sometimes been included for identification purposes preparations on the list should be prescribed by non-proprietary name.

Amoxicillin Oral Powder (proprietary product: Amoxicillin Trio)
amoxicillin (as trihydrate) 3 g sachet

Artificial Saliva (proprietary product: laborant) consists of sorbitol 1.8 g, carmellose sodium (sodium carboxymethylcellulose) 390 mg, dibasic potassium phosphate 48.23 mg, potassium chloride 37.5 mg, monobasic potassium phosphate 21.97 mg, calcium chloride 9.972 mg, magnesium chloride 3.528 mg, sodium fluoride 258 micrograms/60 mL, with preservatives and colouring agents

Azithromycin Oral Suspension 200 mg/5 mL (proprietary product: Zithromax); azithromycin (as dihydrate) 200 mg/5 mL when reconstituted with water

Betamethasone Soluble Tablets 500 micrograms (proprietary product: Betnesol Soluble Tablets), beta-methasone (as sodium phosphate) 500 micrograms

Carmellose Gelatin Paste (proprietary product: Orabase Oral Paste), gelatin, pectin, carmellose sodium, 16.58% of each in a suitable basis

Cefradine Oral Solution (proprietary product: Velosef Syrup), cefradine 250 mg/5mL when reconstituted with water

Cetirizine Hydrochloride Tablets cetirizine hydrochloride 10 mg

Chlorhexidine Gluconate 1% Gel (proprietary product: Corsodyl Dental Gel), chlorhexidine gluconate 1%

Chlorhexidine Oral Spray (proprietary product: Corsodyl Oral Spray), chlorhexidine gluconate 0.2%

Doxycycline Tablets 20 mg (proprietary product: Periostal), doxycycline (as hyclate) 20 mg

Fluconazole Capsules 50 mg (proprietary product: Diflucan), fluconazole 50 mg

Fluconazole Oral Suspension 50 mg/5 mL (proprietary product: Diflucan), fluconazole 50 mg/5 mL when reconstituted with water

Lansoprazole Capsules (proprietary product: Protonix), lansoprazole 15 mg and 30 mg capsules, enclosing e/c granules

Lidocaine 5% Ointment lidocaine 5% in a suitable basis

Lidocaine Spray 10% (proprietary product: Xylocaine Spray), lidocaine 10% supplying 10 mg lidocaine/spray

Loratadine Tablets loratadine 10 mg

Mouthwash Solution-tablets consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash suitable for dental purposes

Penciclovir Cream (proprietary product: Vectavir Cream), penciclovir 1%

Saliva Stimulating Tablets (proprietary product: Sst), citric acid, malic acid and other ingredients in a sorbitol base

Sodium Fluoride Toothpaste 0.619% (proprietary product: Duraphat ‘2800 ppm’ Toothpaste), sodium fluoride 0.619%

Sodium Fluoride Toothpaste 1.1% (proprietary product: Duraphat ‘5000 ppm’ Toothpaste), sodium fluoride 1.1%

Changes to Dental Practitioners’ Formulary since September 2008

Additions
Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as: Clenil Modulite®
Cetirizine Hydrochloride Tablets, 10 mg, DPF
Chlorphenamine Oral Solution, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Lansoprazole Capsules, DPF
Loratadine Tablets, 10 mg, DPF
Gastro-resistant Omeprazole Capsules, BP

Deletions
Ascorbic Acid Tablets, BP
Beclometasone Dipropionate Aerosol Inhalation 50 micrograms/metered dose, DPF
Nystatin Ointment, BP
Pethidine Tablets, BP
Vitamin B Tablets, Compound, Strong, BPC

Changes of title
Old New
Metronidazole Oral Suspension, DPF Metronidazole Oral Suspension, BP

Nurse Prescribers’ Formulary for Community Practitioners

Nurse Prescribers’ Formulary Appendix (Appendix NPF). List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms FP10(CN) and FP10(PN) in Wales or, when available, WP10CN and WP10PN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described on p. 920

Almond Oil Ear Drops, BP
Arachis Oil Enema, NPF
1 Aspirin Tablets, Dispersible, 300 mg, BP
Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths)
Bisacodyl Tablets, BP
Catheter Maintenance Solution, Chlorhexidine, NPF
Catheter Maintenance Solution, Sodium Chloride, NPF
Catheter Maintenance Solution, ‘Solution G’, NPF
Catheter Maintenance Solution, ‘Solution R’, NPF
Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05%
Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05%
Choline Salicylate Dental Gel, BP
Clotrimazole Cream 1%, BP
Co-danthramer Capsules, NPF
Co-danthramer Capsules, Strong, NPF
Co-danthramer Oral Suspension, NPF
Co-danthramer Oral Suspension, Strong, NPF
Co-danthrusate Capsules, BP
Co-danthrusate Oral Suspension, NPF
Crotamiton Cream, BP
Crotamiton Lotion, BP
Dimeticone barrier creams containing at least 10%
Dimeticone Lotion, NPF
Docusate Capsules, BP
Docusate Enema, NPF
Docusate Oral Solution, BP
Docusate Oral Solution, Paediatric, BP
Econazole Cream 1%, BP

Emollients as listed below:
Aqueous Cream, BP
Arachis Oil, BP
Cetraben® Emollient Cream
Decubal® Clinic
Dermamist®
Diprobase® Cream
Diprobase® Ointment
Doublebase®
E45® Cream
Emulsifying Ointment, BP
Epaderm®
Hydromol® Cream
Hydromol® Ointment
Hydrous Ointment, BP
Linola® Gamma Cream
Lipobase®
Liquid and White Soft Paraffin Ointment, NPF
Neutrogena® Dermatological Cream
Oilatum® Cream
Oilatum® Junior Cream
Paraffin, White Soft, BP
Paraffin, Yellow Soft, BP
QV® Cream
QV® Lotion
QV® Wash
Ultrabase®
Unguentum M®
Zerobase® Cream

Emollient Bath Additives as listed below:
Alpha Ker® Bath Oil
3 Balneum®
Cetraben® Emollient Bath Additive
Dermalo® Bath Emollient
Diprobath®
Doublebase® Emollient Bath Additive
Doublebase® Emollient Shower Gel
Hydromol® Emollient
Imuderm® Bath Oil
Oilatum® Emollient
Oilatum® Junior Emollient Bath Additive
Oilatum® Gel
QV® Bath Oil
Folic Acid 400 micrograms/5 mL Oral Solution, NPF
Folic Acid Tablets 400 micrograms, BP
Glycerol Suppositories, BP
Ibuprofen Oral Suspension, BP
Ibuprofen Tablets, BP
Isaphagus Husk Granules, BP
Isaphagus Husk Granules, Effervescent, BP
Isaphagus Husk Oral Powder, BP
Lactulose Solution, BP
Lidocaine Ointment, BP

1. Max. 96 tablets; max. pack size 32 tablets
2. Included in the Drug Tariff, Scottish Drug Tariff, and Northern Ireland Drug Tariff
3. Except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)
4. Except for indications and doses that are...
Paracetamol Tablets, BP
Miconazole Oomucosal Gel, BP
Methbendazole Tablets, NPF
Methbendazole Tablets, BP
Miconazole Cream 2%, BP
Miconazole Oomucosal Gel, BP
Mouthwash Solution-tablets, NPF
Nicotine Inhalation Cartridge for Oomucosal Use, NPF
Nicotine Lozenges, NPF
Nicotine Medicated Chewing Gum, NPF
Nicotine Inal Spray, NPF
Nicotine Sublingual Tablets, NPF
Nicotine Transdermal Patches, NPF
Nyosstat Oral Suspension, BP
Olive Oil Ear Drops, BP
Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
Spermicidal contraceptives as listed below:
Sodium Picosulfate Elixir, NPF
Sodium Picosulfate Capsules, NPF
Sodium Citrate Compound Enema, NPF
Sodium Chloride Solution, Sterile, BP
Senna and Ispaghula Granules, NPF
Senna Tablets, BP
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulfate Capsules, NPF
Sodium Picosulfate Elixir, NPF
Spermicidal contraceptives as listed below: Gygel® Contraceptive Jelly
Sterculia and Frangula Granules, NPF
Sterculia Granules, NPF
Sterculia and Frangula Granules, NPF
Titanium Ointment, BP
Water for Injections, BP
Zinc and Castor Oil Ointment, BP
Zinc Cream, BP
Zinc Ointment, BP
Zinc Oxide and Dimeticone Spray, NPF
Zinc Oxide Impregnated Medicated Bandage, NPF
Zinc Oxide Impregnated Medicated Stocking, NPF
Zinc Paste Bandage, BP 1993
Zinc Paste and Calamine Bandage
Zinc Paste and Ichthammol Bandage, BP 1993

Appliances and Reagents (including Wound Management Products)

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Nx.

The Drug Tariffs can be accessed online at:
National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
Health and Personal Social Services for Northern Ireland Drug Tariff: www.centralservicesagency.com/display/ni_drug_tariff
Scottish Drug Tariff: www.isdscotland.org/isd/2245.html

Appliances (including Contraceptive Devices) as listed in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 (Appliances) and Part 2 (Dressings) of the Scottish Drug Tariff)
Incontinence Appliances as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff)
Stoma Appliances and Associated Products as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff)
Chemical Reagents as listed in Part IXR of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff)

Details of NPF preparations

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary.

Although brand names have sometimes been included for identification purposes, it is recommended that non-proprietary names should be used for prescribing medicinal preparations in the NPF except where a non-proprietary name is not available.

Arachis Oil Enema

archois oil 100%

Catheter Maintenance Solution, Chlorhexidine

(proprietary products: Uro-Tainer Chlorhexidine, Uroflex C), chlorhexidine 0.02%

Catheter Maintenance Solution, Sodium Chloride

(proprietary products: OptiFlo S, Uro-Tainer Sodium Chloride, Uriflex-S), sodium chloride 0.9%

Catheter Maintenance Solution, ‘Solution G’

(proproprietary products: OptiFlo G, Uro-Tainer Suby G, Uriflex G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

Catheter Maintenance Solution, ‘Solution R’

(proproprietary products: OptiFlo R, Uro-Tainer Solution R, Uriflex R), citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

Chlorhexidine gluconate alcoholic solutions

(proproprietary products: Hydrex Solution, Hydrex spray), chlorhexidine gluconate in alcoholic solution

Chlorhexidine gluconate aqueous solutions

(proproprietary product: Unisept) chlorhexidine gluconate in aqueous solution

1. Max. 96 tablets; max. pack size 32 tablets

2. Nurse Prescribers in Family Planning Clinics—where it is not appropriate for nurse prescribers in family planning clinics to prescribe contraceptive devices using form FP10F(PS) for FP10(PS and CN) and FP10(PN), or when available WP10(CN and WP10(PN, in Wales), they may prescribe using the same system as doctors in the clinic.
Co-danthramer Capsules
co-danthramer 25/200 (dantrone 25 mg, poloxamer '188' 200 mg)

Co-danthramer Capsules, Strong
co-danthramer 37.5/500 (dantrone 37.5 mg, poloxamer '188' 500 mg)

Co-danthramer Oral Suspension
(proprietary product: Codalax), co-danthramer 25/200 in 5 mL (dantrone 25 mg, poloxamer '188' 200 mg/5 mL)

Co-danthramer Oral Suspension, Strong
(proprietary product: Codalax Forte), co-danthramer 75/1000 in 5 mL (dantrone 75 mg, poloxamer '188' 1 g/5 mL)

Co-danthrusate Oral Suspension
(proprietary product: Normac), co-danthrusate 50/60 (dantrone 50 mg, docusate sodium 60 mg/5 mL)

Dimeticone Barrier creams
(proprietary products: Conotrine Cream, dimeticone '350' 22%, Siopel Barrier Cream, dimeticone '1000' 10%; Vasogen Barrier Cream, dimeticone 20%), dimeticone 10–22%

Dimeticone Lotion
(proprietary product: Hedin), dimeticone 4%

Docusate Enema
(proprietary product: Norgalax Micro-ema) docusate sodium 120 mg in 10 g

Folic Acid Oral Solution 400 micrograms/5 mL
(proprietary product: Folicare), folic acid 400 micrograms/5 mL

Liquid and White Soft Paraffin Ointment
liquid paraffin 50%, white soft paraffin 50%

Macrogol Oral Powder
macrogol '4000' (polyethylene glycol '4000') 10 g/sachet

Macrogol Oral Powder, Compound
macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet (proprietary products: Movicol, Movicol Plain, Laxido (orange or natural flavour)) or macrogol '3350' (polyethylene glycol '3350') 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 31.7 mg/sachet (proprietary product: Movicol Chocolate)

Macrogol Oral Powder, Compound, Half-strength
(proprietary product: Movicol-Half), macrogol '3350' (polyethylene glycol '3350') 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

Malathion alcoholic lotions
(proprietary product: Prioderm Lotion), malathion 0.5% in an alcoholic basis

Malathion aqueous lotions
(proprietary products: Derbac-M Liquid, Quellada M Liquid), malathion 0.5% in an aqueous basis

Mebendazole Oral Suspension
(proprietary product: Vermox), mebendazole 100 mg/5 mL

Mebendazole Tablets
(proprietary products: Ovek, Vermax), mebendazole 100 mg

Mouthwash Solution-tablets
consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

Nicotine Inhalation Cartridge for Oromucosal Use
(proprietary products: Nicorette Inhalator), nicotine 10 mg

Nicotine Lozenge
nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicotinell Mint Lozenge) or nicotine (as polacrilex) 2 mg or 4 mg (proprietary product: Nicotinell Lozenges), or nicotine (as resinate complex) 1.5 mg (proprietary product: Nicopass Lozenge)

Nicotine Medicated Chewing Gum
(proprietary products: Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

Nicotine Nasal Spray
(proprietary product: Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

Nicotine Sublingual Tablets
(proprietary product: Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg

Nicotine Transdermal Patches
releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary product: Boots NicAssist Patch, Nicorette Patch) or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin)

Permethrin Cream
(proprietary product: Lyclear Dermal Cream), permethrin 5%

Phenothrin Alcoholic Lotion
(proprietary product: Full Marks Lotion), phenothrin 0.2% in a basis containing isopropyl alcohol

Phenothrin Aqueous Lotion
(proprietary product: Full Marks Liquid), phenothrin 0.5% in an aqueous basis

Phosphate Suppositories
(proprietary product: Carbalax), sodium acid phosphate (anhydrous) 1.3 g, sodium bicarbonate 1.08 g

Piperazine and Senna Powder
(proprietary product: Pripsen Oral Powder), piperazine phosphate 4 g, sennosides 15.3 mg/sachet

Senna Oral Solution
(proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL

Senna and Ispaghula Granules
(proprietary product: Manevac Granules), senna fruit 12.4%, ispaghula 54.2%

1. For exemption, see p. 364
2. For use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)
3. To be prescribed as either a starter pack (2 x 15-tablet discs with dispenser) or refill pack (7 x 15-tablet discs)
4. Prescriber should specify the brand to be dispensed
Sodium Citrate Compound Enema
(proprietary products: Micolette Micro-enema, Micralax Micro-enema, Relaxit Micro-enema), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules
(proprietary products: Dulco-lax Perles), sodium picosulfate 2.5 mg

Sodium Picosulfate Elixir
(proprietary products: Dulco-lax Liquid, Laxoberal), sodium picosulfate 5 mg/5 mL

Sterculia Granules
(proprietary product: Normacol Granules), sterculia 62%

Sterculia and Frangula Granules
(proprietary product: Normacol Plus Granules), sterculia 62%, frangula (standardised) 8%

Zinc Oxide and Dimeticone Spray
(proprietary product: Sprilon), dimeticone 1.04%, zinc oxide 12.5% in a pressurised aerosol unit

Zinc Oxide Impregnated Medicated Bandage
(proprietary product: Steripaste), sterile cotton bandage impregnated with paste containing zinc oxide 15%

Zinc Oxide Impregnated Medicated Stocking
(proprietary product: Zipzoc), sterile rayon stocking impregnated with ointment containing zinc oxide 20%

Nurse Independent Prescribing
Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any licensed medicine for any medical condition, including some Controlled Drugs (see below).

Nurse Independent Prescribers must work within their own level of professional competence and expertise. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Nurse Independent Prescribers are also able to prescribe independently the Controlled Drugs in the table below, solely for the medical conditions indicated.

Up-to-date information and guidance on nurse independent prescribing is available on the Department of Health website at www.dh.gov.uk/nonmedicalprescribing

Controlled drugs prescribable by Nurse Independent Prescribers solely for the medical conditions indicated

A range of non-medical healthcare professionals are able to prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed individual Clinical Management Plan with the patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Up-to-date information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/nonmedicalprescribing.

**Nurses**

For further information on Nurse Independent Prescribing, see Nurse Prescribers’ Formulary, p. 922.

**Optometrists**

Optometrist Independent Prescribers are able to prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.

**Pharmacists**

Pharmacist Independent Prescribers are able to prescribe any licensed medicine, except Controlled Drugs, for any medical condition. Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Unlicensed medicines are available from 'special-order' manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at www.mhra.gov.uk

Licensed hospital manufacturing units also manufacture 'special-order' products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine

If you suspect that an adverse reaction may be related to a drug, or a combination of drugs, you should complete this Yellow Card or complete a report on the website at www.yellowcard.gov.uk. For **intensively monitored medicines** (identified by ▼) report all suspected reactions (including any considered not to be serious). For **established drugs and herbal remedies** report **all serious** adverse reactions in adults; report **all serious and minor** adverse reactions in **children** (under 18 years). You do not have to be certain about causality: if in doubt, please report. Do not be put off reporting just because some details are not known. See BNF (page 11) or the MHRA website (www.yellowcard.gov.uk) for additional advice.

How to use the Cardiovascular Risk Prediction Charts for Primary Prevention

These charts are for estimating cardiovascular disease (CVD) risk (non-fatal myocardial infarction and stroke, coronary and stroke death and new angina pectoris) for individuals who have not already developed coronary heart disease (CHD) or other major atherosclerotic disease. They are an aid to making clinical decisions about how intensively to intervene on lifestyle and whether to use antihypertensive, lipid lowering and anti-platelet medication, but should not replace clinical judgment.

- The use of these charts is not appropriate for patients who have existing diseases which already put them at high risk such as:
  - coronary heart disease or other major atherosclerotic disease;
  - familial hypercholesterolaemia or other inherited dyslipidaemias;
  - renal dysfunction including diabetic nephropathy;
  - type 1 and 2 diabetes mellitus.

- The charts should not be used to decide whether to introduce antihypertensive medication when blood pressure is persistently at or above 160/100 mmHg or when target organ damage due to hypertension is present. In both cases antihypertensive medication is recommended regardless of CVD risk. Similarly the charts should not be used to decide whether to introduce lipid-lowering medication when the ratio of serum total to HDL cholesterol exceeds 6. Such medication is generally then indicated regardless of estimated CVD risk.

- To estimate an individual’s absolute 10-year risk of developing CVD choose the chart for his or her sex, lifetime smoking status and age. Within this square identify the level of risk according to the point where the coordinates for systolic blood pressure and the ratio of total cholesterol to high density lipoprotein (HDL) cholesterol meet. If no HDL cholesterol result is available, then assume this is 1.0 mmol/litre and the lipid scale can be used for total cholesterol alone.

- Higher risk individuals (red areas) are defined as those whose 10-year CVD risk exceeds 20%, which is approximately equivalent to the coronary heart disease risk of >15% over the same period.

- The chart also assists in identifying individuals whose 10-year CVD risk is moderately increased in the range 10–20% (orange areas) and those in whom risk is lower than 10% over 10 years (green areas).

- Smoking status should reflect lifetime exposure to tobacco and not simply tobacco use at the time of assessment. For example, those who have given up smoking within 5 years should be regarded as current smokers for the purposes of the charts.

- The initial blood pressure and the first random (non-fasting) total cholesterol and HDL cholesterol can be used to estimate an individual’s risk. However, the decision on using drug therapy should generally be based on repeat risk factor measurements over a period of time.

(Continued over)
Men and women do not reach the level of risk predicted by the charts for the three age bands until they reach the ages 49, 59, and 69 years respectively. The charts will overestimate current risk most in the under 40s. Clinical judgement must be exercised in deciding on treatment in younger patients. However, it should be recognised that blood pressure and cholesterol tend to rise most and HDL cholesterol to decline most in younger people already with adverse levels. Left untreated, their risk at the age 49 years is likely to be higher than the projected risk shown on the age-under-50-years chart. From age 70 years the CVD risk, especially for men, is usually ≥ 20% over 10 years and the charts will underestimate true total CVD risk.

These charts (and all other currently available methods of CVD risk prediction) are based on groups of people with untreated levels of blood pressure, total cholesterol and HDL cholesterol. In patients already receiving antihypertensive therapy in whom the decision is to be made about whether to introduce lipid-lowering medication, or vice versa, the charts can only act as a guide. Unless recent pre-treatment risk factor values are available it is generally safest to assume that CVD risk is higher than that predicted by current levels of blood pressure or lipids on treatment.

CVD risk is also higher than indicated in the charts for:
- those with a family history of premature CVD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years) which increases the risk by a factor of approximately 1.3;
- men with HDL cholesterol < 1 mmol/litre or women with HDL cholesterol < 1.2 mmol/litre;
- those with raised triglyceride levels (> 1.7 mmol/litre);
- those with BMI ≥ 30 kg/m²;
- women with premature menopause;
- those who are not yet diabetic, but have impaired fasting glycaemia (6.1–6.9 mmol/litre) or impaired glucose tolerance (2 hour glucose ≥ 7.8 mmol/litre but < 11.1 mmol/litre in an oral glucose tolerance test).

The charts have not been validated in ethnic minorities and in some may underestimate CVD risk. For example, in people originating from the Indian subcontinent it is safest to assume that the CVD risk is higher than predicted from the charts (1.4 times).

An individual can be shown on the chart the direction in which his or her risk of CVD can be reduced by changing smoking status, blood pressure, or cholesterol, but it should be borne in mind that the estimate of risk is for a group of people with similar risk factors and that within that group there will be considerable variation in risk. It should also be pointed out in younger people that the estimated risk will generally not be reached before the age of 50, if their current blood pressure and lipid levels remain unchanged. The charts are primarily to assist in directing intervention to those who typically stand to benefit most.

The estimation of CVD risk in NICE clinical guideline 67 (May 2008): Lipid modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease (available at www.nice.org.uk) differs from that shown here as follows:

- estimated CVD risk increases by a factor of 1.5 in those with a family history of premature CHD (male first-degree relatives aged < 55 years and female first-degree relatives aged < 65 years)
- estimated CVD risk increases by a factor of 1.5–2 if more than one first-degree relative has a history of premature CHD
- estimated CVD risk for South Asian men is increased by a factor of 1.4
- CVD risk is higher than estimated in those with BMI > 40 kg/m²

The NICE guideline does not include the recommendation to treat all patients with a serum total to HDL cholesterol ratio of greater than 6 with lipid-lowering drugs.

The NICE guideline advises that the following factor is also taken into account when calculating CVD risk:
- presence of left ventricular hypertrophy

In addition, NICE advises that all patients over the age of 75 years should be considered at increased risk of CVD, and are likely to benefit from treatment.
Nondiabetic Men

Non-smoker

Smoker

Age under 50 years

Age 50–59 years

Age 60 years and over

CVD risk over next 10 years

SBP = systolic blood pressure mmHg

TC : HDL = serum total cholesterol to HDL cholesterol ratio

CVD risk <10% over next 10 years
CVD risk 10–20% over next 10 years
CVD risk >20% over next 10 years

(Continued over)
Nondiabetic Women

- **Non-smoker**
  - Age under 50 years
  - Age 50–59 years
  - Age 60 years and over

- **Smoker**
  - Age under 50 years
  - Age 50–59 years
  - Age 60 years and over

Medical emergencies in the community

Drug treatment outlined below is intended for use by community healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the patient’s condition requires investigation and further treatment, the patient should be transferred to hospital promptly.

Anaphylaxis
(section 3.4.3)

Adrenaline injection 1 mg/mL (1 in 1000)
- By intramuscular injection
  - CHILD UNDER 6 YEARS: 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
  - CHILD 6–12 YEARS: 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
  - CHILD 12–18 YEARS: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary
  - ADULT: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary

Chlorphenamine injection 10 mg/mL
- By intravenous injection over 1 minute or by intramuscular injection
  - CHILD 1–6 MONTHS: 250 micrograms/kg up to 4 times in 24 hours
  - CHILD 6 MONTHS–6 YEARS: 2.5 mg up to 4 times in 24 hours
  - CHILD 6–12 YEARS: 5 mg up to 4 times in 24 hours
  - CHILD 12–18 YEARS: 10 mg up to 4 times in 24 hours
  - ADULT: 10 mg up to 4 times in 24 hours

High-flow oxygen (section 3.6) should be given if required.

Hydrocortisone (preferably as sodium succinate) by intravenous injection (section 6.3.2) has delayed action but should be given to severely affected patients to prevent further deterioration.

Asthma: acute
(section 3.1)

Regard each emergency consultation as being for acute severe asthma until shown otherwise; failure to respond adequately at any time requires immediate referral to hospital

Either salbutamol aerosol inhaler 100 micrograms/metered inhalation
- By aerosol inhalation via large-volume spacer (and face mask in young children)
  - ADULT: 4–10 puffs each inhaled separately, repeated every 10–20 minutes if necessary
  - CHILD: 4–10 puffs each inhaled separately, repeated every 10–20 minutes if necessary

or salbutamol nebuliser solution 1 mg/mL, 2 mg/mL
- By inhalation of nebulised solution (via oxygen-driven nebuliser)
  - CHILD UNDER 5 YEARS: 2.5 mg every 10–20 minutes if necessary
  - CHILD 5–12 YEARS: 2.5–5 mg every 10–20 minutes if necessary
  - ADULT and CHILD OVER 12 YEARS: 2.5–5 mg every 10–20 minutes if necessary

or terbutaline nebuliser solution 2.5 mg/mL
- By inhalation of nebulised solution (via oxygen-driven nebuliser)
  - CHILD UNDER 5 YEARS: 2.5 mg every 10–20 minutes if necessary
  - CHILD 5–12 YEARS: 5–10 mg every 10–20 minutes if necessary
  - ADULT and CHILD OVER 12 YEARS: 10 mg every 10–20 minutes if necessary

Plus (in all cases)
either prednisolone soluble tablets 5 mg
- By mouth
  - CHILD UNDER 18 YEARS: 1–2 mg/kg (max. 40 mg) once daily for 3 days; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (CHILD UNDER 2 YEARS max. 40 mg, OVER 2 YEARS max. 50 mg) once daily
  - ADULT and CHILD OVER 12 YEARS: 10 mg every 10–20 minutes if necessary

or hydrocortisone (preferably as sodium succinate)
- By intravenous injection
  - CHILD UNDER 1 YEAR: 25 mg
  - CHILD 1–5 YEARS: 50 mg
  - CHILD 6–12 YEARS: 100 mg
  - ADULT: 100 mg

High-flow oxygen (section 3.6) if available (via face mask in children)

Monitor response 15 to 30 minutes after nebulisation; if any signs of acute asthma persist, arrange hospital admission. While awaiting ambulance, repeat nebulised beta2 agonist (as above) and give with ipratropium nebuliser solution 250 micrograms/mL
- By inhalation of nebulised solution (via oxygen-driven nebuliser)
  - CHILD UNDER 12 YEARS: 250 micrograms, repeated as necessary
  - ADULT and CHILD OVER 12 YEARS: 500 micrograms, repeated as necessary

Angina: unstable
(section 2.6)

Aspirin dispersible tablets 75 mg, 300 mg
- By mouth (dispersed in water or chewed)
  - ADULT: 300 mg

Plus
either Glyceryl trinitrate aerosol spray 400 micrograms/metered dose
- Sublingually
  - ADULT: 1–2 sprays, repeated as required

or Glyceryl trinitrate tablets 300 micrograms, 500 micrograms, 600 micrograms
- Sublingually
  - ADULT: 0.3–1 mg, repeated as required
Croup (section 3.1)

**Dexamethasone** oral solution 2 mg/5 mL.

- **By mouth**
  - **CHILD 1 MONTH–2 YEARS** 150 micrograms/kg as a single dose

Convulsions (section 4.8.2)

**Either diazepam** rectal solution 2 mg/mL, 4 mg/mL.

- **By rectum**, repeated after 10 minutes if necessary
  - **NEONATE** 1.25–2.5 mg
  - **CHILD 1–2 YEARS** 5–10 mg
  - **ADULT and CHILD OVER 12 YEARS** up to max. 30 mg

**or midazolam** buccal liquid 10 mg/mL or injection solution given by buccal route

- **By buccal administration**
  - **NEONATE** 300 micrograms/kg, repeated once if necessary
  - **CHILD 1–6 MONTHS** 300 micrograms/kg (max. 2.5 mg), repeated once if necessary
  - **CHILD 6 MONTHS–1 YEAR** 2.5 mg, repeated once if necessary
  - **CHILD 1–5 YEARS** 5 mg, repeated once if necessary
  - **CHILD 5–10 YEARS** 7.5 mg, repeated once if necessary
  - **CHILD 10–18 YEARS** 10 mg, repeated once if necessary
  - **ADULT** 10 mg, repeated once if necessary

Diabetic hypoglycaemia (section 6.1.4)

**Glucose** or **sucrose**

- **By mouth**
  - **CHILD 2–18 YEARS** approx. 10–20 g (2–4 teaspoonfuls of sugar or 3–6 sugar lumps or 55–110 mL *Lucozade® Energy Original* or 90–180 mL *Coca-Cola®*—both non-diet versions or *GlucoGet®* one or two 25-g tubes (containing glucose 10 g/25-g tube)) repeated after 10–15 minutes if necessary
  - **ADULT** approx. 10–20 g (2–4 teaspoonfuls of sugar or 3–6 sugar lumps or 55–110 mL *Lucozade® Energy Original* or 90–180 mL *Coca-Cola®*—both non-diet versions or *GlucoGet®* one or two 25-g tubes (containing glucose 10 g/25-g tube)) repeated after 10–15 minutes if necessary

**or if hypoglycaemia unresponsive or if oral route cannot be used**

**Glucagon** injection 1 mg/mL

- **By subcutaneous, intramuscular, or intravenous injection**
  - **CHILD BODY-WEIGHT UNDER 25 KG** 500 micrograms (0.5 mL)
  - **CHILD BODY-WEIGHT OVER 25 KG** 1 mg (1 mL)
  - **ADULT** 1 mg (1 mL)
  - **or if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes**

**Glucose** intravenous infusion 10%

- **By intravenous injection into large vein**
  - **CHILD 1 MONTH–18 YEARS** 5 mL/kg (glucose 500 mg/kg)

**Glucose** intravenous infusion 20%

- **By intravenous injection into large vein**
  - **ADULT** 50 mL

Febrile convulsions lasting longer than 15 minutes (section 4.8.3)

**Diazepam** rectal solution 2 mg/mL, 4 mg/mL

- **By rectum**
  - **CHILD BODY-WEIGHT OVER 10 KG** up to max. 30 mg, repeated after 15 minutes if necessary

Meningococcal disease (Table 1, section 5.1)

**Benzylpenicillin sodium** injection 600 mg, 1.2 g

- **By intravenous injection** (or by intramuscular injection if venous access not available)
  - **NEONATE** 300 mg
  - **CHILD 1 MONTH–1 YEAR** 300 mg
  - **CHILD 1–10 YEARS** 600 mg
  - **CHILD 10–18 YEARS** 1.2 g
  - **ADULT** 1.2 g

**Note** Give single dose and transfer urgently to hospital

**or if history of allergy to penicillin**

**Cefotaxime** injection 1 g

- **By intravenous injection** (or by intramuscular injection if venous access not available)
  - **NEONATE** 50 mg/kg
  - **CHILD 1 MONTH–12 YEARS** 50 mg/kg (max. 1 g)
  - **CHILD 12–18 YEARS** 1 g
  - **ADULT** 1 g

**Note** Give single dose and transfer urgently to hospital

**or if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, or urticarial reaction) to penicillin or to cephalosporins**

**Chloramphenicol** injection 1 g

- **By intravenous injection**
  - **CHILD 1 MONTH–18 YEARS** 12.5–25 mg/kg
  - **ADULT** 12.5–25 mg/kg

**Note** Give single dose and transfer urgently to hospital
**Myocardial infarction**  
*(section 2.10.1)*

**Aspirin** dispersible tablets 75 mg, 300 mg  
- By mouth (dispersed in water or chewed)  
  **ADULT** 300 mg

**Glyceryl trinitrate** aerosol spray 400 micrograms/ 
metered dose  
- Sublingually  
  **ADULT** 1–2 sprays, repeated as required

*or* **Glyceryl trinitrate** tablets 300 micrograms, 
500 micrograms, 600 micrograms  
- Sublingually  
  **ADULT** 0.3–1 mg, repeated as required

**Metoclopramide** injection 5 mg/mL  
- By intravenous injection  
  **ADULT (UNDER 60 KG) 18–19 YEARS** 5 mg  
  **ADULT (OVER 60 KG) 18–19 YEARS** 10 mg  
  **ADULT OVER 19 YEARS** 10 mg

**Diamorphine** injection (5 mg powder for reconstitution)  
- By slow intravenous injection (1 mg/minute)  
  **ADULT** 5 mg followed by a further 2.5–5 mg if necessary; **ELDERLY** or **FRAIL** patients, reduce dose by half

**Oxygen**, if appropriate

---

**Pneumonia: uncomplicated**  
*(Table 1, section 5.1)*

**Amoxicillin** oral suspension 125 mg/5 mL, 250 mg/ 
5 mL; capsules 250 mg  
- By mouth  
  **CHILD 6 MONTHS–1 YEAR** 125 mg 3 times daily  
  **CHILD 1–5 YEARS** 250 mg 3 times daily  
  **CHILD 5–18 YEARS** 500 mg 3 times daily  
  **ADULT** 0.5–1 g 3 times daily

*or if allergic to penicillin or atypical organism sus- 
pected*

**Erythromycin** oral suspension 125 mg/5 mL, 250 mg/ 
5 mL; tablets 250 mg  
- By mouth  
  **CHILD 6 MONTHS–2 YEARS** 125 mg 4 times daily  
  **CHILD 2–8 YEARS** 250 mg 4 times daily  
  **CHILD 8–18 YEARS** 250–500 mg 4 times daily  
  **ADULT** 500 mg 4 times daily

Length

1 metre (m) = 1000 millimetres (mm)
1 centimetre (cm) = 10 mm
1 inch (in) = 25.4 mm
1 foot (ft) = 12 inches = 304.8 mm

Mass

1 kilogram (kg) = 1000 grams (g)
1 gram (g) = 1000 milligrams (mg)
1 milligram (mg) = 1000 micrograms
1 microgram = 1000 nanograms
1 nanogram = 1000 picograms

Volume

1 litre = 1000 millilitres (mL)
1 millilitre (1 mL) = 1000 microlitres
1 pint = 568 mL

Other units

1 kilocalorie (kcal) = 4186.8 joules (J)
1000 kilocalories (kcal) = 4.1868 megajoules (MJ)
1 megajoule (MJ) = 238.8 kilocalories (kcal)
1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)
1 kilopascal (kPa) = 7.5 mmHg (pressure)

Plasma-drug concentrations in the BNF are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

Prescribing for children

Weight, height and body surface area

The table below shows the mean values for weight, height and body surface area by age; these values may be used to calculate doses in the absence of actual measurements. However, an individual's actual weight and height might vary considerably from the values in the table and it is important to ensure that the value chosen is appropriate. In most cases the actual measurement should be obtained as soon as possible and the dose re-calculated.

Recommended wording of cautionary and advisory labels

For details see Appendix 9

1 Warning. May cause drowsiness
2 Warning. May cause drowsiness. If affected do not drive or operate machinery. Avoid alcoholic drink
3 Warning. May cause drowsiness. If affected do not drive or operate machinery
4 Warning. Avoid alcoholic drink
5 Do not take indigestion remedies at the same time of day as this medicine
6 Do not take indigestion remedies or medicines containing iron or zinc at the same time of day as this medicine
7 Do not take milk, indigestion remedies, or medicines containing iron or zinc at the same time of day as this medicine
8 Do not stop taking this medicine except on your doctor's advice
9 Take at regular intervals. Complete the prescribed course unless otherwise directed
10 Warning. Follow the printed instructions you have been given with this medicine
11 Avoid exposure of skin to direct sunlight or sun lamps
12 Do not take anything containing aspirin while taking this medicine
13 Dissolve or mix with water before taking
14 This medicine may colour the urine
15 Caution flammable: keep away from fire or flames
16 Allow to dissolve under the tongue. Do not transfer from this container. Keep tightly closed. Discard 8 weeks after opening
17 Do not take more than ... in 24 hours
18 Do not take more than ... in 24 hours or ... in any one week
19 Warning. Causes drowsiness which may continue the next day. If affected do not drive or operate machinery. Avoid alcoholic drink
21 ... with or after food
22 ... half to one hour before food
23 ... an hour before food or on an empty stomach
24 ... sucked or chewed
25 ... swallowed whole, not chewed
26 ... dissolved under the tongue
27 ... with plenty of water
28 To be spread thinly ...
29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
30 Do not take with any other paracetamol products
31 Contains aspirin and paracetamol. Do not take with any other paracetamol products
32 Contains aspirin
33 Contains an aspirin-like medicine

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c. = ante cibum (before food)

b. d. = bis die (twice daily)
o. d. = omni die (every day)
o. m. = omni mane (every morning)
o. n. = omni nocte (every night)
p. c. = post cibum (after food)
p. r. n. = pro re nata (when required)
q. d. s. = quater die sumendum (to be taken four times daily)
q. q. h. = quarta quaque hora (every four hours)
stat = immediately
t. d. s. = ter die sumendum (to be taken three times daily)
t.i.d. = ter in die (three times daily)
